The provinces of the country are each under a governor, or, where two provinces are united, a governor-general. Every province is divided into a certain number of districts, called 'Fu,' 'Ting,' 'Chow,' 'Heen.' A 'Fu' is a large portion or department of a province under the general control of a civil officer, immediately subordinate to the head of the provincial government. A 'Ting,' a smaller division than, and sometimes a portion of, a Fu; when separate, it is governed as a Fu, and called a 'Chub-le.' A 'Chow' is similar to a Ting, as also a Heen, but each is a smaller division. Each Fu, Ting, Chow, or Heen has one or more towns or walled cities under its guidance, one of which takes its name and rank as 'Kwang-Chow-Fu' and 'Shang-Hae-Heen,' which latter, although of that subordinate rank, is the largest maritime city in the empire, and the greatest resort of the native ships or junks. But with all these, there has, besides, always remained a powerful and vivacious spark that the Tartar government has never been able to extirpate; and secret societies have been formed over the empire, the members of which have seen with impatience the Manchu domination, and cherished the idea of overthrowing it, to obtain a national government.

All these are five orders of nobility, the kuo, kuo, paek, tze, and nan, which correspond to the duke, marquis, earl, baron, and baronet of Britain. Each of these has classes. The Kее-Toow-We is a lower grade, and the Wau-Keo-We is a still lower. Other grades of rank are arranged as Chung or Tsung-deputy. Hereditary titles only exist for the imperial family and for the descendants of Confucius, who are still very numerous in the province of Shang-tung. Of the twelve orders of the Imperial nobility of China, tsinw is the first, kiwi-wang the second, belch third, beitsch fourth, chin kwok kung fifth, f-kwok kung sixth. To the hereditary titles which the relations of the emperor enjoy, there are attached certain prerogatives, as well as very modest allowance, the right of wearing a red or yellow girdle, of putting a plume of peacock's feathers in their caps, and of having six, eight, or twelve bearers to their palanquins. They cannot, more than any other citizen, pretend to any public office, without having previously taken their literary degree at Pekin and Moukden, the capital of Manchuria. Many of these nobles are to be seen living in idleness and penury on their small pensions, and having no other proof to show of their illustrious origin than the red or yellow girdle. A private tribunal, however, is charged to govern them and superintend their conduct.

The first civil and military mandarins who have distinguished themselves in the administration or in war, receive the titles of kong, heow, paak or phy, tze, and nan. All the officers, civil and military, of the Chinese Empire are divided into nine orders, kbiou-ling, distinguished one from the other by certain buttons, or rather balls, of the size of a pigeon's egg, which are worn above the official cap. This distinctive ball is of plain red coral for the first order, of carved coral for the second, of a translucent deep blue stone for the third, of pale blue for the fourth, crystal for the fifth, of some opaque white stone for the sixth, and for the seventh, eighth, and ninth, of gilt and wrought copper. Every order is subdivided into two classes, the one active and official, the other supernumerary; but this makes no difference in the balls. All the official personages comprised in these nine orders are designated by the generic term of kong-fon. The term mandarins was invented by the first Europeans who visited the country, and is probably derived from the Portuguese word 'mandar,' to command. The people are all partial to honours, and ornamental arches are raised to men and women who distinguish themselves.

The punishments for crimes are very severe, many are brutal. They transport and flog for petty larceny, use torture to extort confessions; use cages, the caughe, and fetters; chain the criminal to heavy stones and to iron bars; leave the food supply to chance; cut off the ear, or cut the person to pieces at 8, 24, 36, 72, and 120 cuts; decapitate and strangle. The prisons of China may be considered as unequalled upon earth, so far as everything that is most abominable is concerned.

Races.—The great races in the empire are three, the Chinese, the Mongol, and the Manchu. These nations differ very considerably in their physical characters, although much mixture has taken place. The northern or predominant race appears to have a fundamental tendency to an Iranian modification of the Turanian type; and the same tendency is observable amongst the Coreans and the higher classes of the Japanese, as amongst some of the American, Tangusian, and Asiatic peoples. In the south of China, the fundamental tendency is to an extreme flatness of features, the nose being often more insignificant and shapeless than in any other race, although the finer type also occurs. In the eastern maritime province, the northern type is much more common. The dominant or northern Chinese race is much less Mongolian than the S. Chinese, the Malay, and most of the intermediate ultra-Indian races. They are closely allied to the Japanese and Americans, and, indeed, are evi-
dently the same race, however much their language differs. The predominating colour of the skin of the Chinese is yellow; but yellow, brown, and sometimes a maroon tint occur. The face is broad and flat, check-bones projecting, irides black, eyes oblique, beard scanty, stature above that of the Malay and Tibetan, below that of the European. The Chinese head, when viewed from the front, has a strongly-marked physical relation not only to all the races of the Mongolian type, but in a much closer or more special manner to the Tibetan tribes, the American Indians, and in some of the eastern Asiatic tribes, in all which one of the prevailing Chinese types may be traced. Numerous examples of the elongated head, obtusely wedge-shaped cranium, and arched nose of America and New Zealand may be seen in every assemblage of Chinese in Singapore. The occipital truncation remarked in America and Polynesia is common in South-Eastern Asia. It is very strongly marked in the Lau race. The Tibetan tribes have the rise of the skull at the coronal region, but the other characteristics are wanting. The heads of the American men of Dr. Pritchard's Natural History of Man resemble those of the Chinese. The prominent lateral expansion of the zygoma is comparatively rare in the Chinese as in the Americans. The Sumatra Malays have much more frequently the typical Mongolian head, as have also the allied tribes of the Irawadi basin, with whom they are most nearly connected, and whence they have undoubtedly derived their physical stock.

The sea-coast people are skilful and enterprising, with that self-reliance which enables nations to emigrate; and we find them swarming in the Malay ports, in Singapore, Borneo, and the Philippines; numbers are in Australia, the West Indies, Sandwich Islands, and Western America, particularly California. But, except in Buddhist Burma, they are not settlers, only forming temporary connections, sending all their savings, and looking forward to return, to their native land. Next to the Malay, these people have been the most formidable pirates of the eastern seas. Their rapid and wide diffusion is one of the most remarkable of the events of modern history, and is likely to exercise a great influence on the future condition of man. For the Chinese do not migrate to mingle with and be absorbed among other tribes and peoples; they preserve their own language, their one nationality, their own costume and religious usages, their own traditions, habits, and social organization. Though they intermarry with the races among whom they dwell, the Chinese type becomes predominant, and the children are almost invariably educated on the father's model, the influence of the mother seeming almost annihilated. And though the Chinese frequently acquire large fortunes, great influence, and sometimes high rank as a consequence of their prosperity, the ties that bind them to their country seem never to be broken, and the tides of population flow Chinaward with every south-western monsoon, to be replaced by a stronger stream when the monsoon of the north-east sends the junk on their wonted way towards the south. It is estimated that in the kingdom of Siam there are more than a million and a half of Chinese settlers; in the city of Bangkok alone there are supposed to be two hundred thousand. In fact, all the active business appears to be in their hands. Nine out of ten of the floating bazaars which cover for miles the two banks of the Mekam, are occupied by Chinamen; very many of them are married to Siamese women, for a Chinawoman scarcely ever leaves her country. But the children are invariably educated to the Chinese type; the tail is cultivated if it be a boy, and the father alone seems to model the child's nature and education. Yet that strong parental affection which has been remarked as one of the characteristic virtues of the Chinese, is almost invariably exhibited. Fathers are constantly playing with and carrying about their children, encouraging their gambols, and teaching them to observe.

Several estimates of the population of the country have been attempted since the latter part of the 16th century. Captain Gill, a traveller in the 19th century, and who, in 1882, was murdered by an Arab shaikh, is of opinion that they have all been too high. Farnes, with rebellions of the Tse-ping and of the Mahomedans in Kwei-chow and Yunnan, are supposed to have reduced the nation to 250 or 300 millions.

1570 307,467,000 in the reign of Kien lung. 1743, 200,000,000 Grosier. 1813, 360,000,000 Census. 1842, 414,066,994 ,

According to Mr. Knowlton, the census of 1839, as given by M. Sacharoff of the Russian embassy in Pekin, made a population of 415,000,000. A census was found in Governor Yeh's Yaman at Canton; and the Chinese commissioners at Tientsin, in 1859, stated the population at 400,000,000, which is a fourth of the human race, twice the population of British India with its feudatories, and seven times that of Russia. China proper has 280 to the square mile, while that of Britain and Ireland has only 260.

Tribes.—The various types of race on the mountain frontier of China, Burma, and Tibet, possess the highest interest for all ethnographical students. Of the aboriginal inhabitants of China, the Kwei people, remnants are to be found to this day in Northern Cambodia. These Kwei, whom M. Terrien de la Coupérie conjectures to have been an Aryan people, possessed a literature to which the term Kwei shoo or 'Kwei Books' probably refers.

The country at the mouth of the Amur in 1842 was ceded to Russia by the Chinese, but members of the Aino family are settled there, and due north of Pekin is a Mongol tract which nearly separates the true Tungus part of Manchuria.

The Hakka inhabit Loong-Moon, Toong-Koong, Tsen-shing, and other districts. They eat dog's flesh.

The Tan are a race of Chinese boatmen dwelling in their boats in all the Chinese rivers, similar to the Yao and Man tribes. Their physique is vastly superior to that of the house population, who designate them Suee Ki, or waterfowl.

The Ng-Tsouk are a tribe in China who undress and bathe and re-clothe the dead. They are deemed unclean, and are not permitted to worship in the temples; their sons are not allowed to become candidates for literary degrees. They resemble the pollinectors of the ancient Romans.

Miu-tsi is a term applied to the hill tribes of China. They seem to be in small clans; no less than 82 of them residing in the small province of
Kwei-chu. Some of their names are appellatives, -Sang, wild; Huh-rang, black wild; Huh-klo, black foot; Yan-jin; and others are the Nung, the Lo-Lo, and Yau in the mountain ranges of S.W. China. The Miao-tzi, on the south of Szechuan, are said to be wild mountainpeers, but much connected with them is obscure. Frer Odoric noticed the differences between the races on the two sides of a great mountain. Polo also speaks of savage cannibals with blue-painted (tattooed) faces in Foh-kien; and some observations of Sir John Davis corroborate this (Polo, 178; Chinese Supp. p. 260). In the modern Chinese census, one class of the population in a district of the province of Canton appear as blacks (Chin. Mod. p. 167). Indeed, Semedo (about 1632) says there was still an independent kingdom, presumably of the Miao-tzi, in the mountains dividing Foh-kien, Canton, and Kiang-si, viz. those of which Odoric speaks (Rel. Della China, p. 19), certain Fung people who once visited the court of the Chinese emperor, and delighted him by their dancing and singing. These Fung people still exist in South-Western China.

Its Army, of 800,000 men in four divisions, is made up of 68,000 Manchu, 80,000 Mongol, and 625,000 Chinese. The bannermen of the Mongols are the elite of the dominant Manchu. The Chinese soldiers are in two bodies, one of which, about half a million in number, is designated soldiers of the green flag, and receive pay of four silver tael (27a) per month; the other portion are a militia, holding lands for service, and drilled for a month once a year. Since the year 1878, they have obtained from Europe, swift, heavily-armed gunboats. Military Feudatories of the empire are scattered through the regions known to the Chinese geographer as Inner and Outer Mongolia, Uliasaitai, and Tsing Hai or Kokoro; but there are also the troops of Tibet, under the resident minister of that country. The tribes acknowledging the sway of China are divided into Inner and Outer Mongolians. The former occupy the region to which their name refers them; the latter, all the other tracts and districts above mentioned.

Inner Mongolia, lying between the desert of Gobi and the continuous frontier of Manchuria and China, was occupied, in 1812, by 24 tribes, differing in name, irregularly ranged under 49 standards, and divided, in uneven proportions, into 6 chakran or leagues.

The Outer Mongolians were,—1st, four tribes of Kalkas of different names, under Khan, which, with two fragmentary tribes attached to them, formed four standards, and numbered in all 86 standards, and resided in the territory north of the desert of Gobi, geographically named Outer Mongolia. 2d, eleven tribes, not in leagues, under 34 standards, scattered to the west of the Holan mountains, in the S.W. of Inner Mongolia, to the south of the Altai, and to the north of the Teng-kiri ranges. 3d, Two tribes of Mahomedans, under 2 standards, at Hami and Turfan, within the provincial boundaries of Kansu, south of the Celestial Mountains; and 4th, five tribes under 29 standards, round Koko-Nor, called by the Chinese Tsinghai, or Azure Sea. Colonel Gordon, who had taken a prominent part in suppressing the Tae-ping rebellion, recently returned to China to advise the great viceroy, Li-Hung-Chang, regarding the Chinese forces. The occasion was the retention by Russia of the town and district of Kuljia, and war appeared possible. He urged them to avoid pitched battles, to cultivate skirminishing, to throw up earthworks, to harass the enemy by irregular warfare, and to form a fleet of small and cheap ships.

Religions and Philosophies.—The Chinese have acquired, in the course of their long existence, more than one different kind of philosophy; that is to say, there exist in China several radically different ways of viewing the nature of the immanant world and of man. The philosophic systems of Tao-tze, of Kung-tze, of Choo-tet, of Mang-tze, and of Buddha, take the place of Confucianism, but none of these are pure philosophies; those recognized by the state being Taoism, Confucianism, Buddhism with its form Lamaism, and Mahomedanism. They are systems of morality.

There was a long struggle for mastery among the adherents of these three systems,—a struggle which expressed itself in mutual proscriptions and persecutions; but the Confucian (Kong-tze) always succeeded in maintaining for itself the greatest ascendency, except during some comparatively short period, and it became definitively paramount fully ten centuries ago. From that time to this it has continued dominant in the country. It has been the philosophy and morality of all the great historians of China, and has formed the basis of her peculiar national system of legislation and administrative procedure. It may be described as the assemblage of those fundamental beliefs which are entertained by all cultivated Chinese on the great phenomena of animate and inanimate nature. The literature in which it is set forth, and within which it has moulded, whether ontological, psychological, ethical, legislative, or historical, is that exclusively an intimate and extensive acquaintance with which has for many centuries been made indispensable to the passing of the public service examinations, which, are, for the talent and ambition of China, far more than the hussings, the avenues to church preferment, and the bar all combined, are for the talent and ambition of Britain. Hence Confucianism is, and has long been in the fullest sense of the terms, the national, orthodox philosophy and morality of the Chinese people. Taoist and Buddhist temples exist all over China, and in latter centuries Mahomedan mosques have been erected in many of its cities; but the dominant Confucianism merely endures Taoism, Buddhism, and Mahomedanism as erroneous and superstitious systems of belief, prevalent among, because most limited to, people of uncultivated or weak minds, whether rich or poor; but which find most acceptance among the poorer and therefore unlearned and unenlightened classes. They have no influence on the national polity. The people are in nowise prohibited from worshipping in the Buddhist and Taoist temples; in other words, they may regulate their purely religious life by the tenets of these, or indeed of any other sect. But where Taoism or Buddhism would leave the region of religion, and, in the form of philosophy or morality, extend their direct influence into the domain of the social science and art, there Confucianism peremptorily and effectually prohibits their action. Not only are the national legislation and administration formed exclusively on Confucian principles, it is by them also that the more important acts of the private life of the Chinese are regulated, as for
instance marriages. The cause of the prevalence of Mahomedanism in China, in spite of discouragements, lies in the fact that Confucianism says little or nothing of a supernatural world or of a future existence. Hence it leaves almost unsatisfied those ineradicable cravings of human nature, the desire to revere and the longing for immortal life. That it has, notwithstanding its want of these holds on the human heart, maintained itself not simply in existence, but as the ruling system, is a fact that must, as soon as it is perceived, form for every true thinker a decisive proof of the existence of great and vital truths in its theories, as well as through soundness and wholesomeness in the practical rules which it dictates. By Chinese philosophy must be understood Confucian philosophy; and by Chinese morality, the moral principles rooted in that philosophy.

In order to get a distinct general conception of the Chinese philosophical literature, two epochs must be specially kept in mind. The first began with Confucius (Kung-tzse), who was born B.C. 551, and ended with Mencius (Mang-tzse), who died about B.C. 317. The second began with Chow-keen-ke or Choo-tzse, who commenced his labours about A.D. 1034, and ended with Choo-ke or Choo-tzse, who died in A.D. 1200. The first lasted for seven generations. It was separated by an interval of thirteen hundred years from the second, which lasted for five generations. Both were periods of revival of ancient learning and of further development. Both embraced several celebrated philosophers besides those mentioned, but in each case it was the originator and closer of the epoch who became most celebrated. The writers of the second epoch are often mentioned as the philosophers of the Lung dynasty; which latter was established in A.D. 960, about 70 years before Choo-tzse’s labours began, and continued in possession of the sovereignty till A.D. 1271, about 70 years after Choo-tzse’s labours closed. Confucius, though his name in the west became identified with Chinese learning, was by no means its originator. Authentic, though not full records, embodying ethical and political doctrines, extended back to B.C. 2557, or to about eighteen hundred years before Confucius; while the Chinese philosophy originated with Fuh-he, who lived, according to tradition, some twenty-three generations before the exact chronological era, which latter took place B.C. 2637 with the institution of the national cycle of sixty years. Allowing thirty years to a generation, this would place Fuh-he about B.C. 3327. It was he who substituted writing for the knotted strings that had previously formed the only means of record; and it was he who first established marriages and separate families. To him are also ascribed some civilization labours of lesser but still great importance,—the division of the day into twelve Shé-shin, or watches, of two hours each. Fuh-he is therefore the founder of Chinese civilization generally. But he is perhaps best known as the originator of the natural philosophy, and in particular as the author of the Eight Diagrams. He constructed these after a careful and extensive survey of nature and its varied phenomena, as exhibited in the departments which we call astronomy, meteorology, physical geography, and natural history and after reflection on his own nature, physical and mental, and on the nature of men generally, as manifested in the events of the social life around him. The Eight Diagrams consist alternately of whole and broken lines. They have never been read, but they have not the less been made the basis of an ancient system of philosophy and divination. Fuh-he’s diagrams, as re-arranged, together with the short explications of the first monarch of the Chow dynasty and his son, form the basis or text of the first of the Chinese Sacred Books, the Yih-king. After an interval of six centuries, Confucius edited the Yih-king, and appended those annotations which have given the work its subsequent value. What philosophical views may have been attached to the Yih-king of Wan-wang and Chou-kung by the contemporaries of Confucius, we know not. That work, together with the other three works edited or compiled by Confucius, viz. the Shu-king books and the Le-ke, constitute the whole of the ancient literature of China which has come down to posterity, and who have it only, as it was explained, arranged or modified in passing through his hands. It is well known that he expressly repudiated portions of it, as containing doctrines adverse to the views which he held and strove to diffuse. The names only of some celebrated ancient books, one dating from the times of Fuh-he himself, have been preserved. It is these circumstances which constitute the labours of Confucius the commencement of a distinct literary epoch. Apart from the labours of Confucius himself, the permanent literary results of this, the first of the two great epochs to which attention has been directed, are contained in the collection of works called the Four Books, composed by different members of the school which he founded. The last contains a record of the ethical and political teachings of Mencius (Mang-tzse), who died about B.C. 317, and closed the first epoch.

Choo-tzse was the originator of the second epoch of philosophical development. To him is ascribed the merit of having revived that distinct knowledge of the greatest truths, which had been lost to the world for the thirteen centuries that had elapsed after the death of Mencius; and he is regarded as having by the independent efforts of his own mind, unaided by any master. Only two of his works have been preserved, the Tea-heeh-too-shwo and the Tung-shiat. He died in A.D. 1200; and in A.D. 1241 an imperial re-script ordered his tablet, with those of four of his immediate predecessors whose works he had annotated, to be placed in the temple of Confucius, which is to be found in every district city throughout the empire. From that time his views of philosophy, morality, and politics have been supreme in China. His commentaries on the Yih-king and the Four Books are learnt by heart by millions of Chinese, with the text of these works. The public service examinations cannot be passed unless this be done.

The fact is, however, that though the authors of the first and second epochs, Confucius himself included, professed to teach only what was contained in pre-existing sacred books, and though they possibly themselves believed that they did only teach what was virtually contained in such pre-existing books, they nevertheless did, in each case, originate some entirely new views and doctrines.
The Yuen dynasty, which succeeded the Sung in A.D. 1271, were Mongols, immediate descendants of Chengiz Khan, who adopted Chinese civilization only in a very slight degree, and were consequently soon expelled again. Choo-Yuen-Chang, the first emperor of the native dynasty, the Ming, which succeeded them in A.D. 1368, though a promoter of literature, was himself illiterate, having been a servant in a monastery. But the third sovereign of the line, who began to reign A.D. 1403, had a splendid library formed, and several encyclopaedic works compiled. He published an edition of the Sacred Books, which is known by the affix to their title of 'Treasure,' in full parentheses.

Religion.—Mahomedanism was introduced by an Arab, Wos-Kassin, said to have been Mahomed's maternal uncle; but the Mahomedans are neither zealous in the propagation of their doctrines, nor over strict in the observances of their religion. They are perpetually resisting against the Government. In 1863 those living in the north went into open revolt, and spread a ruin and devastation not yet (1882) remedied.

Christianity penetrated into China as early as the 5th and 6th centuries; in the 13th it was very flourishing, and there existed at Pekin an archbishop with four suffragans. The general who conquered Southern China is stated to have been a Nestorian Christian, and to have built a church at Nankin for those of his own faith. Marco Polo, a Christian, was in high favour. We learn from the Mahomedan travellers, who visited China as early as A.D. 850, that when Canton was taken and sacked in A.D. 877 by a rebel army, as many as 120,000 Mahomedans, Jews, Christians, and Parsees perished in the sack (Prinsep's Tibet, Tartary, and Mongolia, p. 10). The Chinese have also books of Christian doctrine, composed by ancient missionaries, and which, even in a purely literary point of view, are much esteemed in the empire. The Chinese designate the Christian religion as the religion of the Lord of heaven (Huc, i. xvi. p. 68). A French missionary, who had been very much in the interior of China, stated the total number of native Christians at 500,000. M. Huc's estimate is 800,000, scattered over all China proper in small communities. They differ from their own countrymen in many of those social and domestic customs and in all those mental peculiarities which constitute the special nationality of the Chinaman. Dr. Knowlton has stated that if the present ratio of conversions goes on as it has for some years back, 'by the year 1900 the native Christians in China will number over two millions!' (Huc, Chinese Empire, i. p. 160.) A popular uprising began in 1848. It originated in 1850 in the teachings of Mr. Roberts, an American missionary, and those of an earnest Chinese disciple. It became blended with the national struggle of the Tae-ping, or the votaries of the divine kingdom of eternal peace. According to the writings of Hung, once a schoolmaster, but afterwards the 'Heavenly Prince' and acknowledged head, the convert, on coming to baptism, pronounced a solemn vow to take the belief in the Father, Son, and Holy Ghost for his rule of life, and to dedicate this life to God, in love to the brethren; while visits to the tombs of ancestors were enjoined, in gratitude for the release of their immortal souls from this trouble-some life, and to renew the vow of life-long devotion to the cause of God and the brethren. The Bible was the word of God, the Ten Commandments the moral law, and opium-smoking a sin equal to adultery (Bunsen, God in Hist. i. p. 272). Chevalier Bunsen was of opinion that the Chinese worship of the dead is the sole connecting link between them and a future state. In their disbelief of immortality and of God, Quinet doubts if they have, in the past 5000 years, lived a single day (Bunsen, God in Hist. i. pp. 265-7). But the nation believe in spirits or disembodied beings, and Chinese officials address letters to their deities, which they despatch in a fire sacrifice. Their philosophies are noticed above.

Throughout China some vague idea is entertained by the people of the existence of one great being, whom they usually designate as Shang-ti, the Supreme Ruler, the Supreme Sovereign, or whom they call Tien, Heaven; and believe that he, by a fixed destiny, controls all affairs; and as such, Tien is taken to be an appellation of the godhead of men. The learned among the Chinese speak of him, as he is represented in their most ancient classics, as having no form, nor sound, nor savour, nor tangibility; and to their minds he appears divested of all distinct personality. The spiritual ministers of heaven they call Shin, expansive spirits, or Shin-ming, illustrious spiritual beings. They divide them into two large classes, of which one is the Tien-shin, or heavenly. But the whole number of these spirits are dependent upon, and ruled by, Tien, or the Supreme Ruler of heaven. They rarely build any temple for the worship of Shang-ti. Still the people universally pay to Heaven, or to Heaven's Lord, a sort of homage daily. Every Chinese house has a lantern suspended outside the street door, and directly over the middle of the doorway, which they call Tien kung-tang, Heaven's Lord's lantern, or simply Tien-tang, Heaven's lantern. These lanterns are all lighted up, and incense is burnt for him during a short time every evening. Also, one day in every year they profess to devote to his honour, the ninth day of their first month, which they call his birthday! Then they have plays acted to please him!

They have an idol. Choo-tai-tsoo, the founder of the Ming dynasty, ordered the manufacture of a metallic figure of a man, 15 inches high, attired as a Taoist priest. This is carried in procession on the installation of every Chinese emperor. Three fingers of the left hand are placed in its mouth; and in the hand is a tablet inscribed, 'Fast for three days, and you will be rewarded.'

The inferior state deities are—
Kwan-te, a distinguished general, the protector of the peace, who is now their god of war.
Lung Wong, or the Dragon King, a rain god.
Yuh Wang-te, or the Pearly Emperor, another rain god.
Mung-Chang, worshipped by schoolboys and collegians; god of learning.
Shing Wong, the protector of walled cities.
Hung Sing Wong, the deity presiding over the Southern Ocean.
Pho-te or Pak Tai, the great deity of the north.
Five genii preside over the five elemental substances, fire, earth, water, metal, and wood.
Tien Hou, queen of heaven.
Koon Yum, the goddess of mercy.
Kuan Fo, the tutelary goddess of women and children; the Venus genetrix of the Chinese.
Shao Tseh, god of the land and of the grain.
Fang Po Shan, the wind and fire gods.
Too Tse, the god of wealth.
Wong Tsz is a deity to whom the Shu-king and She-king ascribe the attributes of omnipotence, omniscience, and immutability.

Poon Koo Wong, with the Chinese, the first parent, a division of the mundane egg. He breathed on gold and on wood, and from the vapour produced a son and daughter, Yong-Yee and Chun-Noce. Poon Koo Wong has many temples, and his image is carved in wood or clay.

Their chief festival occurs on their new year; their festival of Too-tee, of middle heaven, of Thshat-tsie, of the sun, of Wawong, the god of fire, of Ching-yong, the emperor's birthday.

Shu Yee is a Chinese festival of burnt-offerings to the souls of paupers.

San Lin is the new year festival; it is their bacchanalia. The new year commences with the moon nearest to 15° of Aquarius, into which sign the sun passes in the month of January. They also hold as festivals the 1st and 15th day of each month. These bear some resemblance to the Mæninia, or feasts observed by the Hebrews, Egyptians, Persians, Greeks, and Romans, and seem identical with the Hindu fortnightly ceremonies.

Tuen Nin, or Wa Shun, a Chinese festival held on the 28th or 29th of the 12th month, in which thanks are given to the tutelary deity of the house.

Tien Chung Ching Sî is the Chinese feast of the middle heaven.

Thshat-tsie, a Chinese festival held during the 15 days' observance of the Shu Yee, burnt offerings for paupers. It is held on the 7th day of the 7th month, in honour of the seven stars which the Chinese regard as goddesses, one of whom visited earth, and was married to, and lived for a time with a cowherd.

Literature.—The greatest counterpoise of the imperial power consists of the literary aristocracy, or corporation of men of letters, an ancient institution, which has been established on a solid basis, and the origin of which is at least as early as the 11th century before the Christian era. It may be said that the administration receives all its real and direct influence from this sort of literary oligarchy. The emperor can only choose his civil agents from among the lettered class, and in conformity with established arrangements. Every Chinese may present himself for the examination for the third literary degree, and those who obtain this may then become candidates for the second, which opens the way to official employment. To fill the higher offices, the prize must be obtained in the competition for the first degree. The corporation of lettered men, recruited every year by the method of examination, constitutes a privileged class, almost the only nobility recognised in China; and it may be considered as the chief strength and nerve of the empire. The famous imperial academy of Han-Lin is composed of literary graduates. It furnishes orators for the public festivals, and literary examiners for the province, and is supposed to promote the cause of learning and science generally.

Five canonical books were written or compiled by Confucius,—

1st. Yih-king, the Book of Mystical Combinations, mystical form of writing on divination.
2d. Shu-king, or the Book of History, descents from B.C. 2400 to 281. It is in the character of a dialogue, and contains much of a didactic nature.
3d. The Shao-king, or Book of Poetry, a collection of poems, songs, and odes of inappreciable antiquity, to which Confucius attached great value as a means of moulding the national character.

4th. The Le-ke or Record of Rites, a national ceremonial; and the Chinese consider the observance of its ceremonies and usages to be essential to the maintenance of social order and the promotion of virtue.

5th. Chiun-Ts'ew, or Spring and Autumn, a history of his time, and of several reigns immediately preceding it. The first four King were compiled and edited by Confucius; the last is an original work by the sage; but the fourth contains much from later hands.

There are three books, in which the disciples of Confucius have recorded his conversations about poetry, history, and the rules of propriety; above all, about what concerned the growth of social virtue in the individual or the state.

In the year B.C. 213, the emperor Chi-wang-ti burned all the books in his dominions, excepting those on architecture and medicine. The sixth emperor after him, King-ti, commenced the restoration of all books, which Won-ti, who succeeded him B.C. 140, urged on. The materials he collected were put together by See-ma-thsian, whose work was named the Sse-ki, or Historical Memoirs. This is composed of 120 books, and embraces the history of China from the reign of Hoang-ti, B.C. 2097, to that of Hiao-wou, A.D. 122, which has been the model of all succeeding writers. It is divided into five parts, entitled the Imperial Chronicle, Chronological Tables, the Eight Branches of Science, Genealogical Histories, and Biography.

See-ma Ching is the next historian, also called Siao Sse-ma. He lived towards the end of the 6th century. His book is called San-hoang- penki, and is half mythological.

See-ma Koutang flourished in the 11th century. His great chronicle is the Tseu-teh-thoung-kiian, or Mirror for the use of Governors, and consists of 294 books of text, 30 of tables, and 30 dissertations and discussions, and embraces a period of 1362 years. He had several turns of prosperity and adversity whilst alive, and after his death his tomb was thrown down; but in A.D. 1267 his honours were restored, and his name inscribed in the temple of Confucius.

Jin Kim, or Classes of Men, is a Chinese book of great authority. In it the sages occupy the first chapter, and in this Confucius is placed high above all others.

Li is a Chinese word of very extensive meaning, sometimes rendered reason, courtesy, propriety, good breeding. The saying is, Li and Wen (learning) make up the whole sum of human excellences.

Two other classics, known as the Four Books, are mostly Confucian. They are the Ta-heo, or Great Study, the Chung-yung, or Invariable Mean, the Lum-yu, or Miscellaneous Conversations, ethical and philosophical works, which are allied with those of Mang-tze.
The Chinese written language consists of picture words. The alphabet is a hieroglyphic system, each word having its own graphic representative. Chinese is monosyllabic; no word is allowed more than one consonant and one vowel. Hence the possible number of words is extremely small; but each word can be pronounced with various accents and intonations, of which there are said to be 450, and the number of words or ideas in Chinese is said to be 43,496. The vastness of this amount will be appreciable, by mentioning that only about 5000 words occur in the Christian Old and New Testaments. A student of average memory should be able in five years' study to store up enough to carry him through any ordinary business or official documents. M. Remusat, in his Grammaire Chinoise, notices three styles of the Chinese written language, which he calls style antique, style littéraire, and langue des magistrats, or langue mandrínique. Mr. Meadows considers (Des. Notes, p. 13) Remusat not quite correct in this definition. Nevertheless M. Huc also says that the Chinese in their written language have three distinctions of style,—the antique or sublime style, the type of which is to be found in the ancient literary monuments, and which exhibits very rare grammatical forms; the vulgar style; and the academic style, which partakes of the two preceding, being less concise than the antique, and less prolix than the vulgar. The vulgar style is employed for light productions, theatrical pieces, private letters, and proclamations intended to be read aloud. The spoken language is composed of 450 monosyllabic intonations, which, by the very subtle variations of the accents, are multiplied to about sixteen hundred. It results from this, that all Chinese words are necessarily grouped in homophonous series, whence a great number of double meanings may arise either in reading or speaking; but their difficulty is avoided by coupling synonymous or antithetic words. In this manner the ambiguities disappear, and the conversation is no longer embarrassed. The language called Hounan-hoa, that is to say, common universal language, Europeans wrongly designate Mandarin language, as if it were exclusively reserved for the mandarins or functionaries of government. The Hounan-hoa is the language spoken by all instructed persons throughout the eighteen provinces of the empire, but in this a distinction is made between the language of the north and that of the south. The former is that of Pekin; it is marked by a more frequent and sensible use of the guttural or aspirate accent. It is spoken in all the provincial government offices.

The Chinese have six styles or modes of writing their characters, the most elegant being the Kaishoo.

The Chuen-shoo style is the ancient mode of writing, and is derived immediately from hieroglyphics, and is either a caricature or a stiff and imperfectly written character.

The Lo-shoo is used by official attendants, and is written with greater freedom than that employed in books.

The Ping-shoo is the regular running hand used when quick writing is needed.

The Tsau-tzee is a hasty and abbreviate style, used in ordinary transactions and correspondence.

The Sung-ti is the regular form of the character used in printing.

The regular system, by which the Chinese pay to their written character amounts almost to worship. The literati employ men to traverse the streets of towns and villages to collect waste-paper from dwelling-houses and shops, lest fragments bearing Chinese characters should be trodden under foot. Each man is provided with two baskets, and at his call, 'Sow-suee-chu!' Spare the printed paper! The people rush to the door and empty their waste-paper baskets into his. When his baskets are full, he takes them to the temple or guild, provided with a furnace for the purpose of consuming such collections, and in many instances the ashes of this paper are put into earthenware vases, and flung into a tidal stream to be borne out to sea.

The essays of candidates for the various degrees must be in the best calligraphy, and the Kaishoo style is that adopted by them. They must have at least 30 characters in their essays, and not more than 720.

Chinese Currency.—Sycee silver, in Chinese Wan yin, is their only approach to a silver currency. In it the government taxes and duties, and the salaries of officers, are paid; and it is current among merchants in general. The term Sycee is derived from two Chinese words, Se-szé, fine floss silk; which expression is synonymous with the signification of the term Wan. This silver is formed into ingots (by the Chinese called shoes), and by the natives of India, kluri, or hoops, which are stamped with the mark of the office that issues them, and the date of their issue. The ingots are of various weights, but most commonly of ten taels each.

Sycee silver is divided into several classes, according to its fineness and freedom from alloy. The only coined money in China are the brass pieces with a hole in the centre. Silver is sold by the weight, and an ounce is the equivalent of 1700 to 1800 of these brass coins, which are called 'sapek' by Europeans. They have some pieces of brass, called tsian, and in Mongol tchoe,
of which the inhabitants of Siberia make tehek and tehek; they are of less value than a sapec. A kind of notes are in circulation among private persons.

Weights.—The Chinese have communicated their weights to all the adjacent countries. A pikul is equal to 1334 lbs. avoirdupois; and 4 lbs. being equal to 3 catties, 100 catty make a pikul.

10 cash = 1 candarin. 16 tael = 1 catty. 100 catty = 1 pikul.

Calendar.—The Han dynasty of China reformed the calendar. The Chinese, like all the natives of the north-east of Asia, reckon their time by cycles of 60 years, and give a different name to each year of the cycle. The Chinese cycle of sixty years is called Hwa-kea-tsze. The year commences from the conjunction of the sun and moon, or from the nearest new moon, to the fifteenth year of Aquarius. It has twelve lunar months, some of twenty-nine, some of thirty days. To adjust the lunations with the course of the sun, it is necessary, on each year, to add an intercalary month. Day and night are divided into twelve periods, each of two hours. Their division of the day is therefore as simple as the British, and not much unlike it. The Chinese begin the day an hour before midnight, and divide the twenty-four hours into twelve parts of two hours each. Instead of numbering their hours, they give a different name to each period of two hours.

Tze, 11 to 1 morning. Woo, 11 to 1 afternoon.
Chow, 1 to 3
Yin, 3 to 5
Mao, 5 to 7
Shin, 7 to 9
Sec, 9 to 11

The word Keau is added when the hour of each period is intended, and Ching for the last. Thus Keau tze is eleven at night, and Ching tze, twelve at night; Keau chow, one in the morning; Ching chow, too; etc. The word K'hih, 'quarter,' is used after the hour with the numerals yih (one), urh (two), or sau (three), to subdivide the hours into quarters, which is the smallest division commonly employed; example, Ching mao yih k'hih, a quarter past six; Keau woo urh k'hih, half-past eleven.

This division still maintains itself in legal and official language, though the practical value of the European clocks and watches, now largely used in China, is gradually substituting for it the occidental division of twelve hours.

Industry and Art.—The Chinese are laborious, discriminating workers and inventing race skilful in economizing materials, and possessed of no mean share of inventive power. Foreign nations have borrowed from China many of the comforts and ornaments of life. The very names of such aids to existence as silk, satin, and tea are in most European lands a sufficient proof of this fact, being but slight modifications of the Chinese words zee, sze-tun, and tê. Their knowledge of the magnet is supposed to have led them to a knowledge of the compass. Their ordinary ink, composed of lamp-black and glue, is sufficiently pure to be used in the arts. Their ordinary cotton-cleaning machine, for freeing the cotton fibre from the seeds, has not yet been equalled by all the mechanical skill of Europe. In all working in metals,—in ordinary blacksmith work, metal smelting, alloys, particularly their white metal of copper, zinc, iron, silver, and nickel, their sonorous gongs and bells, that of Pekin being 14½ feet to 13 feet, and their ingenious metallic mirrors, some with engravings; their manufactures of porcelain, glass, and glazes; their carving and engraving of gems, agates, and rock crystal, and on ivory and wood, have for centuries been famed, and much of it excites the admiration of Europe, as also does their varnish work. Their lacquerware is beautiful, though perhaps excelled by that of Japan; their excellent metallic colours, red, white, green, and violet, are used in painting their china-ware. Their porcelain long; exceeded that of all other countries. The gold and silver tinsel cloths of Pekin stand deservedly in high estimation; and their gold and silver filagree work equals and is ever produced by ancient Venetian masters; and their chasings in silver and enamelling on silver is unrivalled (see Carving, Lacquer-ware, Colours, Ceramic Manufacture, Enamelling, Filagree Work). In weaving they are superior, in candle-making not inferior, but in painting and sculpture they do not excel. They are bold, self-reliant, skilful gardeners, and excellent farmers, and date their skill in these back four thousand years.

Husbandry and silk-weaving were the earliest of the arts cultivated by this people. The former was introduced by Shin-nong, the immediate successor of Fo-hi, and silk-weaving by an empress; and to both of these inventors the Chinese perform annual sacrifices on their festival days. Husbandry is still highly honoured; and annually, at a grand festival in honour of the spring, the emperor ploughs a field. The Egyptians, Persians, and Greeks held games and festivals, mingled with religious ceremonies, at seed-sowing; and in England, formerly, the festival of Plough Monday was held, during which the plough light was set up before the image of the patron saint of the village. The Chinese, in the reign of Hoang Ti, invented the magnetic needle, the smelting of copper for making money, and vases of high art; and money seems to have been coined in gold and silver and lead so early as Confucius' time, but many payments are still made in kind or by pieces of silver. Most of their calculations are made by a reckoning board. Sir John Davis is of opinion that the art of printing, the composition of gunpowder, and the magnetic compass, which are justly considered in Europe as three of the most important inventions or discoveries of modern times, had their first origin in China. In the beginning of the 10th century printing was invented, and in A.D. 932 that mode of multiplying copies of books received the imperial sanction; a printed imperial edition of all the sacred works having been then published. The greatest of all the arts was not invented in Europe till 500 years after this. Marco Polo speaks much of the stamped paper money of the Chinese; and he must have seen their printed books. Their printing types are made from the pear-tee wood, called by them Ly-mo.

Eighteen centuries ago they had discovered the secret and means of manufacturing paper. Before that invention, they used to inscribe written characters on strips of bamboo or sheets of metal, using a style, or iron pen, for the purpose of marking the characters. Before the art of paper-
making had arrived at perfection, the Chinese had adopted the practice of writing upon white silk, or cotton, with a bamboo pen; this was found a more convenient method than writing either on strips of bamboo or sheets of metal, as the silk or linen could be folded into a small compact. Paper is manufactured from various materials, each province in that district having its own peculiar manufacture. In Foh-kien province, which is formed of dry isinglass, it is manufactured young, soft bamboo; in the province of Chekiang it is made from paddy straw; in the province of Kiang-nan it is made from the refuse silk, and this paper is very fine and delicate, being highly valued for writing complimentary inscriptions upon. To size the paper and render it fit for ink, they make a glue, somewhat similar to isinglass, from fish-bones; these they chop up very small, and soak the mass in water, which is continually renewed. When all oily impurity is extracted, they add a due proportion of alum which has been dissolved. Over the vessel in which this mixture is, a rod is laid; a clift stick is used for holding the sheet of paper during the process of dipping. As soon as the paper has been sufficiently saturated, it is withdrawn by gently rolling it round the stick which has been laid over the vessel; the sheet of paper is afterwards hung to dry either near a furnace or in the sun. Towards the close of the 19th century, they have thought of introducing railways, have worked their coal mines on the system of power, and have formed steam-mills for spinning and weaving cotton and wool, and have established steam navigation companies and steam war-ships.

The trade with India and China ranks next after that with the United Kingdom; in the year 1878 the total value of the foreign trade of China was as follows:—Imports, 70,804,027 Haikwan taels, or, at 5s. 11¾d., £2,019,670; exports, 67,172,179 taels, or £20,011,711; total, 137,976,206 taels, or £41,105,000. The customs revenue in 1878 increased to 12,483,988 taels. The total value of the trade of China with Great Britain and her possessions is set down at 64,943,997 taels or £19,347,899 imports, and 46,022,719 taels or £13,710,935 exports; making together 110,966,716 taels or £33,058,834.

Domestic and Social Relations. — Polygamy exists, and any man may have his second, third, or inferior wives. Women, even as first wives, do not take a favourable position in their household, though as mothers their condition is improved. Chinese differs from Mahomedan polygamy in this, that a Mahomedan woman can legally hold property, is the owner of her own dower, and each wife has a separate establishment and a separate allowance for herself. In China, the extent to which wives are, by law and custom, in the power of their husbands, would produce deplorable effects, but for the almost unlimited power which law and opinion give mothers over their sons of every rank and age. So also the institution of polygamy is largely counterbalanced by the desire of all the men to marry early, in order to secure a progeny of sons as soon as possible. Polygamy is encouraged by the law which compels gentlemen and tradesmen to give their slaves in marriage, and by the physiological views which compel a husband to abstain from cohabiting with his wife during pregnancy, and during all the time the child is at the breast. Wealthy Chinese are generally very careful to follow this custom. The dread of unhappiness caused by polygamy has kept many Chinese girls from marrying, and instances occur of suicide to avoid it. The imperial household is probably unsurpassed in extent, there being married to the emperor, not only the chief wife, who is the empress, but also under-wives of first, second, and third classes, on all of whom he is married. The imperial porcelain factories of K’i-nih-ch’in forwarded to the palace for their use, in the year 1877, 11,888 articles, consisting of fish-bowls, flower-vases, and ornamental jars of the first quality, and inferior products in proportion.

In China, children are married according to seniority, as in Genesis xxix. 26, and Book of Tobit viii. 1. In China, parents choose wives for their sons, as was customary with the early Hebrews, as in Genesis xxi. 21. xxviii. 6. Deut. xxi. 16. and as still prevails with most of the Eastern races. A Chinaman cannot take as a wife a woman who bears the same family or clan name as himself; such a marriage is null. Neither can he marry his cousin on his mother’s side, nor his step-daughter, nor his aunt, the sister of his mother. No lady can marry until she is fourteen years of age. Napp-pie is the presentation of silks in betrothal, as in Genesis xxiv. 22. The bride is seldom seen by the husband, until she leaves the clan chair when she is conveyed, with her belongings, to his house. Mandarin ducks are introduced at marriages as patterns of conjugal felicity. The last part of the ceremonial is for a female attendant to present to the bridegroom a small linen sheet, which he spreads on the nuptial couch, and on the following morning it is presented to his parents. In China, widow re-marriage is not respectable, and a girl whose betrothed dies is regarded as a widow.

Cosmetics are much used by Chinese ladies; they are forbidden to be used by a bride on her marriage day, and are not used in mourning. Playactors, policemen, boatmen, and slaves must marry into their own respective classes. As in Matthew’s Gospel, xxv., lanterns are much used.

In the little feet of the Chinese women, the four smaller toes appear grown into the foot, the great toe being left in its normal position; the fore part of the foot is so tightly bound with strong broad ligatures, that all the growth is forced into height instead of length and breadth, and forms a thick lump at the ankle; the under part measures scarcely four inches long and an inch and a half wide. The foot is constantly bound up in white linen or silk, and strong broad ribbons, and stuck in a very high-heeled shoe. The crippled fair ones trip about with tolerable quickness; to be sure, they waddle like geese, but they manage to get up and down stairs without the help of a stick. The feet of their women are naturally small, but at six or nine years of age they are trained into a deformity. Long bandages of cotton cloth an inch wide are folded round the foot, and brought in a figure of eight form from the heel across the instep and over the toes, then carried under the foot and round the heel, and so on, and drawn as tight as possible. After some years, if the bandage has been well applied, the pain subsides. The tarsus is bent on itself; the back of the os calcis is brought to the ground. A large foot is a sure
indication of humble birth. It is not, however, the
mark of aristocratic or wealthy station, but a Chinese
as opposed to a Tartar practice, though indeed
some Chinese races do not follow it. Infanticide,
of which the husbands are the only perpetra-
tors, is not uncommon; but female children
only are murdered, and those immediately after
their birth. This horrible crime meets with no
punishment from the laws of the country; a father
being the sovereign lord of his children, he may
extinguish life whenever he perceives, or pretends,
that a prolongation of it would only aggravate the
sufferings of his offspring. Professor Douglas is
of opinion that it is only abject poverty which drives
Chinese parents to the rough resource of
infanticide, and that in prosperous districts such
primitive method of providing for children is
unknown. But the stone which stands near a
pool outside the city of Fu-chu, bearing the
inscription, 'Girls may not be drowned here,'
proves that the inestimable blessing of possessing
daugthers is not yet appreciated as it should be
by Chinese parents.

The Chinese are not a moral, though they are a
ceremonial people. Their usual salutation when
meeting is Haou-tsing-tsing? Are you well?
Hail! Hail! Social conversation is replete with
compliments, compelling even the most egotistic
talker always to speak of himself as 'the little
one,' the mean one,' the stupid one,' or 'the
cheap one;' and allowing such a greeting as 'I
congratulate you on having acquired wealth,' to
be addressed to a passing beggar. They, like
most of the natives of the East, waste much time
before commencing the business for which they
meet. The conversation must always begin on
indifferent and mostly insignificant subjects, and
at the end of the visit you explain in three words
what really brings you there. The visitor rises,
and says, 'I have been troublesome to you a very
long time;' and doubtless, of all Chinese com-
pliments, this is the one that most frequently
approaches the truth. They are not truthful. Sir
John Bowring says (p. 105) his experience in
China predisposes him to receive with doubt and
distrust any statement of a nature when any, the
smallest, interest would be possibly promoted by
falseness. They are largely given to the use of
opium. Mr. Knowlton estimates that there are
2,351,115 confirmed opium-smokers, or one in
every 170 of the population.

In ordinary quiet times they appear to main-
tain order as if by common consent, independent of all
surveillance or interference on the part of the
executive. But let them be brought into contact
with bloodshed and rapine, or let them be roused
by oppression or fanaticism, and all that is evil in
the human nature which at onceassert itself, inciting
them to the most fiendish and atrocious acts of
which human nature has been found capable.
Both kindliness and cruelty, gentleness and
ferocity, have each its place in the Chinese
character; and the sway which either emotion has
upon their minds, depends very much upon the
associations by which they are for the moment
surrounded. When in their own quiet homes,
pursuing undisturbed the avocations to which they
have been accustomed, there are no more harm-
less, well-intentioned, and orderly people.

They are good agriculturists, mechanics,
labourers, and sailors; and they possess all the
intelligence, delicacy of touch, and unwearying
patience which are necessary to render them first-
rate machinists and manufacturers. They are,
moreover, docile, sober, thrifty, industrious, self-
denying, enduring, and peace-loving to a degree.

They emigrate to any climate, be it hot or
frigid. All that is needed is teaching and guiding,
combined with capital and enterprise, to con-
vert them into the most efficient workmen to
be found on the face of the earth.

On the pressure of want they readily part
with their children, especially girls, and girls are often
destroyed. On the other hand, asylums exist in
China for aged men and women, for the blind, and
for lepers. The aged men are treated with great
respect, and are allowed to have walking-sticks,
which are not used by Chinese, long-stemmed
pipes being employed. Monumental arches are
raised to their honour.

Food.—The great staff of life in China is rice,
which is either eaten dry, or mixed with water so
as to resemble porridge. Then rice they make
their chief intoxicating liquor, which, when good,
is something like strong whisky, both in its colour-
less appearance and its smoky flavour. Several
vegetables are consumed, such as the sweet potato,
Barbadoes millet, peas, beans, turnips, carrots,
etc. Of their fruits, the orange, lichee, loquat,
and mangoes are much in use. Their favourite
animal food is pork, the taste for which is national.
There is a maxim prevalent among them, that a
scholar does not quit his books nor a poor man his
pigs. The flesh of the bullock, sheep, deer, dog,
cat, wild cat, rat, and horse is eaten, but compared
with that of swine these are rarities. Fish are
eaten in great abundance, either fresh, dried, or
salted; and they rear great quantities of ducks
and various species of fowl for the table. The
comprehensive principle on which Chinese diet is
regulated, is to eat everything which can possibly
give nourishment. Their notions as to dogs
and mice are rather quizzical. The luxuries
consumed by the rich consist of the edible bird's
nest, the beche de mer or sea-shag, shark fins,
fish maws, cow sinews, points of stag antlers,
buffalo hides, which afford the gelatinous food
considered so restorative. Amongst their deli-
cacies also are dishes made of the larvae of the
sphinx moth, and of a grub bred in the sugar-
cane. In China, the various modes of catching
and rearing fish exhibit the contrivance and
skill of the Chinese quite as much as their
agricultural operations. According to the Re-
pository, at least one-tenth of the population derive
their food from the water, and necessity leads
them to invent and try many ingenious ways of
securing the finny tribes. Besides fish, molluscs of
every kind, crustacea of all kinds. A Chinese
is prohibited by law from killing a cow. The
punishment for slaughtering a draught cow or ox,
for the first offence, is one hundred blows; for
a second offence, the same number, and exile
for life from the province.

The amusements of the Chinese comprise
theatrical representations, pyrotechnic displays,
marionettes, peep-shows, conjurors, athletes,
ventrioloquists, regattas, cricket fighting, quail
fighting; and they are very fond of singing-birds.
The horse commonly seen in China is a mere
pony, not much larger than the Shetland pony;
it is bony and strong, but kept with little care,
and presents a worse appearance than it would if its hair were trimmed, its fetlocks shorn, and its tail untied. This custom of knotting the tail is an ancient practice, and the sculptures at Persepolis show that the same fashion prevailed among the Persians. The Chinese language possesses a great variety of terms to designate the horse; the difference of age, sex, colour, and disposition are all denoted by particular characters.

Flora.—The only trees to the cultivation of which the Chinese pay any attention, are the fruit-bearing kinds; and in some places in China there are very fair orchards, containing the mango, loochee, longan, wangipec, orange, citrons, and pumelows. The yang-mai is a scarlet fruit, not unlike an arbutus or strawberry, but having a stone like a plum in the centre. The kum-quat is a small species of citrus, about the size of an oval gooseberry, with a sweet rind and sharp acid pulp. A small quantity is sent to England preserved in sugar. Groves of the kum-quat bush are common on all the hill-sides of Chusan from three to six feet high, and when covered with its orange-coloured fruit is a very pretty object. The huckleberry, plantain, and persimmon are common, and several varieties are enumerated of each; the plantain is eaten raw and formed into loaves; it is an inconsiderable item in the subsistence of the coolie. The pomegranate, carambola or tree gooseberry, mango, custard-apple, pine-apple, rose-apple, bread-fruit, fig, guava, and olive, some of them as good and others inferior to what are found in other countries, increase the list. The whampoe, leechee, longan or dragon's eyes, and loquat, are indigenous fruits at Canton. The first resembles a grape in size, and a gooseberry in taste; the loquat (Eriobotrya) is a kind of medlar. The leechee looks like a strawberry in size and shape; the tough, rough red skin encloses a sweet watery pulp of a whitish colour, surrounding a hard seed. Grapes are plenty, and tolerably good.

In China, the staple summer crops are those which yield textile fibres. The jute of India, a species of Corchorus, is grown to a very large extent, and in China is used in the manufacture of sacks and bags for holding rice and other grain. The gingers, a giganteum hemp (Cannabis) growing from 10 to 15 feet in height, is also a staple summer crop of China, and is used in making ropes and strings of various sizes, such articles being in great demand for tracking the boats up rivers and in the canals of the country. China grass-cloth, a beautiful fabric made in the Canton province, is largely exported to Europe and America. The Urtica nivea plant, which is supposed to produce this, is also abundantly grown in Kiang-si and other provinces. Fabrics of various degrees of fineness are made from this fibre, but none are so fine as that made about Canton; it is also spun into a very strong and durable thread.

There are two very distinct varieties of this plant common in Che-Kiang,—one the cultivated, the other the wild. The cultivated variety has larger leaves than the other; on the upper side they are of lighter green, and on the under they are much more hairy. The stems also are lighter in colour, and the whole plant has a silky feel about it, which the wild one wants. The wild variety grows plentifully on sloping banks, on city walls, and other old and ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its structure than the other kind. The cultivated kind yields three crops a year. A species of juncus is grown, the stems of which are woven into beautiful mats, used by the natives for sleeping upon, for covering the floors of rooms, and for many other useful purposes. This is cultivated in water somewhat like the rice plant, and is therefore always planted in the lowest part of these valleys. In the beginning of July, harvest of this crop commences.

Burials.—When the life has departed, the dead body is arrayed in robes of state, or in most costly apparel; ablations are not performed, nor any unnecessary handling of the body suffered. White is the sign of mourning. The Chinese worship the spirits of the dead; and amongst that nation the desire to have a good coffin is universal. Many purchase for themselves that last tenement, and keep it by them, and it is usually substantial, of metal or wood. In Burma, where many Chinese are settled, the best block of teak is selected, and, the upper portion being sawn off to form a lid, the block is hollowed and ornamented. These may be seen in Moulmein in every carpenter's shop. In China, the coffin-makers' shops have a very gay instead of a lugubrious appearance, as the coffins are small, but the red, or some equally bright colour, and the more expensive ones are decorated profusely with gilt; these coffins are placed on shelves one above the other, and the prices vary from one dollar up to four or five hundred. They are often presented by children to parents. The funeral customs of China vary in the different districts. In Foh-kien, the body is placed in a coffin soon after death; a fan is placed in the hand, a piece of silver in the mouth, and a hole is sometimes made in the roof for the spirit to effect its exit. The tombs are on the hill-sides, where lucky spots are chosen by geomancers. Paper images of clothes, horses, and other luxuries are cast into the grave, and a sacrifice of cooked provisions is offered on the day of the funeral.

Every year, in the month of April, the whole population visit the tombs and worship the manes of ancestors. Sometimes a poor family will keep the coffin for many months in their house till able to purchase a tomb, but the very poor are content to place a token grave within enclosed buildings. The dead are occasionally left exposed on the sides of hills, at the wayside, and on banks of rivers, creeks, and canals. At Nanking they are exposed in great numbers. The rite of respectful burial is, however, so revered, that burial clubs exist in all the large cities. The monumental tombs are small raised truncated cylinders. In mourning for near relations, every part of the ceremonial is exactly regulated,—even the period, manner, and degree of the mourner's grief being duly prescribed. The corpse, being dressed in warm clothes, is deposited in a substantial coffin, and kept for several days above ground, whilst the survivors express their measured grief by gesture, dishevelled hair, sackcloth, and mournful silence. When a good spot has been selected for the grave, the corpse is consigned to the earth. Building a tomb is a form of a horse-shoe, they inscribe thereon the name of the deceased, erect a tablet to his memory in the hall of his ancestors, and repair annually to the grave, in order to prostrate themselves before the manes, and to offer viaticals in sacrifice to the spirits. In the temples,
CHINA.

Chinese. 

CHINA GRASS.

Boehmeria nivea, Gaud. | Urtica tenenschiza, R.oth.
Urtica nivea, Libn.

Rheen, Assam. Tali rami, Beng., Malay.
Inan Bonos, NepaI.
Gambie, East Celedes. Lepesia, Kankura, Rungpore.
Champa, Chinh. Karao, Tenge, Mao, Jap.
Kolo, Kalove, Sumatra.
Rami. Beng., Malay.

This nettle grows in all the moist countries from Bengal, through Rungpore, Assam, into China, and southward all through the Malay Peninsula into Sumatra, Java, and Celebes. In Bengal and Assam its fibre has only been used for string and ropes by the fishermen and by the Dom race of Assam; but in China, where it has long been woven into the China grass cloth, it is carefully cultivated, and great care is also taken in the process of cutting down, scraping, peeling, steeping, and bleaching the fibre. These, indeed, are detailed minutely in the Imperial Treatise of Chinese Agriculture, lib. lxxvii. fol. 3. When grown from seed, a sandy soil is preferred; the ground is repeatedly dug, formed into beds a foot broad and four feet long, raked and smoothed and watered, again raked and again smoothed, and a pint of seed, mixed with four pints of earth, is scattered on the surface of six or seven beds, and left uncovered in. They are sheltered from the sun by a canopy of matting or grass, which is kept damp, and this shelter is retained till the plants be an inch or two high. The young plants are then to be transferred into a stiffer soil, which is afterwards repeatedly hoed, and top-dressings of fresh horse dung, ass, or cow dung can be used. This process is adopted only where the roots of old plants are not obtainable. The plant grows best from shoots or layers. Dr. Boyce (Fib. Pl. p. 344) gives the following as the Chinese method for preparing the rehea fibre, as adopted in Upper Assam by Major Hanway:—

To cut the Rheea.—The rhea is fit for cutting when the stems become of a brown colour for about six inches upwards from the root. Hold the top of the stalk in the left hand, and with the right hand strip off the leaves by passing it quickly down to the root, and cut off with a sharp knife, taking care to be above the hairy network of the roots, as these should be covered up with manure immediately, to ensure another crop quickly; lop off the tender top to the stalk, and make the reeds up into bundles of 200 or 250 if the stripping process is not to be carried on in the field or garden; but it is best to strip off the bark and fibre on the spot, as the burnt ashes of the stem afford a good dressing for the roots, along with dry cow-dung.

To strip off the Bark and Fibre.—The operator holds the stalk in both hands nearly in the middle, and, pressing the forefinger and thumb of both hands firmly, gives it a peculiar twist, by which the inner pith is broken through, and then, passing the fingers of his right and left hand rapidly alternately towards each end, the bark and fibre is completely separated from the stalk in two strands.

Making up into Bundles.—The strands of bark and fibre are now made up into bundles of convenient size, tied at the smaller end with a shred of fibre, and put into clean water for a few hours, which, he thinks, deprives the plant of its tannin or colouring matter, the water becoming quite red in a short time.

Cleaning Process is as follows:—The bundles are put on a hook fastened in a post by means of the tie at the smaller end, at a convenient height for the operator, who takes each strand separately of the larger end in his left hand, passes the thumb of his right hand quickly along the inner side, by which operation the outer bark is completely separated from the fibre, and the riband
of fibre is then thoroughly cleaned by two or three scappings with a small knife. This completes the operation,—with some loss, however, say one-fifth,—and if quickly dried in the sun, it might at once be made up for exportation. But the appearance of the fibre is much improved by exposure (immediately after cleaning) on the grass to a night's heavy dew in September or October, or a shower of rain during the rainy season. After drying, the colour improves, and there is no risk from mildew on the voyage homewards (Royle, Fib. Pl. p. 314). The French have been growing China grass in small quantities ever since 1844, in which year a packet of China grass seed was sent home by M. Leclancher, surgeon to the war corvette La Favorite. The Rouen Chamber of Commerce reported that China grass fibre has an affinity for colouring matters at least equal, if not superior, to that of the very finest kinds of cotton. The plant will flourish north of Paris, and even in Belgium. Mr. Gray's process was said to produce China grass fibres almost as strong as so much silk, quite as free and unentangled as the fibres of the most perfect samples of cotton-wool, and capable of being spun into as delicate a yarn as ever was produced from the very best Sea Island cotton. It possesses a lustre far exceeding that of cotton, greatly in excess of that of the best fibres of the Linum. His process was said to be practicable on any scale, and also to jute, hemp, New Zealand flax, and various other plants. Lord Mayo directed much attention to this fibre, which is said to bring prices of £60 to £120 a ton. But such prices could only be obtained for well-prepared fibre of the finest quality. It is said to be procurable at Ningpo at £20 the ton.—J. R. A. iii. 590; Royle, Fib. Pl.

CHINAKA. Hind. Brassica Grifithii; Malcolmia striigosa.

CHINAKAM. Singh. Alum.

CHINA KARINGUYA. Tel. Gardenia lucida.

CHINAL, a caste of people in the Deraajt who make carpets; in India, a common woman.

CHINANGI. Tel. Lagerstrenna parviflora.

CHINAPATAM, in lat. 12° 39' N., and long. 77° 13' E., is a Mysore town S.W. of Birdi or Bomadi, 1111 feet above the sea; also the name given to Madras city by all natives of the Peninsula.

CHINAR. Hind. Pterocarya, once so extensively exported from China, is now almost confined to the commonest and cheapest descrip-

CHINDWARAHI.

tions of stoneware. The patterns made by the Chinese seldom change, while the European manufacturers both consult and lead the taste and fancy of their customers; and it is owing to this, in some degree, that the demand for the Chinese fine ware has ceased, though the Mongols, Siamese, Hindus, and islanders in the Archipelago are still largely supplied from China. When the productions of the East were first carried round by the Cape of Good Hope, the porcelain of China bore an enormous price; and the profits of manufacturing it having been ascertained, the European nations began to make it, and soon outvalued the Chinese. Chinese ware is sold in China in sets, consisting of a table set of 200 pieces at from 12 to 75 taels, a breakfast set of 20 pieces at 3 taels, a long tea set of 101 pieces at 11 to 13 taels, and a short tea set of 46 pieces at from 5 to 6 taels.

The Ow-mi-ow, or black Chinese ware ornamented with gold, is very much prized in China; to make it they mix three ounces of azure and seven of the oil of stones; this is laid on the ware, and when perfectly dry it is baked, after which the gold is laid on and the vessel is re-baked. The To-wi-kie is a porcelain prepared simply by varnishing the vessels with a whitish ash-coloured varnish, made from calcined transparent white pebbles. This has the property of marbling and veining the ware, and giving it an appearance as if it had been fractured into many pieces, which had been carefullv reunited. This Chinese ware is highly prized under the designation of cracked porcelain.—Compendium by Hon. Mr. Morrison. See Ceramic Manufactures.

CHIN-CHIN. Chin. Corruption of Tsing Tsing, a Chinese greeting, meaning, I pray you! I pray you!

CHINCHEKD or Mai-ji, in the taluk of Pathara in the Bombay Presidency, has an annual fair in the 15th of the month Paosh, about the beginning of January. It originated from the circumstance of a female devotee named Mai-ji burying herself alive. She was the daughter of a man of the Firoli Kunbi caste of the village of Hewli, in the Jamner district. Being distressed by her husband's want of respect to her, she committed suicide and was buried under Gorakh Nath in the Taran Mal mountain. She finally settled at Chincked, where she was annually provided with a house, which she every year burned, and at the close of the twelfth year she buried herself alive, about the middle of the 17th century. People made vows to her while alive, and after her death to her remains.

CHINCHONA, a genus of plants, natives of South America, several species of which are of great value in medicine, yielding 'bark' or Peruvian or cinchona bark, from which quinine is produced. See Cinchona.

CHIN-CHOO. Chin. The true God, of Chinese Mahomedans.

CHINCHOR, a town in the Dekhan, with a temple containing an idol named Kandoba, to whom many Murli girls are devoted. See Murli.

CHIN-CROU. Chin. Grass carina.

CHIN-DEO, in Caua, means Jain images, and is supposed to be a corruption of Jain deo.

CHINDWARAHI, in the Nerbadda division of the Central Provinces, is a district lying between lat. 21° 25' and 22° 50' N., and long. 78° and 79° 30' E., with an area of 3852 square miles. It has
two distinct natural subdivisions,—the hill country above the slopes of the Satpura mountains, called the Balaghat, and a tract of lowland beneath them to the south, and called the Zer Ghat. It is a sana-
torium, and there is a barrack for fifty men.

CHINESE FEET. The binding of the feet is not begun till the child has learned to walk and do various things. The bandages are specially manu-
ufactured, and are about two inches wide and two yards long for the first year, five yards long for subsequent years. The end of the slip is laid on the inside of the foot at the instep, then carried over the toes, under the foot, and round the heel, the toes being thus drawn towards and over the sole, while a bulge is produced on the instep and a deep indentation in the sole. The indentation, it is considered, should measure about an inch and a half from the part of the foot that rests on the ground up to the instep. Successive layers of bandages are used till the strip is all used, and the end is then sewn tightly down. The foot is so squeezed upward, that in walking only the ball of the great toe touches the ground. Large quantities of powdered alum are used to prevent ulceration and lessen the offensive odour. After a month the foot is put in hot water to soak some time; then the bandage is carefully unwound, much dead enticle coming off with it. Ulcers and other sores are often formed on the foot; frequently, too, a large piece of flesh sloughs off the sole, and one or two toes may even drop off, in which case the woman feels afterwards repaid by having smaller and more delicate feet. Each time the bandage is taken off the foot is kneaded, to make the joints more flexible, and then bound up again as quickly as possible with fresh bandage, which is drawn up more tightly. During the first year the pain is so intense that the sufferer can do nothing; and for about two years the foot aches continually, and is the seat of a pain which is like the prickling of sharp needles. With continued rigorous bind-
ing, the foot in two years ceases to ache, and the whole leg, from the knee downward, becomes shrunk, so as to be little more than skin and bone. When once formed, the golden lily, as the Chinese lady calls her delicate little foot, can never recover its original shape.

CHINESE MOSS, Plocaria tenax. See Alge. CHINESE TARTARY, also called Chinese Turkestan, is a great depressed valley, shut in by mountains of great height on three sides, and on the east are barren sands, which merge imperceptibly into the great desert of Gobi. It comprised two great divisions, viz. Zunger or Kughistahan, and Kashgar or Eastern Tur-
kestan, on the N. and S. respectively of the intersecting range of the Tian-Shan mountains. The northern portion was called by the Chinese Tian-Shan Peh-Lu, and the southern, Tian-Shan Nau-Lu. The first of these has lapsed in great part to Russia. The Tian-Shan range separates it from Zungaria, the Bolor range from Transoxiana, and the Kara Koram and Kouch Lun from India and Tibet on the south. The land is clayey near the base of the mountains, but sandy in the central tracts. Rain is rare, and the air is of exceeding dryness, but the climate is temperate and healthy. It is well watered from the mountains, the waters converging towards the Ergol or Tarym. The country has gold, copper, salt, sulphur and the jade-stone. The southern line of the caravan route passes through it from Khamil to Aksu and Kashgar. From Aksu to Khokand is 800 miles. It was subject to China from the beginning of the Christian era, to the time of Chengiz Khan. After the middle of the 18th century, the Chinese power regained possession of it. Alti-Shahr, or the six cities, forms the western district, comprising Yarkand, Kashgar, Khotan, Aksu, Yangbacar, and Oosh-Turfan, with territories subordinate to each.

CHINGLEPUT. Eastern Turkestan is eminently Mahomedan. Yarkand is the entrepot of trade between China and Bokhara. Khotan, from the time of Ktesia, has been celebrated for its mineral products, its jade and emeralds, its shawl wool, and flax. It was at one time the entrepot of a vast trade with Hindustan and now imports largely furs, broad-cloth, leather, and sugar. In the latter part of the 19th century, there was a short-lived Maho-
medan uprising, from which sprang difficulties between China and Russia, the latter having taken possession of the province of Ili, and the town and district of Kuldja.

CHINGANI, a name of the Kara-chi of Central Asia, supposed to be a gipsy race.

CHINGARI. Hind. A thug; a clan of Muttii thugs assuming to be Mahomedans, and travelling as ostensible grain merchants.—Wilson.

CHINGERITT, a Penang wood of a brown colour, sp. gr. 2'165. A small tree, used for furniture.

CHING-HAE or Chin-hae, in lat. 29° 57'-4' N., long. 121° 45'-4', is the maritime town of the river Yung or Ningpo. The city of Ningpo is about 10 miles from the river's harbour. Ching-
hae is a bcten or city of the third class. It was captured by the British on 10th October 1841.— Horse.

CHING - HWANG - MEAOU. Chin. The temple in Chinese towns dedicated to the patron deity of the town. On the morning of the new or full moon, is a lecture, one of sixteen which the emperor Kung ordered to be read, but first put in practice by his son. They are practical homilies on the duties of life.

CHING-KEANG-FO, a town of China, battle of, fought 21st July 1842.

CHINGLEPUT, a town 36 miles S. of Madras. It gives its name to a revenue division which lies between parallels of 12° 15' and 13° 54' N. lat., and wraps round Madras. The several races of Maho-
medans number 23,192, and Hindos 899,686, of the Vala, Vanin, Kamalar, Kukilar sections, and a small number of Irunai and Parials. It is known as the Jaghir, having been, in 1763, granted as a jaghir to the lst Co. by the nawab Muhammad Ali, for services rendered to his father Anwar-ud-
Din Khan and himself; and in 1765 the grant was confirmed by the emperor of Delhi. It was twice overrun by Hdry Ali, in 1768 and in 1780; and in 1784 many parts presented only the bones of the persons who had been massacred, and the ruins of houses made desolate. It has small rivers. The Palar, rising in Mysoor, passes Arcot, Walajahbad, and Chingleput, and falls into the sea at Sadras. The Cheyar falls into the Palar opposite Walajahbad; the Adyar falls into the sea at Madras; and the Corellar flows into the marine lagoon at Emerre. There are four large tanks, of Chambrambukam, Utamalur, Red Hills, and Karangoli. St. Thomas' Mount, a military cantonment eight miles south of Madras.
CHINGO PANMARI.

is the headquarters of the artillery. It has two hills rising from a level plain. One of these is St. Thomas' Mount, 220 feet high, on which in 1547 the Portuguese had built a church, and another church on the Little Mount, a rocky hill two miles nearer Madras. On the 9th February 1759, a battle was fought on this plain between the British under Captain Calliand, and the French. It lasted from 5 A.M. to 5 P.M., and the French, under Lally, withdrew. Between 1746 and 1872, 16 disastrous cyclones swept over it.

CHINGO PANMARI, the Tibetan name of Mount Everest.

CHINGORIER, one of the thing clans.

CHINNA. SANSK. A cognisance, an emblem. Each of the Jaina thirthankara and each of the chief Hindu deities has one. The Chinnas of the 24 Jaina thirthankara, are the snakelike, ape, buffalo, boar, bull, cobra, chank shell, crocodile, curlew, elephant, falcon, goat, horse, lion, lotus, moon, Nandyavarta mark, chinoceros, the Srivatsa mark, the Swastika mark, thunderbolt, tortoise, water jar, and water lily. The apostles of the Christians had emblems similarly.

CHINI, HIND., i.e. China, or relating to China; hence Chini, sugar-candy, first brought from China, but is also white moist sugar. Rewand Chini, HIND., is Verbasum thapsus, Eremostachys vicaryi, and Rheum emodi. Chini-kam is porcelain.

CHINI, in the Western Himalaya, is situated on the northern side of the snowy range. A few marches to the north of Chini, sharp to the left of the road, there is a grand pass from the Sutlej to the Spiti valley, 18,600 feet high, the Manse or Manecrung crest in the month of May resembling a hurricane of snow, beyond everything sublime and cold.

CHINI. PUSHTU. A China silk fabric of Yorkand.

CHIN-INDIA, a name proposed for the countries beyond the Ganges.

CHINOT, a town in the Jhang district of the Punjab. It has the shrine of Shah Burhan, a Mahomedan saint, revered by Hindus and Mahomedans.—Imp. Gaz.

CHINKAH. HIND. A traversing basketbridge.—Wilson.

CHINKARA, HIND., of European and native sportsmen, is the Gazella bennetti, found generally on the plains and low open hills of India. In many parts it especially affects the nullahs and stony eminences which diversify the plain. The horns of the male are annulated, and twist back with a slight but graceful curve. They are ten or twelve inches in length. The doe has horns also, but much smaller in every way than those of the buck. They are not annulated, and are sometimes strangely distorted, without any approach to regularity of appearance. They roam in herds of six or eight, but they are more abundant in the province of Cutch than elsewhere, and the antelope is not seen there, though, across the gulf, on the coast of Kattiyawar, they abound.

CHIN KILICH KHAN, of Turk origin, of respectable family, was son of Ghazi-ul-Din, who long served under the emperors Aurangzeb, Jahandar Shah, Bahadur Shah, and Farokhshir. Chin Kilich Khan also served and raised himself to independence in Hyderabad, where he was known under the titles Nizam-ul-Mulk and Asaf Jah. He was the founder of the Asaf Jahl dynasty still ruling there, A.D. 1880, as Nizams of the Deccan. Chin Qilich, are Turk words meaning a sword-drawer.

CHINRAIPATAN.

CHINNA. AKU, Acalypha betulinum, Retz.

CHINNA AVAGUDA, Trichosanthes rhomboidea.

CHINNA BOTUKU, Cordia angustifolia.

CHINNA DULAGONDI, Tragia cannabina.

CHINNA JAIMII, Aescine cineraria, Wulle.

CHINNA KALINGA, Dillenia pentagyna, R. ii. 625.

CHINNA KALIVA PANDA, Carissa spinarum.

CHINNA MANDULA MARI, Vitis Linnaei, Will.

CHINNA MORALLI, Buxanaha latifolia, R.

CHINNA MUTTAMS, Sida allu, R.

CHINNA MUTTAVAPALAGAM, Pavonia zeyclandica.

CHINNA NAUJI, Lagerstræmia macracarpa, Roeb.; L. parviflora.

CHINNA NARIN, Triphasia trifoliata.

CHINNA NAVULI, Niebubria linifolia, R.

CHINNA NARO, Eugenia salicifolia, R.

CHINNA NIFRA KANTI, Desmanthus triquetrus.

CHINNA PULLI, Larger panther.

CHINNA RANABHARI, Anisomeles Malabarica.

CHINNA RANTU, Raphitopsis globra, Nexe.

CHINNA KIMMEDY, a district in the N.E. part of the Madras Presidency, inhabited by Khand races, who until lately practised human sacrifices, the victims being styled Meriah. The rite is supposed to be now suppressed. In Chonna Kimmedy, ' the Meriah was dragged along the fields, surrounded by a crowd of half-intoxicated Kandhs, who, shouting and screaming, rushed upon him, and with their knives cut the flesh piece by piece from his bones, avoiding the head and bowels, till the victim, dying from loss of blood, was relieved from torture, when the remains were burnt, and the ashes mixed with the new grain to preserve it from insects.' Captain MacViccar, writing in 1851, stated that in Mairy Desa, midway between Bood and Patna, ' on the day of sacrifice, after the appointed ceremonies, the Meriah was surrounded by the Kandhs, who beat him violently on the head.'

CHINNAMA. TAM., Tel. Little mother, an ordinary name for women.

CHINNA MASTAKA, in Hindu mythology, is a form of Paravti as Kali, and possibly is the saci of Siva, in the form of Kajali. She is described as a naked woman with a necklace of skulls. Her head is almost severed from her body, and her blood is spouting into her mouth. In two of her hands she holds a sword and a skull. Mr. Ward states that this goddess was so insatiated of blood, that not being able at one time to obtain enough of that of giants, she cut her own throat to supply herself therewith. Ward derives the name from Chinnia, cut off, and Mastaka, a head.

CHINNHERTHI, called also Gennasareth, Tiberias, Galilee, and Rahel ul Tibariath, a sea or lake formed by the river Jordan. It has many fish. Its surface is upwards of 300 feet below the Mediterranean, and it is enclosed by steep hills 300 to 1000 feet high. It is 12 miles long and 6 broad.

CHINNY. TAM.? A Travancore wood of a rather dark colour, sp. gr. 0.515. From 8 to 16 feet in circumference; used for building canoes.—Col. Frith.

CHINRAIPATAN, a town in Mysore famed for a Jaina statue, estimated 54 to 70 feet high. It has been cut out of the solid rock.
CHIRTETTA.

CHIRICOCCA JAVANICA, the Java snowberry, a parasitical shrub, found on the mountains of Java upon trees.—Eng. Cyc.

CHIONANTHUS, a genus of trees. Ch. albiflora, Thun., the taccada gas, grows up to 3000 feet in Ceylon. Ch. intermedius, Wight (the Lenociera inter., Wight), grows on the Animalay in 5000 feet. Ch. ramiflora, Roxb., is a tree of the Moluccas; and Ch. leprocarpa, Thun., is a small tree growing at 3000 to 4000 feet in the Central Province of Ceylon.—The.

CHIONE, a genus of molluses, of which many species occur in Indian seas.

CHIPPEVADU, Chippiga. Tel. A tailor.

CHIPPI, a beggar's bowl made of the shell of the sea, or double coconuot, Laodicea Seychellarum.

CHIPULU, Chippa. Tel. A tailor.

CHIPULU GADDI. Tel. Aristida setacea, Retz.; Chatteria set., Beane. The words mean broon or sweeping-grass, from the use to which it is applied.

CHIPURA TIGE. Tel. Cocculus villosus.

CHIR. HIND. Phasianus Wallachii.

CHIRA of the Periplus, an ancient kingdom that seems to have been formed out of the Pandyas dominions. The Chira seem to have possessed also Kerala, and to have sent an embassy to the Romans, to whom the Chira prince was known as the Kurobothras. See Chera.

CHIRAGADAM. Tel. Bhatas edulis, Ch. CHIRAGH. PERS. HIND. A lamp. Ba-charagh, an inhabited house or town. Be-charagh, in ruins. Chiragh ka tal, lamp oil. In Southern India, oil of large-seeded Ricinus communis. In N. India, poppy and other oils are used for lamps.

CHIRA KURA. Tel. Amarantus polygonoides.

CHIRA MELLA. HIND. Phyllanthus longifolius.

CHIRAN. HIND. Prunus Armeniaca.

CHIRANJI. Tel. A dyeing root of Rubia cordifolia, in the bazars of the Northern Circars.

CHIRA SAMUDRA. SANSK. In Hinduism, the sea of milk on which the serpent Sesha rested when Vishnu was reposing. See Balaji.

CHIRATALA BODA. Tel. Dalbierca scandens, R. iii. 232.

CHIRAYUT. HIND. Agathodes chiraya.

CHIRCHIRA, also Chirchitta. HIND. Lycium Europæum, also Achyranthes aspera, resembling the Penicillaria spinata; the people believe if a person eat one chitak of its grain, they will not be hungry for 21 days.

CHIRETTA. HIND. Ceyrat root.

CHIRETTA. HIND. Kusum-buz-zericheh, ARAB. create, Kusam-buz-zericheh, ARAB. create, KBalapnath, BENG. Ceyratya, Kiatti, HIND. Kala-megh, Maha tita, SANSK. Toa-kha-kiyi, BURM. Atadi, SINGH. Kirtat, CAN. Sherai-kuchi, TAM. Kreat, DUKH. Nela venn, TAM.

Chirretta, or chirnaya, or kriot, for all these pronunciations are in use, is the name given to several plants, all of them closely allied in medicinal properties to gentian, for which several of
them are perfect substitutes. Like gentian, chiretta promotes digestion, improves the appetite, and gives a tone to the system, without producing much stimulant effect, or causing constipation. It contains a resin and yellow bitter matter, on which the activity of the plant depends. Its use is admissible in all inflammatory states of the intestinal canal, and in febrile diseases. The chiretta of the bazzars is the produce of the several following plants:—

Adenema hyssopophila, the chota or small chiryata, is common in various parts of Southern India, is very bitter, also somewhat laxative, and much used by the natives as a stomachic.

Agathotes chiraya, Don., Ophelia chirayta, Grisbach, Gentiana chiraya, Fleming, north of India, and Morung hills. All parts of the plant are extremely bitter, and are identical in composition with the common gentian. It is highly esteemed as a tonic and febrifuge all over India. It is a common and abundant plant in the bazaar, supplied chiefly by the lower range of the Himalaya.

Andrographis paniculata (Justicia paniculata, Roxb.), Kalamegh, Beng. Kalupnath or Maha tita, Hind., is the genuine or original chiretta.

Chronia centauroides of Roxburgh (Erythrean Rubrughii, Don.), is another and powerfully bitter plant, common in the Ghats.

Cicendia hyssopophila (syn. Exacum hyssopifolia), common in various parts of the East Indies; the whole plant is bitter and somewhat laxative; is used by the natives as a stomachic.

Exacum bicolore grows rare on the Nilgirgherry below Kotagerry, and abundant a mile below Nadawurutum, where it flowers during the autumnal months. This species enameles the swards of the Western Ghats with its beautiful blossoms, has the same bitter stomachic properties for which the Gentiana lutea is so much employed, and, it is believed, may be used with advantage in lieu of gentian for medicinal purposes. The infusion is a mild pure bitter. It is known in Mangalore as country treat, and sold there at 1 anna 6 pie per pound.

Exacum tetragonum is another species of this genus, and is called Ooda chirayta, or purple chirattha.

Ophelia angustifolia, Don. (O. Swertia, Roiye), is called puckarree chirayta, and is substituted for the true chirayta.

Ophelia elegans, Wright, grows plentifully in several parts of the Madras Presidency; is considered febrifuge by the native physicians, who prefer it to the Himalayan chirayta. It grows plentifully in the Jeypore zamindari of Vizagapatam, and is annually exported, as Silaras or Seljijit, to the value of about Rs. 2500. The infusion of O. elegans has a powerful bitterness.

Ophelia alata and Ophelia chirayta seem to be used similarly; they grow in the Himalaya.

Villasia Indica, V. artistata, and V. nympheoides occur in every part of India.

Chiretta may be regarded as a type of the simple bitters, so many of which have been employed in Europe as febrifuges. For such purposes it is employed in India, and it will do whatever a simple bitter can in stomachic intermittent. Chiretta is of much service in convalescence from fever. It is one of the few articles of the Indian Materia Medica which is in every respect an adequate substitute for the corresponding European article. Chiretta is a useful vehicle for other remedies. It is the basis of the celebrated drogue amere, a compound of mastic, frankincense, resin, myrrh, aloes, and great root, steeped in brandy for a month, and the tincture strained and bottled. Chiretta is met with in a dried state, tied up in bundles, with its long slender stems of a brownish colour, having the roots attached, and which have been taken up when the plant was in flower. It is procurable in all native druggists' shops. The extracts of chiretta agree in being valuable bitter tonics. Both these and gentian contain a peculiar principle, termed the gentisic acid. The dose is ten to thirty grains twice or three times daily, usually prescribed with sarsaparilla, henindestans, or iron (Beng. Pharr. p. 290). The wine of chiretta is cordial bitter and tonic in a dose of two fluid drachms. A compound tincture of creat is prepared by creat root six ounces, myrrh and aloes each one ounce, French brandy two pints; macerate for three days, and strain. This preparation is equivalent to the celebrated drogue amere. Its effects are tonic, stimulant, and gently aperient. It is a valuable preparation in the treatment of several forms of dyspepsia and torpidity of the alimentary canal, in a dose of one fluid drachm to half an ounce.

Faulkner, J. L., Pharr., On Chiretta, by Dr. Cleghor.; Dr. J. L. Stewart.

CHIRGAH, a Punukha war-ery. Chirgha wal, a fighting man.

CHIRI. SANSK. Wrightia antidysenterica; Memusops hexandrus.

CHIRI. Tel. A term applied to several plants resembling others:—

Chiri alli, Villarsia cristata, Spregn.
Chiri annem, Birdelia semandens, Willid.
Chiri benda, Sida cordifolia, L.
Chiri bikki, Gardenia gymnifera, L.
Chiri chatarast, Dentella regina, Forst.
Chiri dudduga, Alphonsa lutea, H.
Chiri galigeru, Trianthema, L.
Chiri gillicicheha, Crotalaria laburnifolia, L.
Chiri gimusu, Batatas paniculata, Ch.?
Chiri jegura, Chirya, sp.
Chiri kiki, SANSK., fruit of Buchanania latifolia.
Chiri kiti goru, Pterolobium lacrens, R. Br.
Chiri kura, Amaranthus polygonoides.
Chiri mallika, Jasminum anisatum, L.
Chiri manu, Conacarpus latifolia.
Chiri nanupala, Euphorbia, L.
Chiri palleri, Tribulus lanuginosus, L.
Chiri sanagalu, Evlum, sp.?
Chiri teka, Clerodendron, sp.
Chiri teku, bastard teak, Erythrina Indica, Wormia bracteata.
Chiri tumbiri, Leucas, R. Br.
Chiri vanga, Solanum melongena, L., small var.
Chiri veru, Oldenlandia umbellata, L.
Chiri ulva, Rhynchosia rufescens, D. C.

CHIRIA. HIND. A bird; hence Chiria-Mar, a bird-catcher, a low caste fowler.

CHIRIMI. MALAY. Cica disticha, Linn.

CHIRIT. MALAY. Cicca disticha, Linn.

CHIRITA SINENSIS, the manmeen-chung of the Chinese, a dwarf species of Leycepodium, highly prized by that people. — Fortune's Tea Districts, p. 8.

CHIRI-URAL. MALAY. Caoutchouc.

CHIRIYA-GHAS. BENG. Helopus annulatus.

CHIR-MITI. HIND. Abrus precatorius seeds.

CHIR-MUTTI. HIND. Lepopus cordifolia.

CHIR-NATH. HIND. For cones of Pinus longifolia and P. Gerardiana.
CHITRA KOOTA.

CHITRA KOOTA.

CHITRA KOOTA. Beng. Jeevabhihi caunamata.

CHITRA KOOTA. Beng. Urraha chetkubhba.

CHITRA KOOTA. Hind. Urri deputy.

CHITRA KOOTA. Hind. Kuanis elata.

CHITRA KOOTA. Hind. Acanthus heterophyllum.

CHITRA KOOTA. Hind. Poincianella elata.

CHITRA KOOTA. Hind., also Chiti-phil, Heliotropum brevifolium.

CHITRA KOOTA. Hind. Desmodium argenteum.

CHITRA KOOTA. Hind. Sida acuta, Burm.

CHITRA KOOTA. Hind. Codrela toona; c. serrata.

CHITRA KOOTA. Beng. Bauhinia acuminata.

CHITRA KOOTA. Beng. Polypodium glad-brum.

CHITRA KOOTA. Hind. Marlea begounifolia.

CHITRA KOOTA. Beng. Polygodum glad-brum.

CHITRA KOOTA. Hind. Stephylea emodi; Drosera muscipula. Lal chitra is Plumbago zeylanica.

CHITRA KOOTA. Beng. Polypodium glad-brum.

CHITRA KOOTA. Beng. Sarcodium bongaipatnam; also Hind., Berberis lycium, B. Asiatica or B. aristata.

CHITRA KOOTA. Beng. Cucumis Madraspatanaus; also Hind., Berberis lycium, B. Asiatica or B. aristata.

CHITRA KOOTA. Beng. Chitrak,Beng. Chitpata, and Chittra, the first month of the Tamil solar year, answering to the Hindu Vaishacha, when the sun is in the sign Meha. But this name is also of that last month of the Hindu solar year, used everywhere (excepting in the Tamil country) when the sun is in the sign Min, answering to the Tamil Punjoni. Lastly, Chitra is the name of the first month of the lunar-solar year, which begins on the new moon preceding the sun's entrance in the sign Meha. This variety of significations of terms so nearly resembling each other requires the greatest attention, when adhering to dates, and reading books written in different countries.—Warren.

CHITRA KOOTA. Hind. Sarcodium bongaipatnam; also Hind., Berberis lycium, B. Asiatica or B. aristata.

CHITRA KOOTA. Beng. Polypodium glad-brum.

CHITRA KOOTA. Hind. Urri chetkubhba.

CHITRA KOOTA. Hind. Kuanis elata.

CHITRA KOOTA. Hind. Acanthus heterophyllum.

CHITRA KOOTA. Hind. Poincianella elata.

CHITRA KOOTA. Hind. Acanthus heterophyllum.

CHITRA KOOTA. Hind. Poincianella elata.

CHITRA KOOTA. Hind. Acanthus heterophyllum.

CHITRA KOOTA. Hind. Poincianella elata.
CHITTAGONG HILL TRACTS.

land has some legend; every cavern is connected with his name. It is a sacred spot; crowded with temples and shrines of Rama and Lakshmana. Many thousands annually visit the spot, and round the hill is a raised footpath, on which the devotee with naked feet, tread, full of pious awe. It was the seat of Valmiki, the sage and poet, author of the Ramayana. The hill is crowded with monkeys. The river is lined with the landing-places called ghats, and flights of stairs for ceremonial ablutions.

CHITRAI - MULL. IND. Thalictrum foliosum.

CHITRA-MULAM. (Tella, Nalla, and Erra, white, black, and red). A general name for species of plumbago.

CHITRA-RAT'HAN. Chamaesiphon paniculatoides.

CHITRIKA. Tel. Limonia pentagyna, R.

CHITRA-AMADUM. Tel. Castor-oil.

CHITRA-BURKANI, also Chittagadun. Tel. Leggada lepida, Jordan.

CHITTABUTE of Murree, Abelia triflora; also Buddlea crispa.

CHITTA-DUDAGA, Guatteria cerasoides, Duin.

CHITTAGONG, or Islamabad, a town which gives its name to a district of British India along the N.E. coast of the Bay of Bengal. The town is built on the bank of the Karnaphuli river, in lat. 22° 21' 3" N., and long. 91° 52' 44" E. The district is bounded on the N. by Tipperah, S. by Arakan, E. by the Yomadong mountains, and W. by the Bay of Bengal, and has an area of 2322 square miles, and a population of 1,006,422 souls. It is a low strip of coast about 165 miles long, with many large tidal creeks; and the central parts opposite the islands of Yomadil and Kutubdia which resemble the Gangetic Sunderbungs. Since historic times it has been subjected successively to Tipperah, to the Afghan rulers of Bengal, to the raja of Arakan, to the Dehli empire; and it was ceded to the British East India Company in 1760. The Portuguese descendants are known as Feringhi. They were 854 in 1872; the Nat., 949; the Magh, 30,026; and the Rajbansi, 10,852;

Brahmans, 22,657; and Kayasthas, 68,916. The Lascaris of the coasting and foreign-going ships are largely from Chittagong. The Rajbansi are the offspring of Bengali women and Burmese husbands. 70.5 per cent. of the population are Mahomadians, the Hindus 26.7 per cent.—Imp. Gaz.

CHITTAGONG HILL TRACTS are a portion of the great chain of mountains running from Assam southwards to Cape Negrais, and the Blue Mountains, on the frontier of Chittagong, rise 5000 feet above the sea. Several rivers rise in these mountains, amongst others the Karnafili, which flows into the Bay of Bengal. The hill tribes of Chittagong call themselves Kayoug-tha, or sons of the river, and Toung-tha, or sons of the hills. The latter, to which the Lushai belong, are the more savage and independent, and speak different languages. The former have a written language, and even possess several copies of the Raja wong, or History of the Kings of Arakan. They are of Arakanese origin, speak the Ita-khlu dialect, and are Buddhists. All are Mongolian in physique. They have an honest, bright look, with frank and merry smile, and their look is a faithful index of their mental characteristics. They live in bamboo houses raised above the malaria of the ground. They practise Jum, Cheena, or Kumuri cultivation, burning down the jungle to prepare the soil for mixed seed scattered broadcast, and moving off to a new site next season. And they have a mild form of debtor slavery, which Captain Lewin thinks the British too suddenly interfered with, so that the hillmen fall victims to the usurer.

The Kyoung-tha, or Junia Magh, have 15 clans, who dwell in village communities under a Raja, or village head.

The Young-tha tribe, a wilder and less civilised group, are the Tipperah, Muong, Kumpi, Mro, and Khuyeng. Bangi, Pan-kho, Lushai or Kuki, and the Shinde, the last four being independent. Their villages are generally situated on lofty hills. They worship the sacred tree, the pythons, and the leopard.

The Chakma (Tsak or Tsakma, or in Burmese Thock) is the largest of all the tribes. It has 49 clans. Their habits are similar to those of the Kyoung-tha. The tribes all practise the Jum or Kumuri form of agriculture; and rice, cotton, tea, tobacco, and potatoes are their chief crops. The elephant, the rhinoceros, the tiger, and the leopard are numerous, with the Malay black bears, the wild buffalo, the sambur (Rusa Aristotela). The pythons grow to a large size.

Among the independent tribes beyond the British border, prisoners of war are sold like cattle. Raids are caused by the usage of wehr-gold, which they call goung hpo, or the price of a head; for when a villager dies, his friends charge the village which he may have last visited with his death, and demand a price for his life. Raids for women seem to keep up the necessary supply. Chastity is enforced only after marriage. All the unmarried lads sleep in one house in the village, under the eye of the 'bachelor's hall,' or chairman. The matters-of-facts and customs which are connected with this 'bachelor's hall,' as Colonel Dalton calls it, are the same as in the Koi and Gond countries. In the hills marriages are unions of affection, not of convenience or interest. Girls marry at 16, lads at 19. The most favourite offering to a sweetheart is a flower; and the lover will often climb the hills before dawn to procure the white or orange blossom of some rare orchid for the loved one's hair. One of Captain Lewin's police sought a week's leave of absence on this ground: 'A young maiden of such a village has sent me flowers and birnee rice twice as a token, and if I wait any longer they will say I am no man.' Among the Kyoung-tha, a leaf of paw, with betel, and sweet spicemixins, accompanied by a certain flower, signifies "I love you." If much spicemix is put inside the leaf, and one corner turned in a certain way, it signifies 'Come.' The leaf being touched with turmeric means 'I cannot come.' A small piece of charcoal inside the leaf is 'Go, I have done with you.' The love songs are as pure as they are pretty, and no improper ditties are allowed in the hearing of the village maidens. As the lads and lasses work in a crowd at harvest times, they respond in chorus, or, when the leader has finished, the whole party break out into the hoia or hill
call, like the jodel of Switzerland, and the cry is taken up from hill to hill, till it dies away in the distant valleys. In their mode of kissing, instead of pressing lip to lip, they apply the mouth and nose to the cheek and give a strong inhalation. They do not say, ‘Give me a kiss,’ but ‘Smell me.’ The religion of these tribes is a mixture of Buddhism and nature-worship. At the Maha Muni temple in Arakan, the bamboo is adored by some as the impersonation of the spirit of the forest. But wherever, as in the case of the Chakma, the tribes come into contact with the Bengali, they show a tendency to gravitate towards Hindism, the caste of which would soon kill the yassu, and check the freedom of their life. The Khamia and Kuki tribes occupy the hills of Sylhet, Tipperah, and Chittagong; the Kuki at the tops of the hills, and the Khamia on the skirts. The Kuki are the ruder or more pagan race, though also tinted with Hindism. They term their chief deity Khoejen Putiang, to whom they sacrifice a gyal; and to an inferior deity, named Shem Saq, a rude block of wood put up in every quarter of a village, a goat is offered; and they place before it the heads of the slain in battle, or the heads of animals killed in the chase. The Kuki say that they and the Mug are the offspring of the same progenitor.—Captain Lewis.

CHITTAGONG WOOD, Chickrassia tabularis, is used at Madras for furniture. It is light, cheap, and durable.

CHITTA. HIND. An Indian weight, equal to 914 grains = 2 oz. 394 grs. aver.

CHIT'TA LILXY. TAM. A Travancore wood of a red colour, sp. gr. 0.847, 1 to 14 feet in circumference; used for furniture.—Col. Frith.

CHITTAMANAK YENNAI. TAM. Castor-oil. Chittamudapa, Tel. Ricinus communis, the small variety, from the seeds of which only the medicinal castor-oil is expressed.

CHITSTAT. TEL. Gardenia gummi flora. CHIT'TA-RATT. MAL. Alpina galanga.

CHITTA-ROHI, in Northern India, sand with salt efflorescence.

CHITTA TUMIKI. TEL. Diospyros tenuifolia.

CHITTA YELKA. TEL. Leggenda lepida.

CHITTEDEWU. TEL. Vanda Roxburghii.

CHITTENTA KURA. Riedelia corchorifolia.

CHITTHI. HIND. A note, a letter, an order or demand; hence Chit-navis, a note-writer.

CHITTIANKUDU. TEL. Wrightia tinctoria.

CHITTHI PHUL. HIND. Heliotropium brevilobum.

CHITITTACHETTU. TEL. Phœnix farinifera.

CHITTORE or Chetur, a town in Rajputana, in the kingdom of Mewar. Its dynasty are Rajput, and claim to be descended from Lob, the eldest son of Rama, of the Solar dynasty. They say that they were first ruling at Balahhipura, a city in the gulf of Cambay, but their capital was laid waste by a son of Nushirwan of Persia, in A.D. 524. The Rajput queen escaped the general destruction, and gave birth to a son, named Goho, from whom the rajas of Udaipur are descended. Goho established the kingdom of Edur, and eight princes succeeded him on the throne. The race seem to have remained in the desert till the middle of the 8th century, but in A.D. 727 Bappa took Chittore. Shortly afterwards Bappa proceeded to Saurashtra, and married the daughter of Esugpe, prince of the island of Bunderdiva. With his bride he conveyed to Chittore the statue of Vyan-mata, the tutelary goddess of her race, who still divides with Eklinga the devotion of the Gohlot princes. The temple in which he enshrined this islandic goddess yet stands on the summit of Chittore, with many other monuments assigned by tradition to Bappa. Bappa is not a proper name, it signifies merely a child. He is frequently styled Sved, and in inscriptions Syed Adhes, the mountain lord. The Mori prince from whom Bappa took Chittore was of the Tak or Takshak race, of whom Nagnecha, Nagani Mata, was the mother, represented as half woman and half serpent, the sister of the mother of the Sylhet race, according to their legends. Many rites of the rana of Mewar’s house are decidedly Sylhetic. According to Sir H. Elliot, however, when Mahomed bin Kasim, the general of Wald, overran Gujarat about A.D. 718, and advanced to Chittore, Bappa met and entirely defeated him, and after this Bappa was raised to the throne of Chittore. After a long and prosperous reign, Bappa abdicated and departed to Khorasan, Tod says to Sylhet. In the reign of Khumian, his great-grandson Mahmun, governor of Khorasan, invaded Chittore, but was defeated and expelled by Khumia. After a twenty-four engagements, Baber, 1527, sustained a great defeat at Fatehpur Sikri at the hands of the Rajput Rama Singh, chief of Chittore; but in 1527 Baber led his army a second time against the Rajput prince, whom he overthrew, and completely broke his power. While ruled by Oody Singh, Chittore was invested by the emperor Akbar, and captured after a prolonged siege. Oody Singh, at the approach of the imperial army, withdrew to the Aravalli hills, and left Jeymul, the Rajput chief of Bedore, to defend his kingdom; Jeymul, with 8000 of his men and women, perished on the occasion, and 74½ mounds of plunder were taken away by the army of Akbar. The capture of Chittore was regarded at the time by the Rajput race as the greatest of misfortunes, and they have perpetuated the remembrance of it by impressing on all their correspondence the figures 74½. Oody Singh did not re-occupy Chittore, but was succeeded Udaipur, which he made his capital.—Elliot’s Hist. of India; Tod’s Rajasthan, i. p. 594; Elphinstone.

CHITT-PAWAN. MAH. A Konkanish Brahman.

CHITTULDROOG, a hill fort which gives its name to a town and district in the Nagar division of the Mysore kingdom, 120 miles N.W. from Bangalore. It gets its name Chutta thul droog, or the Umbrella Hill, from its shape. The district has an area of 4471 square miles, and a population in 1871 of 551,360. It is a sterile tract, with little rainfall. It was long held by a Polygar chief of the Beder race, and the present non-Aryan races are the Bedar 90,500, the Wakkaliga 69,755, Golla 46,396, and the Kuruba 36,459, with out-castes 58,245, and wandering tribes 44,142. The Mahomedans are 18,065, and the Siva Chaktars or Lingaat, 44,142. The district in the early years of the Christian era was largely of the Jain faith; and there are many

704
inscriptions of the Chalukya, Ballala, and Vijaynagar dynasties, and there are now several matas or Hindu monasteries. Here, on the 6th August 1809, East India Company's officers induced the native soldiers to mutiny, but they were attacked and defeated by detachments of the British army.

-Chittur, a town and fort in the N. Arcot district, 98 miles west from Madras, and 1100 feet above the sea. It is in lat. 13° 14' N. The hills are rugged and barren; they are intersected by a vein of iron ore. It is built on the south side of the Pooney river, which runs through the valley, and joins the Palayar.

-Chitulia, a genus of water-snakes of the order Hydroide. C. mornata and C. fasciata inhabit the Indian Ocean.

-Chitz, Mahr. Tamarindus indicus.

-Chiu, Hind. Rhododendron arboreum, also Euphoria royleana.

-Chiun, of the prophet Amos, v. 26, is supposed by Calmet to be Bal-peor, Chivin, or Siva.

-Chiuracy? a Penang wood of a brown colour, sp. gr. 1081; used for beams.

-Chivian amelipodi, Maleal. Ophioxylost sermonsum, Linn.

-Chivati, Maleal. A small coasting vessel of Malabar.

-Chivendi, Tam. A Ceylon timber tree, about 8 inches in diameter and 20 feet in height; used in housework.—Edge, Ceylon.

-Chives, Allium schoenoprasum, a variety of the onion, held in estimation for its leaves and small bulbs, and used in soups and salads. Propagated either by slips, or dividing the roots at any season, but best after the rains; 9 or 10 inches of space must be allowed between each bulb. Requires plenty of water, and protection from the vertical rays of the sun.—Riddell.

-Chiviki velama. Tel. Elemsine coracana.

-Chiwana, Hind. A place for the cremation of the Hindu dead, called also Chihnee and Chilane. These three terms are derived from Ceech, ashes, Marg'hat, Bhoeungdigha, and Smaasan or Samasen (in Benares), are also employed to signify the burning place.

-Chilatı'e or the Kallat, with the Kaniki, Kapchak, and Kharlik, are four Turkish tribes descended from the Oguz Khan.—De Guignes, ii. p. 9; Yule, Cathay, i. p. 165.

-Chloranthus brachystachys, one of a genus of plants belonging to the natural order Chloranthaceae; is a native of the coast of Java. Its properties are like those of C. officinalis.

-Its small flowers, along with those of Aglaia odorata, are mixed with certain kinds of tea, called after the plant, Ciu-lan-cha. This is the scented caper of commerce, a very expensive but expensive tea.—Smith.

-Chloranthus officinalis, a smooth shrub 3 to 4 feet high, a native of Java, in the moist woods 1500 feet above the sea. All the parts are powerfully aromatic. The roots, if quickly dried, retain their properties for a long time; and the mountaineers employ them in infusion as a remedy for spasm; also, united with anise or Ocimum, in small-pox. In fevers it is said to be of great service. It is a powerful and active stimulant.—Eng. Cyc.

-Chloride of zinc. Captain Keppel believes Sir William Barrett's solution of chloride of zinc, properly applied, the only composition yet known that will preserve anything from the white ants.—Keppel's Ind. Arch. ii. p. 159.

-Chlorite is found in connection with tin. Portions of the clay-slate east of Tavoy contain chlorite slate. The Moongnee stone of Orissa is said to be chlorite slate.

-The satin-wood tree grows in Ceylon, chiefly in the eastern districts, where it attains a large size, and is esteemed both for its wood and taste. It grows in Combatore, in the Anamolly hills, where Dr. Wight got planks 15 inches broad. Indeed, some of the finest satin-wood to be anywhere seen is to be met with near the foot of the Anamolly, though even there this valuable wood was rapidly disappearing under the cultivator's axe. It grows at Gokak; but Dr. Gibson had never seen it reach beyond the size of a small tree, which, when straight (seldom the case), would afford a log squaring 3 inches. It is found only in the Padshaoor jangles, and in those of the upper Mool, in the Almadnaggar collectorate. In Ganjam the tree is not so common as in Bodo gold; and it is said to be still more plentiful in Mohery and other taluks to the south. It is a most serviceable hard wood, well suited for naves of wheels, and, were it procurable in any quantity, for all framework requiring strength and durability. The Peradenia bridge, a single arch of 205 feet on the road to the great inland port, was probably executed in this wood. The wood is very close-grained, hard, and durable, of a light orange colour, takes a fine polish, and is suited for all kinds of ornamental purposes, but is somewhat apt to split. For picture frames it is nearly equal to American maple. The timber bears submersion well; in some instances it is beautifully feathered, and flowered or feathered satin-wood, when first polished, is one of the most beautiful woods in the world. Mr. Rohde had seen specimens surpassingly beautiful; but the valuable logs are not distinguishable from ordinary satin-wood till sawn, and twenty or forty may be cut without one of any beauty being found. The feathered satin-wood seems very liable to secrete when dry and old. Articles of satin-wood get darker and lose much of their beauty by age, unless protected by a coat of fine varnish. A cubic foot weighs 55 to 57 lbs. It is used for axletrees, oilpresses, posts, bed-posts, rafters, and the handles of axes; and in the Madras Gun Carriage Factory, for naves of wheels, also for fusess. The wood is excellent for agricultural implements, internal decoration and furniture, brushes and turnery.—Drs. Roxb. ii. 400, Gibson, Wight, Clegborn; Mr. Rohde; Mr. Meudts; Hartweig; Thue.

-Chio, or Chor, are vast and continually encroaching beds of sand left by the torrents that rush down from the low hills of the Siwalik range. The rapid increase of the area thrown out of cultivation by
being covered with barren sand, has been a source of continual trouble and anxiety to the revenue officers of the district; and the incrustation of the sandstone is being continually accelerated by the destruction of forests on the outer hills. These hills are composed chiefly of an exceedingly soft sandstone. When once its surface is laid bare by the destruction of the grass and brushwood that once covered the hills, it is very readily swept away by the heavy rainfall. The vertically falling rain at once penetrates it, down almost to the level of the plain, and excavates a narrow gorge with perpendicular sides extending far into the hills, but with the bed of the stream sloping very gently until it terminates in a vertical wall at the upper end. The rush of the water over this precipice, every time a shower falls, disintegrates a quantity of the rock, and helps to extend the area of loose sand on the plain below. The sandstone in its natural state is not unfertile; it is easily penetrated by the roots of plants, and contains a considerable admixture of lime and clay. Moreover, patches of ancient forest are still occasionally to be found on the hills.

CHO. HIND. Pyrus malus. 

CHOAR KULLI MAIRAM. Tam. Soymila febrifuga? yields clear, transparent gum, slightly tinged with red, and with a slight dash of bitter in the taste.

CHOASPE. The ancient name of the river on which Susa, in Khuzistan, was built. It is the modern Kerah river, near which are the ruins of Susa.—Williams’ Esseys, p. 13.

CHOB. HIND. A stick, a pole, timber, a mace. Chob-dar, a mace-bearer. The chob or mace is made of silver, ivory, or wood. It is probable that the office of gold stick, adopted in the British Court, was borrowed from the East. Most men of rank in India—Hindu, Mahomedan, or British—retain this class of attendants, mostly, however, bearing a silver baton, but having the common name of chob-dar, or staff-bearer. The chob or baton is about five feet long, with a head, and as thick at the upper end as one’s wrist, or as a constable’s staff.

CHOB, a strong fibre of Chutia Nagpur, made into ropes.

CHODA, a dish of polao, mixed with slices of cocconuts, dates, and almonds.

CHOB-I-PAU. 

CHOB. 

CHOI. 

CHOIL. 

CHOHAN. 

roasted, and ground, constitute cocoa; if merely broken up after roasting, cocoa nibs; mixed with starch and very fine ground, soluble cocoa of the shops. Chocolate consists of the same, made up into a paste, and flavoured. In 1870 nearly 15,000,000 of pounds of cocoa were imported into Great Britain, more than 6,000,000 being entered for home consumption.—McCulloch.

CHODA of Hazara, Pryus baccata, crab apple.

CHOD-TEN, in Tibet, is the chalaya of the Sanskrit, a Buddhist monument numerous in Tibet, dedicated to the celestial Buddha.

CHOHARIODD. A genus of Manofedea common to India and tropical America.

CHOGA, a loose cloak worn by the Afghans, not unlike the dressing-gown of European nations. It is made of a fabric woven of camel’s hair or of the fine wool of the rufus sheep, or of that which grows at the roots of the hair of the goats in the northern parts of Afghanistan. That of camel’s hair cloth costs up to £20; it is called Shuti choga. From Barrak, the cloth made from the rufus-wooled sheep, is made the Barraki choga. Kurk cloth, made from the wool of the highland goat, is used for the Kurki choga. Kurk resembles the pashmina or woolen cloth of Kashmir, but is of denser texture. They are made chiefly near Herat and in the Hazara country. Those of Kashmir are famous. A choga of British broad cloth, lined with the fur of the sambar deer, costs £60 to £80; but the fur of the ermine, squirrel, and fox are also used.—MacGregor, p. 50.

CHOGOD. HIND. An owl; a pronounced chuhat.

CHOGU. HIND. Taxus baccata.

CHOHAN or Chahuman, one of the four Agnicula tribes, which formed a dynasty that reigned at Ajmir and Dehli, and afterwards at Kotah and Bundi. Ajipala, one of this dynasty, founded Ajmir in A.D. 145; and it was afterwards lost to the Mahomedans by Dola Rai. Harihara Rai defeated Sabakttun. The race has been conspicuous for bravery during two thousand years. The leading individuals have been—

Anhil or Ajnipala, off-spring of fire, the first Chohan; probably period 550 before Vikrama, when an invasion of the Turka took place; captured and destroyed by Rastinaghzi magri (Garra Manuill); conquered the Konkan, Aser, Golconda.

Suvateha Mallan. In all probability this is the patriarch of the Mallani tribe.

Gulun Soor; Ajipala, Chukwa, or universal potentate; founder of Ajmir, some authorities say in 202 of the Vikrama, others of the Viraat Samvat. The latter is the more probable.

Dola Rai, slain, and lost Ajmir on the first irrigation of the Mahomedana. S. 741, A.D. 685.

Manikta Rai, S. 741, founded Samuhb; hence the title of Sambri-Rao borne by the Chohan princes, his issue.

Hursraj, S. 827, defeated Nazir-oo-din (qu. Subakttun), thence styled Sultanraghara.
CHOHAR.

Beere Beunludo or Dharmaguj, slain defending Ajmir against Mahmud of Ghazni.

Beensudeo (classically Vissaladeva); his period, from various inscriptions, S. 1066 to 1130.

Anah, constructed the Anah Sugar, Ajmir; still bears his name.

After Anah were Jeipal, Ajeydeo or Anundeo, and Someswar. Someswar married Rooka Bae, daughter of Anung Pal Tuar, king of Delhii, and their son Prithi-raj succeeded to the throne of Delhii, and is said to have been slain by Shahab-uddin S. 1249, A.D. 1193. His son Rainsim also fell. Vijaya raj, son of Someswar, whose name is on the Delhii pillar, was a nephew of Prithi-raj, and was adopted as his successor. His son Lakuni had twenty-one sons, seven of whom were legitimate, the others illegitimate, and founders of mixed tribes. From Lakuni there are twenty-six generations to Nonud Singh, a late chieftain of Nembata, the nearest lineal descendant of Ajipal. The genealogical tree of the Chohan tribe exhibits thirty-nine princes, from Anshul, the first created Chohan, to Prithi-raj, the last of the Hindu emperors of India. Mahomedian historians say that Prithi-raj was killed at the battle of the Cugger, or shortly afterwards: but Chand, or rather his continuator, represents him as dying in captivity at Ghazni, and the bard would gladly have concealed so humiliating a fact if he could. Several Chohan sepoy, after the capture of that fortress, sought out and professcd to find the Ch'hatres of their ancestor, where they showed their devotion to his memory, by presenting their humble offerings in honour of the champion of their faith. The desert tribes in the Chohan territory, the Sahraii, Khoa, Koli, Buil, were till lately predatory. The western Chohan are said to be free from infanticide. They do not wear the zornar, nor forest, or circle (shoki) in cooking, and their cooks are usually of the barber caste. The Chohan and Gehlot were neighbours, and on friendly terms, but the Rahtor and Tuar were most at war, though only separated by the Kali naddi. The Chohan territory on the S.E. has Koliwara, on the W. the desert Dhat, on the S. the Rin. It has two divisions, - Vira Bohn on the F., and across the Looni on the W. is Parkar, the Naggur Parkar of the maps. Bundi and Kotah are the most celebrated of the existing Chohan. Twelve branches of the Chohan became Mahomedians.

CHOHAR or Choi, a tribe of mountaineers in the hills of Hamargat, etc. - Wilson.

CHOI, also Jima. Hindi. A hole in the bed of a river, to get water; the outer leaf or spathe of the sugar-cane. - Elliot.

CHOIYAL. Tin. Dharmaraaja, the judge of the dead. Shinje, Tin., is also said to have the same meaning.

CHOIIL. Parsi. Of Cis-Sutlej. Low, swampy, undrained land.

CHOITRO, a Hindu month corresponding to the latter half of the month of March and first half of April. The full moon of Choitro, therefore, corresponds with the full moon of Easter. It was in this month that the devotees formerly engaged in the ceremonies of the Charakhi puja, the swinging sacrifice.

CHOLA-MANDALOOR.

CHOKA. Hindi. Rinncu vesicatoria.

CHOKA. Deuk. Piper nigrum.

CHOKHA, the root of a plant that is brought from Delhii to Ajmir. It is heating, taken internally as a narcotic; is bitter. It is chiefly used, mixed with sulphur and oil, to cure the itch in camels. - Gen. Med. Top. p. 131.

CHOKI. Hindi. Custom-house. A circle drawn round the spot on which Hindus cook their food. The interior area is holy. No stranger must step within or over it; with the Sri Vaishna of the Ramanuja followers, no strange eye must look on it. Such occurring, the food is thrown away, no matter how long the abstinence had been.

CHIKIDAR, in India, a watchman, a policeman. The Chokidar or Ich Agasi of the Pashali of Baghdad is one of the pages of the pasha's presence. - Mijwan's Travels.

CHIKL. Hindi. Bhus successaden.

CHIL. Tur. Desh.

CHILA, an ancient dynasty in the south of the Peninsula of India; the Sorai of Ptolomy. Their several capitals were Areqo, Conjeveram, then Warin, near Trichinopoly, Combaconum, Gongudaram, and lastly Tanjore. At the beginning of the Christian era they seem to have been ruling over all the countries speaking the Tamil language; and Mr. Ellis was of opinion that in the 8th century its princes were occupying large portions of Karnataka and Telangana, and ruling over as much of the country up to the Godavery as lay east of the hills of Nundidurg. They seem to have been first checked in the 12th century, and ultimately driven back within their ancient frontiers. In this state they continued to subsist either as independent princes or feudatories of Vijayanagar until the end of the 17th century, when a brother of Sivaji, the founder of the Mahatta state, who was at that time an officer of the Adil Shahi government of Bijapur, being detached to aid the last Chola raja, supplanted him in his government, and was the first ruler of the Mahatta government of Tanjore. The capital of the Chola for the most part was at Kanchi or Conjeveram. They must have been exercising sovereignty in the time of Ptolemy, who makes mention of 'Arceti sors'; and in the Mahawanso frequent references to transactions with the Chola occur during the earliest periods of the Singhalese annals. The Tamil traditions abound with stories of Arondha Chakravarti, who appears to have been the subdar of the aboriginal or Curumber tribes; yet no trustworthy records of his origin and actions are forthcoming; neither have authentic accounts of the overthrow and extinction of any of the great southern states been yet obtained. The Chola kingdom at one time reached as far as the river Kistna. The Ceded Districts formed part originally of the kingdom of the Chola, with whom they were occasionally disputed by the Kalyan Chalukya; and ultimately they constituted the principal portion of the kingdom of Bijanagar or Agungadi. The capitals of the latter power were successively Bijanagar on the Tumbudra, Penaconda, and Chanderagir, - Elphinestone.

CHOLA-MANDALOOR, supposed to be the source of the term Coromandel, applied to the east coast of the Peninsula of India, the Carnatic below the ghats. It was the country of the rajas of the
CHOLAY.

Chola dynasty Choran, who seem to have been coeval with the Chera and Pandyan dynasties.

CHOLAY of Nepal, Capra hircus, Linn.

CHOLER, also called Cholera morbus, a disease which has been reappearing at intervals in British India, certainly since the latter part of the 17th century. In its attacks only one or two or three recover. It has spread to most countries, and seemingly has Lower Bengal as an abiding place. Cholera reappeared at Negapatam in October 1781. A third time it appeared in 1786, and a fourth time in 1817. It appeared amongst the native troops, who marched from Bengal 5000 strong in February 1781, and they arrived near Madras in August, reduced to little more than 2000. It broke out near Ganjam in March 1781, and lasted about six weeks.—Hough, p. 115.

CHOLL. HIND. A bodice worn by most of the women of British India. It is of various shapes, but generally of coloured materials; in Sind, under the shift, of cloth called kanjuri, the choli or gaj conceals the bosom. When it passes round the side like a bodice, and is fastened behind, its name is pathi. The Marwari and Brahni women have the latter form. In Sind, over the choli or anga bodice is a light muslin shirt, which continues below the waist, called a koornti; and over all a scarf of white or coloured muslin of fine texture, do-patta, passed once round the waist, and thence across the bosom and over the left shoulder and head, like the sari, completes the costume.—Watson: Burton's Scinde, p. 301.

CHOLUM. DUKU. Porunga quadrifida, R.

CHOLLA. Tel. Eleousina coracana, Gaertn.

CHOLUM. TAM. Sorgum vulgare.

CHOMONDRI or Chalamby. TAM. A Ceylon tree; wood of a very dark colour, and durable. It grows to between 12 and 20 inches in diameter, and 20 feet in height. It is used by the native carpenters for general purposes. It produces a fruit which is used as medicine.—Edge, Ceylon.

CHOMOREK LAKE, according to Major Cunningham, is slightly saline. It has evidently had an outlet at its southern extremity, where it is only separated from the valley of the Parang river by a very low range of hills. The outlet of the little salt lake of Thogi has evidently been near its north end; and its waters, previous to the change in the state of the country which interrupted their exit, in all probability flowed into that tributary of the Zanskar river which runs to the eastward of the Lachalang pass. A goddess, Mo, is said to have haunted this lake Chu, and while flitting over it used to call out incessantly, "Ree, Ree!" thence Choo-mo-ree-ree! It is on the lofty platform of Rupelh, which extends from the Parang pass across the main chain of the Himalaya to the adjacent head of the Zanskar valley. The lake is 15,200 feet above the level of the sea.—Mrs. Hervey's Adventures, p. 148; Hooker and Thomson.

CHOMPIRENG. MALAY. A river cargo boat. The prahu boat, called Sekong, is made of one log of wood, very sharp fore and aft, with long out-riggers to prevent it upsetting.—J. I. Arch.

CHONDROPTERYGI, a sub-class of fishes. The skeleton is cartilaginous, and skull without sutures; body with medial and paired fins, the hinder pair abdominal; caudal fin with produced upper lobe. Gills attached to the skin by the outer margin with several intervening gill-openings; rarely one gill opening only. No air-bladder. Embryo with deciduous external gills; males with prehensile organs attached to the ventral fins. In the family Carachidae the eye has a nictitating membrane, and the mouth is crescent-shaped and inferior. The families Ammidae, Rhinodontidae, Notidanae, Scyllidae, and Pristophoridae, have no nictitating membrane. In the saw-fish family Pristidae, the snout is produced into an exceedingly long flat lamina, armed like a saw with a series of strong teeth along each edge. The electric organ of the family Torpedinidae is composed of vertical bars in the wall of the interspace between the pectoral fins and the head. The ray family, the Rajidae, have a broad rhombic disc, generally with asperities or spines, and the pectorals extend to the snout. The pectoral fins of the Trygonidae are similarly prolonged, and they have a long and slender tail. The pectoral fins of the Myliobatidae are greatly developed; they leave the head free, and reappear at the extremity of the snout as a pair of detached (cephalic) fins.—Gunther, CATALOG. OF FISHES.

CHONDROS CEPHALUS. Cargareen moss.

CHONEMOPHORA MACROPHYLLA, one of the Apocynaceae. It takes its name from Chone, a funnel, and Morpha, form. A very handsome climbing shrub, with large white flowers, well adapted for a screen or covering a wall.—Riddell.

CHONEMOPHORA MALABARICA. Don. Echites Malabarica, Lam. P. Polyn.—Malay.

A Malabar plant. Its leaves, rubbed up in rice water, are applied to carbuncles; and its root is used in fever, with dried ginger and coriander seed.—Useful Plants.

CHONG, an infusion or fermented liquor, made by the Lhoba of Bhutan, from wheat, barley, or rice, which is boiled and strained. Afterwards, one ball, size of a nutmeg, to each pound of grain, of the blossom of the Cacalia saracenica (Bakka), is crumbled and stewed over the grain. It is then pressed in baskets lined with leaves. To use it, a portion of the digested mass is put into a vessel, boiling water poured over it, and infused. It is now the Chong, and it is a grateful beverage, slightly acid, and not powerfully alcoholic.

CHONG, a hill tribe on the side of the Mei-kong basin, but towards the sea, between lat. 11° and 12° N. They preserve more of the Australo-Tamulian character than any of the neighbouring tribes. Their hair, instead of being stiff or harsh, as in the Mongolian, Tibetan, and prevalent ultra-Indian and Malaya-Polynesian race, is comparatively soft; the features are much more prominent; and the beard is fuller. The Moi or Ka-moi, who, on the opposite side of the Mei-kong, occupy the broad expansion of the Annam chain towards Kamboja, and appear to extend northwards along these mountains, marching with the Lau on the westward, are said to be black savages, with Negro features. The Kambojans style them Khamen. They are the Kho-men of Leyden, and the Kha-men of Gutzlaff.

CHONG-MON-GO. HIND. Nepeta floccosa.

CHONITI. HIND. Amongst Hindus, a tuft of hair left unshaven on the top of the head. It is also called Choti, also Ghonda and Chota. Mahomedans sometimes use some, as a votive offering to some saint. All Mahomedan women of the Peninsula dress their hair with the choni or tail, hanging behind, and largely added to by
CHOONEA or Choonea, also called Choona, Choona, or Choonea, is a village in the Barjati, a town in the district of Barjati, in the state of Bihar, India. It is located near the town of Barjati, which is a part of the Barjati subdivision of the Barjati district.

Choonea is situated on the banks of the Barjati River, which flows through the village. The village is known for its beautiful scenery and the traditional architecture of its houses, which are made of stone and mud. Choonea is also famous for its traditional festivals, which attract tourists from all over the state.

The village has a population of around 5,000 people and is divided into several neighborhoods. The main occupations of the villagers are agriculture, fishing, and trade. The village has a small market where villagers can buy and sell their goods.

Choonea is accessible by road and is connected to other parts of the district by a network of local roads. The nearest town, Barjati, is around 10 kilometers away and is well-connected to major cities in the state through a network of highways.

The climate of the village is tropical, with hot and humid summers and mild winters. The village receives moderate rainfall throughout the year, with the monsoon season being the main source of precipitation.

Choonea is a peaceful and quiet village, known for its friendly and hospitable locals. The villagers are proud of their traditional customs and are eager to share their culture with visitors.
by the rulers of the country before the Mahomedan sway. This empire of the Khwarizm kings rose upon the ruins of the Saljuk dynasty, and their territories extended from Azerbaijan and the Caspian Sea to the Indus, and from the Persian Gulf to above the Jihun or Jaxartes. A succession of nine princes reigned for 158 years, from 491 to 628 Hijira (1057 to 1230 A.D.); but in 618 it, the line of them, Jalal-ud-din Mankburni, was driven by Chenga Khan beyond the Indus, and he was killed in Mesopotamia ten years afterwards, stripped of all his dominions.

CHORBAT. This district is a dependency of the government of Iskardo, which, like that of Leh, is subject to that of Kashmir. The desert country by which Nurba and Chorbat are separated, has for the present acted as a barrier to the further extension eastward of the Mahomedan religion, which is now universally that of the people of the whole of the Iskardo (or Balti) district, as well as of Dras. On the Indus and in the valleys south of it there is no uninhabited tract between the two, so that the Mahomedan and Buddhist population are in direct contact. The result is that Mahomedanism is in that part generally, though very slowly, extending to the eastward. — *Dr. Thomson’s Travels in Western Himalaya and Tibet*, p. 204; *Tibet*. See Maryul.

CHOR. CHITTI. *Hind*. Deed of relinquishment.

CHOR-DEO. CHORI CHITTI. CHOR-KANTA. CHORTEN, the Persian dynasty of the Arsacides. Choreses I., styled Nushirwan, A.D. 531 to 571, was defeated on the plain of Meltene by Justinian, the general of Tiberius Constantine. Amongst the plunder obtained was his drinking-cup, of gold and paste jewels, which is now in the Bibliothèque Impériale of Paris. He was succeeded by Hormuzd. Choreses II., or Khusru Parvez, A.D. 591, reigned till A.D. 628, when he was put to death by Kobad. He was grandson of Choreses I. He married a daughter of the emperor Maurice, and this lady is generally supposed to be the muse and heroine of the eastern romances Khawarux and Shireen, and Farhad and Shireen. Near Baghdad is an arch, known as the Tak-i-Kasru, or arch of Choreses, which marks the site of the ancient Ctesiphon.—*Mordtmann ; Smith*; *Princess by Thomas*. See Greeks of Asia; Kaar. CHOT, also Ghoonghi. *Hind*. A blanket, cumuli, or sheet, folded or tied at one end to form a cloak.—*Elliot*.

CHOTA. HIND. Pyrus Kumaonensis. CHOTA. HIND. Small, little; Choti, fem.; and Ch’oto or Choto, BENGALI; hence,—CHOTA-bish-tarik, Ipomoea speciosa. CHOTA-chard, Ophiosylon serpentinum. CHOTA-chirraya, Cicendia hyssopoflora. CHOTA-dhoam, Cleome tomentosa. CHOTA-gul-khairu. See Khabaji. CHOTA-jam, Eugenia Caryophyllifolia. CHOTA-karnoda, Carissa spinarum. CHOTA-koksun, Vernonia cinerea. CHOTA-kando, Aloe litoralis. CHOTA-okra, Zipsina nodiflora. CHOTA-pind-aliu, Dioscorea aculeata. CHOTA-sundhi, Nymphaeæ edulis. CHOTA-tul, Rheum emodi. CHOTI, Corchorus olitorius. CHOTI-sim-khi-bhalli, Dolichos lablab, native bean. This is a smaller species of the D. lablab; the legume and seeds are both eaten; it is sown in the plains and sold from time to time a two piece a seer. CHOTI-ilachi, Elettaria cardamomum. CHOTI-mal, galls of Tamari orientalis. CHOTI-phutika, Osbeckia aspera. CHOTA-sukum, Calotropis herbeacea. CHOTA-al-ki-pat, Morinia umbellata leaves.

CHOTA NAGPORE, properly Chutia Nagpur, is the country on the eastern part of the extensive plateau of Central India, on which the Koel, the Subunreka, the Damula, and other rivers have their sources. It extends into Sirgurja, and forms what is called the ‘Upar - ghat’, or highest part of Juspur, and it is connected by a continuous chain of hills with the Vindhyan and Kymor ranges, from which flow alluvial of the Ganges; and with the highlands of Amarkantak, on which are the sources of the Nerbada. The plateau has an area of about 7000 sq. miles. It is on all sides difficult of access. It is a well wooded, undulating country, diversified by ranges of hills, and has a genial climate. The population at the 1872 census was 8,825,571, and is formed of a number of non-Aryan tribes who had fallen back to that refuge from the plains, more than half of them being of the race known to Europeans as Kol. On the south-west frontier of Bengal, besides Chutia Nagpur, are Sirgurja, with Palemow, Ramgur, Hazaribag, Mynap, and Amarkantak. The elevation of Chutia Nagpur is 2000 to 3000 feet, with hills running E. and W., but of little height; Sirgurja is mountainous, rising 600 to 700 feet above the level of Chutia Nagpur. Mynap is a table-land about 30 miles S.E. from Sirgurja town, and about 3000 or 3500 feet high. Palemow district is very mountainous. Hazaribagh town, lat. 24° N., long. 85° 54′ E., is 1750 feet. Slope of the country is south towards Sumbulpoore; N. and E. parts of district very mountainous, but level and even depressed towards the Mahanadi.
CHOTA NAGPORE.

Sumbulpore town, only 400 feet. Orissa table-land then rises on the southern side of Mahanadi, in some places to 1700 feet, backed by the chain of K. Ghats. Amarkantak jungle table-land, lat. 22° 40' N., long. 81° 5' E., 3500 feet. The soil in the plains is generally fertile, producing abundant crops of wheat, barley, rice, pulse, excellent vegetables, cotton, and sugar-cane. The cultivated parts are overrun with a coarse grass. There are 21 mahals, which form the S.W. frontier of the Bengal province, and which have been classified in four groups, the Sumbulpore, Patna, and Sirguja groups, and Singhbhum. The Sumbulpore and Patna groups are in the circle of the Cuttack Tributary Mahals. Singhbhum was never Mahatta; and in 1857 its chief, the raja of Poorahat, joined in the rebellion, many of the Larka Kol following him. A Christian mission went to Chutia Nagpur in 1845, and has made much progress amongst the Dhanger race. In Chutia Nagpur, in which are the districts of Manbhum and Singhbhum, the mortality from the famine of 1866 fell on the population almost the same as in Orissa. More than half of the population are aborigines or semi-Hinduized. The fourteen Kolarian tribes being the Asur, Bhumij, Birhor, Ho, Kharia, Kora, Korwa, Musi, Mundah, and Santal, who speak the Mundah, or a language closely allied; with the Cheru, Kharwar, Kisan, and Saont, who have lost their own primitive speech. The Dravidian tribes are the Bhuiber, Binjia, Gond, Khand, Kaur, Kol, Mora, Rautia, Sabar, and many others. The census of 1872 showed as under:—

The Asur or Agaria are wild, uncivilised iron-smelters. The Bhuiher and Boyar are supposed to be the same tribe, to be identical with the Parhaya, and allied to the Gond. They are also called Beorhi, from practising the kumari or jhum form of cultivation. The Bhumij (128,257) are in Dhalbhum, Manbhum, and Orissa, and, under the name of Chmar, were formerly known for their daring exploits. The Birhor, a very small tribe, who claim alliance with the Kharwar. They used to practise cannibalism; a Birhor whose end was approaching, would invite his relatives to come and feast on his body. The Kaur claim descent from the Kanuva race. The Korwa are a very wild tribe of Kol, but agricultural.

The Oraon, and those of the Oraon tribe called Dhanger, are a merry, light-hearted people, very fond of dancing, but given to excess in eating and drinking.

The Santal are most numerous in Manbhum, Singhbhum, and Chutia Nagpur. The Bhumij form the majority of the population in all the estates of the Manbhum district to the south of the Kassai river. As they approach the confines of Chutia Nagpur, they appear to be called indifferently Mundah or Bhumij, and they intermarry. More to the east, the Bhumij have greatly assimilated to the Bengali; many have acquired estates and influence as Sirdar Ghatwals, the hereditary guardians of the passes. They tenaciously cling to their national songs and dances. Bhumij are to be found in Mohunburg and Keonjur, and it is this branch of the Mundah race which has spread farthest in an eastern direction. The Bhumij of the lower part of Singhbhum and Manbhum are tolerably civilized. All the wild tribes of Central India worship relatives immediately after death; and the Bhumij, Bhumij and Kol tribes or clans practise the ceremony whereby a soul of a man in the deceased is attracted or conjured into some tangible thing, which is brought back into the house soon after the funeral, apparently that the soul may thenceforth be worshipped as a household spirit. Traces of this superstition may be found all the world over. It is practised by Hindus; Herodotus and Homer show its antiquity. Captain Burton mentions it in Africa.—Cent. Ind. Prov. Con. Rep. pp. 5-9; Dalton, pp. 147-156; Campbell, p. 33; Aitcheson; B. As. Soc. Jdo. 1866; Bengal Census Report.

CHOTA SUR. HIND. Porculia salvmvns.

CHOTI PIUL of Shahpur, a flat, shield-like ornament worn on the top of the head by Arora women. It is also in the form of a round spherical boss, different in form from the ornament of the same name in the Jach Doab.

CHOTRA. HIND. Berberis aristata.

CHOU. HIND. Four; softened from Char, four, from which are many compound words.

CHOUBE or Choubay, a class of Brahmans who originally received their name from reading the four (chou) Vedas, as Doobe was derived from reading two, and Tribedee from reading three, of the Vedas. Choube are numerous in Muttra, where they claim the exclusive right of worshipping in the temples of Krishna. They are of large physical frame; and the Choubai women have a commanding style of beauty.

CHOUBEKSA, from Choubees, 24, is a term applied to a tract of country containing that number of villages in the occupation of a particular tribe. There are several of them scattered over the provinces, but they may perhaps be more frequent in the neighbourhood of Muttra than elsewhere.

CHOHUARDHI, an overseer, commonly written Chohwadi. In Hindustan the chohwadi is the revenue officer of a district, called desmukh or desai among the Marathas. He is also a head of a division, or sect, or gaun. In many Hindu cities, the different classes of the community of every rank still acknowledge certain of their members as their hereditary headmen or provosts. These are the Sartavaha of the Brahmans, and Sirdar of the Mahomedans. The chowdari is usually a woman overseer. Many of the Hindu temples of the south of India are pyramidal,
but in successive tiers, four-cornered, each tier or platform being upheld by two men at the corner; these are the chourdari, though in reality there are eight for each tier.—Wilson, Hind. Th.

CHOWDWAH, a tract of country in the district of Dehra-i-Ismail Khan.

CHOUGH, the Cornish chough, Fregilus granulosus, inhabits the more elevated regions of the Himalaya, and of all high middle Asia, also stated to have been obtained in the vicinity of Calcutta.—Cal. Rev.

CHOUGHAN, in Rajputana, the Rajput champ-de-Mars. See Dard.

CHOUKA. Hind. Tetraceros quadricornis.

CHOUKANDI, or Luri-ka-kodon, so called from the leap from its top of an Ahir, by the name of Luri. It is in the town of Sarnath, and is a lofty mound of solid brickwork, surmounted with an octagonal building. Hiwen Thangan describes this tower to have been no less than 300 feet in height.—Tr. of Hind; i. p. 295.

CHOUK MARAM. Tam. Casuarina muricata.

CHOULA, also Choura. Hind. Dolichos Sinensis; a pulse commonly cultivated in Hindustan; also called Ruwas and Ramas, and in Persian Lobia.

CHOUlam. At five months of age, a Hindu ceremony called Choulam occurs, and the lobes of the ears are pierced with a small thin gold ring.

CHOU-LEEN-KE, or Chow-teze, commenced his labours about A.D. 1034. He died A.D. 1100? From 1241, his views of philosophy, morality, and politics have been supreme in China.

CHOUHTRY. Chatter, Chatham, H., Tam. | Chawadi, . . . . Tel.

In the Madras Presidency, a resting-place like the Mahomedan sarai; a police-station, a post-house.

CHOMASA. Hind. The Indian seasons are, according to the Sstras, six in number, each comprising two months. The common people are content to adopt the more definite division of three. Chomasa, or Barkha, constitutes the four months of the rainy season. The rest of the year is comprised in Scena, Jara, or Molasa, the cold season; and Dhoobkala, or Klaura, the hot season.—Elliot.

CHOU-MURTI MAHADAYA, a name of the four-sided lingam, one of which is in one of the Ellora caves, others in the Burabur caves, and many in the Glyh district. The meaning is, as an ordinary lingam can be worshipped only looking in one direction, this four-faced one can be looked to from four sides.

CHOURA-DADUR, a plateau in Central India, which has an area of about 1000 sq. miles. It is covered with jungle.

CHOURAGARH, the highest summit of the Mahadeva hills, has an altitude of 4200 feet above the sea; the usual height of the range, which, entering the Nagpur territory from Gawilghur, passes by Dewagurh towards Shiwani, is not above 2000 feet, though in the east of the same chain, where it goes under the name of the Lanji hills, some of the peaks attain an elevation of 2800 and 2400 feet. At Nagpur, the country falls to a level of 1000 feet. On the west, however, it immediately rises by 200 or 300 feet in a succession of eminences.—Carter's Geological Papers, p. 248.

CHOURASSI. Hind., literally, eighty-four, is a revenue term applied to a subdivision of a pargana or district amounting to 84 villages. Tod, in his Annals of Rajputana, where the chourassi are numerous, remarks that they are tanta-

CHOUCHAR, the Cornish chough, Fregilus granulosus, inhabits the more elevated regions of the Himalaya, and of all high middle Asia, also stated to have been obtained in the vicinity of Calcutta.—Cal. Rev.

CHOWK BYTHINA.

Hind. To sit in a circle; a technical phrase among fakirs.
CHRISTIANITY.

CHRISTIANITY, a classical author of China.

CHOWLE, DUKH. Portulaca quadrifolia.

CHOWSUN KHAMDEH, or Chownasat Satoon, as it is commonly called, is a singular structure quite close to the tomb of Nizam-ud-Din Aoleem near Dehli. As the name implies, it is composed of 64 pillars. They are of white marble, supporting a square roof of the same material, which occupies a tolerably wide area. It is a building of great purity, its pale aspect of white throughout being interrupted by no other colour. The lattice-work that surrounds it is of very delicate execution, and well polished. This building seems to be erected to the memory, if not actually over the remains, of a celebrated poet and historian, Amir Khmsri, a native of Samarcand, and a prince. He was a contemporary and friend of Shaikh Nizam-ud-Din Aoleem, not far from whose tomb this building is raised.—French's Tour, p. 13.

CHOWRI, Chamara, or Chaurri. Hind. A whisk, made sometimes of peacocks' feathers, sometimes from the tail of the yak, sometimes of spilt shavings of sandal-wood, of ivory, or of horse hair, or of grass, and used for the purpose of driving away flies, mosquitoes, and other insects. They are usually seen in the hands of the attendants of the gods. The chaurri or chowri from the white bushy tail of the yak or Tibet cow, was in ancient India fixed on a gold or ornamental shaft between the ears of the horse, like the plume of the war-horse of chivalry; the banner or bannier, with the device of the chief, rose at the back of the car; sometimes several little triangular flags were mounted on its sides.

'The waving chowri on the steel's broad brow points backwards, motionless as a picture.'—Coleman, p. 376; Hindoo Theatre, i. p. 199.

CHOWRA, a dynasty that ruled at Anhilpura in Gujarat from a.d. 746 to 942, when they were dispossessed by Mui Raj, a Solunki Rajput. The Chowra dynasty is usually known as the Saura; the natives of the S.W. of India change it to Chaurri.

CHOWRI. Tel. (Chavalli). A caravansary, a choultry, a chatram.—Wilson.

CHOWTHEE. Hind. The bridal ceremony of uniting the kunggar on the fourth day after the marriage.

CHOW-YU. Cinc. Dioscorea batatas.

CHOZAN TARTARS were Israelites professing the Jewish religion, and practising circumcision.

CHRIST, from the Greek word Christos, equivalent to the Hebrew and Arabic Masshia, from Mas'hi, anointed. The Christ is Jesus of Nazareth, called Jesus and Jesus Christ, also the Messiah. The Mahomedans' designation is Isb Massia, Jesus the Anointed; they also entitle him Ruh Allah, the Spirit of God, as Moses is known as the Kalam Allah, the Speaker with God, and Abraham as the Khali Allah, or Friend of God. Christians and Mahomedans believe him to have been born of the Virgin Mary.

CHRISTIANITY.

Christians in Southern and Eastern Asia are in many sects, and are the converts to this creed from many races, and since the earliest days of the Christian era. Africans seems to have early adopted the Christian faith. The Eastern Churches believe that St. Thomas preached in Arabia Felix and Socotra, on his way to India, where he suffered martyrdom about a.d. 50; and it is said that the rudiments of this religion were first implanted amongst the Hunsyrites by St. Bartholomew. It is also recorded that St. Pantenus was sent by Domitius, Bishop of Alexandria, to preach in Arabia Felix, and there to found traces of St. Bartholomew,—amongst others a colony of St. Matthew's Gospel, written in the Hebrew character, which he brought away with him to Alexandria. In the reign of Tibba, son of Husan, from a.d. 297 to 320, Christianity became more generally known in Arabia, and extended to Abyssinia, where the people, though surrounded by Mahomedan and pagan tribes, continue Christian till the present day. Subsequently, in a.d. 326, Frumentius was elected by Athanasius, Bishop of the Indians, and he is said to have contributed much to the propagation of the Christian religion, but whether Arabia or Abyssinia was the scene of his labours is disputed. In a.d. 342, Theophilus Indus, a native of Diu, obtained permission to build churches in Yemen, one of which was erected in Aden (Playfair). The Arab conquerors' first emigration from Arabia is supposed to have taken place about 700 years before the time of Solomon, and the Abyssinians appear to have of Arab descent. Christians in the four century of the Christian era, and in the sixth they re-crossed over to Arabia to avenge the persecution of Christians by a Jewish ruler, conquered Yemen, and marched to the gates of Meeca, where they were overthrown, two years before Mahomed was born. St. Thomas is believed to have become a martyr near Madras, at the Little Mount, half way between St. Thomé or Mylapur and St. Thomas' Mount. The first historical record of Christianity in India shows that its followers were Persians, followers of Mani.

Cosmas Indicopleustes, who travelled in India a.d. 530–550, and afterwards became a monk, mentions the presence of Christians.

Alfred the Great, in a.d. 885, sent Sighelm as an ambassador to the Christians at Mylapur, but there is no authority for his having reached India. Christianity in Arabia at the time of Mahomed was in a grossly corrupt state. The heresies of Ebion, Bani-thahara, Suraian, Collyrians, and Miriamites were current.

At present, in Arabia, there are two sects which have attracted the notice of travellers, because of their names. One of these, the Salebi, from Saleb, a cross, which they reverence; the other are the Sabian sect, who are known to Europeans as the Christians of St. John. But the Salebi seem to be the sects that are homeless and migratory dwellers in tents, and many races have used crosses; and the Sabians are a sect who have adopted portions of the Jewish, the Christian, and the Mahomedan beliefs. The Kadi, however, of Mesopotamia are Christians, and have been styled Nestorian Christians, a term which they do not recognise. Throughout those regions, Christians of the Armenian, Romish, and Protestant forms have scattered representatives.

Christianity, according to tradition, was introduced into Armenia by St. Jude or Thomas, one of the twelve apostles of Jesus, who converted King Algar. The Armenian Church separated from the Greek Church of Constantinople in the sixth century, on a dispute concerning the nature of Christ,—the former holding the Jacobite doctrine of his divine and human nature being monophysite,
or united in one; while the latter, like most other Christian churches, holds his divinity to be distinct from his humanity. Persian Christians are chiefly Nestorians, whose evangelical views have sometimes caused them to be termed the Waldensians of Asia. They trace their origin to the labours of the apostle St. Thomas. About 1870 they sent a deputation of two of their chief ministers, named Deacon Abraham and Deacon Marcus, to Britain to solicit aid from British Christians. In that region, the several sects have long been agitated by questions of belief and of church government. The Chaldean Patriarch of Mosul, after the middle of the 19th century, consecrated a bishop for Malahar. The Oriental Catholic Church of the Armenians has entirely separated itself from the papal chair. The United Chaldeans are said to intend to break off all connection with Rome, and the Copts are ready to do the same, and withdraw, like the Maronites, Syrians, and Greek Melchites, from communion with Rome.

The British Indian Government provides funds for army ecclesiastical services of the Episcopal, Presbyterian, and Roman forms, costing in the three presidencies about three lakhs of rupees. The British Government has not alienated revenue for the support of the religions of the country, but maintains what was alienated by their native predecessors. In some cases the land has been resumed and cash payments substituted; but the grand result is as follows in the Madras Presidency:

Payments in cash to native religious institutions, per annum, Rs. 8,68,000. The assessment of lands alienated, less quit-rent, equals Rs. 2,30,52,000. The total, therefore, is Rs. 3,20,000,000. This is exclusive of enormous grants of land revenue to Brahman and others. In 1871 the total acreage for Hindu religious purposes was 1,347,000 acres, assessed at Rs. 22,23,100. The acreage for Mahomedan religious purposes was 137,000, with an assessment of Rs. 2,65,000. The acreage for Christian religious purposes was 2600 acres, and the assessments Rs. 5000. Consequently the total area and revenue alienated was little less than 1,500,000 acres, assessed at twenty-five lakhs.

On all the sea-coasts of the south and east of Asia, and on the great rivers, the people are largely fishermen. Those along the coasts at Madras became Christians early; indeed, from the southern outskirts of the town at St. Thomé to its northern village of Ennore, nearly all the fishermen are earnest Christians of the Roman Catholic persuasion. The Koli tribe of fishermen in Bombay are nearly all Christians, though they have occasionally wavered. There is something remarkable in the circumstance of the fisher races being amongst the earliest and most eager converts to Christianity in India,—so much so as to render it questionable whether it be only an accidental coincidence, or the result of some permanent and predisposing cause. The Parawa, or fishermen of Cape Comorin, were the earliest proselytes of St. Francis Xavier; and they have still a pride in alluding to the fact that they were the first, as they have since been the most faithful and abiding, of his converts. It was by the fishermen of Mannar that he was invited to Ceylon in 1544; and, notwithstanding the martyrdom inflicted by the raja of Jafna, and the persecution with which they were visited by the Dutch, that district and the adjacent boundary of the Wanny has to the present day been one of the strongholds of the Roman Catholics in Ceylon. Amongst the Parawa, or fischer caste of the Singhaless, the Roman Catholics have at all times been most successful in their efforts to proselytize.

There were many Christians in Ceylon in the 9th century, and in the 16th century St. Francis Xavier is said to have converted the inhabitants of Manaar. The king of Jafnapatam put 600 of the converts to death; to revenge which, Constantine de Braganza in A.D. 1560 invaded Jafnapatam, destroyed many villages, and is said to have carried off and destroyed the celebrated tooth of Buddha. Throughout the entire of the British territories in Southern Asia are small bodies of Nestorian, Armenian, Romish, and Protestant Christians, of Persian, Armenian, Portuguese, Dutch, Danish, English, and French descent. The census of 1871 showed 896,658 of Christians in British India, as under:

- Bengal, 90,763
- Assam, 1,947
- Ajmir, 249
- Oudh, 7,761
- Panjab, 22,154
- Central Provinces, 19,477
- Bar, 906
- Bombay, 9,036

Besides these, there are numbers in the native States of India, and the total may be about 14 million. The Ecclesiastical Council at Rome, however, obtained a statement of the numbers in India of the clergy and professing Catholics. It showed an archbishop of Goa, 19 bishops, who are vicar-apostolic, and 815 priests, besides the clergy resident in the island of Goa; and the laity were stated at 1,076,102. The Protestant missions of India, Burma, and Ceylon are carried on by 35 missionary societies, in addition to local agencies, and in 1873 employed 606 foreign missionaries in 3022 principal and subordinate stations. The Romish clergy of British India are almost fully occupied by the duties relating to their respective charges, but the Protestant missionaries are zealous educationalists and propagandists. In India in 1871-72 there were 25 Protestant mission presses. During the ten years between 1852 and 1862 they issued 1,034,940 copies of the Scriptures, chiefly single books; and 8,604,033 tracts, school-books, and books for general circulation. During the ten years between 1862 and 1872 they issued 3410 new works in 30 languages, and circulated 1,815,508 copies of books of Scripture, 2,375,040 school-books, and 8,750,129 Christian books and tracts. But throughout the S. and S.E. of Asia, and in the Archipelago, there may, in the latter third of the 19th century, be about ten millions of Christians, amongst about six hundred millions of Buddhists, Hindus, Mahomedans, and Shamarists, amongst Aryan, Semitic, Mongolid, and Negro races. In proselytizing, much success has attended the efforts of the Portuguese and Spaniards in India and the Archipelago; and the same may be said of the labours of Dr. Mason and other Baptist missionaries amongst the Kares, and other uncivilised tribes of Burma; also of those of Bishop Caldwell amongst the Shanar and other ruder Tamul races of the extreme south of the Indian Peninsula; and of others amongst the Kolarian and Dravidian races of the Central Provinces, and in the Chutia Nagpur province of Bengal. Mahomedans in S. Asia, of Arab and Persian and Mogul descent, adhere to the religious instruction
of their childhood, and very few Hindus of Aryan descent have accepted the Christian doctrines. They have not, however, been quiescent, but, rejecting their own polytheistic legends, they have been, from time to time, following monotheistic reformers, and in the 19th century have been trying to construct, under a church, council, or society, bearing the designation of Brahmo Samaj, an unrevealed code, in which they recognise a first principle and the teachings of morality. In British India, amongst Hindu races, the educational efforts of the British Indian Government have been on the largest scale; but over-education has unspiritualized the educational efforts of Christian missionaries, and created a desire for more worldly advancement, which has killed in some hopeful cases the inner life.

In Cochin and Travancore there have been Jews from prehistoric times, and Christians from the earliest years of the era. Some of them have adopted the Latin hierarchy, others serve under the rule of the Patriarch of Antioch, others under the Patriarch of Mosul, and others, again, are designated Nestorians. The disputes there led to, and followed, the arrival of the Patriarch of Antioch, and on the 4th March 1876 the Travancore Government issued a proclamation, declaring all matters connected with the churches to be adjudicable by the ordinary courts of the country. The Syrian Christians in Travancore are styled Nasram Mopla, also Pullen Kar; and Mahomedans are Iona Mopla. The Palaya Kar is a convert from the Syrian sect to that of the Roman Church. The seaboard regions of the Peninsula have many Christian sects meriting notice. One part of these, the Travancore state, is in alliance with the British Indian Government. Its population in 1875 was 2,311,379, of whom 468,000 were Christians, 63 per cent. being Syrians, in part Roman Catholics of the Syrian rite, and the rest Nestorians; Roman Catholics of the Latin rite were 24 per cent., and the remainder Protestants. The Syrian Christians on the Malabar coast date from the earliest centuries of the Christian era.

Cochin is another tributary state on the Malabar coast, with a population over half a million, of whom 140,262 are Christians and 1278 Jews. The Christians belong for the most part to the Romano-Syrian Church, under the Archbishops of Malabar and Goa. The Jacobite and Nestorian Churches were established long before any European settlements there, and they acknowledge the Patriarch of Antioch as their head. The Christians are almost all fishermen and boatmen.

Trinvely is a British district in the extreme south-east of the Indian Peninsula. In 1871 it had a population of 1,693,979, 102,576 or six per cent. of whom were Christians, mostly of the Parawa race, and those of the Romish and Protestant persuasions were in nearly equal numbers. It was on the Trinvely coast that St. Francis Xavier landed in 1542, after a short stay at Goa. He found there a small body of Christians; but since his time their numbers have largely increased in Madura and along the coasts of Trinvely and Ceylon. They have not been free from persecution. In 1549 Father Antonio Criminales became a martyr at Punnäkayal. In 1693 John de Brito fell a martyr at Madura; and after the middle of the 18th century (1773) the Portuguese suppressed the Jesuits in their own dominions, and greatly oppressed the Eastern and Italian missions. Robert de Nobili, in 1607, founded the missions at Madura. Early in the 18th century, Father Beschi, a great Tamil scholar, lived for some time at Kayatar. In 1816 was founded the vicariate-apostolic of Madura, including Trinvely. Beschi died in 1746. The Protestant missionary Schwartz was in Trinvely in 1770, Jenieick from 1792 to 1800; after him came Gericke, J. Hough, 1816, with Ithenius, a man of great ability, Schmid, Dr. E. Sargent, and Dr. R. Caldwell, all of them men of great intellectual ability.

Christianity made much progress in India from the time of Xavier and his fellow-labourers. Louis Almeida, a Portuguese Jesuit, was everywhere welcomed among the territorial princes of Kew-sew. Somnathadas, prince of Omura, became a convert. In A.D. 1582, four noble Japanese went to Rome on an embassy to Pope Gregory XIII., from the princes of Bunga, Aroma, and Omura, and were for eight years absent from Japan. But the secular emperor, Tyco-sama, repressed the movement, and his successor, Eyaves, issued an imperial edict, A.D. 1638, expelling and exterminating the Christian religion and foreign races. In 1638, 4000 Japanese Christians were thrown into the sea from the Papenburg rock near Nagasaki.

The first missionaries to China were Italians. In the middle of the 17th century, workmen at Sen-gan-fu, in the N.W. of China, found a Syrian inscription, which had been sculptured by the missionaries of the Nestorian Church in the 7th century, and native scholars regard it as a most valuable specimen of the caligraphy and composition of the Tang dynasty. Christianity seems to have penetrated three times into China, the first time in the 5th or 6th century. We learn from the Mahomedan travellers, who visited China as early as A.D. 850, that it then prevailed; and that, when Canton was taken and sacked in A.D. 877, by a rebel army, as many as 120,000 Mahomedans, Jews, Christians, and Parsees perished in the sack. The general who conquered Southern China is stated to have been a Nestorian Christian, and to have built a church at Nankin for those of his own faith. Marco Polo was himself in high favour, though a Roman Catholic. In the 13th it was very flourishing. At this epoch there existed at Pekin an archbishop with four suffragans. The Chinese have also for a long time had at their command a precious collection of books of Christian doctrine, composed by the ancient missionaries, and which, even in a purely literary point of view, are much esteemed in the empire. These books are diffused in great numbers throughout China, the first printed in the 9th or 10th century.

Christianity was encouraged at the Moghul court during the reign of the emperor Jahangir. But Bernier mentions (p. 198) persecutions there. Pero Ricci went from Macao into the interior of China in A.D. 1585, and established himself in the first instance at Nankin. He removed, after a few years, from Nankin to Pekin, where he was well received, and his doctrines made an impression on some nobles of the court. He lived there for many years, the recognised head of several missionary establishments.
located in different parts of China, making many
converts, and respected by all, until his death,
which occurred at the age of fifty-seven, in the
year 1610.
A popular uprising began in 1818. It origin-
ated in 1800, in the teachings of Mr. Roberts, an
American missionary, and of an earnest Chinese
disciple. It became blended with the national
struggle of the Tae-ping, or the vortaries of 'the
divine kingdom of eternal peace.' According to
the writings of Hung, once a schoolmaster, but
afterwards the 'heavenly prince' and acknowl-
dged head, the Tae-ping convert on coming to
baptism had to pronounce a solemn vow to take
the belief in the Father, Son, and Holy Ghost for
his rule of life, and that he was resolved to dedicate
this life to God, in love to the brethren; and
visits to the tombs of ancestors were enjoined, in
gratitude for the release of their immortal souls
from this troublesome life, and to renew the vow
of life-long devotion to the cause of God and the
brethren. The Bible was their word of God, and
the ten commandments the moral law; opium-
smoking, a sin equal to adultery. The Chinese
designate the Christian religion as the religion of
the Lord of Heaven; and M. Huc observes that
every one must be struck with the new doctrines
with which the proclamation and manifestations
of the pretender and his generals have been filled.
He styled himself Tien-ti, or Celestial Virtue. The
unity of God has been distinctly expressed; and
around this fundamental dogma have been grouped
a number of ideas borrowed from the Old and
New Testament. War was declared at the same
time to idolatry and to the Tartar dynasty. A
French missionary, who had been very much in
the interior of China, states the total number of
native Christians at 500,000. M. Huc's estimate
was 800,000, which, as he correctly observes, is
a mere nothing in the enormous population of the
country. These Catholic Christians are, however,
not collected in one place; they are scattered over
all China proper in small communities, called by
the French Chrétienst. The members of these
Christianities are educated and trained as Chris-
tians from their infancy, being either foundlings
of Christian Chinese parentage. They are Chinese
in the outward and more obvious characteristics
dress and features, but in other respects are
more like Bavarians or Neapolitans than their own
countrymen, from whom they differ in many of
those social and domestic customs, and in all
those mental peculiarities, which constitute the
special nationality of the Chinaman.
The portion of India under British rule is
divided by the Church of Rome into vicariates-
apostolic, each under a vicar-apostolic, who is
also a bishop in partibus infidelium. The Madras
vicariate contains thirty-seven churches, sixty-
seven chapels, and thirty-four priests are en-
gaged at work in it. A very successful college
in Calcutta, for the education of Europeans and
natives combined, is one which belongs to the
Jesuit sect of Christians; and there is a similar
college at Bombay. At Negapatam, the Jesuit
Fathers have a college which is worthy of being
spoken of. This college, dedicated to St. Joseph,
was founded in 1846 by the Jesuits in charge of
the Madura Mission (attached to the province of
Toulouse in France), and at a time when education
was little appreciated by the people of India. It
occupies the site of the Government House and
compound of the Dutch governor, who resided in
Negapatam prior to 1751, when the town was occu-
pied by the British under Munro. The library of
the college contains nearly 3000 volumes, compris-
ing works in English, French, and other
European tongues, Sanskrit, Tamil, and various
vernacular languages, and a fair collection of
ancient and modern writings in Latin. There is a
printing office and a good laboratory. The chapel
of the college, dedicated to the Sacred Heart, is
a fine vaulted edifice, but rather small for its pre-
sent requirements. The Catholic parish church
near to the jetty at Negapatam is one of the most
remarkable structures in the town. These
buildings, together with others belonging to the
mission, have been erected entirely under the
direction of the Jesuits. The vicariate of Pondi-
cherry has 68 European and 26 native priests. It
contains 182,126 Christians. The French Govern-
ment support a college at Pondicherry; and St.
Joseph's College at Cuddalore is year by year
rising into importance as an educational institu-
tion.
Romish, Armenian, Presbyterian, Episcopalian,
Baptist, and other Christian sects have cathedral
and other churches in every district of British
India and the feudatory states, and British, French,
Italian, German, and American missions are spread
through the country.
The following table gives some interesting facts.
We exclude Ceylon, but include Mysore, Pondi-
cherry, Travancore, Hyderabad, and all the Madras
Presidency:

A French mission has settled in Perak, in the
Malay Peninsula.
The Protestant Christians, early after the Refor-
mation, sent missions to Ceylon and the south of
India. Ziegenbald was the first arrival, followed
by Schwartz, Gericks, Kohlhoff, Fabricius, Plu-
schau, and others. In 1706 Ziegenbald began at
Tranquebar; in 1726 the Christian Knowledge
Society made a settlement at Madras, under
Schultz and Sartorius, Lutheran missionaries;
in 1740 Kiernander arrived at Cuddalore, and in
September 1758, at the request of Clive, he left
Tranquebar to open a mission at Calcutta. Indeed,
the missionaries from Europe of the past four
centuries, who have devoted their lives to the dif-
fusion of the Christian doctrines, are many.—St.
Francis Xavier, Bartholomew Ziegenbald, and also
Henry Plutschau Danes at Tranquebar, 1705; John
Ernest Grundler at Tranquebar, to whom George 1.
of England addressed a complimentary letter of
23rd August 1717; Schwartz at Trichinopoly and
Tanjore; Schultz at Madras; Rottler, Dubois,
Rhenius in the Sa, of India; John Anderson at
Madras; Bishop Caldwell in Tranqueville; Ward,
Carey, Marshall, Duff, Brown, Buchanan, Thomp-
son, Henry Marty, Wilson, with Bower, Ellis,
Hough, Marks, Mason, Miller, Pallegoix, Winslow
of Bengal, Bombay and Madras Christian mis-
ionaries, pioneers of civilization, education, human
progress and improvement, scientists, ethnologists,
and philologists.—Tennent's Ceylon; Meadows'
Chinese, pp. 52-337; Prinsep's Tibet; Bunsen's
God in History; Huc, Chinese Empire; Bishop
of Victoria in Japan; Travancore Administra-
CHRISTIE, Dr. TURNBULL.

**CHRONOLOGY.**

Dr. TURNBULL, of the Madras Medical Service, gave the first account of per- 
celain clay at Mangalore, in Brit. As. Trans. 1841, x. part 2, p. 967. Also wrote on the Min- 
eralogy and Geology of the Southern Maharatta 
Country, Mad. Lit. Trans. iv. pp. 135, 452, 
which was reprinted from Edin. Phil. Jl.; In- 
structions for Meteorologists, Observations on 
41, 70; Observations on the Geology of the 
Hyderabad Country, ibid. 1827. See memoir of, 
Trans. xv. p. 150.—Dr. Buist's Catalogue.

CHRISTOLEA GRASSIFOLIA, the Shangho 
of Ladakh, grows at from 10,000 to 15,000 feet in 
Ladakah; is browsed by goats, but little by the yak. 
CHRISTOPHER, Captain W., of the Indian 
avny, author of Memoir of the Maldivie Islands, 
in Bon. Geo. Trans., reprint, 1. p. 54; Account 
of Adam's Bridge and Ramisaram Temple in Ceylon, 
ibid. vii. p. 130; Account of Haines River and the 
 adjoining Country, ibid. vi. p. 375; On a Voyage 
up the Indus and Sutlej, ibid. viii. p. 144; Jour- 
nal of a Visit to the River Ganges, ibid. 1829. 
He discovered the Haines River in 1812. He 
was mortally wounded by a cannon shot before Multan 
in 1814, and died on the 8th October of that year. 
—Dr. Buist's Catalogue.

CHROME IRON ORE, or chromate of iron, is 
a compound of oxide of chrome with protoxide of 
iron. It is met with massive, and in octahedral 
crystals of a blackish colour, and imperfect 
metallic lustre. It is found in Unst in Shetland, 
France, Baltimore in America, and in the Madras 
Presidency, in Salem and Vizianagram; but, as 
yet, nothing has been done in India to turn this 
mineral to useful account on a large scale, from 
the want of proper appliances. The consumption 
of this substance in Europe is in the manufacture 
of bichromate of potash for dyes, the chromates 
of lead for painting, and chromic acid for colour- 
ing pottery, porcelain, and glass. Chrome ore in 
Salem is abundant, but the raw material will not 
pay the expense of mining. It is of a dark 
greenish or nearly black colour, granular. To 
decompose it by nitrate of potash requires more 
than a red heat; by caustic potash it is more 
readily acted on. Chrome yellow, or chromate of 
lead, is used in dyeing. Chromate of potash is a 
crystallized yellow salt of a bitter, disagreeable 
taste, used by calico printers.

CHRONOLOGY. The greater periods 
employed in the computation of time by the Hindus, 
though founded on astronomical data, are purely 
mythological. A complete revolution of the 
years, and in the form 12 × 5. In the Chaldean 
chronology, a cycle of 60 × 10 years was employed 
(10 Sossi being equivalent to 1 Saros); and 
Josephus styled the epoch of 600 years which 
grew out of it, the great patriarchal year. The earliest 
Chinese chronology rests upon a conventional 
basis peculiar to itself, that of limiting the lunar 
year of a cycle of 600 years, which was common to 
the whole of Northern Asia and the Chaldeans, 
and probably (as it is also met with in India) to 
the Bactrians also. This basis is historical. The 
communication took place before the Chaldees 
invented the cycle of 600 years. The Chinese 
observation is based upon the use of the Baby- 
lonian (Bunsen). The Chinese, from the time of 
the emperor Yao, B.C. 2000, had a lunar year 
and a solar year.

The Sakas, Kaliyuga, and cyclic years of the 
Hindus commence together about March, and 
terminate almost simultaneously.

The beginning and end of the day has varied. 
Among the Greeks and Etruscans the day began 
at noon; among the Romans, as with the British, 
at midnight; among the Persians, at sunrise; 
but among the Jews and Egyptians, as now with 
Hindus, Mahomedans, and Parsees, it began at 
sunset.

The great epochs have been recognised, viz.: 
In the history of Babylonia, the fixed point 
from which time was reckoned, was the era of 
Nabonassar, B.C. 746.

Among the Greeks, the reckoning was by 
Olympiads, the point of departure being the year 
B.C. 776, in which Coroneus was victor in the 
Olympic games.

Roman chronology started from the foundation 
of the city, B.C. 753 (various dates).

Of the writers who framed chronological lists, 
the earliest was Berosus, a priest of Belus, living 
at Babylon in the 3rd century B.C., and who added 
to his historical account of Babylonia, a chrono- 
logical list of its kings.

Manetho, a priest of Lower Egypt, gave an 
account of thirty dynasties of its sovereigns.

Eratosthenes, in the latter half of the 2d 
century B.C., was keeper of the Alexandrian library, 
and wrote an important work on geography, and 
treated on chronography. This was the first 
attempt to establish an exact scheme of general 
chronology.

The great cuneiform inscription at Behistun, 
discovered in 1835 by Sir Henry Rawlinson, and 
subsequently copied and translated by him, threw 
a flood of light on some obscure passages of 
Persian history. And, in the year 1862, Sir Henry 
Rawlinson published the Assyrian Canon.

The authorities quoted below will show that the 
chronology of the south and east of Asia has 
received much attention in the later years of British 
supremacy; but on the plan of this Cyclopedia, 
the dates of battles and wars, of events in British 
India, the advent of reformers and learned men 
with their literature, will be found alphabetically, 
and the notice here is restricted to dynasties and 
eras:——

DYNASTIES, alphabetically.

Adal Shahi of Bijapur, A.D. 1459 to 1579.
Aiudra or Vrisapa of Andhra, B.C. 21 to A.D. 428.
Arsaces (Parthia), B.C. 225 to A.D. 225.
Arsaces (Armehian), B.C. 130 to A.D. 450.
Asaf Dali of Hyderabad, A.D. 1671, still reigning.
CHRONOLOGY.

Bactrian monarchy, from the reign of Antiochus II, third of the Seleucids, B.C. 313.

Bactria. Kings of Kulburga, A.D. 1347 to 1566.

Balabhi dynasty of Saurashtra, A.D. 0 to 523.

Belal rajas of Dwarasamudra, A.D. 984 to 1268.

Bengal rajas, A.D. 1576 to 1803.

Bijali Shah of Beed, A.D. 1598 to 1609.

Bihar Khanday dynasty, B.C. 915.

Bikanir, A.D. 1458, still reigning.

Bundu, a Chohan dynasty, A.D. 1575 to 1819.

Ceylon, A.D. 540 to 1796.

Chera or Kong, ended A.D. 894.

China, Manchut, 1616, still reigning.

Chola, of Ajay, Dehli, Kotha, and Bundu, B.C. 700 to 1192, when Prithi-raj was slain. Raina, successor of Prithi-raj, was slain in the sack of Dehli.

Chola, ended A.D. 1407.

Deltuni, A.D. 92 to 1655.

Faruki of Kadesel, A.D. 1370 to 1596.

Ghor, A.D. 1186 to 1206.

Gujarat kings, A.D. 1396 to 1572.

Ghazni, A.D. 961 to 1156.

Hara, a Chohan dynasty of Harauti, A.D. 1024 to 1575.

Imad Shahi of Borar, A.D. 1184 to 1568.

Irak Atabeks,—

Mosul branch, A.D. 1127 to 1259.

Aleppo branch, A.D. 1127 to 1197.

Jeynmlir, B.C. 94, still reigning.

Jauipur, A.D. 1394 to 1457.

Kandesh, A.D. 1399 to 1596.

Kashmir Musalman kings, A.D. 1326 to 1588.

Khalifs, A.D. 629 to 1242-43.

5 Ahulaksha, Umar, Ali, and Hasan, A.D. 632 to 661.

15 Ommiades, A.D. 661-2 to 744-5.

37 Abbasides, A.D. 749-50 to 1242-3.

Khorasan, at Ajay, Dehli, Kotha, and Bundu, B.C. 747 to 818.

Tahirides, A.D. 819 to 862.

Safarides, A.D. 873 to 900.

Kutub Shahi of Golconda, A.D. 1312 to 1560.

Loi, A.D. 1450 to 1526.

Maharatta Governments, —

Sivaji, 1644 to 1618.

Hereditary Peshwas, 1740 to 1818.

Bhonsla kings of Nagpur, 1732 to 1818.

Solipha, 1724, still reigning.

Holkar, 1724, still reigning.

Gaekwar, 1792, still reigning.

Malwa kings (Pr.), A.D. 1387 to 1568.

(. (Cl.), A.D. 1401 to 1612.

Marwara, of Jipaj, still reigning.

Maurya dynasty, B.C. 315.

Mewar or Udaipur, A.D. 727, still reigning.

Mohgul of Tartary, A.D. 1206 to 1226.

Mohgul Tartar or Il-Khan of Persia, A.D. 1256 to 1346.

Mohghul Shahis of Khurasan, to 1505.

Mohl Emperors of Hindustan, A.D. 1494 to 1857.

Mysore, A.D. 1530, still reigning.

Nayak dynasty of Madura, A.D. 1530 to 1731.

Nepal, B.C. 5800 to 3500.

Kerrat tribe, B.C. 3420 to 1739.

Suryavansis, B.C. 1565 to A.D. 27.

Ahir, A.D. 43 to 175.

Neverit, A.D. 218 to 1749.

Gurkhali, A.D. 1745, still reigning.

Nizam Shahi of Ahmadnagar, A.D. 1390 to 1607.

Oudh Nwabs and kings, A.D. 1756 to 1847.

Pandu dynasty of Magadha, B.C. 1400 to 915.

Pathan Gohri of Sind, A.D. 1193 to 1555.

Pathan Gohri of Dehli, A.D. 1206 to 1573.

Peshbadan dynasty, mythological.

Samanian dynasty of Bokhar, Khorasan, and Persia, A.D. 574 to 999.

Sassanian monarchs of Persia, A.D. 223 to 630.

Seljuk of Iran or Persia, A.D. 1037 to 1175.

Seljuk dynasty of Kerman, A.D. 1041 to 1169.

Seljuk dynasty of Rum or Anatolia, capital Iconium, 1077 to 1253.

Semaumaga dynasty, B.C. 777 to 415.

Sikh Government of Lahore.

Sind, Arab governors, A.D. 711 to 750.

Sumera Rajputs, followed by the Sumera, Sama Rajputs, and the Afghans, till Akbar's time.
CHYSANTHEMUM ALBUM.

CHYSANTHEMUM ALBUM. Peh-kiah-hwa, Chn. The ashes of the flowers are said to destroy insects. The Chrysanthemum genus of plants belongs to the natural order Compositae, and the sub-order Corymbifereae or Astereae. The species are very numerous in the temperate parts of the earth (Eng. Cyc. p. 1058). The name is from two Greek words, Chrysos, gold, and Anthos, flower.

—Smith.

CHYSANTHEMUM INDICUM. D. C. Gul-dawadi, Hind. Grows in several parts of India, and is used medicinally in calculation. —Drury.

CHYSANTHEMUM PERUVIANUM turns continually towards the sun. As a general rule, however, all plants turn towards the sun. Hypothesi:... 

CHRYSANTHEMUM ROXBURGHII. Desf. C. seneckeioides, Don. — Pyrethrum Indicum, Roxb. 

Marratia oleracea, Buch. — Pinardia Roxburghii, Less. 

Glebionis Roxburghii, Cass. — Bagaur, ...Chn. 

Christmas flower, Eng. — Kalzang, Ladhak. 

Gul dawadi, ...Hind. — Chamanti, Tel.

The plants commence flowering generally in November, and continue for several months. The colours are mostly yellow, orange, and a purplish colour mixed with white. They are made into garlands, and offered at the shrines of Vishnu and Siva. They are commonly cultivated in gardens in the plains of India, in Kashmir, Upper Chenab to 9200 feet, and in Ladhak at 11,900 feet. —Ainslie.

CHYSANTHEMUM SINENSE is extensively cultivated in European gardens, and is the Chinese gardener's favourite winter flower, although it is generally past its full beauty at the Chinese new year. There is no other plant which he takes so much pains with or which he cultivates so well. His camellias, azaleas, and roses are well grown and well bloom, but in all these the people of Britain excel him. In the cultivation of the chrysanthemum, however, he stands unrivalled. It is in great request among the people, and is used in the decoration of courtyards, halls, and temples. It is everybody's plant, and blooms alike in the garden of the lowly Chinese cottager as in that of the red-buttoned mandarin. —Eng. Cyc. p. 1052; Fortune's Tea Districts, p. 125.

CHRYS., 'the gold land.' of the Peripius, has been supposed to be Pega, the Suvarna Bhumi of the Golden Land of the old Indian Buddhists. Sonarpanga, a term of like meaning, is still the sacred or classical term for the central territories of Ava. Gold-scatterer, Zar-afshan, is applied by the people of Central Asia to the head-streams of the Oxus and Jaxartes ending in the inland sea of Aral. —Peripius of the Erythraean Sea; Yale, Cathay, i, p. 114.

CHRYSIDI.E, or golden wasps, do not sting, but possess the power of rolling themselves up into a ball, which is almost as hard and polished as if really made of metal. They are all adorned with the most gorgeous colours.

CHYRSOBALANACEAE of Lindley, the cocoa-plum tribe of plants, has the genera Chrysobalanus and Primepsia. Roxburgh mentioned C. racemosa of the Moluccas. C. iaco, the cocoa-palm tree of the West Indies, has been introduced into India.

CHYRSOBERYLLI, or prismatic cornulid, is found among the Tora hills near Raja-mahal, on the Murus, in irregular rolled pieces, small, and generally of a light green colour. These stones are considered by the natives as emeralds, and pass under the name of 'panna,' but the natives are aware that they are softer than the real emerald. —Gen. Med. Top. p. 160.

CHYSOPHYLLUM ROXBURGHII. G. Don. C. acuminatum, Roxb., star apple.

Hali mara, ...Can. —Tarsee phal, ...Mah, Pita-kara, ...Hind. —Lawooloo-gass, ...Singh.

This tree, one of the Sapotaceae, grows to thirty feet or more. In Canara and Sunda, it is very common in the jungles near the ghats above, particularly to the south. There are some trees in the Residency garden at Hyderabad. The wood seems straight and good, but the tree is chiefly noticeable from the gutta-percha-like incrustation common on the fruit. Fruit, about the size of a large crab-apple, ripens in October, and is edible but insipid. Not uncommon in the warmer parts of the island of Ceylon. —Gibson; Thw. iii, 174.

CHYRSOPOGON ACICULARIS. Hott. Andropogon acicularis, R. Bhaphis trivialis, Low. 

Gung-myeet, ...Burn. —Lampa, ...Hind. 

Spear grass, Eng. —Shumini, ...Sanuk. 

Chor-kanta, ...Hind. —Kat-chettu, ...Tel. 

Soorwals,...Kathe-gaddi,...

Abundant in barren land; troublesome to the feet of those who walk among it; eaten by cattle when other grass is not to be had. Its seed stick in the stockings, and produce a disagreeable itching. A longer variety, known solely as 'soorwals,' is a good winter pasture grass for cattle. —Mason; Gent. Med. Top. p. 176.

CHYSOPHASE, from Chrysos, golden or beautiful, and Prasen, leek, is a rare, pale apple-green chalcodyl, which owes its colour to the presence of the metal nickel. It is found in many parts of India, in Upper Silesia, and Vermont.

CHYRSORREIA, or 'Golden Stream' of the ancient geographers, is the Barada river of Damascus, which, so soon as it issues from the cleft in the mountains, is immediately divided into three smaller courses. The largest, which is the middle one, runs directly to the city, and is there distributed to the different public fountains, baths, and cisterns; whilst the other two, branch- ing off right and left, contribute mainly to the luxuriant vegetation which adorns the environs. South-east of the city their scattered waters unite again into one channel, and, after flowing towards the eastern hills for two or three hours, are finally lost in a marsh which, from one side view, appears like a small lake. Well may Damascus be called Sham-i-Shereef, the noble and beautiful. —Robinson's Tr. ii, p. 115.

CHU, or Chu-ma, or Tchon-ma. Chn., Bichoumera nivens; China grass.
CHU.

CHU. TIBETAN. Water. In Seythian, Ku; Assyrian, Hu; Greck, Ku.

CHUA. HIND. Rosa Webbiana. In Kulu, an amaranth cultivated for its grain; Amaranthus crenaceus.

CHUAL. HIND. Staphylea emodi, also Euonymus fimbriata.

CHUAN-YUAN, in the classical education of the Chinese, is the highest in the annual examina-
tion—the senior wrangler and senior classic from amongst 400 millions of people.

CHUHI. MALAY. Chillies.

CHUBREI. HIND. Dactylotenium Egyptianum, also Elouaine flagellifera.

CHUCHO, CHUCHI. Malay.

CHUK. CHUBIRI.

CHUKAN, CHUAL.

CHUAN-yUAN, CHUKAN.

CHUKKADUMPA.

CHUKKAR or Chakra, a Sikh weapon resembling a quoit in size and shape, thrown from the finger with a rotary motion.—Herklotz.

CHUKKEE, a hand-mill. Chukkée nama, a song sung while grinding at the mill; at weddings.

CHUKMA, a race, in number 28,000, occupying the Toonia Joon mahals, a forest tract in the hills of the Chittagong district, along with Mug, Reang, and Tiperah races, all more or less nomadical. Some one of these hill races till lately performed human sacrifices annually, and in the year 1852 several were tried for murder by sacrificing. The place of sacrifice was a cleared district in the jungle, and staked round with bamboos about six feet high. The sacrificial pole was a Phula bams bamboo, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. During the celebration of these sacrifices at Agartollah, a gun was fired every evening at sunset, when every person hurried to his home.

CHUKOTARA. HIND. Citrus deccanana.

CHUKHI. HIND. Rheum emodi, also R. palmatum; a powder of the dried acid stalks of the rhubarb.

CHUKKARI. HIND. Citrus communis.

CHUKL. HIND. Euphorbia royleana.

CHUKLA. HIND. Euphorbia royleana.

CHUL. CHUHARA. CHUHRA.

CHULAI. HIND. Spinacia tetrandra, also Amaranthus polygonum, Linn.

CHULCHILHERA, a lichen of the Himalaya, the Borrera aashne, Royce; with ammonium it gives a reddish-brown colouring matter, and is used accordingly as a dye-stuff. Dr. O'Shaunnessy examined this and several other Indian lichens, but without success in the production of any valuable colour. It means, in the Panjab, a mixture of lichens employed for dyeing, contains Parmelia Kauntschadalis, Parmelia perlata and its variety sorediata, Usnea florida, Ramalina calicaris, and fragments of Physcia lencemula.—O'Shaunnessy, p. 672.

CHUL, a whirlpool. In the stream of the Cham-
bul near Beroli, the whirlpools and eddies have given a sacred character to it, like the Nerbadda, at the whirlpools of the great god Chuli Maheswar. A multitude of round stones are found in these vortices, where they have been rounded by attrition into a perfectly oblong form, are consecrated, and smeared with red lead, and are then called Bhyrn, the god of war, the eldest son of Siva. The round stones of the Nerbadda whirlpools are called Ban-Lang, or whirlpool lingam, and Rori at the temple of Beroli. See Binlang.—Tod's Travels.

CHULL. HIND. Prunus Armeniaca, also Prunus padus and Villarisa Indica.
CHULI.

CHULI, a Malomadan of Malabar; amongst the Malays, any native of S. India. The Chullia and Kling comprehend the traders and settlers, both Malomedans and Hindus, from the Coromandel coast. These names have been given to them by the Malays from the earliest times of the ancient commercial intercourse subsisting between this part of Asia and India. Kling is from Kalinga, or is a corruption from Teleng or Telenga; Chulhia may be derived from the ancient Chola Kingdom of the Peninsula.—Newbold’s British Settlements, i. p. 8.

CHULIA, also Chur. Hind. Syzyphus taitensis, Latham; the lesser florikin.

CHULU. Hind. Of Himalaya, Armeniacae vulgaris, Lam.: the apricot.

CHUM. Hind. Euphorbia Royleana; also Morus serrata; also Ficus xanthoxylloides.

CHUMANG, a low or out-caste race in the non-Bhot district of Kunwar, with dark skins. The people of the lower hills call them Koli, and the Rampur people, Channil. They till the soil and weave.

CHUMAYAN, a Gujar clan occupying twelve villages in Paniput Bangur.—Elliot.

CHUMBA. Hind. Artemisia saerorum.

CHUMBA-GUDEE, a race in the Chumba hills, in the Himalaya. They say they are Rajputs, and of the Guđee-jat. They are somewhat short, but strong, and cleanly in their habits. They are sharp, and able to impose on their less knowing neighbours. Most of the witch-finders are of the Chumba-gudee race; and the race may always be known by their peculiar conical caps, with huppies to turn down over their ears, like an English travelling cap. When Europeans made their first appearance in the Kangra valley, these men had very slight notions of caste, and would eat or drink anything the Europeans gave them, but since their contact with the natives of the plains they have become as bigoted as any Hindu.

CHUMBARA. Mah. Premna tomentosa.

CHUMBELI. Hind. Jasminum grandiflorum.

CHUMBI SAG. Hind. Amaranthus polygamus.

CHUMBRANUK, a single valve of the mussel shell without the mollusc, used in Ajmir as an aphrodisiac.—Gen. Med. Top. p. 132.

CHUMBUL, a tributary to the Jumna. It rises in Malwa in lat. 22° 26', and long. 75° 45', or 9 or 9 miles S.W. from Mhow, which is 2019 feet above the sea. It rises on the cluster called Janapaya. It runs north 105 miles, N.W. 6 miles, S.E. 10 miles, N.E. 23 miles, S.W. 25 miles, north to junction with Kalce Sind, N.E. 145 miles, S.E. 78 miles to Jumna; length, 570 miles; described in a form nearly semicircular, the diameter being only 30 miles. It receives the Chumbula, 70; Sirdar, 120; Parbatii, 229; Kalce Sind, 225; Bharda, 329; Chota Kalce Sind, 104 miles. About 50,000 square miles drained. The average declivity of its bed, 2 feet 5 inches per mile. Its average volume of water is so considerable, that at its junction it has been known to raise the united stream 7 or 8 feet in twelve hours. The nominal source of the Chumbul is in a part of the Vindhya range, 9 miles S.W. of Mhow; but this part of the river is dry in the hot season, during which it owes its waters to other tributary streams. The current is in most parts gentle, its bed rocky, and its course through Malwa much obstructed by shallows; but, after entering Harrowtee by an opening in the Mokundra range, it becomes a fine and deep stream. The course of the Chumbul, not reckoning the minor sinuosities, is upwards of 500 miles; and along its banks nearly every race now existing in N.W. India may be found.—Sondhi, Chunderawat, Sesodia, Hara, Gore, Jaddun, Sikeredal, Goorj, Jat, Tuar, Chohan, Bhadora, Kutchwaha, Sengar, Boondela, each in associations of various magnitudes, from the substantive state to the little republic communes between the Chumbul and Cohari. The Chumbul runs through the territories of Sindia and Holkar, viz. Gwalior and Indore, and passes near Kotnh.—Tod’s Rajastan, i. p. 16; Rep. Royal Com.

CHUM GADHAL. Hind. One of the Chirioptera, the flying-fox, species of Pteropus.

CHUMIAH, a race to the north and east of Chittagong, dwelling in the lower hills between the Kuki and the plains. The Chumiahs and the Kuki are described as having flat noses, small eyes, and broad round faces, and to differ from the Naga race both in appearance and customs.

CHUMIARI. Pam. Cerasus puddum.

CHUMKI. Hind. Coloured and striped satins, red, white and red, and blue and red, value 1 rupee to 24 rupees the yard.

CHUMLA, a valley near the Bumair or Bumoo country in Afghanistan. The valley and the central plain of the Yusufzai are commanded by hills that descend from the Hindu Kush.

CHUMPA, properly Champi or Champaka, the Michelia champaca, Linn. The flower of the champa is one of the few with which Kama, the Hindu god of love, tips the arrows he uses.

CHUMPADA, Malay. The small jack-fruit.

CHUMPA NUTIA. Beng. Amaranthus polygamus.

CHUMPARUN, a town in the Patna division of Bengal.

CHUMPOUTE, the berry of a small plant, brought to Ajmir via Pali, used in perfumes and also in medicine; one seer is sold for one rupee.—Gen. Med. Top. p. 131.

CHUMWA, a tribe in Assam, exempt from manual labour.—Wilson.

CHUNA. Beng. Also Chuna-batoola and Chunai Butkale, Cicer arietinum, Linn. It is the Bengal gram of Europeans in India. Through the Italian ece and the French chicher comes its English name ‘chick-pea.’ The term ‘arietinum’ is derived from the resemblance of the seed to a ram’s head. The word ‘used by Europeans in India is gram, or Bengal gram, of which the origin has been much disputed, but is supposed to be from grana.—Elliot.

CHUNAM. ANGLO-TAM.

Channa; Chunnam, HIND. | Sunam; Choomnoo, TEL. Chumambu. . . . TAM.

Chuna or Chumna is a term applied to quicklime made from nodular limestone, from limestone rock, from marble, or from calcined shells; also applied to plaster and mortar. The chunam plaster of Madras, long famed for its marble-like polish, is prepared either from shells or limestone. The shells generally used at Madras are both recent and fossil, but the latter, of recent species, are found in extensive beds a few feet below the surface, on the banks of the Pulicat lake and other low marshy places on the seacoast, which are covered by the sea at high water.
The shells are calcined with charcoal, one parah of charcoal being allowed to every two parahs of chunam. The kilns generally used are calculated to hold altogether 60 parahs, that is, 40 of shells and 20 of charcoal. A small arch, 1 foot 3 inches in height, the same in breadth, and raised 5 feet above the surface of the ground, runs longitudinally through the kiln; the top of this arch is a grating of brick on edge, which is partially covered with broken tiles, so that neither the shells nor charcoal can drop through them, but small apertures are left for the escape of the ashes and for the necessary circulation of air. Over this bed of charcoal, the kiln is placed throughout, about 3 inches in thickness, and fire applied. When sufficiently kindled, the mixed shells and charcoal are laid in small heaps of not more than ¼ of a parah each at about 1 foot 6 inches apart, and when the fire has been communicated to them, the intermediate spaces must be filled up with more shells and charcoal to a level; and when the fire has thoroughly extended to them also, another row is to be laid in a heap upon this mass, as was done in the first instance; and in the subsequent operations are to be repeated in the same manner until the kiln is filled. The transverse arches are to promote the requisite current of air, and the windward ones are invariably to be kept open, whilst those on the opposite side must be closed. The kilns used at Madras are built of brick or clay, and require renewal every three years. The shells will be sufficiently calcined in 12 hours, and 24 more are required to cool them, so as to admit of their being moved and the charcoal sifted from them. It is found that chunam thus prepared and slaked to a powder is increased to double its original bulk when in the form of shells.

For plastering with chunam at Madras, if for one coat, the plaster is composed of one part of chunam and one and a half of river sand, thoroughly mixed and well beaten up with water. This operation is usually performed by women, who stand round a small stone trough prepared for the purpose, into which the ingredients are thrown and gradually moistened with water, as the process of mixing proceeds. The women use wooden pestles about like a rice-pounder. The plaster, when mixed, is taken out of the troughs and made into conical heaps, where it remains till required, and may be kept without injury for several months; but when left, for any time, a small cistern or hollow is made at the top of the heap, into which water is occasionally poured. Before applying the plaster, the wall is trimmed with a trowel and swept perfectly clean, and then slightly sprinkled with water. The wall being ready, the plaster is put into small wooden boxes at convenient places among the bricklayers, by whom it is mixed up with jagari water, ¾ lb. of jagari or coarse sugar being allowed to every parah of quicklime, until it is brought to the required consistency; it is then laid on with a trowel above half an inch thick, and levelled with a flat wooden rule, being afterwards smoothed with a wooden roller till it acquires an even surface. During the process of rubbing, the plaster is occasionally sprinkled with a little pure white lime mixed with water, to give it a hard surface. If for two coats of chunam, the first coat is applied as already described, with the exception that the surface is left rough, and no pure lime is applied during the process of rubbing. A day or two after the first coat is applied, and while moist, the second is laid on. The plaster used for the second coat consists of three parts of lime and one of white sand. These are mixed as before, and afterwards ground by women on a flat stone with a small stone roller, till they are reduced to a fine paste. This is laid on a wooden roller, and applied with care over the first coat about ¼ of an inch thick. It is then rubbed down perfectly smooth with a small trowel, and afterwardspolished with a crystal or smooth stone rubbing, and, as soon as it has acquired a fine polish, a little very fine charcoal (Bullaram) powder is sprinkled on it to increase the whiteness and polish, and the polishing continued. The second coat ought to be applied and finished in one day, for it usually hardens too much during the night to be polished the following day, except in damp weather. The practice is to continue polishing the plaster until it is quite dry, and a number of bricklayers are employed, in order that it may be well polished the first day. Moisture continues to exude from the plaster for some days after it is completed; this must be carefully wiped off with a soft cloth, and the wall kept perfectly dry till the moisture entirely ceases. For three coats of chunam, the first coat is as above, but it is left a fortnight or three weeks to dry before the second coat is applied. The plaster for the second coat consists of one part of lime and one of river sand, freed from the coarser particles and clay by sifting. It is well mixed and beaten up in a clean trough, and applied over the first coat about ½ of an inch in thickness, the first being previously moistened with a little water. It is next rubbed down in the same manner as the first coat, but acquires a much smoother surface, the plaster being of a finer quality. A day or two afterwards, when it has had time to dry, the third coat is applied. It consists of four parts of lime and one of fine white sand. These, after being well mixed, are reduced by grinding to a very fine paste, quite free from grittiness. This is put into a large earthen jar, of the size nearly of half a hogheads, and mixed with the white of eggs, sour milk (tyre), and ghi, in the proportion of 12 eggs, ^1_2 measures of tyre, and ^1_2 lb. of ghi to every parah of plaster. These are all thoroughly mixed, and rubbed between the hands till the ingredients are thoroughly incorporated, and the composition reduced to a uniform consistent paste a little thicker than cream, and perfectly free from grittiness. The plaster is now fit for use, and is put on with a wooden rubber about ½ of an inch thick, and gently rubbed till it becomes perfectly smooth. Immediately after this, another coat of still finer plaster is applied, consisting of pure lime ground to a very fine powder, and afterwards mixed with water in a clean tub, till it is of the consistency of cream. This is put on about ½ of an inch thick with a brush, and rubbed gently with a small trowel till it acquires a slight degree of hardness. It is then rubbed with a rock-crystal or stone roller till a beautiful polish is produced, not forgetting to sprinkle the wall with fine white sand (Bullaram) powder during the process of polishing. If the plaster is not entirely dry on the second morning, the operation of polishing ought to be continued until it is quite dry. The moisture, as above directed, must
be carefully wiped off, and the wall kept quite dry till all appearance of moisture cease. The result of the process depends chiefly on the plaster for the upper coat being reduced to a very fine paste perfectly free from grittiness, and on its being, after it is applied to the wall, rubbed constantly with great care till it is quite dry and has acquired a very fine polish. The wall ought then to be frequently wiped with a fine clean cloth to remove the moisture, and it may be occasionally dusted with Ballapum powder. The stone used in polishing it is rock-crystal or a white quartz pebble about 3 inches long and 1½ broad, the face of which has a very fine polish. The wall is rubbed with this for one or two days, the moisture being carefully wiped off every morning, and potstone (Ballapum) powder sprinkled on it several times during the day. When the lime is prepared from sea-shells, these are first cleaned and washed, and then calcined with charcoal, care being taken to exclude everything likely to injure the whiteness of the lime; very white sand only is employed, as common sand destroys the brilliancy of the plaster. When white sand is not procurable, white rock-crystal or quartz pebbles reduced to a fine powder may be substituted. Mortar for building consists of one part of chunam and two of sand. Immediately before being used, the mortar is mixed with jagari water, 1 lb. of jagari being allowed to every yarah of lime. It is used in a much more fluid state than is the practice in Europe. When shell-lime is used in situations requiring a hydraulic cement, it should be mixed with burnt clay in powder; fresh burnt tiles more or less broken are in general conveniently procured. In building the pier at Masulipatam, Captain Buckle employed a cement consisting of one part of lime, one of the tile dust, and two of sharp river sand, and it appeared to answer well. Jagari was used in the usual proportion of one pound to a parah of chunam. Limestone abounds in most districts of Southern Asia, but the qualities of the different varieties are best ascertained by experiment. When found in large blocks of very compact stone, the breaking of it forms a considerable item in the expense. Such stone as yields a very hydraulic lime is not suited to the purposes of ordinary building, unless the precaution is taken of keeping the work constantly wet. The best form of kiln for burning stone with charcoal is given by Captain Smith in his translation of Vicat, plate 1, fig. 11 and 12. When wood is used, the spheroidal form of kiln is recommended. It will be found to facilitate the expulsion of carbon, if the stone is well moistened in water previous to placing it in the kiln. It should be remarked that nothing but clean sand should be added to the hydraulic limes; such sand should be used immediately after being slack. When used in situations requiring hydraulic cement, no more water should be used in slaking it than is sufficient to reduce it to a fine dry powder. Magnesian limes have been found at Salem and in the Tanjore district, where it was used with success by Captain Cotton in forming the anicuts; the cement formed with it was stronger than that formed with other lime. It should not be immersed immediately on being used. Much controversy has occurred in regard to the advisability of using the lime while hot; the generally received opinion is that it should be so used; but in regard to the pure limes, free from clay and iron, that is, without hydraulic properties, this course is questionable. It was not permitted in Rome; and lime mortar kept moist has been found suitable for building after the lapse of several hundred years; lime used hot is seldom thoroughly slackled. A common practice in India is to mix the slaked lime and sand, form it into heaps, on the summit of which is formed a hollow, which is kept constantly filled with water. Shell-lime, so kept and subjected to the usual beating when used, seemed to Mr. Rohde at least as good as when at first burned; hydraulic limes, including of course all which become hard under water, ought no doubt to be used hot. At Terrane, and other coral islands, coral is largely burned into lime for mortar.—Rohde, MSS.

CHUNAR or Chunar, an ancient rock fortress in the Mirzapur district in the valley of the Ganges. It is perched on the crest of a limestone spur that rises to the height of 150 feet abruptly from the edge of the stream, on the right or south bank. It fell to the British in 1764. The treaty of Chunar between the subadar of Oudh and Warren Hastings was signed on the 19th September 1781. In the fortress is a state prison in which Tribunkji Danglia pined away his last days, hopeless of ever being able to give a second slip to his enemies.—It is 17 miles W. of Benares, and 490 miles from Calcutta. —Trac. of Hind. i. p. 132.

CHUNAR. Hind. The Platus orientalis. Char-Chunar lake, the Shalimar garden, was one of the great works of Jahangir.—Baron Angle.

CHUNARI, also Chunari. Hind. Lime-burners, or workers in lime, as plasterers.

CHUN-CHU. Chln. Allanthus ketica and A. glandulosa; but also Cecrela odontanta and species of Dryandra and Fraxinus, Smith.

CHUND, a Hindu poet and religious reformer, but now known only in the former character. He lived in the time of Prithi-raja, the last Hindu king of Dehl. He was a monotheist, and, after having separately invited the three persons of the Hindu triad, says that he believes them distinct, 'hell will be his portion.' His work is a general history of the period in which he wrote. It consists of 69 books, comprising 100,000 stanzas, relating to the exploits of Prithi-raja; and every noble family of Rajasthan finds in it some record of their ancestors. It is accordingly treasured amongst the archives of each race having any pretensions to the name of Rajput. From this he can trace his martial forefathers, who 'drank of the wave of battle' in the passes of Kirman, when 'the cloud of war rolled from Himachal' to the plains of Hindustan. The wars of Prithi-raja, hisances, his numerous and powerful tributaries, their abodes and pedigrees, make the works of Chund invaluable as historic and geographical memoranda, besides being treasures in mythology, manners, and the annals of the mind. They are entirely heroic; each book a relation of one of the exploits of Prithi-raja.—Todd's Rajasthan, i. p. 98, ii. p. 254.

CHUNDA. Maleal. Solanium Jaccquinii.

CHUNDA GUDDA. Tel. Tacea pinatitida, L.

CHUNDAO, Chundul, or Chundal. Hind. Antiaris saccul dorma.

CHUNDA SAHIB, a Mahomedan ruler with whom the French sided in their efforts to establish
themselves in the south of India. In the beginning of the 18th century, Saadut Allah was ruler of the centre of the Karnatic, from 1710 to 1732, and was succeeded by his nephew, Ali Dost. Ali Dost was killed in battle against the Maharrattas, and was succeeded by his son, Safdar Ali. Of his two daughters, one married Chunda Sahib. Chunda Sahib was seized on Trichinopoly in 1736, but the place was besieged and taken by the Maharrattas, and Chunda Sahib was made captive, and lingered eight years in prison at Tanjore, where he was murdered by the raja. Safdar Ali was assassinated by his brother-in-law, Martuzza Ali, leaving a minor son; but this youth also was assassinated while Anwar-ud-Din was his guardian, and Anwar-ud-Din succeeded to the throne as nawab of the Karnatic, but fell at the battle of Ambur, and is buried in the Jamma mosque of Hyderabad.

CHUNDEE-MANDAPA. SANSK. From Chundee, the goddess Chundee, and Mandapa, a house. This is a kind of temple, with a flat roof. It is often erected by rich Hindus adjoining to their houses, and is designed for the image of Durga or Kali. It is built on four sides, with an area in the middle.—*War'd's Hindus*, ii. p. 3.

CHUNDEKIA or Soondekia. TAM. Solanum pubescens.

CHUNDEL, a tribe of Rajputs scattered in various parts of the N.W. Provinces, who came from Mahoba in Bundelkhand. Before the Mahomedan conquest, Mahoba appears to have been the capital of a principality that extended to the Narhadda, and included the province of Chundari, which is called after their name. They are styled Sambans, but they are not considered to be of pure descent, and their sons are carefully excluded from marriages with the higher castes. This tribe expelled the Baland tribe from Ajori, Burhur, and Mirzapur.—*Elliot*.

CHUNDELI, a very fine cotton fabric of India, so costly as to be used only in native courts. It is made from Berar or Amroati cotton. The chief care is bestowed on the preparation of the thread, which, when of very fine quality, sells for its weight in silver. The weavers work in a dark, underground room, the walls of which are kept purposely damp to prevent dust from flying about. Amroati cotton is alone used.—*Elliot*.

CHUNDER KOOP, three hills in Las, of extremely light-coloured earth, which rise abruptly from the plain. The largest is 400 feet high, another about 200 feet, and the third is a broken cone. The last encloses a basin of liquid mud about 250 yards in circumference, in which the mud heaves and bubbles up continuously. They are called the basins of Raja Ram Chunder. The Koops are said to be altogether 18 in number, viz. seven in the neighbourhood of Kattyawara, and eleven between Kej and Gwadd in Meikran.

CHUNDIGAR. GUJ. A bracelet maker; one who makes armlets of glass or ivory for married women.

CHUNDOO. HIND. Fried mince-meat.

CHUNDOO. HIND. A hanging lamp, made of bamboo framework covered with mica.

CHUNDOO LALI, a Khatri, who succeeded Mir Alam as Poshikar-i-Diwani, of the Hyderabad state. He was unsuccessful as a financier.

CHUNDRA, Soma, and Indu are epithets for the moon.

CHUNDRA or Chundraka. BENG. Ophioxyylon serpentinum.

CHUNDRAGHERRI, a town and fortress 11 miles W.S.W. of the Hindu temple of Tripati, which seems to have been founded about A.D. 1490, by Narisingha, a raja of Vijayanagar of the Vaishnava sect. It was occupied as a seat of Government in 1570 by a successor, Timma raja, but in 1644 the ruling sovereign, Sri Ranga Rayel, who in 1640 had granted the site of Madras to the English, was driven from his throne by the Bijapur army, and in 1646 took refuge with a former feudatory at Bedore, and with him the last of the Vijayanagar dynasty disappeared.

CHUNDEE. HIND. A printed fabric of silk or cotton, made in Kutch, Kattyawar, and Gujarat. The design is stamped on the cloth, and is caught up and tied with a continuous thread, and the piece of cloth is then dyed with the wished-for colour.

CHUNDROO. HIND. Copal resin. Fine shavings of it are used to stop hemoptysis, made up into a medicine called "Khairwa." It is much used in varnishes.—*Gen. Med. Top.* p. 132.

CHUNDUN, Chundan, or Chandana, also Ghundasa, DUKH. Sandal-wood. Safed chandan is sandal-wood. Lal-chandan is the red sanders wood, Cesalia pippaan.

CHUNDUN HAR. HIND. A necklace, neck ornament.

CHUNDUS, a scented wood used for the mala or chaplets of Hindus.—*Tod's Rajastan*.

CHUNDWASSA. Close to this place are the Buddhist caves of Dumnar, with a Hindu temple behind. About 40 miles from Nemuch.

CHUNE, MALEAL. Cathartocarpus fistula.

CHUNERIA. HIND. An embroidered net fabric.

CHUNG. HIND. Hordeum hexastichum, also Pyrus malus; in Pangli and Chenab, Bouceria edulis, also Salix alba, white willow.

CHUNG, a border race between Nepal and Sikkim. They are also called Limbu, Chunge or Lhamu, being the name given to them by the Lepcha. They are a Hardy, hard-working tribe. They cultivate grain, and rear cows, pigs, and poultry. Their huts are made of split bamboo, and thatched with the leaves of the wild ginger and cardamom, guyed down with rattans. They drink to excess.—*Latham*.

CHUNGAR, a wandering houseless race in the Panjeb, probably the same as the Chinganeh of Turkey, the Italian Zingaro, the Spanish Gitano, and the English Gipsy. About Dehli the race is called Kunjar,—a word which, in the Panjeb, properly implies a courier or dancing girl.

CHUNGHA, also Chun. HIND. Euphorbia Royleana.

CHUNGI. HIND. Boucercia acheri.

CHUNGI. HIND. A tax gathered daily from grain merchants, being as much grain as a man can grind in a day.

CHUNG-PER-LAH. CHIN. Wax insect.

CHUNGSAKHAGO. a pass in Kunawar leading from Chekkia to Neilung, on the Jankee or
Jannabee branch of the Ganges. It is a lofty pass, probably not under 18,000 feet.

CHUNG-TSEW. CHIN. The Chinese festival of middle autumn.

CHUNI-BADLI. HIND. A scarf of gold muslin.

CHUNNA, Bengal horse grain, Cicer arietinum.

CHUNNI-MARAM. TAM. Acalypha betulina.

CHUNNI-SAFAD. HIND. Abrus precatorius seeds.

CHUNSER. HIND. Cress, garden cress; Lepidium cress.

CHUN-SHAW-CAP. CHIN. Manis Javanica.

CHUN-SHEAUMA, a tribe of Chanderbansi Rajput in Junpar, Azimgurh, and Gorakhpur.—Elloit.

CHUPAO. PERS. A foray; a charge of cavalry.

CHUPATHI or Chaptapi. HIND. An unleavened wheat cake. Chaptapi-ki bhaji, Mar-siles quadrifolia.

CHUEIN. HIND. Potamogeton gramineus.

CHURPA, the chief civil station of Sarun. It is on the left bank of the Ganges, in lat. 25° 45' N., and long. 84° 48' E., 90 miles above Patna, and 370 miles from Calcutta.

CHUPRI ALU. HIND. Dioscorea globosa; properly Safri-alu. — Roxb.

CHUPITA-LAC or Chaptla-lac. HIND. Shell-lac.

CHUR. HIND. Of Khishengung, Quercus illex.

CHUR, in the Punjab, the sweeper caste, many of whom have become followers of Nanak, and are commonly called Rungrethia Sikh or Maahabi Sikhs. See Churn.

CHUR. HIND. BENG. Properly Chor. The shifting alluvial deposits of a great river so called in Bengal.—Yule's Embassy, p. 26.

CHUR, one of the spars of the Himalaya, 12,500 feet in height, composed chiefly of mica schist and clay-slate, with intrusive dykes or seams of granite. Boulders of the same rock are abundant in the valleys. The summit of the mountain is composed entirely of granite.—Adams.

CHUR or Churi. HIND. A crest, a top-knot, a tuft of hair.

CHUR. BALECH. A small defile.

CHUR; Churi. HIND. A knife, a dagger.

CHUR, of the Panjab, are serfs. They are the direct descendants of the Churua or military out-castes of the Mahabharata.—W. W. Hunter.

CHUR, a tributary state in Gujerat, with a population of 13,793 souls.

CHUR, a caste of sweepers; one of the Ghair Mulzim castes in a village.

CHURA. BENG. Xyris indica, Linn.

CHURA. HIND. Commelina Bengalensis; also Angelica glauca.

CHURA and Tirah are fertile and well-peopled valleys, enjoying a cool climate; and it was not unusual for the Peshawar sirdars and others, who had an understanding with the inhabitants, to pass the warm weather in the former of these places, which also frequently became a place of refuge to the distressed. At Chura resided Khan Bahadur Khan, Afridi, who attained immense influence amongst his tribe from the circumstance of his attendance at court during the sway of the Sadozai. Shah Shuja married one of his daughters, too, and on more than one occasion found an asylum with him.

CHURAL. HIND. Lathyrus sativus.

CHURANG or Chor Gang, the founder of the Gangavansa dynasty of Orissa. His name is also written Saranga-deva. He invaded Orissa in A.D. 1131, and his dynasty ended with raja Narasingdeo, who in 1217 built Kanarack, the Black Pagoda. Churang was a benefactor to Jaga-nath, adored it, and peopled its neighbourhood.

CHURAY-KAL. TAM. Cucurbita lageneria.

CHUR-CHE, of early European travellers, are the Yu-iche or Nu-iche of the Chinese, the ancestors of the modern Manchus.

CHURGHI, the female; Churghela or Churghlo, the male bird. Hunting hawks, natives of Cutch, are considered, fastened on the antelope, and also kills the 'tuber,' a kind of florekin.

CHURI. DUKH. A bird; hence Khan-churi, a house-sparrow. Churi-mar, a bird-catcher.

CHURI. HIND. Bracelets of glass, or lac, or metal. Chur, Chura, or Churi, the bracelet put on a newly-married bride, which she wears till widowhood. Churgar, ivory bracelet maker.

CHURIAL. HIND. Aralia Cachemichria.

CHURI KI BHAJ. DUKH. Anuramus campestris, Linn. Churi-sarooh, Artemisia scoparius; also Asparagus Punjabensis and A. elegans.

CHUKKA or Charkha. HIND. A cotton-cleaning jin. It is worked by two people. Two men working day and night can clean about 160 lbs. each.

CHURMA. MALEAL. Phoenix dactylifera.

CHURO. SIND. An unleavened cake of wheat flour made into dough with clarified butter, and mixed with brown sugar; supposed, in Sind, to increase the delicacy of the skin.—Burton's Scinde.

CHURRA, a sanatorium on the N.E. frontier of India. The mean temperature at 4000 feet is about 66° or 16° below that of Calcutta; which, allowing for 24° of northings, gives 1° of temperature to every 290 to 300 feet of ascent. In summer the thermometer often rises to 88° and 90°; and in the winter, owing to the intense radiation, hoarfrost is frequent.—Hooker, Hist. Jour. ii. p. 284.

CHURWA. HIND. Bruised rice.

CHUSAN ARCHIPELAGO, including the Kwseshan group, is a large assemblage of islands near the mainland of China, between lat. 29° 20' and 41° N. The Kwseshan group consists of 11 islands. Chusan island is 42½ miles in circumference, and the walled city of Ting-hae on the S. side of the island is upwards of one mile in circumference. The Chusan northern group consists of numerous islands, mostly barren or rocky. Chusan, the largest island, is the station of a sub-prefect, and, with the smaller neighbouring islands, forms a district called Ting-hae, the name by which it is always spoken of by the mandarins among themselves, and which it bears in all the works published by imperial authority.—Horsb.: Meadows's Deportive Notes, p. 89; Murray's Indian Archipelago, p. 150.

CHUSBAL. HIND. Potamogoton crispus.

CHUSHM-I-MAIDAI. PERS. The cat's eye gem.

CHUSHUL, a place in Ladak where is a hot spring of a temperature of 96°. The waters are without taste or smell, but are said to have medicinal properties.

CHUSSAE. HIND. Arango, GUI. Large rough carnelian beads of various sizes and shapes, made in Cambay, and formerly extensively used in the African slave-trade.—Faulkner.
CHUTIA, the dominant race in Upper Assam when the Ahom race from the south swarmed into the valley. The Chutia kingdom was overthrown by the Ahom chief Chutupha about A.D. 1350, and great numbers of the Chutia were deported and forced to settle in other parts of Assam, as in Chutia of the Durrung district; and still a great many of the Sadya and Upper Assam population are Chutias. The Bihlya are of the same family, and, as a tribe of Lalong in Upper Assam, claim to be of Chutia descent. The Chutias, long before the appearance of the Ahom, had adopted Hindu customs. They are of a light olive complexion, but with a flatness of face and a want of sharpness in the features. The Deori Chutia are an isolated colony on the river Dihing in Luckimpur. Their language contains words used by the Garo and Bodo, but their origin is unknown. They profess Hinduism, but are considered to be a low caste.

- Dalton’s Ethn. of Bengal, p. 78.

CHUTIAL. Hind. Rheum emodi.

CHUTIALLI, a plain in Cutch Gandava.

CHUTIA NAGPUR, or Chota Nagpur, is a province in Bengal and the Central Provinces, lying between lat. 21° 15’ 30’ and 24° 48’ N., and long. 88° 22’ and 87° 15’ E., with an area of 43,301 square miles, and a population in 1872 of 8,825,571 souls, two-thirds of them professing Hinduism, and upwards of a million following aboriginal faiths. The Kolarian and Dravidian aboriginal tribes number 230,034, the semi-Hinduized aborigines 101,849, and Hindus 71,749. Chutia Nagpur is on the eastern part of the extensive plateau of Central India, on which the Koel, the Suburanga, the Damuda, and other rivers have their sources. It extends into Sirgajur, and forms what is called the Upar-ghat or Highland of Jashpur; and it is connected by a continuous chain of hills with the Vindhyas and Kymor ranges, from which flow affluent streams of the Ganges, and with the highlands of Amarkantak, on which are the sources of the Nerbudda. The plateau is, on the average, about 3000 feet above the level of the sea, with an area of about 7000 square miles. It is on all sides difficult of access; it is a well wooded, undulating country, diversified by ranges of hills, and it has a genial climate. The non-Aryan tribes had fallen back to that refuge from the plains, more than half of them, however, being of the race known to Europeans as Kol; the other races in Chutia Nagpur and its adjoining tracts are the Larka Kol, Ho, Bhumi, Mundah, and Santal. The Kol in former times possessed the whole of Chutia Nagpur, which may now be said to be divided between them and the Dhangar or Oraon, who came from Rotaftur. The chief men in most of the villages are still, however, of the old Mundah or Kol tribe, and they do not intermarry with the Dhangar or Oraon. The greater part of Singbhum is inhabited by Kol, and they are numerous in Bamanghonth; and dispersed to the vicinities of Cuttack (Kotak) and Maypura. They are in a confused mass of flat-topped hills called pattas, capped with a horizontal layer of trap. It is arranged, for revenue and administrative purposes, into the districts of Hazaribagh, Lohardaga, Singbhum, Manbhum, and the seven small tributary states designated the Chutia Nagpur mahals are Bonni, Chang Bahar, Gangpur, Jaspur, Korra, Sirgajur, and Udaipur. The chiefs are tributary. The races have a strong belief in witchcraft.

CHUTKA. Beng. Bauhinia acuminata. CHUTNSEE is a warm condiment used in every family of India, either prepared fresh daily from ripe vegetables, or preserved. The following is a recipe for the Dehlí or celestial chutnee:

Take of green mangoes, raisins, mustard-seed, salt, green sugar, and garlic, each one seer; onions (one or) half a seer; dried red chillies, half to one seer; moist or soft sugar, one to two seers; white wine vinegar, four bottles. The ginger, garlic, and onions are to be peeled, and, together with the chillies, are to be cut into thin slices previously to being pounded; the mustard-seed to be washed and dried, then gently bruised and winnowed, the raisins to be washed and freed from the stones; the sugar to be made into a thick syrup; the mangoes to be picked of their rinds, cut into thin slices (some boil them in three bottles of the vinegar, adding the fourth when mixing them up with the other ingredients) and pounded; the remaining articles are to be separately pounded, and then the whole is to be incorporated, put into a stone jar, well closed, and placed in the sun for a month or two. If put into a glass bottle, it should occasionally be put out in the sun. It will keep good for years.

Love-apple Chutnee. Take the love-apple (Solanum aculeasicum, Linn.), a large plateful, the rinds and seed to be rejected, and only the pulp used; dried salt fish cut very fine (as if rasped), a piece about two inches square; six onions cut into thin longitudinal slices; eighteen green chilies chopped fine; dried tamarind, two pice weight (or one ounce), mashed up in about three or four ounces of water (stones and fibres to be rejected); salt, a teaspoonful; ghi or butter, five pice weight (or two ounces and a half). First put the ghi into a tinned copper vessel placed on the fire; when it is melted, add the onions; and as the latter begin to assume a reddish hue, add the chillies, stirring them well for five minutes. Then add the salt fish, and continue stirring the whole; when the ghi has nearly evaporated, add the love-apple, and stir it about for a good while. I wash the tamarind water and salt, and mix the composition well until it acquires a pretty dry consistence (like that of brinjal chutnee or sambhal). This chutnee is only for immediate use, and will not keep above a day or two.

CHUTOOR - ANANA. Sansk. Four-faced; from Chutoor, four, and Anana, a face.

CHUTSALEE. Tibet. Coarse borax from Ruthog. Chiuwa Sirsa, first-class barilla or sajji.

CHUTSAO. Chin. Ganjah.

CHUTTUR. BENG. Laidies cleared for salt-making: a salt field.

CHUYAR, a hill tribe in the range bordering Bengal on the west, in Ramgurh and the neighbouring districts.—Wilson.

CHU-YUL. Chin. Yam.

CHYAVANA; in Hindu mythology, is the son of Bhuma, the son of Brama, by his wife Paloma. A Bakshis, or friend, attempting to carry off Paloma, the child was prematurely born; whence his name, from Chya, to fall from. Upon his birth, his splendour was such as to reduce the insulter of his mother to ashes. Having adopted a life of asectic devotion, he was so immersed in...
abstraction, that he became completely covered with the nests of white ants. Sukanya, daughter of king Sarhati, wandering in the forest, observed what she thought two lights in an anthill, and thrust in two blades of kusa grass, which, when withdrawn, were followed by a flood of blood. Much alarmed, the princess repaired to her father and related what had happened. The king, conjecturing the truth, immediately went to the spot to depurate the wrath of the rishi, and pacified him by giving him the damsel in marriage. After being married some time, the Aswini Kumara, passing by Chyavana’s residence, conferred upon him youth and beauty, in requital of which boon he gave them a share in the soma juice offered at sacrifices to the gods. The gods, with Indra at their head, opposed this grant, and Indra lifted up his hand to strike Chyavana dead with his thunderbolt, when the sage paralyzed his arm. To appeal the gods, he created the demon Asura into intoxication suspended in terror of venom and of the power of the saint, the gods acceded to the participation of the Aswini Kumara in divine honours. Indra was restored to the use of his arm, and Mada was divided and distributed amongst dice, women, and wine.—Bharavyat Purana and the Duma Dharma section of the Mahabharat, p. 263.

CHYCHIM. Egypt. Cassia abius.

CHYEBAASA. the chief station of Singbhum.

CIANDU or Xanadu, a place in China 150 miles beyond the Great Wall, and ten days’ journey from Pekin. It was called Che-min-fu, or by the Tartars Kai-min-fu. It was noticed by Marco Polo, as there stood that magnificent park and palace of the Tartar ruler of China, the great Kublai Khan, the description of which set Coeridge a-dreaming (ordreaming that he dreamt) that wonderful poem which tells how

‘In Xanadu did Kublai Khan
A spacious pleasure dome design’d;’

A later traveller mentions and how this lord passed the summer at a certain place which is called Sandu, situated towards the north, and the coolest habitation in the world.—Yule, Cathay, i. 134.

CICC DISTICHA. Liau.

Phyllanthus longifolius, R. Averrhoa acida, Liau. Harfanari, ... Hend. Chirim, Cherim, Malay. Nelli, ... Maedal. Cherbulia, ... Per. Rata nelli, ... SING. Arumelli, ... TML. Rachus uricr, ... Hend. Chelem. ... Hend. A small tree, leaves pinnate, from one to two feet long, scattered about the ends of the branches. Its flowers small, and of a reddish colour. It is commonly cultivated in the gardens of India, all over the Tenassarim Province, and is planted by the Burmese, who value its fruit highly. It bears some resemblance to a gooseberry both in appearance and taste, and yields a roundish subacid fruit about the size of a large marble. The fruit is largely used as an article of food, raw or cooked, or in pickles or preserves. Leaves are sudorific, and seeds cathartic. Wood inferior.—Roxb. iii. 672; Ainslie, 222; O’Sh. 551; Mason.

Kuratai, ... Hend. Valla ruga, ... TML. Charaita, ... Hend. Nellagidi, Golimidi, Tel. Chota charaita, ...

This plant is common in various parts of Southern India, as at the mouth of the Adyar river in the environs of Madras. The whole plant is bitter, and much used by the natives as a stomachic, being also somewhat laxative. It is used as one of the Chirretta plants.—O’Sh. p. 460; Ceghorn.

CICER ARETINUM. Liau. Chick-pen.

Kur, Humuz, ... Arab. Channa, ... Hend. Chunnai, But-kai, Hend. Cee, ... It. Chunnai, Batoola, ... Nakhud, ... Panj. Ku-lo-pai, ... BERM. Chola, ... Pers. Kadlay, ... TML. Cheunaka, ... Sansk. Harbarab, ... Gok. Garvanos, ... Scl. Homos, ... EGYPT. Sanaga, Sanagagol, Tel. Bengal gran, ... Eng. Cattana, ... Chenna, ... GUL. Hari-mandhakamu, ...

This valuable pulse is much prized in India, and in the more northern provinces of Hindustan, where it is common. The natives use it, parched and ground, mixed with wheat flour. Split with the hand-mill and steeped, it forms there the principal food of horses and all cattle. These, and barley roasted and ground, form a mixture called gattoo, given to horses. Each pod contains a single pea. Col. Sykes counted 176 seeds on one pod. When parched it tastes not unlike the roasted cashew nut, and is often used by the people of Northern India for food. Its composition per cent. is,—moisture, 10-80; starchy matter, 62-20; nitrogenous, 19-32; fatty or oily matter, 4-56; mineral constituents (ash), 3-12. It constitutes, after wheat, the chief food of the lower class in Spain. It is grown extensively by the Burmese, especially in Burma. The fresh plant has an acid reaction; and if clothes are placed in a field of it in the dewy morning, and then wrung out, they give an acid infusion.—Powell; Roxb.; O’Sh.; Ainslie; Mason. See Chuna.

CICHRORIUM INTIBUS. Liau. Chicory.

Shikorah, ... Arab. Khichorion, ... GR. Suchal-band, CHERNAB. Kasl (seeds), ... Hend. Ku-tasai, Ku-ku, ... CHIN. Ku-mai-tai, Pu, ... Hend. Hand-gui, ... KAGHAN, Chicory, ... ENG.

Two varieties of this are grown in many parts of India, from Cape Comorin to the Himalaya. Wild chicory vegetables luxuriantly during the summer in Kashmir, and in the Panjab during the cold season. It grows there up to 5500 feet, and in Lahoul up to 9500 feet; and the young plant is used as a vegetable. The seeds are used in medicine, and are consequently kept in the bazaars. Seeds of both varieties appear to be officinal, being considered carminative and cordial. The root also is used medicinally. The roots contain nitrate and sulphate of potash, mucilage, and some bitter extractive principle. An infusion of chicory mixed with syrup causes a thickening of the liquid. The root, Bch Kasni, Hend., is used as a tonic and demulcent in fever and dyspepsia, and is largely used to adulterate coffee in England. This and C. endivia are raised and eaten by the Chinese as pot herbs.—Honigerger, p. 25; J. L. Stewart, M.D., p. 408; Smith.

CICINDELIDE.A family of the Coleoptera. The genera common in India are Therates, Tricondyla, and Colliurus; the two former are characteristic of a southern range, while the latter is abundant throughout the eastern continent. The most splendid of the race abound in Nepal. Cicindela
heros and C. gloriae also occur, the latter of a rich velvety green colour.

CINCHONIA, a genus of birds of the order Grallatores. Ciconia alba, the white stork, occurs in Europe, Asia, North Africa; is migratory, and is common in India during the cold season in immense flocks in Lower Bengal. Ciconia nigra, or black stork of Europe, Asia, North Africa, is not uncommon in India.

CICUTA VIROSA. Boyle.

CIO of Spain, the Arabic term Sayyad, lord, by which all the descendants of Mahomed are styled. It was bestowed as an honorific distinction on a brave Christian knight, who opposed the Mahommedans in Spain.

CIDER or Cyder, the wine of the apple. It is made in Britain, on the continent of Europe, and in the United States. There was a manufacture of cider by the maharaja of Kashmir upon a large scale.—Paukner; McIolloch.

CIGARS.

Chutta, . . . HIND. Shrattu, . . . TAM. Robak, . . . MAlk. Tuutta, . . . TUR.

Cigars are made all over the south and east of Asia, but the most celebrated are those of Manilla, of Chinurah in Bengal, of the islands or Lumbu of the Godavery, of Trichinopoly, and of Disdiguil, in the peninsula of India.

CIMERI, Cimbr, or Camri, a Getic race, who entered Europe from Asia. Herodotus (Melponene, p. 190) says the Cimmerians, expelled by the Massagetae, migrated to the Crimea. Here were the Thyssagetae or western Getae; and thence both the Getae and Cimbri found their way to the Baltic. Rubruquis, the Jesuit traveller, describing the monuments of the Comani in the Dasht-i-Kipchak, whence these tribes came, says 'their monuments and circles of stones are like the Celtic or Druidical remains of Europe.'—Bell.

CINCHONA, a genus of plants of the order Cim節araceae, natives of South America. Joseph de Jussieu, in his history of Peru, relates that in 1600 a Jesuit, who had a fever at Malacotas, was cured by Peruvian bark. In 1638 the Countess Anna of Chinchon was suffering from tertian fever and ague at Lima, whither she had accompanied the viceroy, her husband. The corregidor of Loja, Don Juan Lopez de Canizarus, sent a parcel of powdered quinina bark to her physician, Jun de Vega, assuring him that it was a sovereign and infallible remedy for tertian. It was administered to the countess, who was 62 years of age, and effected a complete cure. This countess, returning with her husband to Spain in 1640, brought with her a quantity of the healing bark. Hence it was sometimes called 'countess bark,' and 'countess powder;' and Linnaeus, long after, named the whole genus of quinina-bearing trees, in her honour, Chinchona. By modern writers the first h has usually been dropped, and the word is now almost invariably spelled in that way, instead of the more etymological Chinchona. The Jesuits afterwards made great and effective use of it in their missionary expeditions, and it was a ludicrous result of their patronage, that its use should have been for a long time opposed by Protestants and favoured by Catholics. In 1679, Louis XIV. bought the secret of preparing quinquina from Sir Robert Talbot, an English doctor, for 2000 louis-d’or, a large pension, and a title. Under the Grand Monarch it was used at dessert, mingled with Spanish wine.

The British, in British India, Ceylon, and Burma, and the Dutch in Java, have successfully introduced several of the species,—at Neddiwat- tam, Pykara, Kalhatti, and Ootacamund, in many private plantations, also in Wynad, in the Baba- chooloo and hills of Baligum, family of chinchon in Ceylon; also at Darjiling, in the Downs of the N.W. Provinces, and in Sikhim; and the Travancore Government has likewise aided in their diffusion, by selling seed and seedlings; also in Burma it has been planted near Tounghoo, at Than-toung- glee in the Sitang division; likewise on the Khasya hills. The better known species are C. Boliviana, calisaya, condaminea, cordifolia, lancifolia, lucmeaeoflia, magnifolia, micrantha, nitida, oblongifolia, officinalis, ovata, Pahudiana, Peruviana, purpurea, succhurba, and scrobiculata.

The commercially valuable species are,— C. officinalis, var. a. condaminea, var. b. bonplandiana, var. p. crispa, crown bark; of Loxa region.

C. suaveolens, Par. red bark; west slopes of Chimbora.

C. Pitayensis, etc., C. lanceli, C. cordifolia, Columbian bark; Columbian region.

C. nitida, C. micrantha, C. Peruviana, grey barks; of Huancoo region in North Peru.

C. calisaya, yellow bark; in Bolivia and South Peru.

Cinchon a calisaya bark, of the best kinds, of South America, yields, on the average, 3.8 per cent. of quinine. That of the variety C. Josephiana, 3.2 per cent. One variety, grown in Java from seeds transmitted by Mr. Ledger, yields nearly 10 per cent. of quinine; but in Java and Ceylon 15 per cent. of quinine has been obtained, and from Ledgeriana plants grown on theNeillgheries, 11 per cent.; and it is recognised that the yield of the plants is the sole guide in planting.

The treatment of the trees, by barking, mowing, and shaving their bark, adds greatly to their yield; and since 1880, their quantity supplied to Britain and imported into British India was about 10,000 lbs., value about £4,000.

In Madras there have been the following gratifying comparisons between expenditure and revenue:—

Cinchon a barks imported into London from June 1879 to June 1880 amounted to 6,002,380 lbs. from Colombia, and 959,080 lbs. from all other parts of South America. India and Ceylon, 1,172,060 lbs.; Java (to Amsterdam), 70,088 lbs.; Jamaica, 21,140 lbs. In September 1882, at a sale of barks from the Madras Government plantations, the following table shows the prices realized as compared with those of the sale on 11th Jan.:—

In 1881, in Ceylon, almost all estates had trees planted along road-sides, or in the midst of the coffee, or in places where the coffee trees had died out; but in other estates almost the whole acreage had been planted with them, in regular rows between the limits of coffee. They are said to grow in the Yatiyantota district on the west slope, at about 50 feet; and at Kalutara, about 30 miles of Colombo, nearly at the sea-level. The number of cinchona plants growing in Ceylon at the beginning of 1881 was estimated in Ferguson's Handbook at from 50,000,000 to 100,000,000. C. succirubra was the most numerous, being reckoned at more than one half. The remainder consists of C. officinalis and C. calisaya, with such varieties as C. Ledgeriana and C. pubescens. The export from Ceylon of cinchona bark for the eleven years 1869 and 1871 to 1880, shows an increase from 28 oz., value Rs. 50, in 1869, to 1,161,989 lbs. in 1880, value Rs. 12,00,000:—

| Miscellaneous local receipts | 4,453 | 17,470 | 20,330 | 4,322,000 | 24,844 |
| Total | Rs. 1,10,427 | Rs. 35,875 | Rs. 4,00,353 | Rs. 34,385 | Rs. 4,322,000 | 24,844 |

In the year 1880-81 the cinchona factory at Darjiling disposed of 8600 lbs. of febrifuge; the plantation harvested a crop of 348,500 lbs. of bark. The earnings for the year amount to 80,290 rupees, representing a dividend of 8 per cent. on the capital of the plantation; exclusive of the saving which Government derive from substituting the febrifuge for quinine in public hospitals and dispensaries. This saving Dr. King estimated at 4½ lakhs for the year,—almost the value of half the capital expenditure on the plantation. The Government encouraged competition by their free sale of seed; and in 1879-80 as much as 1711 lbs. of seed were distributed. They had 847 acres under cultivation; and at the end of 1879-80 there were 677,350 plants in permanent plantation. The people of India owe a deep debt of gratitude to Mr. Clements Markham for bringing cinchona to them, and they should exercise it while he still lives. It is one of the largest boons conferred on India and its people. He went and resided in South America. He published (1862) his travels in Peru and India, while superintending the collection of cinchona plants and seeds; and in 1880 his 'Peruvian Bark' gave a popular account of the introduction of cinchona cultivation into British India.

Cinchona calisaya is found to be a very variable species in Sikkim; and its variations are not confined to the form of leaves and flowers, but extend also to the chemical constitution of the bark, some of the varieties grown in Sikkim containing nearly eight per cent. of pure quinine, while the bark of others yields very little of quinine or of any other useful alkaloid. But the differences in external form and of richness in alkaloid are not related to each other in any very definite way; and trees, of which the leaves and flowers are so
CINCHONA.  

much alike as to be undistinguishable from dried specimens, have been found to yield bark of quite different chemical composition. In Java the Dutch have a variety of callisaya, the bark of which is richer in quinine than any bark ever imported from South America; some of the Dutch samples having yielded on analysis the extraordinary amount of 13.7 per cent. of quinine. They had been raised from a parcel of seed purchased in 1866 by the Dutch Government from Mr. Ledger. Mr. Ledger got them from a half-caste, who would not tell where he collected them, and who was murdered soon after; the exact locality in where they were gathered, therefore, remains unknown. Mr. Ledger’s seed produced 6300 trees, which have since been largely propagated from. The 6500 plants all agree in being rather shabby-looking trees, averaging in height 25 feet, and girdling at 6 feet from the ground 27 inches. They have tall stems, and rather small, lax, conical heads, the branches of which are more or less distinctly arranged in tiers. The cinchonas under favourable circumstances become large trees, and have the habit of erect foliage. The leaves are lanceolate, glossy, and vividly green, traversed by rich crimson veins; the flowers hang in clusterting pedicles like lilacs, of deep rose-colour, and fill the vicinity with rich perfume. Nineteen varieties of cinchona were established by Dr. Weddell. The cascarilleros of S. America divide the species into a category of colours, according to the tingé of the bark; there are yellow, red, orange, violet, grey, and white cinchonas. The yellow, among which figure the Cinchona callisaya, lancedola, condaminea, micrantha, pubescens, etc., are placed in the first rank; the red, orange, and grey are less esteemed. This arrangement is in proportion to the abundance of the alkaloid quinine, used in medicine instead of the bark itself. The following prices have been realized in London:—

C. succirubra, red bark, 2s. 6d. to 3s. 6d. per lb. 
C. callisaya, C. frutex, C. vera, yellow bark, 2s. 10d. to 1s. per lb. 
C. officinalis, var. (a) Urutisinga, Loxa bark, var. (b) Condaminea, select crown bark, 2s. 10d. to 7s. 
C. crispa, fine crown bark, 2s. 10d. to 6s. 
C. nitida, genuine Loxa bark, 1s. 8d. to 2s. 9d. 
C. sp., undetermined, fine grey bark, 1s. 8d. to 2s. 10d. 
C. micrantha, grey bark, 1s. 8d. to 2s. 9d. 
C. Peruviana, finest grey bark, 1s. 8d. to 2s. 10d. 
C. pabuudiana.

Plants of the C. Ledgeriana from Java have been sold at 500 rupees a thousand; and price for seed paid for this variety, 822 per ounce. This seed was taken from trees of a superior kind, of a good age, the bark of which had been tested, and the firm advertised the seed in Java. The 1880-81 crop of Madras amounted to 250,271 lbs., against 183,084 lbs. in 1879-80. 284,736 lbs. were supplied to the home market, 5096 lbs. to a firm in Madras, and 2000 lbs. to the Bombay Medical Department, leaving a balance of 8493 lbs. in store. Experiments are still (1882) being made to determine the merits of the grassing and mowing systems. Low-country coolies were employed as labourers with success.

Cinchona callisaya, Raiz, and Pavon, grows on the Andes of Peru, New Granada, and Bolivia, at 5000 to 6000 feet above the sea. It attains a height of 40 feet. It yields the yellow bark, also part of the crown bark. It is one of the richest yielders of quinine, and produces, besides, cinchonine, but yields little of other alkaloids. Its varieties do not all furnish bark of equal value. It grows under conditions more limited than those of C. succirubra, and it is not so easily propagated. The Santa Fé variety ascends the Andes of New Granada up to 10,000 feet, and produces the highly valuable soft Colombia bark.

Cinchona cordifolia, Mutis, grows on the Andes of Peru and New Granada, at between 6000 and 8000 feet elevation, and yields the hard Cartagena bark, or West Pitaya bark, one extremely rich in alkaloids. It is hardy, grows with rapidity and vigour. The thickest bark is obtained in the highest altitudes, where it has the action of misty clouds.

Cinchona hasskariiana, Miq. In Java, some of the best results were obtained from this species, as yet not critically identified.

Cinchona lancifolia, Mutis, considered by Weddell a variety of C. officinalis. It grows in places where the mean annual temperature is that of Rome, with, however, less extremes of heat and cold. It yields part of the Pitaya bark of commerce.

Cinchona micrantha, Raiz, and Pavon, grows on the Cordilleras of Bolivia and Peru to a height of 60 feet, and from it part of the grey and of the Huanuco bark as well Lima bark are obtained. It is comparatively rich in cinchonine and quinidine, and also contains quinine.

Cinchona nitida, Raiz, and Pavon, grows in the Andes of Peru and Ecuador to a height of 80 feet, and yields part of the grey and Huanuco bark, also the Lima bark. It contains predomi-
nantly cinchonine and quinidine.

Cinchona officinalis, Lindl., is partly C. condaminea, Humboldt. It grows on the Andes of New Granada and Peru, at a height of 6000 to 10,000 feet, and yields the crown or brown Peruvian bark, besides part of Loxa bark. It is comparatively rich in quinine and cinchonidine. Super-abundance of moisture is particularly pernicious to this species. The temperature of the middle regions of the Andes where this tree grows is almost the same as that of the Canary Islands. The crispella variety endures a temperature occasional as low as 27° Fahr.

Cinchona pitayensis must also be referred to C. officinalis as a variety. It attains a height of 60 feet, and furnishes also a portion of the Pitaya bark. In Upper India it has yielded in some instances the unprecedented quantity of 11 per cent. alkaloids, nearly 6 per cent. quinine, the rest quinidine and cinchonine. This plant is now annihilated for bark purposes in its native forests.

Cinchona succirubra, Pavon, a tree of the mid-Andes regions of Peru and Ecuador, yielding the red Peruvian bark, rich in quinine and cinchonidine. It attains a height of 40 feet. It is this species which is almost largely cultivated in the mountains of Bengal. This has proved the hardest species in Sikkim; it grows under a wide range of conditions, and seeds freely; all its varieties produce bark of great value, yielding an average of 4 per cent. of alkaloids. Beetles (a male stag-beetle, family Lucanidae) have been found feeding on the renewed bark (after shaving) of succirubra trees in Maskelyia. The female has much shorter mandibles; and it is said to use them in forming a hole in the trunks of trees for the reception of its
eggs. Westwood says (i. p. 187) the perfect insect feeds on the honey-dew upon the leaves of the oak; they also feed upon the sap exuding from the wounds of trees, which they lap up with their finely ciliated maxilla and lower lip. It has been supposed that the larva of this insect, which chiefly hides in the willow and oak, remaining in that state several years, is the animal so much esteemed by the Romans as a delicacy, and named cossus. The injury which it causes is often very considerable, boring not only into the solid wood, but also into the roots of the tree. The stag-beetle found in Maskelija was a male, with immense mandibles, and greatly resembles Iucanus cervus, the common stag-beetle of Europe.—*Observer, Ceylon* ; Von Mueller.

**CINCHONACE.A**, the coffee tribe of plants, of which there are 233 genera and 870 species. Of these, 729 species are known to occur in the south and east of Asia, viz. in Zanzibar, Timor, Persia, Japan, each three; in Arabia four, and in India 693.

**CINNAMBAR.**

This is found in commerce, native and manufactured. It is the red or bisulphuret of mercury. The best native cinnabar is red, heavy, brilliant, of a high colour, and free from earthy or stony matter. It is found in various places, chiefly in quicksilver mines, being one of the ores of that metal. It occurs native in China abundantly in Shen-si; and all the quicksilver (shwin yin, water silver, *i.e.* hydrargyrum) not imported into China is there obtained from this ore, by a rude process of burning brushwood in the wells, and then collecting the metal after condensation. Cinnabar is brought from the mines of China in the form of a coarse shining powder, with a varying depth of red colour. The finest is used as a pigment, and in making red lacquer for varnishing. Cinnabar has been discovered at Bassin, in Borneo, in a mountain range called Bungo, extending between two branches of the Sarawak river. It yields 84 per cent. of quicksilver. For making artificial cinnabar, when two parts of mercury and one of sulphur are triturated together, the mercury gradually disappears, and the whole assumes the form of a black powder. When this is heated red hot, it sublimes, and if a proper vessel be placed to receive it, a cake is obtained of a fine red colour, which, when reduced to a fine powder, is known by the name of vermilion. Artificial cinnabar is largely manufactured in Calcutta, and in small quantities at Surat. It has been employed in medicine by the Hindus from time immemorial, to salivate their patients, causing them to inhale its fumes. Cinnabar is entirely volatile from a slip of talc, while the impurities remain behind. Compound cinnabar ointment is Captain Aitkin's useful ringworm ointment.—*Williams' Middle Kingdom* ; *Mason; Beng. Pharmac.* ; *Thomson's Chemistry*.

**CINNAMMOMUM**, a genus of plants belonging to the natural order Lauraeæ, confined to Eastern and Southern Asia. The species are—

**CINNAMOMUM ALBIFLORUM.** *Nees.* C. camphoratum, Bl. C. tamala, F. Nees.

Dalchini, Tjakalim, HIND. *Tez-bal, Tejpat,* HIND. This tree grows in Tiperah, Nepal, Kurnool, and the Punjab; is not uncommon in the Himalaya east of the Sutlej; grows sparingly at about 5000 feet as far as the Ravi, and probably in Hazara. Part at least of the official bark that leaves are probably derived from this tree. The former is given for gonorrhoea, and the latter are used in rheumatism, being considered stimulant. Its timber does not appear to be valuable.—*Voigt; Stewart; Powell.*

A tree of considerable size, said to grow in the dry sandy districts lying N.W. of the town of Fni-foc, between lat. 15° and 16° N. It is said to produce the cinnamon of China and Cochín-China, as also cassia bark and the aromatic flowers called cassia buds.—*Bogue; Wright; Voigt.*

**CINNAMOMUM CITRIDIORUM.** *Thun.* Pangares. Kuruntu gas. Singh. A tree of Ceylon, growing to a height of 30 or 40 feet in the Sufra-Ceylon district, at an elevation of 1000 to 2000 feet. It is distinguished by the venation of its leaves, and by the truncated cup of the fruit. The bark has much of the odour of citronella oil, intermixed with something of the fragrance of common cinnamon.—*Thw. Zoély. p. 258.*

A native of Ambon, especially in Leitimoo, near the villages of Sava Rutton and Emu. It also grows in Cochín-China. The bark when dry is aromatic like cloves, but less pungent and sweeter. It has some medicinal activity to a combination of volatile oil, resin, and bitter extractive. It is used in dyspeptic complaints, diarrhoea, etc. The natives of Ambon use the oil both in an internal medicine and as a stimulating liniment.—*Roöz. iii. p. 299; Voigt; Engel. Cyc.*

**CINNAMOMUM DULCE.** *Nees.* C. Chinensis, Bl. | Laurus dulcis, *Roöz.*

A small tree of China, leaves and bark of a sweet aromatic taste and odour.—*Roöz. ii. 203.*

**CINNAMOMUM EUCALYPTOIDES.** *Nees.* Grows on the mountains of Malabar. Its leaves have a strong acrid clove-like odour, and taste somewhat tinctured with camphor. It is the *Laurus Malabaristhrum.* *South Planters’ Garden.*

**CINNAMOMUM INERIS.** *Reine.*

CINNAMONUM LITSEFOLIUM.

This tall tree grows along the whole range of the W. Ghats, and in the hilly parts of Malabar and Konkan; also in Moulmein, Atarun, Chapedong, Penang, and Java. It is supposed to yield part of the cassia and cinnamon of commerce. Its leaves, on being bruised, have a strong spicy smell; the wood is fine, even-grained, and supposed very good, but the carpenters are not acquainted with it.

CINNAMONUM LITSEFOLIUM. Thuw. Koodoo-Kurundu gass, Singil. A tree of 50 or 60 feet, growing at Hapootelle, in the central province of Ceylon, at an elevation of 5000 feet. Its bark is quite inodorous.—Thuw.

CINNAMONUM NITIDUM. Nees. C. cassia, Nees, W. Ic. | Laurus nitida, Roxb.

Kadigi-Hindi, Arab. | Putraj (bark), Hind.

Tej-pat, Beng. | Tamalpatra, Sansk.

Sadhus, Hind. |

Described as a tree in Sumatra, but as a small tree or shrub on the continent of India. Its flowers are small and of pale yellowish colour, and the bark is cinnamon-like in taste and odour. It is the plant which furnished the wood, and is the principal part of the Folia Malabathri of the old pharmacologists.—Roxb. i. p. 300; Eng. Cyc.: Voigt.

CINNAMONUM OBTUSIFOLIUM. Nees. Laurus obtusifolia, Roxb. | L. Malabatharica, Roxb.

A tree of the mountainous countries immediately east of Bengal, with small greenish-yellow flowers. Its timber is very useful for various purposes. C. obtusifolium, C. pauciflorum, and C. tamala were found by Dr. Hooker up to 6000 feet in the Khasysya mountains.—Roxb.; Voigt.

CINNAMOMUM ZEYLNICUM. Nees. C. capparis-coronope, Blume, Nees.

Var. β. Multiflorum.

C. multiflorum, W. Ic. | C. dubium, Nees.

C. perpectuoflos, W. Ic. | C. villosum, W. I.

Var. γ. Ovalifolium, Wight.

This exceedingly handsome variety of cinnamon is very abundant on the higher ranges of the Neelgherries, and in all sholas about Ootacamund, flowering in May. All the parts, when fresh, if crushed, have a powerful odour of cinnamon. The tree is very large, and has great girth. The timber is even-grained and good, but is not much in use. There are seven well-marked varieties of cinnamon found in the western (moist) forests of the Peninsula, growing up to the highest elevations. They differ much in size, and in the manner of growth of the tree itself, shape and size of the leaves, pubescence, etc.; but Colonel Beddome, after long observation, and with a very large collection of specimens, is inclined to look upon them all as varieties only of the C. Zeylanicum. They run almost imperceptibly into one another, and it is almost impossible to lay hold of any constant character worthy of a specific distinction; and many of the differences are, he believes, the effect of elevation and climate.—Roxb.; Wight; Beddome.

CINNAMON.

Darsini, Arab. | Yuh or yuh-kwe, Chin.

Theet-ka boh, Bum. | Kanli, Dut.

Cannelle, Fr. | Zimmet; Kanelli, Ger.

Cinnamonum, Lat. | Sama lavanga patta, Tel.

Kaisamania, Malay. | Kali manis, Malay.

Katu karu, Maler.

Darsisita, Sansk.

Kaxayamana, Sisgar.

Kurundu, | Davoul kurundoo, SP.

Rassu kurunday.

Canales, SP.

Karua; Lawanga, Tam.

The bark of Cinnamomum Zeylanicum, Nees., is the true cinnamon of the shops, and the true Kinnamon of Exodus xxx. 23. Two varieties of cinnamon are known in commerce, that of Ceylon and Cayenne, and the Chinese cinnamon, which is of far inferior quality. Cinnamon is exported from China, Siam, Cochin-China, and Java; but that which is of greatest value comes from Ceylon, which has been the chief place of production from the earliest period at which any record exists concerning the use of this spice, and which extends back to the days of the Roman republic. Up to the year 1760, during the latter portion of the Dutch rule in Ceylon, cinnamon grew in a wild state amongst the thick jungles of the low and hilly country, the best always having been cut upon the light soil of the maritime provinces. The tree is found only in the western, southern, and central provinces. The peelers recognise ten varieties of Kurundu or cinnamon, viz. Naga or snake, Kapuru or camphorated, Kahate or canuelle or astrigent, Savell or glutinous, Dawoo or drum, Nika or wild, Mal or flowering, Toupat or trefoil, and We Kurundu or white ant cinnamon. The true cinnamon is often adulterated with the inferior barks of other species; and the volatile oil, on which its virtues depend, is sometimes fraudulently extracted. Besides the oil of cinnamon, a fatty substance called cinnamon butter and cinnamon suet is expressed from the ripe fruits.

CINNAMON BUTTER, or Cinnamon Wax, is obtained from Cinnamomum Zeylanicum. By strong decoction, the fruit yields a concrete oil, used for candles, and which exhales while burning a most delicious odour.

CINNAMON STONE, a precious stone found in Ceylon. It is a variety of lime-garnet of a clear cinnamon-brown tint, commonly occurring in masses, which are full of fissures. Translucent, seldom transparent.

CINNARA, in Hindu mythology, genii; and male dancers in Swarga, the heaven of Indra.

CIRCAETUS GALLICUS. Om. Serpent eagle. C. brachydyctylus, Meyer.

Sap mari, Beng. | Pamala gelsa, Tel.

Mal path, In. | Riwal of In. Warel.

Samp mar, Hind. | Kondatelle of Vendal.

Pambu prando, Tam.

This is found in the south of Europe, North Africa; it is common all over India and Asia; has been killed in Denmark, but never in the British Islands; prefers the open ground, questing like a harrier. It eats any creature, but snakes and lizards are its chief food. Hovering in the air, and pouncing down suddenly like a stone, it seizes the snake by the head with its talons, and the snake often twines its body around the bird, and so eumences it that it is occasionally so caught.—Jerdon.

CIRCAR. In the Mahomedan land revenue system, a circar was a subdivision of a subah. The N.W. Provinces of India, excluding the Sougar and Nerbada territories, comprised no complete subah but only portions of the four subahs of Agra, Allahabad, Deoli, and Oudh. Each subah was divided into a certain number of circars, and each circar into parganas or mahala (which are used as equivalent expressions); and the parganas again were aggregated in dastors or districts; and as the parganas of the same
CIRCASSIA.

CIRCUMAMBULATION.

dastoor are of course always contiguous, the dastoor statement in old registers, if copied with any regard to correctness, frequently forms a very important means of the verification of doubtful names. Subah is an Arabic word, signifying a head of money, or a granary. Circar (Sir-kar) is literally a chief, a supervisor. Dastoor, besides signifying a rule, is also a minister, a moonshee. Pargana means taxing land, as well as a perfume composed of various ingredients. The title of subahdar, or lord of the subah, is long subsequent to Akbar's time. Sphassalar was the only designation of the emperor's viceroy in eastern India.

Circars is a political appellation of a large tract of country between lat. 15° 40' and 20° 17' N., running from the Chikla lake to Motaquli, along 470 miles of sea-coast, with a breadth of from 70 to 100 miles of low country, an area of 17,000 geographical miles, watered by the Kistna, the Godavery, and Gondeccama; and three or four British districts have been formed out of it, viz. part of Ganjam, Vizagapatam, Godavery, Kistna, and Guntur, and part of Nellore district, between the Eastern Ghats and the bay. From the 5th to the 11th centuries, the Kesari, or Lion kings of Orissa, held sway there, followed by the Gajapati dynasty in the north, and Narapati in the south, then by the Bahmani, the Kutub Shahi, and the Asaf Jahi. They were ceded to the French in 1753, and to the British E. I. Company in 1750, after Colonel Forde's successful attack on Masulipatam in April of that year. They contain the important towns of Ganjam, Chincadole, Vizianagram, Vizagapatam, Coringa, Yanoor, Masulipatam, Eullore, and Nizampatanam.—Annals, Ind. Adm. xi. p. 248; Imp. Gaz.

CIRCASSIA is the Circassians of Asia. It is a mountainous country in the S.E. corner of Europe, on the northern face of the Caucasus, lying between lat. 41° 50' and 45° 20' N., and 37° and 47° 20' E., about 550 miles long and 75 miles broad; area, 40,000 square miles. The highest summits for nine months are covered with snow.

—MacGregor. In a small tract not less than seventy-two dialects are spoken. The Circassians and the Che Chou are the two great tribes. They take the common name of Adighe; but the Circassians include amongst them the Khbard Akhas, Ubiche, and other clans, and number from 400,000 to 500,000 souls. The Che Chou number 150,000 souls. Their religion is a mixture of Christianity, Mahomedanism, and paganism. They reverence Merem, a benevolent deity, and Tashibile, the spirit of thunder. There are three social classes,—Uskud or nobles, Tschofok and freemen, and Pchilt or slaves,—and these grades are hereditary, like the castes of India. When their forts or villages have been surrounded, they have destroyed their women and children, set fire to their dwellings, and perished in the flames, rather than surrender.

Their young women are famed for their beauty, and are sought for in the neighbouring kingdoms. They are brought up in simple and domestic habits by their mothers, are taught the use of the needle in decorative works, and to make their own clothes, and those of the men of their family, and are otherwise very carefully reared. They are sold to the bridegroom and to traders.

The Circassians were typical representatives of the West Caucasian races. They were the most powerful and warlike of all the western nations. Since their final reduction, in 1864, by Russia, most of their lands on the left bank of the Kaban have been occupied by their conquerors, the great bulk of the Circassians having withdrawn into Turkish territory, and dispersed over Armenia, Asia Minor, Syria, and the Balkan peninsula. Similarly, 20,000 Akbskians migrated to Turkey at the close of the last Russian war, and both races have become predatory. Circassians are to be found in Asia Minor, along with Lazi, where also are the Yuruk, a nomade Turk race occupying the uplands between Erzerum and the plains of North Syria. In the Kazzelkhs are also there, and are scattered over Anatolia, Persia, and eastwards to Kabul. They call themselves Eski-Turk, or old Turks. The fertile plains of Raz Ova and Ard Ova, near Tokat, and the villages between Angora and Anaisia, and between Kara Hissar and Tokat, are the Kazzelkhs headquarters. They profess Islam, but avoid all inquiry into their doctrines.

The Circassians and Akbskians have never found a suitable home in Asia Minor, and are a serious disturbing element (Asia, p. 37), being indolent and predatory. The Circassians and Akbskians of West Caucasus are Sunni Mahomedans; the Kabad are Christians; and these three races number 138,000. In the time of Selim I., the Manuelks were all slaves of pure Circassian blood.

More recently, only the Borgia Manuelks were of Circassian origin.—Charles Tashchin, Circassians, Porter's Tr. i. p. 141; Lond. As. Trans. i. p. 98; MacGregor; A. H. Keane and Sir Richard Temple's Asia.

CIRCASSIAN BEANS, seeds of the Aden-thanera pavonina, used for ornamental purposes.

CIRCLE. Under the form of a winged circle, the Assyrians worshipped the supreme deity.

The Buddhist wheel of the law, to be seen on the caves of Ellora and Ajunta, was probably borrowed from the Assyrians, as it reminds us of the wheel within wheel of Ezekiel. It is a symbol of the Hindu god Vishnu, under the Hindu term Chakram.—Cat. Rev. 1868. See Chakram.

CIRCUMAMBULATION.

Touaf, . . . . . ABAR, . . . . . Parikarma, . . . . . HIND. Deisel, . . . . . . . CELTIC, . . . . . . . Pradakshana, . . . . . . . SANSK.

The circumambulation of sacred places has ever been part of the ritual of worship of Asiatic nations. The Mahomedans in circumambulation, Touaf, presents his left shoulder; the Hindu and Buddhist in Pradakshana walk round with the right side towards the face or idol, and this would appear to be the original form of the rite. Its conjunctive significance is an imitation of the procession of the heavenly bodies, the motion of the spheres, and the dances of the angels. These are also imitated in the circular whirlings of the Rafai darvesh. El Shahistani informs us that the Arab philosophers believed the sevenfold circumambulation to be symbolical of the motion of the planets round the sun. It was adopted by the Greeks and Romans, whose Ambavallia and Amurballia appear to be eastern superstitions, introduced by Numa, or the priestly line of princes, into their pantheism; and in Britain the processions round the parish preserve the form of the ancient rite. It is the processional of the Romish and other Christian churches, in which the clerical attendants permultamate the aisles, and is practised
in sanctifying a church or a churchyard. At the Holy Sepulchre, the Greek, Armenian, and other
pilgrims circumambulate three times. In Ireland
it is a very common practice to circumambulate the
graveyard three times before proceeding with the
corpse to the grave. See Parikarma. In Britain,
at the time Christianity was established in Ireland
by St. Patrick, and in the coast of England by St.
Columba, it was a practised rule, Hindus encircle
with right hand to the shrine. The Buddhist
Bhot, in passing the Mani, always leave it on the
right.—Northern Barrier; Burton's Mecca, iii. 204.

CIRCUmCISION.

Khatna, . . . ARAB. │ Soomtan, . . . HIND.
Circumcision, . . . FR. │ Circuncisione, . . . IT.
Beschneidung, . . . GER. │ Circumcision, . . . SP.

The Phœnicians had this rite in common with
the Egyptians and the Jews, who acknowledge
having derived it from the former. According
to Bunsen, however (iv. p. 273), it was not followed amongst the Phœnicians. It seems
to have been a Semitic rite, which Abraham
revived, for he was ninety-nine years old when he
circumcised himself, Ishmael his son was thirteen, and Isaac was one year old. This rite
now is practised amongst all the Jewish peoples
and most Mahomedans. With the latter the usual time is in infancy, though the poverty of the
parents and other circumstances sometimes retard its performance. It is performed with
some ceremonial, and in presence of the friends
of the family. It was prohibited by Akbar until the age of twelve, when the person to undergo it
could judge of the propriety of the rite. It is not
even mentioned in the Koran. It is considered
as an act of imitative practice founded on the
example of the disciples, but not on that of
Mahomed himself. In Oman, on the shores of
the Persian Gulf, among the Christians of Abyss-
inia, and in Egypt among the Arabs and Copts,
the custom is prevalent. At Boera and Baghad,
all the women of Arabian blood circumcise their
daughters, as well as their sons. At Cairo the
women who perform this operation are as well
known as midwives. They are openly called into
houses of the people, without any secret being
made of the intention with which they are invited.
This is noticed by several Mahomedan writers,
viz. in the Dur-ul-Mukhtar, the Tahlatvi, and
Fattah-ul-Muain, and, according to the last book,
it is the inner labia that are removed. The
Spaniards, at the time of the conquest of Central
America, found circumcision practised, and it is
still observed by the Tecuma and Manacs tribes.
Amongst the people in the Gulf of Carpentaria,
all the males before the age of twelve or fourteen
years undergo this rite. This custom is not
derived from the Masaccas, the latter affirming
that it existed previous to the commencement of
their intercourse with the coast. Flinders ob-
served a case upon the Wellesley Islands, and the
custom is also prevalent amongst the natives of
certain parts of the south coast of Australia. Mr.
Earl says a peculiar formation prevails among
the aborigines of this part of Australia, and also
of the adjacent coast of New Guinea, which renders
the practice exceedingly conducive to comfort
and health.—Earl in Ethn. Lib. i.; Niebuhr, Travels, ii. pp. 250, 251; Malcolm's Hist. of
Persia, ii. p. 359; Bunsen's Egypt, iv. p. 273; Herodotus, ii. p. 36.

CIRCUS, a genus of birds of prey, known as
the Harriers, found over all the world. They
have a slender form, soft and downy plumage,
and hence a noiseless flight. They are much on
the wing, and hunt near the ground. They are
of the sub-family Buteonine, family Falconidae,
and order Raptorea.

True Harriers.

Circus cyanneus, Linn. Falco albidus, Gmel. | F. pygargus, Linn.
The hen-harrier of Europe in the winter visits
the N.W. Himalaya, the Panjab, Bhutan, Nepal,
and Kanaan.

Circus Swainsonii, A. Smith.
C. albecens, Less. C. pallidus, Sykes.
C. Dalmaticus, Rap. Falco herbofer, Tickle.
Pandouvii, . . . BENG. Pattai, . . . HIND.
Tera, Dirajat, . . . HIND. Pun-pranda, TAM.
Dastmal, . . . HIND. Tella-chappa-gaddd, TEL.
Girgut-mar, . . . Filli-gadda, . . .

The pale harrier is pretty generally distributed
over Asia, Africa, and southern Europe, and is
abundant in India during the cold weather.
The male is pale grey above.

Circus cinereus, Montag.
C. Montagi, Vieill. | C. Nipalensis, Hodgson.
This visits every part of India.
Circus melanoleucus, Gray.
Pahatai, . . . HIND. Abla pehata, . . .

The pied harrier is common in Bengal and in
the rice-growing districts.

Circus aeruginosus, Linn.
Falco rufus, Gm. | C. variegatus, Sykes.
Mat-chil, . . . BENG. Safed Sira, . . . HIND.
Kutar, Kulesar, . . . HIND. Tika, Bauri,

The marsh harrier frequents the banks of
rivers, lakes, marshes, inundated fields, and wet
meadow land, carrying off frogs, fish, water
insects, rats, shrews.—Jerdon.

CIRRHA'TE, or Cirrhade, or Cirrodex, of
classical history, are the ancient Kirata, the
modern Kiratii of Nepal. Once a powerful
dominant race, they have long since succumbed
first to the Mahawani, and then to the Ghorkali.
In the Sanskrit tale of the Hero and the Nymph,
occurs the word Vedhaka. In some copies Re-
chaka is explained to be a Kirata, a forester, and
the Kirata were known to the classical geography
of ancient Europe as the Cirrhade or Cirrodex.
They were the occupants of Sogdiana, near the
river Oxus. The term Kirata, however, seems
to have been general, and applied to the savage
mountain non-Aryan tribes, to whom the Aryan
races were opposed. Some of them were in the
south of the Peninsula, on the Coronadal coast.

CIRRHIPE'DIA. The balanus or barnacle of this
class of molluses occurs in India.

CIRRHOSTALUM, a genus of plants of the
order Orchideceae. In India are C. albideum,
caudatum, cephalotus, cornum, sformiatum, grandiflorum,
Lindleyi, Macrostachys macrophyllum,
Neilgherrensis, Roxburghi, Walkerianum.

CIRSIUM ARGYRACANTHUM, C. horridum
and C. lanceolatum, flowering plants belonging
to the order Matri carineae. The roots of C.
lanceolatum, the Suh-twan or Chuen-twan of
several parts of China, are used in diarrhoea and
in urinary affections.—Smith.

CIS, a Latin word in use amongst geographers
of Europe, to indicate a country on the hither
side of rivers or mountains, as Cis-Himalaya, Cis-

CIS.
Indus, Cis-Sutlej, etc. Trans, another Latin word, is used to indicate the further side, as Trans-Indus, Trans-Gangetic, etc.

CISSA, a genus of birds of the jay magnies, the sub-family Garruline, and order Passeres. Cissus cynanchica, C. paucilla, Rhythm, occur in Hind.-Temple's Ceylon.

CISAMPELOS, a genus of plants of the natural order Menispermacae. C. convolvulacea occurs in Dindigul, Rajmahal, and Nepal; C. obtecta, of the Garhwal mountains, yields an ardent spirit in distillation.

The extract of pareira is a valuable astringent diuretic, in doses of twenty grains dissolved in water thrice daily. The extract and infusion of nemooka, C. hermandifolia, afford good substitutes for this useful article.—Beng. Pharr.

CISSA, mentioned by Herodotus, is the Susiana of Strabo, and the modern Khusistan.

A pretty climber, in the valleys of the N.W. Himalaya, from 2000 to 8000 feet. It is eaten by camels; and in Jammu, the root, ground with black pepper, is applied to boils.—Dr. J. L. Stew.

CISUS DISCOLOR, a vine of Java, with leaves coral-red beneath, and variegated with silvery patches above, owing to the presence of a film of air under the epidermis.

CISUS QUADRANGULARIS. Wall. Vitis quadrangularis, Wallt. Nillur, ka binj; paat, DUK. Perrandei, coddi, TAM. Harjora, . . . . HIND. Nulluru tige, . . . . Tel. Vajra valli, . . . . SANSK.

Stems fourangled, winged, and jointed; it has all the properties of a parasite. The stems are succulent, and, beaten up into paste, are given by the natives for asthma. The young, tender, and succulent stems are very generally eaten in India. When old this plant is deemed acrid, and a useful article for cattle. In Arabia it is used as an external application in rheumatic pains of the back and limbs.—Riddell.

CIS-SUTLEJ, a political term applied in British India to the territory south of the Sutlej, occupied by Sikh chiefs during the last years of the Dehli empire, and now including the British districts of Ambala, Ludhiana, Firozpur, and Hisar, with the native states of Patiala, Faridkot, Maler Kotla, Chithrauli, Baisi, Buriya, Mandot, Jheend, and Nabha, which came under British protection in 1809. By the treaty with Ranjit Singh, of the 26th April 1809, he undertook not to make or allow any encroachment on the states on the left bank of the Sutlej. In 1849 the British abolished the sovereign powers of the various chieftains. Several states have lapsed to the British.

Patiala was formed by a Jat family of Sikh religionists, who emigrated from the Manjhit about the early part of the 18th century. The area is 8412 sq. m., with a population of 1,586,000, and a revenue of Rs. 3,000,000.

Jheend has an area of 1236 sq. m., and a population of 311,000 souls, with a revenue of four lakhs of rupees. The maharaja is a Jat of the Sikh faith. In 1587 its chief was the first person who marched against the mutineers at Delhi.

Nabha territory has an area of 863 sq. m., a population of 276,000 souls, and a revenue of four lakhs. The chief is of the same stock as the maharajas of Patiala and Jheend, but is the elder branch of the family. The family beheld ill in the Sikh war of 1845-46, but did well in the revolt of 1857, and were rewarded by a grant of land out of the Jhujur territory.

Kalsia territory has an area of 155 sq. m., and a population of 62,000 souls, with a revenue of Rs. 130,000. The family came from the village of Kalsia in the Manjhit.

Maler Kotla has 156 sq. m., with a population of 46,200 souls, and a revenue of one lakh. The family came originally from Kābul.

Faridkot consists of Faridkot proper and Kotkapura; is S.W. of Firozpur, borders to the S.E. on Patiala. It has an area of 613 sq. m., and a population of 51,000 souls, with a revenue of Rs. 75,000.

Munudote is a Mahomedan chieftaincy, and was re-established in 1863.

The minor Cis-Sutlej chiefs were deprived of their sovereign powers, and the police management of their estates was assumed by the British Government; all customs duties were abolished, without compensation except in the case of the nawab of Konjipura and the mir of Kotahbar, and the chiefs were reduced to the rank of ordinary jagirdars. These were 80 in number, with revenues varying from Rs. 250 to 71,900.—Imp. Gaz.

CISTACEAE, the rock-rose tribe of plants; one genus is the Helianthemum. Cistus creticus, of the Levant, one of the species which afforded Labdanum, collected formerly for medical use during the prevalence of the plague, by whipping the plants with leathern thongs, the resin adhering to the leathern straps. C. Cyprium, Lam., also yields this product.

CISTI TREES, the Cytinus hypocistus. See Balanophoraceae.

CISTUDO, a genus of reptiles of the family Chelonias. C. Amboinicus occurs in Ambon, C. dentatus in Java, and C. atrata in Ceylon.

CITIERN. ENG. A musical instrument. It obtained its name from the Sih-tara, the three-stringed lute of the East, supposed to be also the source of the word guitar.

CITRATE, or Auratiacea, the Citron, oranges, are dicotyledonous polytetalous plants, and the orange, lemon, lime, shaddock, pomelo, and citron are the chief fruits of the orange. The wampee, a fruit highly esteemed in China and the Indian Archipelago, is produced by Cookia punctata. The fruit of Glycosmis citrifolia is delicious, and that of Triphasis very agreeable. The Ægle marmelos is used in medicine, and a perfume is made from its rind. The Indian guava are — atalantia, citrata, lymonia, glycoecia, sclerosytis, bergeria, Murunya, Cookia, clausena, micromelum, para-mignya, suvunga, polycyna, feronia, agle, citrus, citric ACID, lime-juice, Acidum citricum.

This occurs in commerce either in the form of the pure juice of lemons and limes, or crystallized by a chemical process.

735
CITRUS, Citrus medica, Linn.

It bears many names and varieties. In Egypt, it is known as the "Orange Tree". The fruit is often used in cooking and in traditional medicines.

CITRULLUS, Citrullus vulgaris, Linn.

This plant is a climbing vine that bears edible fruits. It is widely cultivated for its fruits and seeds, which are used in cooking and medicine.
CITRUS BERGAMIA.

producing two crops a year. The blossoms of February and March yield their ripe fruit in November and December; and from the flowers of July mature fruits are obtained in March and April. To prevent exhaustion, only alternate fruiting is allowed. The leaves are rather bitter, and contain essential oil. A still more fragrant oil, called oil of neroli by the perfumers, is afforded by the flowers. The berries, while unripe, are gathered, dried, and turned in the lathe to the size of peas, and are used in issues on account of their fragrant colour. The rind or peel of the orange is bitter and aromatic, and affords a very useful stomachic tincture and syrup. The juice of the ripe fruit contains sugar, malic and citric acids, citrate of lime, muscalig, albumen, and gum. Like the lemon juice, it makes an excellent cooling drink, and is an invaluable specific in the treatment of scroborbic diseases. The seeds of the orange yield oil by expression, but not available in any quantity.

Citrus aurantiun, var. Seabra, Hwa-kui-hung of the Chinese, a variety of sweet orange largely cultivated in China.—Smith; O'Sh.; Eng. Cyc.; Voigt; Elliot; Ainslie; Riddell.

CITRUS BERGAMIA. Rich and Acid lime.

Citrus limetta, D.C. | Citrus acida, Roeb.
Nihu, | Beng. | Fun mitche nar- | Maleal.
Dan-tha-yaa, Shouk, Bum. | cam. | Maleal.
Chin-p‘o-lo, | | Dehli.
Limbo, | Duk. | Elimicham, | Tam.
Bergamot olive, | Eng. | Gaja-nimma, | Tel.
Common sour lime, | | Nima-chhettu, |.
Limmu, Nimbu, | Hind. | Janbira-nimma, |.

This is grown in Peninsular India, Bengal, Assam, the Sanda and Molucca islands. There are many varieties,—round, small, spongy, smooth, thick-skinned, and yellow-juiced. The Arab variety from Muscat is large. Bergamout oil is obtained from the rind, and also oil from the flowers. The Mellarosa variety furnishes a superior oil and exquisite compounds. Large varieties of the acid lime are diffused all over the Tenasserim Provinces; and Europeans usually call them citrons. The forinae known in Hindostan are,—

Pati neboo, common round lime.
Gora neboo, thick-skinned, small, oval lime.
Kaghazi neboo, long, small lime.
Cheena-gora neboo, China lime, yellow-juiced lime.
Kanurali neboo, large, oval, smooth-skinned lime.
Rungpo neboo, round, smooth-skinned lime.
Taba neboo, a large globose spongy-skinned lime.
—Drs. Roxb., Mason, O'Sh.; Voigt; von Mueller.

CITRUS BIGARADIA. Dukamel.
Mae fadyin, | Arab. | Bitter Seville orange, Eng.
Kau-kiihi, | Chin. | C. vulgaris.

The leaves differ from those of the sweet orange by the petirole only. The flowers are alike in both species. The rind of the fruit is bitter, acrid, and hot to the taste, the pulp acid and bitter, the seeds excessively bitter. The bark of the tree participates in these qualities. The rind of the fruit is used in making the celebrated Curaeon liqueur. Its flowers yield the costly neroli oil. An acre will annually yield flowers to the value of £50. The rind is used for candied orange peel.—O'Sh.; von Mueller.

CITRUS DECUMANA. Linna. Panuwalu.
Bator nihu, Babavi, Beng. | Maha-nanam, | Singh.
Shouk tug, | Bum. | Jamboloo, |.
Hu, Yu, | Chin. | Punnapalina, | Tam.
Chakotra, | Hind. | Bomharmanas, | Tel.
Poompleemoos, | Malay. | Pampa panasa, |.
Bambali-naring, Maleal. | Pulla pampa panasa |.
Paravata, | Sansk. | (acid var.).

The shaddock, the largest of the orange tribe, is cultivated in Southern Asia in gardens. The varieties are red and white, the former being preferred by persons. The tree grows to a large size in a rich soil, and requires much pruning; the best time for doing this is when the crop of fruit is off. Fine fruit has been produced from the seed. The tree, when planted, should have a space of twelve feet all round it. The blossom is used for flavouring sweetmeats. It is a fine fruit, cooling and aperient, and in taste somewhat resembles a fine orange. It has been cultivated in China from the time of the great Yu, who mentioned it in his tribute roll. It flourishes near Amoy, and much pain are taken in grafting the tree upon other species of Citrus, so that the character of the fruit has been greatly improved. Its peel is very bitter, but aromatic.—Ainslie; Riddett; Mason; Roeb.

CITRUS DULCIS. Volkmer. The sweet orange. Of this are many varieties. One tree, in a sheltered place of the St. Michaels, in the Azores, has been known to bear 20,000 fruits in the year. Neroli oil is obtained from the flowers of this and other varieties. The oil of orange peel may be used for distilling with it costly odorous substances.—von Mueller.

CITRUS FUSCA, Smith, the Chih-koh or Chishib of the Chinese, an orange tree of several parts of China.—Smith.

Lu-kia, | | The fruit—Cum-quat, Ch.

The Cum-quat is extensively grown by the Chinese in pots, and at one season of the year the plant is covered with its small, oval, orange-coloured fruit. This, as well as various other species of the orange, is mixed with the forced flowers, and together produce an excellent effect. It is grown in Chusan in groves on the sides of the lower hills. The plants are all arranged in rows about four feet apart, average three or four feet high, and do not exceed six feet. It is much more hardy than any other of its tribe. It produces its flowers and fruit in great abundance. In China, all the plants of the orange tribe which bear fruit in a small state are grated.—Fortune, p. 122.

CITRUS LIMONUM. R. and P.
C. medica, Roxb. | Korina neboo, Hind.

The true lemon. Fruit yields the lemon juice, peculiarly rich in citric acid. Its aromatic peel is a volatile oil. A large variety is the Rosarine lemon.—von Mueller.

CITRUS LUMIA. Rasso. The sweet lemon. It includes the pear lemon, with large pear-shaped fruit. Pulp not acid; rind thick, and peels.—von Mueller.

The citron was described by Theophrastus as occurring in Northern Persia (Media), and culti-
vated by the Jewish nation in Syria while under Roman dominion. Cultivated, and grows to a large size. The outer rind very rough, and covered with excrecences, and when ripe of a deep yellow colour and fragrant. Used to form a preserve, and the juice is made into lemonade. It is propagated by cuttings, layers, or seed. Essential oil and citric acid are obtained from the acid tubercular fruit. The candied thick rind of a variety is the Citronate or Succade. Cedra oil comes from a particular variety. The variety C. digitata is cultivated in China.—Voigt; Riddell.

CITRUS MICROCARPA is the Tsing-kihn-pi or Tsing-pi of the Chinese.

CITRUS MONOPHYLLA grows wild along the Western Ghats of the Peninsula of India.—Riddell.

CITRUS PLANCHONI, F. von Mueller. C. australis, Planchon. A noble tree, 40 to 60 feet high, in the coast forests of E. Australia. Its globular fruits, the size of a walnut, are called native oranges. Its wood is beautiful, takes a high polish, and is used for furniture. Might be introduced into India.—von Mueller.

CITRUS TOROSA. Mason. Grows at Tavoy, with a leaf that looks like two leaves joined together, the wings on the petiole being as broad, or even broader, than the leaf itself. The fruit is small, and there are two varieties,—one with a smooth and another with a rough skin. Dr. Pickering met with a similar tree on the Samoan Islands, a member of the Philippine floras.—Mason.

CITRUS TRIFOLIA, a native of China; fruit about the size of a marble.

CITRUS WOOD of the Romans was extravagantly prized for tables, and is supposed to have been the Callitriss quadrivalvis, Vent., or jointed arbor-vita, the conifer which yields the gum sanderach. The wood was distinguished as striped 'tigrine,' spotted 'pantherine,' or speckled 'apiate.' Cicero gave £9000 for a citrus wood table.

CITRUTTA CYANOTUS is the forest king-fisher of Celebes. Along with it occur the Monoglossus Forsteni; Carphophaga Forsteni, a fruit pigeon of North Celebes; Buceros cassidix, the great hornbill of Celebes; Trichoglossus ornatus, a beautiful brush-tonged parrakeet; Corvus advena, a rare black and white crow.

CITY.

Pur, ur, basti, . . . HIND. | Buri, . . . Siam. Shahr, . . . PERS. Ur, . . . TAM. Tel.

With all nations the eastern end of a house is the more honourable part; the west end, of a city. The towns of the south and east of Asia are small compared with those of Europe.

CITY OF THE Willows, name of a secret political society amongst the Chinese.

CIVET, Castoreum.

The civet perfume of commerce are obtained from two sources. One of the civets is a concrete substance obtained from two small bags in the preputial follicles of the beaver, Castor fiber, of both sexes. This is the commercial civet castor of N. America, and it is imported into India for medicinal purposes. The civet cats (Viverra), a genus of carnivorous animals, approach nearest in their form and habits to the fox and the cat. But the distinctive character of the civets consists in an opening near the tail, leading into a double cavity of considerable size, furnished with glands for the secretion of this odorous substance. When the secretion is in excess, the animal frees itself from it by a contractile movement, which causes the civet to ooze from the bag. This is carefully collected, and sold (not without adulteration with butter or oil to increase its weight) at a very high price. In Malay and Javanese this perfume is known by the names of rase and dedes, but the Sanskrit kasturi and the Arabic zabad, corrupted jabad, are also used as synonyms; and doubtless the Dakhani javad, Malay jabad, English civet, French civette, and German zibeth are all from the Arabic zabad. In the Eastern Archipelago, two species—Viverra rase and V. zibetha—are kept in a half domesticated state for the purpose of yielding it. The first is a native of Java, and the last of the other large eastern islands, where the natives of rank are partial to the use of this perfume,—a not generally acceptable one to Europeans. A variety of this is an inferior sort of musk-bag procured from V. zibetha, found in many parts of Lower Hindustan, and called in Tamil Pulughoo poonai, and in Telugu Poong-hoo pilli. The article is chiefly used by the people as a perfume, and in the preparation of certain liniments. These animals are carefully kept and tended in North Africa for the sake of the perfume. They are also common in South America and in the forests of Japan. Civet contains free ammonia, resin, fat, and extractiform matter, and a volatile oil, to which its odoriferous properties are due. It is imported into Britain from the Brazils and from Guinea. When genuine, it is worth from 30 to 40 shillings an ounce.—Crawford, Dict. p. 100; Als; O'Sh.; Eng. Cyc. Sec. IV, Viverra.

CIVIL SERVICE, the usual designation of the civil department of British India, including the members of it in the performance of political, magisterial, revenue, and judicial functions. There are two distinct branches, the higher being Covenanted officers, and almost all of this class are natives of Great Britain, and several of them, as Lord Clive, Warren Hastings, Sir George Barlow, Mountstuart Elphinstone, Sir Charles Metcalfe, have risen to be Governors-General of India, and Governors of Presidencies. The next grade are termed Unconvenanted, and comprise many Europeans, East Indians, and Natives, and, generally speaking, are in offices with lower powers than those of the Covenanted, as munsifs, magistrates, tahsildar, mahlaladar, deputy collector, assistant commissioner, sereishtadar. Many military officers have distinguished themselves as civil administrators.

CLAdOBATES, found in the Malay countries, is an insectivorous genus of mammals. Several species very closely resemble squirrels.

CLADONIA RANGIFERINA. Hoff. Reindeer moss. See Lichen.
CLAM. Eng. A mollusc of the genus Tri-
dacna, common in many parts of the world. There
are six recent and one fossil species known, and
the great clam shell of the Archipelago is used in
Europe for church fonts.

CLANSHIP, somewhat resembling the form it
assumed in Scotland, prevails amongst several of
the Afghan and Baluch races, where the adjoining
tribes have not as yet amalgamated into nationali-
ties. Moral worth, national pride, love of country,
and the better feelings of clanship, are the chief
grounds upon which a great people can be raised.
These feelings are closely allied to self-denial, or
a willingness on the part of each man to give
up much for the good of the whole. By this,
chiefly, public monuments are built, and citizens
stand by one another in battle; but all these are
wanting from most of the races occupying British
India at present. Many of the Rajput races are
in clans, and Mahomedanism has given a bond,
but even it is not strong; and China has three
distinct races, the Chinese, the Manchu, and the
Mongolian, which separate in civilisation and in
aspirations.—Short's Egypt, i. p. 274.

CLARET, a term generally used to designate
the red wines, the produce of the Bordeaux.
The most esteemed are Lafitte, Latour, Chateau-Mar-
gaux, and Haut-Brion. Clarret is a general name
for all rose-coloured wines, and in France what
the English call clarret is styled Bordelus.

CLARIFIED BUTTER is the ghi of Hindustan
and the yennai of the Tamil.

CLAUDIUS CæSAR. The first authentic
account of Ceylon, or Taprobane, extant, is given
by Onesiculus, the Macedonian admiral, who lived
B.C. 320 or 330. Diodorus Siculus, B.C. 44, gives
an account of it. Strabo also mentions it; and
Dionysius, who flourished A.D. 36, confirms former
accounts, and alludes to its elephants. Sinbad
also speaks of it in a volume, perhaps a compila-
tion and in part a romance, as does Abdoor Razak.
Ribiero also gives a notice of it. In the reign of
Claudius Caesar a Roman publican, who formed
the custom duties of the Red Sea, was driven
from Arabia by storms on to Ceylon, where he
found a flourishing kingdom and an enlightened
sovereign, whom he persuaded to send an embassy
of four envoys to Rome, by way of the Red Sea,
for the purpose of negotiating a commercial
treaty.

CLAUDIUS PTOLEMY, author of the Alman-
gest, lived A.D. 140-160.

CLAUSENA, a genus of shrubs or small
trees belonging to the natural order Citraceae.
C. heptaphylla (Karan-phal, Hind.) grows in
Bengal, has small flowers, greenish-yellow and
anise-scented, and its bruised leaves have the
fragrance of fresh anise seeds. C. nana grows in
the Mohuccas, C. punctata and C. suffruticoso,
grow in Chittagong; and the fresh leaves of C.
Sumatra, when bruised, have the fragrance of a
lemon leaf. C. Volkmannii, W. and A., grows
near Chingleput, and C. pubescens. W. and J.,
in the Peninsula.—Robx.; Voigt.

CLAVIJO. Don Ruy Gonzales de Clavijo was
appointed, a.D. 1403, by Henry III. of Castile
on an embassy to Timur. He quitted Constanti-
nople 14th November, and passed through Arme-
nia, Azerbaijan, Teheran, Damghan in Khorasan,
and reached Samarcand 8th September 1404; but
Timur was too ill to receive them, and they
returned 21st November by Trebizond and Genoa
(31 January 1406); Clavijo reached Neville in
March.

CLAY. Fire-clay.

Claymar, . . . Hind. | Sangti-dalam. HIND.
Gi'. | Chikii miti. HIND. | Tamhle, white clay, MAIY.

Clay is a compound, or perhaps only a mixture,
of the two earths, alumina and silica, with water.
Pipe-clay, Namam, TAMIL. Kharra, DUKK.

Clay is of a greyish-white colour, with an earthy
fracture, and a smooth, greasy feel; it adheres
to the tongue, and is very plastic, tenacious, and
infusible. When burnt, it is of a cream colour,
and is used for tobacco-pipes and white pottery.
This is found in abundance in several parts of
India; and Hindus employ it for making the
distinguishing marks on their foreheads, and
(noised with water) it is often applied round
the eye in certain cases of ophthalmia, as well as
to parts of the body that are bruised.

Potter's clay is of various colours, chiefly reddish
or grey, and becomes red when heated. Mixed
with sand, it is formed into bricks and tiles. It is
abundant in many parts of South-Eastern Asia.

Stourbridge clay resembles potter's clay to a
certain extent, but is far more refractory in the
fire. It is of a dark colour, owing probably to the
presence of carbonaceous matter. It is exten-
sively used in making crucibles, glass pots, etc.

Brick-clay or loam, abundant in S.E. Asia,
varies greatly in appearance, texture, and com-
position; its colour depending on the proportion
of oxide of iron contained in it.

Porcelain clay, the kaolin of China, is very
abundant in S.E. India, produced by the decom-
position of felspar, and of binary granite.

Fireclays are procurable at Streupermatoor,
Trippoor, Chingleput, Metapolliam, and Cudda-
pat; indeed, are very common in many parts of
India, and bricks can be made that resist the
action of great heat. A clay found at Beyapore,
20 to 30 feet below the surface, is used for fire-
bricks and for lining furnaces.

Luscious clay is excavated from a pit near
Kolah in large quantities, and exported as an
article of commerce, giving a royalty of Rs. 1500
yearly. It is used chiefly to free the skin and
hair from impurities; and the Cutch ladies are
said to eat it to improve their complexion.

The clay used for making pottery in Sind is obtained
from situations washed over by the Indus river,
10 feet under ground. It is reduced to a fine
powder, and soaked in water for 24 hours; after
which it is kneaded with the hands and feet, and
when it becomes dough-like, it is divided into
lumps of the required shape.—Gomlinson: Brs.

CLEAN and Unclean, terms often occurring in
Scripture, as in Levitians xi.-xv., have refer-
ence to unclean creatures, unclean persons, and
personal and ceremonial uncleanness. As in
Lev. xii. 2, after childbirth a Brahman mother is
unclean for eleven days, a princess sixteen, mer-
chant's wife seventy-one, and a Vellala Sadora
thirty-one days. As with the Hebrew women,
the Hindu mother in her days of uncleanness
cannot touch any hallowed thing nor any domestic
article. When the days of her purification are
over, she takes or sends an offering to the temple.
In the matter of clean and unclean things and
persons, Mahomedans follow the Mosaic law.
CLEARING NUT.

The ripe seeds of Strychnos potatorum are dried and sold in every market in India to clear muddy water. Natives of India never drink clear well water if they can get pond or river water, which is always more or less muddy. One of the seeds is rubbed very hard for a minute or two round the inside of the vessel containing the water, which is generally an unglazed earthen one, and the water left to settle; in a very short time the impurities fall to the bottom, leaving the water clear and perfectly wholesome.—Roxburgh.

CLEVELAND, AUGUSTUS, a Bengal civil servant, who in a brief space won over the wild races near Rajmahal. He died while still young; and the Government of India decreed a monument to his memory at Bhagulpur, with the following inscription:—To the memory of Augustus Cleveland, Esq., late collector of the districts of Bhagulpur and Rajmahal, who, without bloodshed or the terror of authority, employing only the means of conciliation, confidence, and benevolence, attempted and accomplished the entire subjection of the lawless and savage inhabitants of the jungle-terry of Rajmahal, who had long infested the neighbouring lands by their predatory incursions; inspired them with a taste for the arts of civilised life, and attached them to the British Government by a conquest over their minds, the most permanent, as the most rational mode of dominion; the Governor-General and Council of Bengal, in honour of his character and for example to others, have ordered this monument to be erected. He departed this life on the 13th day of January 1784, aged 29.—Tr. of Hind. i. p. 101.

CLEGHORN, HUGH, M.D., a medical officer of the Madras army; a learned botanist, contributor to scientific journals of articles on botanical subjects; Conservator of Forests at Madras and Northern India, founder of the Indian Forest Department. He wrote on the Hedge Plants of India, and the circumstances which adapt them for special purposes in particular localities, Rep. Brit. Ass. 1850; on the Grass Cloth of India, ibid. 112; on the Physical Effects of the Destruction of Tropical Forests, ibid. 1851, London Athenæum 1851, p. 781; also on the Forests and Gardens of Southern India; in 1864, upon the Forests of the Punjab and the Western Himalayas; and the article Forests in the Encyclopaedia Britannica.

CLEIDION JAVANICUM. BL.

Lasiostyles salisifolia, Prot. | Rottleriara undara, Dalz.

This middling-sized glabrous tree is common in the moist forests on the Annamalais, elevation 2000 to 3000 feet, Travancore below Ghats, in the western forests of the Peninsula, Ceylon, Bengal, Burma, Java, etc.; timber hard, and good for building purposes.—Beddome, Fl. Sylv. p. 272.

CLEMATIS VITALBA? Smith, the Tung-tsau or Muh-t'ung of the Chinese, is a climbing plant of Shan-si, Shen-si, China, has a yellow bitter wood, and vascular tissue arranged in plates passing from the centre to the circumference, and open enough to allow air to be blown through. The wood, root, and fruit are used medicinally.—Smith.

CLEODORA, a luminous mollusc, with a vitreous shell.

CLEOME, a genus of plants belonging to the Capparidaceae or caper tribe. Species formerly placed under this genus have been transferred to the genera Polanisia and Gynandropsis. C. monophylla, Linn., the C. cordata, D. C., grows in Ceylon and the Peninsula, and has small, pale, rose-coloured flowers.—Roxb.; Linn.; D. C.

CLEOPATRA'S NEEDLE, a monolith, so called by the British; by the native eicoroni it was called Massallat-ul-Firaun, Pharaoh's packing needle. It was granted to the British nation, and in 1875 was brought to London, and erected on the left bank of the Thames.—Burton's Mecca.

CLEOPATRIS, an ancient town near the modern Suez.

CLEFTSYDRA, the Ghatka-patra of the Mahratta race. A hollow vessel for measuring time. It has an aperture in it, and when placed in water the vessel gradually fills and sinks, and the final submergence indicates the measure of time.

CLEARODENDRON, a genus of plants belonging to the Verbenaceae. One species in the Tenera forms a large shrub beneath every tree, generally intermixed with ferns, as polypodium, pteris, and goniopteris, and its sweet odour is borne far through the air. Clerodendron leaves, bruised, are used to kill vermin, fly-blows, etc., in cattle, and the twigs form toothpickts. Its flowers are presented to Siva (Mahadeo), milk, honey, flowers, fruit (ambrosia), etc. being offered to the pacific gods, as Vishnu, Krishna, etc.; while Mudar (Calotropis asclepias), Bhang, Cannabis sativa, Datura, flesh, blood, and spirituous liquids are offered to Siva, Durga, Kali, and other destroying deities. The Burmese cultivate a fragrant double cleroendron. One species, supposed by Dr. Stewart to be C. Infortunata, or, called Kali basuti on the Ben, occurs in the Siwalik tract, and occasionally in the plains, and is probably the one at the close of the rains, and give out a very strong perfume. It is a hardy plant, and grows in any soil. C. grata, Biliri, HIND., is a plant of Kaghan and Nepal, and has small yellowish fragrant flowers; C. florida is of Japan. In France the Clematis vitalba is used by mendicants to cause artificial sores for the furtherance of their impositions. In Cochsin-China, according to Loureiro, the C. Sinensis is used as a diuretic and diaphoretic. At the Mauritius, the C. Mauritiana is employed to blister the cheek for the relief of toothache.—C. Wightiana, W. and A., is scendent, perennial, with very soft villous leaves, coarsely serrated. It also is called Moriel, and grows common at Mahabaleshwar and the adjacent ghats, flowering in the month of August. C. Wallich's C. grata, Asiat. Pl. t. 98, much resembles it, and is perhaps identical. Hedges and thickets where these plants grow have the appearance of being covered with hoar-frost, from the white feathery tails of the seeds. They are very ornamental, and worthy of a place in gardens for trellis work.—Roxb.; Gr. Cat.; Riddell; Mason, p. 671.

CLEFTSIDRA, the Ghatka-patra of the Mahrratta race. A hollow vessel for measuring time. It has an aperture in it, and when placed in water the vessel gradually fills and sinks, and the final submergence indicates the measure of time.

CLERODENDRON GROWS THE MACROPHYLLUM, THE INfortunate, which is Burmese a

The Karen mountain glens of Tavoy and Mergui are embellished with the elegant flowering nodding clerodendron. The flowers are tinged with rose, but nearly white, growing in long panicles at the extremities of the branches, from which they make a graceful curve, and hang down perpendicularly from ten to fifteen inches, like an inverted cone, so that the soft green foliage seems canopied with rose-white veils. It grows in Syieth, blooms in the dry season, and rarely exceeds ten feet in height.—Mason; Voigt.

CIJMATE PLUMOIDES. Linn.
Volkmannia multiflora, Burn.

Taludala, . . . Tam. Tekkali, Tilaka . . . Tel.

Grows in the Dekhan, Coromandel, Bengal, and Lower Kamaon.

CIJMATE SERRATUM. Blume.
C. macrophyllum, Sims. [Volkmannia serrata, Linn.
Jaru taka . . . MALEAL Brahmani mari . . . Tel.
Chiru dekku . . . Tam.

Grows in Salsette above the Bombay ghats, in Nepal, Morung mountains. The flowers and leaves are said to be eaten as greens; but in the northern Circars the root is known as Ganta-baringa, and is largely exported for medicinal purposes, being used for febrile and catarrhal affections. The leaves and seeds are also used medicinally.—Clerodendron siphonanthus. Br. Siphonanthus Indica, Linn.; Arni., HIND. OF BEAN.

Arnab, . . . HIND.; Dawal-mubarak, Pers.

Grows in both Peninsulas of India, in Bengal and Syieth. Its root and leaves are officinal; the Persian name means the blessed medicine. It is slightly bitter and astringent; yields resin. Employed in syphilitic rheumatism.—Stewart; Voigt.

CIJMATE SQUAMATUM.
Volkmanna Kamberiana, Jacq.

Scarlet clerodendron. Bu-gye-nee, . . . BURN.

The Burmese gardens are ornamented with this species, which bears a large cone of superb scarletflowers. Although said to be originally from China, it appears to be naturalized in Burma.—Mason.

Sarawati aku, . . . Tel.

Grows in both the Indian Peninsulas, also in Bengal and Oudh.

CLEVERA GYMNAANTHERA. W. and R. A large tree on the Neelgerry hills, timber of a reddish colour, strong and durable.—French.

CLIMATE OF INDIA.

The Hindu races familiar with the tropical countries in which they dwell, use ‘water’ as the term for describing the effects of a climate on health. In this sense it is the salubrity of a locality that is alluded to. Mahomedans of Asia treat of seven climates, the Haft aklim. This applies to the northern hemisphere, which they partition with zones of various breadth from east to west. When alluding to the salubrity of a locality, the Mahomedans of India and Persia use the words Ab-o-Howa, water and air. In Hindustan the people usually arrange the year into three periods, the Choumass or Bark’ha, which is the rainy season, of four months’ duration; after which is the Seela, or Jarn, or Mohasa, the cold season; followed by the Dhopp-kala or Khurra, or hot season. This division indicates generally the course of the seasons in India, though in one locality the rains or the hot season may be somewhat more prolonged. The primary divisions of the abode of the Mahomedans are thus four:—Hindustan, including in which term the whole Peninsula of India, and the Gangetic plain to the base of the Himalaya. 2. The Himalaya, a mountain chain which rises abruptly from the Gangetic plain, and is connected with a still loftier mountain mass (of Tibet) to the north, and beyond India. 3. Eastern India ultra Gangem, including native and British Burma and the Malay Peninsula. 4. Afghanistan. These divisions are marked out by great mountain barriers and by the ocean. The Himalaya mountains on the north are nowhere under 15,000 feet, usually exceed 17,000 and 18,000 feet, and rise in isolated peaks or groups of peaks to 21,000 and to 28,000 feet.

From the western extremity of the Himalaya, the Afghan mountains descend parallel with the Indus, with a gradually decreasing elevation from about 15,000 feet to the level of the ocean at the Arabian Sea. Throughout Afghanistan the climate is excessive. The cold of the winter is intense, the spring is damp and raw, and the summer, during which hot winds prevail, is intensely hot at all elevations. The general aspect of the whole of Afghanistan is that of mountains with broad flat valleys. The crops are chiefly wheat and barley, even up to 10,000 feet elevation. Rice is cultivated in great quantity at Jalalabad 2000 feet, at Kabul 6400 feet, and to a considerable extent at Ghajni, 7730 feet. Poplars, willows, and date-palm trees are extensively planted, as well as mulberry, walnut, apricot, apple, pear, and peach trees, and also the Elaeagnus orientalis, which bears an edible fruit. The vine abounds as in all warm and dry temperate climates. The majority of the Afghan and Tibetan plants are also on the one hand natives respectively of the Caspian steppes and N. Persia, and of Siberia on the other.

The date is cultivated in Baluchistan up to 4500 feet; and a dwarf palm, Chamerops Ritchiana of Griffith, perhaps identical with the Chamerops humilis of Europe, occurs abundantly in many places, but with a somewhat local distribution.

The Burmese and Malay mountains, being given off from the snowclad mountains of East Tibet,
The climate of India is remarkably varied. The rainy season extends from June to September, and the dry season from December to February. The monsoon winds are the principal cause of the rainfall, and are most marked in southern India. The prevailing winds are from the south-west during the months of June and July, and from the north-east during the months of October and November. The temperature varies considerably in different parts of the country, being hot in the south and tropical in the north. The humidity is greatest in the south-western part of the country, and least in the north-eastern part. The rainfall is heaviest in the southern part of the country, and least in the north-eastern part. The vegetation is also very varied, ranging from the dense forests of the south to the dry grasslands of the north.
feet, and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, humidity, and many local circumstances. In Ceylon and the Western Peninsula, whose mountains attain 9000 feet, and where considerable tracts are elevated above 6000 to 8000 feet, snow has never been known to fall. On the Khassa mountains, which attain 7000 feet, and where a great extent of surface is above 5000, snow seems to be unknown.

Sikkim occupies an intermediate position between Nepal and Bhutan, and unites the flora of Nepal, Bhutan, East Tibet, and the Khassa mountains, being, hence, in a geographical-botanical point of view, one of the most important provinces in India, if not in all Asia. In Sikkim snow annually falls at about 6000 feet elevation, in Nepal at 5000 feet, in Kumaon and Garhwal at 4000, and in the extreme W. Himalaya, lower still.

East Tibet is an enormously elevated mountain mass, and many of the large rivers of Asia flow from it in several directions.

The Eastern Archipelago, from consisting of large islands separated by belts of sea, possesses a humid and equable climate; but the great continent of Australia, being a vast expanse of low land, becomes very heated when the sun is in the southern hemisphere, and presents extremes of climate. The common characters of Sind are great summer heat but little tempered by rain, great winter cold, a dry soil. Its flora resembles those of Egypt, Arabia, and the countries bordering on the Persian Gulf.—Dr. Stocks: Journ. of the Ind. Archipelago, ii., February 1818.

CLIMBING PLANTS are exceedingly numerous in the damp forests of India. At Tonglo, in Sikkim, at an elevation of several thousand feet, Dr. Hooker found great scented trees twisting around the trunks of others, and strangling them; the latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups,—(1) Those whose stems are merely twine, and by contrivance attain the heights of their support, induce death. (2) Those which form a punk round the trunk by the coalescence of their lateral branches and aerial roots, etc.; these wholly envelope and often conceal the tree they enclose, whose branches appear rising far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are leguminosa, ivies, hydrangeas, vines, pothos, etc. The insouciant ones are almost all fags and Wightia; the latter is the most remarkable for its grasping roots.—Hooker, Himal. Journ. i. p. 163.

CLISOBORA, now called also Muzumgar and Calisapura.

CLITORIA TERNATEA. Linn.
Nipurajita, B. Niluparajita, Shwet Upurajita, Oungmai-bhuyo, BURM. Aparajita; Aapjota, Kali zar? DUKH. Khagin, Aparajita, Kowatheti, HIND. Shlonga-kuspi, MARR. Tamsa dintena; Nalla, Formika pauk, MALEL. dintana, . . .

The most common variety of this cultivated flowering plant are the blue and white. They blossom all year round, and, being shrubby twining plants, are well suited for covering trellis work. They are of easy growth. Dr. O'Shaughnessy does not recommend its use in medicine. Its flower is favored to Durga. A variety of C. carunculosa is reported—Hooker, Himal. Journ. ii. p. 291: Musson; O'Sk.; Powell.

CLIVE, ROBERT, LORD, a Madras civil servant, who became a great military commander, was Governor of Madras and of Bengal, and Commander-in-Chief of India. Amongst the many eminent men who have served and ruled in British India, he alone has been styled 'Great;' and whether his deeds as a military commander be considered, or his successes in the civil administration of India, posterity has conceded that title to him alone. He entered the service of the E. I. Co. in 1744 as a writer, but shortly afterwards obtained an ensign's commission. In September 1748 he distinguished himself as an ensign before Pondicherry, and again in August 1749 at Devicottah. In May 1751 he was present in the fight at Voloonda, and in July defeated the French at Condore. In 1751 he laid siege to Arcot, with only 129 Europeans and 200 natives; in August, took it. Arcot fort was invested by Chanda Sahib, with 4000 troops, but Clive withstood and repelled all assaults, and his opponents ultimately withdrew. This defence made a powerful impression on all the native races. In November he defeated Basin Rao at Arni; in December took the pagoda of Conjevarum; in 1752 he defeated the French and Chanda Sahib at Canverypan, destroyed the town of Duplex Pattchadal, defeated the French army, took Covelong, and commanded the land forces against Gheriah. In 1756, after the loss of Calcutta and the imprisonment by Suraj-ud-Dowlah in the guard-room, since known as the Black Hole, he left Madras with 900 Europeans, recaptured Calcutta, and made peace. But war again broke out, and Clive with 3000 British and native soldiers defeated Suraj-ud-Dowlah on the 23d June 1757 at Plassey, 40 miles south of Murshidabad. Mir Jafar was then declared subahdar of Bengal, Behar, and Orissa. Clive revisited Britain in 1760, with the rank of colonel. Mir Jafar was restored in 1763. Clive subsequently returned to India, corrected abuses in the government, obtained the dewani of Bengal, Behar, and Orissa, and assumed the civil and military government of the country, as Governor and Commander-in-Chief. His retributions caused a mutiny amongst the officers and men, which he quelled with severe measures. He returned to Britain in 1767, and at first was well received, but was subsequently impeached before Parliament, and only escaped trial by voluntary death in November 1774. In the ungrateful and final treatment by his country, his fate resembled those of La Bourdonnais, Duplex, and Warren Hastings. Lord Clive was the territorial founder of British India. The whole system of British India is organized on a branch of the public service, created courts of justice, and reformed the revenue collections. Lord Clive's life has had several historians, amongst whom are Caraccioli and Malcolm.

Clive, Lord, Governor of Madras in 1801, was a relative. The descendant of Lord Clive's family is now styled Earl Powis in the peerage of Great Britain.—Mallson: Orme.
CLOAK.

Many races in the south and east of Asia wear cloaks. That of Egypt is called burnous. The cloaks of Afghanistan are the postin, postaki, postinchi, choga, and kholsi; and the aba is worn in Arabia.

CLOCK.

Uuren; Uhrwerken, Dut. | Orologgi; Orinoli, . . . It.
Horologien; Horologiés, Fr. | Tschasii, . . . . Rus.

The clocks to be seen in the south and east of Asia are wholly of European manufacture. Prior to their introduction, the clepsydra or water-clock was in general use. These were of copper, with a small aperture at the bottom, through which, when placed in water, the clepsydra filled and sank, the sinking marking an hour. The water-clock of the Malay sailors is half of a coconut shell, with a small hole, through which, when placed in a bucket, it fills and sinks in an hour. Pendulum clocks were invented about a.d. 1260.

—Mr. Cullock.

CLOTHING.

The materials used for clothing, and the forms of dress of the peoples of the south and east of Asia, differ according to the climate, the pursuits, and the customs of the races. Through a thousand years, seemingly, the south-eastern races continue to wear clothing similar to what their forefathers put on; but Andamanese live wholly without apparel, and Chinese dress in a very elaborate manner. Hindu men and women, until the middle of the 19th century, wore only cloths without seams; and even yet their women's bodice (choli) and the men's jacket (angriká) alone are sewed, the lower garment of both sexes being cloths which are wrapped round the limbs, and often as neatly as so as to form this form of dress in the most perfect manner. Hindu clothing is not called clothes, but cloths. Most Hindus wear trousers when on horseback; but the prevailing Hindu custom illustrates Mark x. 50, where mention is made of the blind man throwing off his upper garment, which was doubtless a piece of cloth. It is not considered at all indecent among the Hindu people for a man to appear naked from the head to the waist, and servants thus attired serve at the tables of poor Europeans. In Arabia, a coarse cloak of camel or goat's hair is generally worn, often as the sole attire. It is called an aba, and its material is camel's hair. Amongst men of the very humbler classes of Southern India, at work, the simple loin-cloth is the sole body clothing; but almost all have a sheet, or a cumbi, or coarse blanket of wool or hair, as a covering for warmth. The Nair women move about with the body uncovered down to the waist, as an indication of the correctness of their conduct. The women of the Ptnab or Jumna, in the Denkénial district of Orissa, also called Patra-Sauri or Leaf-Sauri, till 1871 wore a covering of a bunch of leaves, hanging from the waist, both in front and behind. Forest races in Travancore also wear leaves as covering. Hindu children, both boys and girls, up to three or four years of age, have no clothing; the Abor young women have a string of shell-shaped embossed bell-metal plates, and Míri women wear a small loin kilt made of cane. Throughout British India, however, almost every Hindu and Mahomedan woman, or her juniors in circumstances, is wholly covered, from the neck to the ankles, with choli and gown or trousers, or cloths of kinds. This seems to have been the practice from remote antiquity. In Vedic times the women seem to have dressed much like the present Rajputni. They had a gogra or petticoat, a kaučhali or corset, and a do-patta or scarf. In the Rig Veda there is an allusion to Indrani's headdress as being of all forms, and several passages are indicative of considerable attention having been paid to personal decoration (Calculta Review, No. 109, p. 30). Weaving is frequently alluded to in the Vedas. The Yajur Veda mentions gold cloth or brocade as in use for a counterpane. In the Ramayana are mentioned the wedding presents to Sita as consisting of woollen stuffs, fine silken vestments of different colours, princely ornaments, and sumptuous carriages. The Mahabhárata mentions furs from the Hindu Kush, woollen shawls of the Abhira of Gujarat, cloths of the wool of sheep and goats, etc.; and weaving and dyeing are repeatedly mentioned in the Institutes of Menu.

The best representations of ancient costumes in India are the celebrated fresco paintings in the caves of Ajanta, some of which are still very perfect, and in the Buddhist caves of Ellora some paintings in a similar style had been executed. It is difficult to decide the date of these paintings, which represent scenes in Buddhist history; and the series may extend from the 1st or 2d century before Christ, to the 4th and 6th century of this era. In either case they are upwards of a thousand years old, and as such are of much interest.

One very large picture, covered with figures, represents the coronation of Sinhala, a Buddhist king. He is seated on a stool or chair, crowned with a tiara of the usual conventional form, and in a dress which, as an emblem of plenty and fertility, is being poured over his shoulder by girls. He is naked from the throat to the waist. All the women are naked to the waist; some of them have the end of the cloth or sari thrown across the bosom, and passing over the left shoulder. Spearmen on foot and on horseback have short waist-cloths only.

In another large picture, full of figures, representing the introduction of Buddhism to Ceylon, and its establishment there, all the figures, male and female, are naked to the waist. Some have waist-cloths or kilts only, others have scarfs, or probably the ends of the dhoti, thrown across their shoulders. Female figures, in different attitudes around, are all naked, but have necklaces, ear-rings, and bracelet, and one a girdle of jewels round her loins.

Some writers have maintained that the ancient Hindus were ignorant of the art of preparing needle-made dresses. It has even been said that there is no word for tailor in the language of the Hindus; but there are two—one, tumaavaya, which applies to darning, and the sauchika, which applies to tailoring in general. The Rig Veda mentions needles and sewing, and the Ramayana and Mahabharata allude to dresses which could not have been made otherwise than with the aid of needles. In the ancient sculptures at Sanchi, Amarnoti, and Orissa, several figures are dressed in tunics which required needles. Amongst these garments are discoverable what may be called the ancestors of the modern chapkan and jamah. The dress differs so entirely from the chiton, the chlamys, the himation, and such other vestments as the soldiers of Alexander brought to India,
that they cannot be accepted as Indian modifications of the Grecian dress. In many ancient sculptures of Buddhist times, queens, princes, and ladies of the highest rank are represented without any garments; and it has been suggested that there prevailed either a conventional rule of art, such as has made the sculptors of Europe prefer the nude to the draped figure, or a prevailing desire to display the female contour in all its attractiveness, or the unskilfulness of early art, or the difficulty of chiselling drapery on such coarse materials as were ordinarily accessible in this country, or that a combination of some or all of those causes exercised a more potent influence on the action of the Indian artist than ethnic or social peculiarities in developing the human form in stone.

Allusion is made to "saffron-tinted robes" and to "red-dyed garments" in occasional passages of the early writings, but even these are comparatively rare, as we see, and in one and the same text there is little more in respect to women. In the drama of Vikram and Urvashi, written probably in the reign of Vikramaditya, B.C. 56, Puravas, one of the characters, says of Urvashi, a nymph who has fainted,—

"Soft as the flower, the timid heart not soon
Foregoes its fears. The scarf that veils her bosom
Hides not its flutterings, and the panting breast
Seems as it felt the wreath of heavenly blossoms
Weigh too oppressively."—Act i. Sc. 1.

Again,—

"In truth she pleases me: thus chastely robed
In modest white, her chattering tresses docked
With sacred flowers alone, her haughty mien
Exchanged for meek devotion. Thus arrayed,
She moves with heightened charms."—Act iii. Sc. 2.

In the drama Mrichchakatii, attributed to king Sudraka of Ujjain, who reigned, according to the traditional chronology, in the first century before the Christian era, and is certainly not later than the 2d century after Christ, Act iv. Sc. 2 says,—

"Maitrena. Pray who is that gentleman, dressed in
silk raiment, glittering with rich ornaments, and rolling about as if his limbs were out of joint?

Attendant. That is my lady's brother.

Maitrena. And pray who is that lady dressed in
flowered muslin?—a goodly person, truly," etc.

The following passage, taken from the Uttara Rama Charitram, by the same author, affords an idea of the costume of a warrior race. Jannaka, the father of Sita, the heroine, in describing the hero Rama, says,—

"You have rightly judged
His birth; for see, on either shoulder hangs
The martial quiver, and the feathery shafts
Blond with his curling locks. Below his breast,
Slight tinted with the sacrificial ashes,
The deer-skin wraps his body, with the zone
Of Murva bound; the madder-tinted garb
Descending veda's his limbs; the sacred roasy
Degrifts his wrists; and in one hand he bears
The pimple staff, the other grasps the bow.

Arunaditi, whence comes he?"

The clothing of the Mahomedan races, who came from the north-west, has been of wool and of cotton, to suit the changing seasons, and the articles of dress were cut out and sewed in forms to fit the body. The Rajput and other martial races have always dressed similarly.

Most of the Hindu women of the present day appear in public, and at their numerous religious festivals opportunities for seeing their holiday clothing are numerous. On such occasions the wealth of the mercantile classes admits of much display. In Bombay, a brilliant and picturesque array of women drifts along the streets and ways. The large and almost bovine Banyan and Bhattia women roll heavily along, each plump foot and ankle loaded with several pounds' weight of silver. The slender, gold-tinted Puthal women, with their hair tightly twisted, and a coronal of mogra flowers, have a shrinking grace and delicacy that is very attractive; and, barring the red Kashmir chadar, their costume is precisely that in which an artist would dress Sakuntala and her playfellows. The Marwari females, with skirts full of plaits, tinkling with hawk-bells, their eyes set in deep black paint, and the sari drooped over the brow so as to hang in front, are very curious figures, seldom pretty. Sirmati girls, with their drapery so tightly kitted as to show great sweeps of the round, brown limbs, smooth and shapely, that characterise those Venuses of the stable and brothel, which are so familiarly seen, frequently with a child on their rounded hips. There is a quaint expression of good-humour on their features, which have a comely ugliness unlike that of any other race. Then the trim little Malvén girls, who are already growing fairer and lighter in colour from their confinement in the cotton factories, slinging quickly along with a saucy swing of their oscillating hips; and the longer-robed Ghati, scarcely to be distinguished from women of the Marathi caste, go more demurely. The Brahman woman is best seen at Poona, Wye, and at Nasik. In Bombay she is scarcely distinguishable from Sonar, Santar, and others. Those odd, gipsy-like wenches, the Wagri beggar women, each provided with a plump baby, carried in a tiny hammock slung on a stick, and handed to the spectator as if it were something to buy or to taste, are to be seen in numbers, sometimes twanging on a one-stringed sitar, but more often playing the tom-tom on their plump forms, with that frank simplicity of pantomime which is the supreme effort of Hindu eloquence, and the art of suitting the action to the word. Gossains, with their little stalls of shells, brass spoons, bells, and images. Everybody very happy, and all differently clad.

In the present day, before a Hindu puts on a new garment, he plucks a few threads out of it and offers them to different deities, and smears a corner with turmeric to avert the evil eye. The Cloth of a married Hindu woman has always a border of blue or red, or other colour. The dress of a Hindu widow is white.

Arab (men's) dress has remained almost the same during the centuries. Over the shirt, in winter or in cool weather, most persons wear a shalwar, a short vest of cloth without sleeves; kation or kufan of striped silk, of cotton or silk, descending to the ankles, with long sleeves extending a few inches beyond the finger-ends, but divided from a point a little above the wrist or about the middle of the forearm. The ordinary outer robe is a long cloth coat of any colour, called by the Egyptians gibbeh, but by the Turks juube, the sleeves of which reach not quite to the wrist. Some persons also wear a benceh or banish robe of cloth, with long sleeves, like those of the kufan, but more ample. It is properly a robe of ceremony, and should be worn over the other cloth coat, but many persons wear it instead of
the gibbon. The Fanageychs robe nearly resembles the benceh; it has very long sleeves, but these are not slit, and it is chiefly worn by men of the learned professions. In cold weather, a kind of black woollen cloak, called abaye, is commonly worn. Sometimes this is drawn over the head. The abaye is often of the brown and white striped kind.

In British India the ordinary articles of clothing of Hindu and Mahomedan women comprise the bodice, called choli, angka, kachuri, koortee, and kupissa; the petticoat, called lahunga, lahunga, ghagra, and pesghir; and the sari, or wrapping loin-cloth.

Men's clothing consists of—
- Loin-cloth, dhoti or loongi;
- Trousers, called paijama, izar, turwur, gurgi, and shalwar;
- Jacket, coat, and vost, called anga, angarka, chapkan, dagia, jora, koortta, kula, kufcha, mina, mirzali, jama, labada;
- Skull-cap, topi, taj;
- Head-dress, pagri, turban (sir-band), shumla or shawl turban, rumal, or kerchief, dastar;
- Kamurband or waist-belt, sash.

The women of Burma wear a neat cloth bodice, and, as an under garment, a cloth wrapped tightly round from the waist downwards; but so narrow that it opens at every step, and all the inner left thigh is seen.

Fabrics used for the clothing of the masses of the people of India are plain and striped dooria, mutinol, aghatani, and other figured fabrics have established themselves; the finest qualities of muslin must necessarily be confined to very rich persons.

Long cloths or pajamias of various qualities were formerly manufactured to a great extent in the Northern Circars, as well as in other parts; the great proportion consisted of 14 pajam or cloths containing fourteen times 12 threads in the breadth, which varied according to local custom from 38 to 44 inches. 14 lbs. was considered the proper weight of such cloths, the length 36 cubits, half-lengths being exported under the denomination of salamwors. The manufacture of the finer cloths, which went up to and even exceeded 50 pajam, has long been discontinued.

Other articles of dress of women of Bombay are the bungur - kulde, chikhee, choli or khun, chomee or head-cloth, doorangu-pytanee, guj (covering for breast), guaze or long robe, izarband, kempdhinder (widows), kurch-chunderkulee, pesghir, paijama, saris of kinds, silaree.

In Cutch, the khombre, saldo, for women; for men, pairahan, paijama, izarband.

Other articles of dress of the men of Bombay.—angarka, chaga, dhoti, izarband, koortaa, labada (in Baluchistan), pairahan, paijama, turban, ujuruk or coloured sheet (in Sind).

Men's Cloths are manufactured all over British India, and those of the Madura district have lace borders; they are sold as high as 70 rupees for a suit of two pieces. Conjeveram is noted for its silk-bound cloths, which are sold for not more than 15 rupees a pair.

Women's Cloths of cotton form an article of manufacture in every district. Madras manufactures a nicely coloured women's cloth called colloor sailay, sold for 7 rupees and upwards. Arnee is noted for its manufacture of a superior quality of white cotton cloths of various patterns. Those of Sydapat, in the outskirts of Madras, are of ordinary quality, and of different colours. Ganjam also manufactures a common sort, with a few of more value worked with lace borders, but not sold for more than 50 rupees.

Women's Silk Cloths.—The principal places for the manufacture of native female silk cloths are the towns of Benares, Berhampore, and Tanjore. Those of Benares are generally of superior quality, with rich lace borders, and they are sold at from 50 to 350 rupees or upwards. Berhampore cloths are wholly silk, but nicely finished. Tanjore cloths are also neatly finished, with nicely-worked borders, both of lace and silk, of various colours; they are sold at from 15 to 150 rupees.

Silk Cloths, called pethambaran, are chiefly bought from Benares and Nagpur; they are also made at the town of Combaconum. The Benares cloths are highly prized for their superior quality; they measure 12 by 2½ cubits a-piece; two pieces make one suit of an upper and under garment. Hindus wear these cloths during their devotions and holiday time. They are sold from 50 to 350 rupees, or even more. The silk fabrics of Combaconum are good, although not equal to those of Benares.

White Cloths were manufactured all over Southern India, but those of Manamadu, in the district of Trichinopoly, were very superior in quality, and used by the more respectable of the inhabitants as clothing, under the name of Manamadu sullah. That at Arnee, in the district of Chingleput, known as Arnee sullah, is of different quality.

Women's coloured cotton Cloths.—These coloured cotton cloths are largely made in the Madura district. They are of various sizes, with or without lace-worked borders. Those with lace vary in price from 15 to 200 rupees each; they are generally purchased by the wealthier natives, by whom they are highly prized. These fabrics are known in the market as vankey, thombo, jonnada, and amboorasa, all of them lace-bordered.

Women's silk Cloths are made chiefly in Benares and Nagpur; but they are manufactured also at Berhampore, Tanjore, Combaconum, and Conjeveram, in the Madras Presidency. Those of Benares and of the Maharta countries are celebrated for their superior quality, and are highly prized for their lace borders; their size is 16 by 2½ cubits, and they are sold at 50 to 500 rupees and upwards; those made at Berhampore, Tanjore, and Combaconum are not equal to the Benares cloths, but are well made, and sold at from 15 to 70 rupees each. The women's cloths of Tanjore and Madura manufacture, and men's head-cloths, also from Madura, will compete with the production of any other loom in the world.

Printed Cloths are worn occasionally, as in Benar and Bundelkhand, for sarrees; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the humbler classes in Upper India; but the greatest demand for printed cloths is for palemiores, or single quilts.

In the costlier Garment Cloths woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the
CLOTHING.

sarees or women's cloths, those made at Baranaras, Pytum, and Burhanpur, in Gujerat, at Narrainpatt, and Dhanwarun, in the territory of His Highness the Nizam, at Yeokia in Kandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black shot with crimson or yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of, or approach to, glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexion of the people of the country; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair—as any lady of Britain or France. Another exquisitely beautiful article of Indian costume for men and women, is the do-patta scarf, worn more frequently by Mahomedan women than Hindus, and by the latter only when they have adopted the Mahomedan hnga or petticoat; but invariably by men in dress costume. By women this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head; by men, across the breast.

Do-pattas, especially those of Benares, are perhaps the most exquisitely beautiful and prized of all the ornamental fabrics of India; and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and ductile description imaginable, woven in broad, rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns, of the ribbon borders, or broad stripes. How such articles are woven with their exquisite finish and strength, fine as their quality is, in the rude handlooms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colours—the creamy white, and shades of pink, yellow, green, marvce, violet, and blue, are clear yet subdued, and always accord with the thread used, and the style of ornamentation, whether in gold or silver, or both combined. Many are of more decided colours—black, scarlet, and occasionally violet, dark green, and madder; but whatever the colour may be, the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing; but the dyers and soucers of India have a process by which the former colour can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The do-pattas of Pytum, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Dekhan, not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares.

Scarf{s} are in use by every one,—plain muslins, or muslins with figured fields and borders without colour, plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called sehla in India, are in everyday use among millions of Hindus and Mahomedans, men and women. They are always open-textured muslins, and the quality ranges from very ordinary yarn to that of the finest Dacca fibres. The texture of the dhootes, sarees, and loonkees manufactured in Britain and sent to India, is not that required by the people, but, too close,—for which reason the fabric, which of course makes the garment hang too heavy in women and difficult to wash. Again, the surface becomes rough, and, as it is generally called, fuzzy in use, while the native fabric remains free.

Few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But all classes wear coloured cloths,—black, red, blue, occasionally orange and green, violet and grey. All through Western, Central, and Southern India, sarees are striped and checked in an infinite variety of patterns. Narrainpatt, Dhanwar, and Mukul, in the Nizam's territories; Gidduk and Battigerry in Dharwar; Kolhapur, Nasik, Yeokia, and many other manufacturing towns in the Dekhan; Amnee in the south, and elsewhere, send out articles of excellent texture, with beautifully-arranged colours and patterns, both in stripes and checks. For the costly and superb fabrics of cloths of gold and silver (kimkhab), and the classes of washing satins (mushroom and hemroo), even if European skill could imitate them by the handloom, it would be impossible to obtain the gold and silver thread unless it were imported from India. The native mode of making this thread is known, but the result achieved by the Indian workman is simply the effect of skilful delicate manipulation. The gold and silver cloths (kimkhab) are used for state dresses and trousers, the latter by men and women; and ladies of rank usually possess petticoats or skirts of these gorgeous fabrics. Mushroom and hemroo are not used for tunics, but for men's and women's trousers, and women's skirts; as also for covering bedding and pillows. They are very strong and durable fabrics, wash well, and preserve their colour, however long worn or roughly used; but they can hardly be compared with English satins, which, however, if more delicate in colour and texture, are unfit for the purposes to which the Indian fabrics are applied. For example, a labada or dressing gown made of scarlet mushroom in 1842, had been washed over and over again, and subjected to all kinds of rough usage, yet the satin remained still unfrayed, and the colour and gloss as bright as ever. Many of the borders of loonkees, dhotees, and sarees are like plain silk ribbons, in some instances corded or ribbed, in others flat. The saree, boonee, bafta, jore, ekatta, gomacha, etc. of Dacca, have latterly been made of imported British yarn. Fabrics of a mixed texture of cotton and silk, are in Dacca designated by various names, as nowbuttee, kutan, roomee, appooles, and lucka; and when embroidered with the needle, as many of them frequently are, they are called kushnees.

The silk used in their manufacture is the indigenous muga silk of Assam and Sylhet, but the
CLOTHING.

Cotton thread employed was lately almost entirely British yarn, of qualities varying from Nos. 30 to 80. These cloths are made exclusively for the Jolda and Bussora markets, and a considerable stock is yearly imported in the Arab vessels that trade between Calcutta and these ports. Pilgrims, too, from the vicinity of Dacca, not unfrequently take an investment of them, which they dispose of at the great annual fair held at Meena, near Mecca. They are used by the Arabs chiefly for turbans and gowns. The golden colour of the mugra silk gives to some of these cloths a rich lustrous appearance; pieces made of native-spun cotton, threads and of the best kind of mugra silk, are admired.

The export trade of the Madras Presidency in madapollam and long cloths has been annihilated by the goods laid down by the British manufacturer in all the bazaars of India.

The dress of Hindu men is of white muslin or cotton cloth, and their upper coat is now generally sewed. The under garment for the lower part of the body, the do-woti or dhoti, is a loose unsquared wrapper or Cloth. Hindu women of all classes mostly wear unsquared Coths of green, red, or yellow-coloured cotton, edged with silk or gold embroidery, and a bodice of cotton or silk.

The dress of the Bhattia men consists of a jama or tunic of white cloth or chintz, reaching to the knee; the karboud or cincture, tied so high as to prevent the appearance of waist; trousers very loose, and in many folds, drawn tight at the ankle; and a turban, generally of a scarlet colour, rising conically full a foot from the head. A dagger, shield, and sword complete the dress. The Bhattiani wears a fine woollen brilliant red gopra or petticoot, and scarf thirty feet in width. They also wear the chauri, rings of ivory or deerhorn, which cover their arms from the shoulder to the wrist, of value from sixteen to thirty-five rupees a set; and silver kurri (massive rings or anklets) are worn by all classes, who deny themselves the necessaries of life until they attain this ornament.

John xix. 23 says, 'Without seam, woven from the top throughout;' and the clothes of a Hindu, when not employed in the service of Europeans or Muhammadans, are always without a seam; have neither buttons nor strings, being merely cloths wrapped round the upper and lower parts of the body. A Brahman, strict in his religious observances, would not on any account put on clothes which had been in the hands of a Muhammadan tailor.

The angarkha or undress coat, and the jama or dress coat, are worn only by men. The anga is a sleeveless vest.

Buchannee, in Dharwar, is commonly worn as a waist-cloth by children of respectable people; also worn by adults of the same class while sleeping. Price one rupee two annas.

Chadar is a sheet. A chadar made to the order of Kunde Rao, the Gaekwar of Baroda, for a covering of the tomb of Mahomed at Meilla, cost a krur of rupees. It was composed entirely of inwrought pearls and precious stones, disposed in an arabesque pattern. The effect was highly harmonious.

Chandusee, a cotton scarf, coloured border and ends, used in Khyrrpur.

The Choli or bodice of women is of silk or cotton, and is usually fastened in front. Many women of Gujerat also wear a gown. The choli is an under-jacket worn by women. The thans or choli pieces of Dharwar, of a description used by women working in the fields, cost three annas for each choli, or twelve annas the piece.

Camblit are blankets of goats' hair or wool. Every labouring family in the Peninsula has them. They cost from one to three rupees.

Kamrbandz are sashes worn by men. They are of cotton and of silk.

The Dhotis, a flowing cloth for the body, from waist to the feet, is worn by men, and is generally bordered with red, blue, or green, like the toga praetexta (limbo purpuroe circumdata). Dhoties are usually worn so as to fall over and cover the greater portion of the lower limbs. One of a coarse cotton, commonly worn by cultivators and labourers in the field, may cost about two rupees.

Earband is of silk or cotton, and is a tie for trousers.

Khes, a chintz scarf in use in Hyderabad (Sind).

Labadee, a dressing-gown.

Loonjee, or scarf of cotton, of silk, and of silk and cotton, is worn by men. Where of silk, it is usually enriched with a border of gold and silver.

Manlunas, a cloth worn by the poorer classes in Dharwar; costs 1½ rupees.

The Patajama, or trousers, is worn both by men and women.

Panhakrungi of Dharwar has a warp of silk and weft of cotton, worn ordinarily by dancing women, not considered proper for respectable women; 1 than, 1 rupee 12 annas.

Panpee of Dharwar is a cloth used by well-to-do people to dry themselves after bathing, but also worn as a waist-cloth by poor people.

Pato of Burmah is a cloth worn by men of all classes. In Akyab it is worn by the Mow race.

Pitambara means clothed in yellow garments. Hindu hermits, and many of the Hindu and Buddhist ascetics, are required to wear clothes dyed of an ochrey yellow.

The Rumal or kerchief, the kamrband or waistbelt, and the do-patta or sash, are men's garments.

Sandalony, a silk scarf of Singapore.

Satimote, a silk scarf of Singapore.

Sarree, the Hindu woman's lower cloth, costs from two rupees and upwards. Each woman generally has a new one once a year. It is often used also as an upper garment, in the form of a scarf for enveloping the person, one end being usually brought over the head as a covering. The sarree, as used by women to cover the whole body, is the kalumma of Homer.

Selja, in the south of India, is a sheet or body covering in use amongst the poorer classes, cultivators, and labourers, wrapped round their shoulders and body when employed in the fields. Their usual cost is about 1¼ to 1½ rupees. In Dharwar one is always presented to the bridegroom by the relations of the bride, together with a turban.

Turbars of all kinds are worn by Hindus and Muhammadans, and known as dastar, pagri,—turban being from the Persian words, Sir-hand, head-binder. The Arabs and Turks call it Imamah. The other head-dresses are the rumal, the taj, and the topi. — Ward, Hindus, iii. 186; Drs. Taylor and Watson, Ex. of 1862; Calcutta Review; Pioneer Newspaper.
CLOTHS manufactured in India:—

Cotton fabrics of Bombay comprise the bafta, bochun, carpet, chadar, chadni, choli, du-patta, dhota, dhoti, dunigaree, dustorkhana, horni, khes, khojii, khurwa a coarse red cloth, kurchar, looneeg, musooti, pagga, peshig, phatka, phicoreo, quilt or razzii, rumal, saroo, sousee, soot, soojneen, tablecloths, table napkins, towels, turbans.

Silk fabrics of Bombay are,—bochun, bulbul, cholepun, doornjeege—pyttanee, gul-badan, gown pieces, hemroo, karrah, katchia, khun, khudraa, kootnee, kud, kunawaz, meenaa-sirin, mukhmal, petanbar-zamani, petanbar-mardana, pajamma, rowa, rumal, senna, shalwar, tasta, uddruusa, yeolah.

Silk and cotton made fabrics of Bombay are the dairiai-sirii, ghaut, kunhirae, lake, luke-meenia, loongi, lupa, with silk and gold and silver embroidery, mukhtiar-khunee, meenaghaat, mushroo.

Bhangarik, a very coarse and strong sackcloth, made from the inner bark of trees, and much used in Nepal as gruia sacks.

Buck Puga of Nepal, a fabric, half woolen, half cotton.

Chhanga, a coarse cotton cloth manufactured by the natives of Newar.

Chintz (Chinti, Hind., a drop) or pintado, printed calicoes.

Dalimian, or net.

Dariyai, plain silk.

Dequn, a coarse cloth of silk, with gilt tissue.

Elaiach, a mixture of mixed cotton and silk.

Susie and Khesi, striped calico, woven with coloured thread. The silken khesi is also edged with gold or silver.

Kakashas-tussur, embroidered muslins made at Dacca, and largely sold in India, Persia, Arabia, Egypt, and Turkey.

Kasa, a Newar imitation of the Indian malmal, used for turbans.

Khadi, a coarse cotton cloth.

Kurchar, felt for pillows.

Kimkab, or gold and silver brocaded silk; a silk brocade. The kimkab brocades are distinguished as smeri or golden; ruperi or silvery; chand-tara, moon and starry; dup-chun, sunshine and shade; maz-char, ripples of silver; palimtar-akshi, pigeons' eyes; bulbul-chasm, nightingale eyes; mahir-gala, peacock's neck; par-i-taas, peacocks' feathers.

Malida, red woolen cloth, woven like shawl cloth.

Musrhoor, a fabric of cotton mixed with silk, with a cotton warp or back, and wool of soft silk in a striped pattern, having the lustre of satin or atlas.

Muslins, the finest or malmal-i-khas of Dacca were known as ab-rawan, running water; batthowa, woven air; shabnam, evening dew.

Malmal-i-khas means special (king's) muslin. Doria or striped muslin.

Charkham or checked muslin.

Jamdani or figured muslin.

Chikan or embroidered muslin.

Mandul, a cloth of cotton and gold, obtainable in Kutch; costa Rs. 8-11.

Nimbu, a woolen pile fabric.

Palampore (palang-poo), or bed-covers.

Pancheen, white woollen cloth.

Pankhi, woolen twill.

Pepnun, a silk material used as a hair ornament in Lahore.

Pushlama, or woollen fabrics.

Pumika of Nepal, an imitation of the Dinapur tablecloth.

Puri-khadi, a coarse cotton cloth manufactured by the Khassa hill tribes (Purbedi, eastern).

Patasi, a blue and white check worn by Newar women.

Sianak, a woollen stuff of Nepal.

Sufi is the striped (gulbadan) silks, called also Shuja khan of Bahawulpur. They differ from musrhoor in having no satiny lustre, and look like a glazed calico. They can scarcely be distinguished from sufii, and are glazed with a mucilaginous emulsion of quince seed. Mushroo and sufii are made plain, striped, and figured.

Taffa, a fabric of twisted thread.

Tappa, coarse cotton cloth of Nepal.

Tasar, Tussar, Tussak, eria and munga, are made of wild silks.

Tsang, a coarse woollen fabric.

CLOVE, Mother clove.

Polang, . . . MALAY. Dharanghe, . . . MALAY.

Mother clove means seed-clove, clove fruits that have been allowed to grow to full maturity.

CLOVE BARK of eastern commerce is the bark of several species of cinnamon clove.

CLOVE OIL.

Huile de girofle, . . . Fr. Warala-tel, . . . SINGH.

Lavang ka tel, . . . HIND. Lavango taiman, . . . TAM.

Oleo de garafano, . . . It. Kirambati taiman, . . . "

Minak-changhe, Malay. . . . Malanga taiman, . . . Tel.

This is obtained from cloves by distillation.

When new it is of a pale reddish-brown colour, which becomes darker by age. It is extremely hot and fiery, and sinks in water. The smell is agreeable, and not unlike that of koolfa, or Malarbar cassyia oil. The kind met with in Bombay is chiefly made at Surat.—Faulkner.

CLOVE PEPPER. Allspice, clove-pepper, or pimento, are Pimenta vulgaris berries, gathered while still green, and dried in the sun; this well-known spice is also called sometimes Jamaica pepper, from its cultivation being chiefly confined to that island. The ripe berries, when dry, are almost devoid of flavour.

CLOVER, or trefoil, a name given to several species of the genus Trifolium grown in Europe. In India, a species of Hedysarum supplies the place of the species of Trifolium and Medicago in Europe.

CLOVER SEED.

Klaevzaa, . . . DET. Trifolium, . . . LAT.

Semence de treille, . . . Fr. Trilistik, . . . Res.

Kleesaat, Kleee, . . . GER. Trebel, . . . Sp.

Trifolium, . . . It.

Red and white clover seed, Trifolium pratense, L., and T. repens, L. Upwards of 155,000 cwts. were imported in 1870. Frequently adulterated with old and dead or kiln-dried seed, and with the cheaper hop clover, T. procumbens, L., etc.

CLOVES. CLAVUS, LAT.

Karnful, . . . ARAB. Clous de girofle, . . . Fr.

Buwah-luwung, . . . BALI. Giroles, . . . "

Lang-yen-bwen, . . . BURM. Nagleem, . . . GER.

Theng-kio, Theng-kii, CHIN. Gewurzelken, . . . "

Ting-tze, Kii-chhii, . . . LUWUN, . . . GER.

Ting-hiang, . . . JAB. Long, . . . HIND.

Kruul-nagelen, . . . DUT. Garofani, . . . "

Naglen-boomen, . . . " CHIOVI di Garofoli, . . . "
CLUSIACEÆ.

CLOVES.

In a law passed by Aurelian the First, in A.D. 175 and 180, cloves are mentioned. The cloves of commerce are the unopened flower-buds of the clove tree, Caryophyllus aromaticus, which was originally a native of the Malaccas and of China, but is now cultivated in Penang, Sumatra, S. India, Bourbon, Zanzibar, Guiana, E. Africa, and the West Indian Islands. The clove tree may be seen in a few gardens on the Teuasserim coast, and in Travancore, Tinevelly, Canara, Cochin, and near Oodagerry, 1800 feet above the sea. They have the form of a nail, and when examined are seen to consist of the tubular calyx with a roundish projection, formed by the unopened petals. The flowers, produced in branched peduncles at the extremity of the bough, are of a delicate peach colour. The elongated calyx, forming the seed-vessel, first changes to yellow, and when ripe to red, which is from October to December, and in this state it is fit to gather. If left for a few weeks longer on the trees, they expand, and become what are termed 'mother cloves,' fit only for seed or for candying. In the gathering, the ground under the tree is first swept clean, or else a mat or cloth is spread. The nearest clusters are taken off with the hand, and the more distant by the aid of crooked sticks. Great care is taken not to injure the tree. The cloves are then prepared for shipment by smoking them on hurdles near a slow wood fire, to give them a brown colour, after which they are further dried in the sun. They may then be cut off from the flower branches with the nails, and will be found to be purple-coloured within, and fit to be baled for the European market. In some places they are scalded in hot water before being smoked, but this is not common. The tree begins to bear from the seventh to the fifteenth year, and is fruitful till it is 75 or 150 years old. The annual yield of one good tree is about 4½ lbs., and the annual crop from Ambonya, Haruku, Sopampa, and Nassault, was 350,000 lbs. of Amsterdam (Birkmore, p. 154). The companions of Magellan loaded two ships with cloves at the single island of Tidor, after a stay, from their arrival to their departure, of no more than forty-four days. The Portuguese made their first appearance in the parent country of cloves in the year 1512, and, until expelled by the Dutch in 1605, they had the principal share of the clove trade for 93 years, a period of rapine, violence, and bigotry. The main object of the Dutch was the exclusive monopoly of spices, by the expulsion of all rivals. They extinguished the clove trees in their native islands, and endeavoured to limit their growth to the five Ambonya islands, in which the clove is an exotic. Periodical expeditions for the extermination of young plants, that might spontaneously have sprung up, or been propagated by birds, formed part of that system. The periodical exterminating expeditions became merely nominal after the year 1820, and have been discontinued.

CLUB-WOOD of Tahiti, Casuarina mucirata. 

CLUPEIDEÆ, a family of fishes of the order Physostomi, placed by Cuvier between the Salmoide and the Gadideæ, and they form the fifth and last division of his section 'Malacoptyergynæ Abdominaux.' The family contains the following eighteen genera, the number of species of which are indicated:—

Cetengraulis, 2 Pristigaster, 7
Engraulis, 37 Chirocentodon, 5
Colia, — 10 Sprattleodes, 3
Chatoeaus, 61 Dussumiers, 1
Clupea, 3 Albula, 1
Clupeoides, — 1 Pelleonula, 2
Clupeichthys, — 1 Megalops, 2
Pellona, 14 Chanos, 2

There are about 100 recognised and doubtful species of clupea. They inhabit every part of the globe, and several are found in the seas of south and east of Asia. One species in Ceylon is called the poisonous sprat. C. pilchardus, the pilchard, frequents the coast of Japan in the latter part of the month of June and commencement of July. They are taken by the seine nets. When fresh, they are sweet and nutritious; but they are chiefly valued for their oil, to obtain which they are piled up in heaps for twenty-four hours, are then boiled for some time in sufficient water to prevent their burning, then laid into strong canvas presses, and the lever action of a lid presses out the oil. The oil after cleaning is used for 'lamps, and the refuse for manure.

CLUPEONIA PERFORATA, Caustor, inhabits the seas of Penang, Malayan Peninsula, Singapore, and Sumatra. Total length, 5½ inches. They are of delicate flavour, and pass in the Straits Settlements as sardines, in imitation of which they are sometimes preserved in oil. The general form, the yellow dorsal fin with a small black spot, give this species a certain resemblance to Meletta venenosae (C. et V. xx. 377). In 1822, at Sumatra, great numbers of what was supposed to be this species, presented the unusual appearance of having red eyes. Many natives, having eaten these fishes, were suddenly attacked with violent vomiting, which, in cases where remedies were not immediately applied, was known within an hour to terminate fatally. At the same time, the fishes with the ordinary silvery eyes were, as formerly, eaten with impunity. This phenomenon recurred at Bencoolen during the seasons of 1823 and 1825, but not of 1824. It was surmised that the poisonous fishes had fed on a gelatinous substance which at that season exudes from the beautifully-coloured coral reefs on that part of the coast of Sumatra. It is, however, more probable that the poisonous fishes were shoals of Meletta venenosae, an inhabitant of the Seychelles and the neighbouring seas, which happened in those seasons to visit Sumatra. M. Valenciennes describes this fish as being poisonous, and producing effects as noted above. In the Straits of Malacca, Clupeonia perforata has never been known to produce bad effects. —Caustor.

CLUSIACEÆ, one of the orders of plants according to the natural system of Lindley. The genera, Garcinia, Mammea, Mesua, Calophyllum, and Kayea are now usually arranged under Gareciniaæ. The genus Clusia was named after Charles de l'Ecluse, or Clusius, one of the most celebrated botanists of the 16th century. C.
flava, the yellow-flowered balsam tree, the mountain mango or wild mango of Jamaica, might well be introduced into India.

**CLUYTIA COLLINA.** R. Amanta collina, *Baill.*

Wodishah, Kaidishen, *Tel.* Kurseca, . .

A small tree of the Euphorbiaceae, of Ceylon and the Peninsula of India, frequent in the Wallajur jungles of Coimbatore; flowers in the hot season; seeds ripen in December and January. Bark or outer crust of the capsule said to be exceedingly poisonous. Wood red-coloured, exceedingly hard and durable, but of small size. Notwithstanding its hardness, being very even-grained, it is easily worked, and is, from its fine close grain, a pretty wood.—Roxb.; Mr. Rohde's MSS. *Wight; O'Sh.; Thw.*

**CLUYTIA OBLONGIFOLIA.** *Roxb.* A tree of Assam and Sylhet; wood hard and durable.—Roxb.; *Voigt.*

**CLUYTIA PATULA.** *Roxb.*

A tree of Southern India; grows to a large size, and logs measuring four to five feet in girth are purchasable in the market. The wood is pale red, the colour of dried rose-leaves, hard and durable, very brittle, sp. gr. 75-8, and when broken the fracture seldom shows a fibre. It is used for rulers, knobs, handles for tools, such as chisels, etc., in turnery. It flowers during the hot season.—Roxb.; Mr. Rohde's MSS.; *Voigt.*

**CLYDE, LORD,** longer known as Sir Colin Campbell, whom Sir William Napier styled the war-bred Sir Colin. He was a military officer of the British army, and commenced his career as a volunteer with the 9th Regiment of infantry in the British army, which he accompanied to Portugal. He afterwards served in Holland at the disastrous expedition to Walcheren, and again in the Peninsula under Sir John Moore, and he was present at Vimiera, Corunna, Barossa, Vitoria, and San Sebastian, at the siege of which he led the storming party, where he was again severely wounded, having been previously wounded at the passage of the Bidassoa. He was in the expedition of 1814 and 1815 to America. In 1842 he served in the war of China. In 1848 and 1849 in the Panjub campaign, at the passage of the Chenab, at Chillianwalla and Gujerat, and he was engaged against the hill tribes up to 1852. In the war in the Crimea he commanded the Highland Brigade, and to him was due the success of Alma; and he preserved Balachava against an attack of the Russian forces. The triumphal termination of his long career of war, however, was in India, to which he was sent in 1857, when the Bengal native army revolted, and much of Northern India was in rebellion. He gathered troops about him until he could advance, and he did so without a single check. He died at Woolwich at the close of the mutiny. A statue has been erected to his honour in Waterloo Place, London. See Battles of India; British India.

**CLYPEA GLABRA.** *W. and A.* This is the *Cissampelos glabra, Roxb., and Cocculus Roxburghianus, D. C.* It is a native of Sylhet; root large, acrid, and used medicinally.

**CLYPEA HERNANDIFOLIA.** *W. and A.*

This is the *Cissampelos Hernandifolia, Wild.,* and *C. hexandra, Roxb.,* the Ninakta and Niuni muka, HINDI. It is a valuable diuretic.

**COACH.** Conveyances of kinds have been used from very early times in Tartary, Southern and Western Asia, in Hindustan, Asia Minor, Northern Africa, and Europe. See Carriage.

**COAL.**

*Steinkohle,* . . . *Eur.*

Carbon de terre, . . . *Fr.* Carbonos de tierra, . . .

Steinkohle, . . . *Tele.*

Valaist kuela, . . . *Gez.* Stenkol, . . .

Carboni fossilis, . . . *It.* Simai Karri, . . .

Coal differs considerably in its physical properties, and its varieties obtain various names in the markets. The mineralogist generally classifies its coal without bitumen, and coal with bitumen. The first variety is known by the general name of anthracite. It is sometimes very hard, has a high lustre, and is often iridescent. It is used for fuel, but it is often made into small inkstands, boxes, and other articles of use. This is more especially the case with the anthracite of America. Anthracite is the most common form of coal in the Welsh beds. The kinds are known in commerce as splint, caking, cherry, cannel, and brown or wood coals, also lignite and jet.

Coal was worked in Bengal in 1774 by Messrs. Healy and Summer of the Bengal civil service, who obtained a monopoly. Their operations were in the Raniganj coal-field, but they found it unprofitable, and the mines remained unworked till 1815, when Mr. Jones commenced operations. He too was unsuccessful; and in 1820 Messrs. Alexander & Co. undertook them. From that date coaleries increased in number; and in 1859 so many as fifty were at work, employing 27 steam-engines, producing then 304,094 tons of round coal. During 1878 and 1879, in the Raniganj fields, 388,931 men and 196,627 women, with 27,277 children, were supported by mining operations, the out-turn of coal being 528,001 tons (Tr. of Hind. i. p. 170). The quantity of coal brought down in 1840 was about 15 lakhs of maraths. In 1850 it was nearly its double, and in 1860 it had become its quadruple. The supply and the consumption of coal in India during ten years was as under, in maraths of 80 lbs.—:

Of the coal raised in 1868, almost the whole was from the Raniganj field. One-half of the supply was consumed by the East Indian Railway, and was used for locomotives as far as Ambala.

Coal of British India occurs in the lower Gondwana system, paleozoic rocks, in which three series have been recognised, viz.—

(a) Damuda, Raniganj, or Kamthi.

(b) Ironstones, shales, and Barakar.

(c) Karharbari and Taleghi.
The Karharbari group yield coal, but, except in some of the eastern fields of the Damuda valley series, the Barakar group includes all the valuable coal of Peninsular India. In the Jharia coal-field its thickness is estimated at 3800 feet, and at Raniganj 2000 feet.

The Raniganj group consist of sandstones, carbonaceous shales, and coal. The coal is of good quality, and comparatively uniform in composition and in the closeness of its seams.

In the rocks of the Khamti group coal rarely occurs.

The areas of the 37 separate Indian coal-measures and associated younger rocks, which may conceal coal-measures, have been drawn up by Mr. Hughes as under, total 35,000 sq. m.:

Gondwana and G. affluents, 11,000 sq. m.
Sone, 8,000 sq. m.
Sirugula and Orissa, 4,500 sq. m.
Assam, 3,000 sq. m.

The rocks which in Peninsular India probably correspond, as regards the time of their formation, to the true carboniferous rocks of Europe, are not coal-bearing; and the oldest coal-measures in British India belong to a period which is well included within the limits of the upper paleozoic or permian and the lower jurassic formations.

The separate coal-fields are:

(a) North of Damuda river, in Bengal, viz. Birbhum, Deoghar, Karharbari, and Rajmahal hills.
(c) West of Damuda valley, viz. Arungra, Chopé, Daltonganj, Hutar, and Ikuri.
(d) Sone and Mahanadi valleys, viz. Bisrampur, Jhilmilli, Lakhnapur, Raigarh, and Hingir; Rampur, S. Rewa and Sohabpur; Udaipur and Korba, Tattapani; and in Orissa, Talchir.
(e) Central Provinces, viz. (1) Satpura region, Mopani, Pench, Tawa; (2) Gondwana valley, Bandar, Kanmaram, Singareni, Wardha or Coa.
(f) Sikkim.
(g) Assam, in valley of Brahmaputra, viz. Disai, Jalpur, Jangi, Makam, Nazira.

There are other places in the N.W. Provinces, Assam, and Burma, where tertiary coal occurs, but it is not in sufficient quantity to constitute workable coal-fields. Of the above 37 separate coal-fields, five only (Raniganj, Karharbari, and Daltonganj in Bengal, and Mopani and Wardha in the Central Provinces) are at present (1881) worked with regularity.

Rajmahal hills form a series of low plateaus, which are situated at the point where the Ganges turns southwards to form the head of its delta. The coal-measures are exposed over 70 sq. miles at Hura, Chuparbita, Pachwara, Mhowagarki, and Brahmani, but doubtless extend over a vastly greater area underneath the younger formations.

—Bull, p. 68.

Birbhum and Deoghar have small detached basins in which coal occurs, but it is of little economic importance.

Karharbari has a field of coal of 11 square miles. It occurs in three principal seams, which have an average total thickness of 16 feet, spread over an area of 83 square miles. The amount of coal is estimated at 1,300,000,000 tons, and the available portion of it at 80,000,000 tons. It is worked by three companies.

Raniganj coal-field, of 11,200 sq. miles, is on the rocky frontier of W. Bengal, 120 to 150 miles from Calcutta. The coal is in five groups, viz.:

Upper Panchet or, sq. m.
Mahalava, 5,000 Ironstone shale, 1,600
Panchet, 1,500 Barakar, 2,000
Raniganj, 5,000 Talchir, 8,000

It is the largest and most important of the areas in which coal is worked in India. It is worked by several European companies.

Jharia coal-field is in the valley of the Damuda river. It is 16 miles west of the Raniganj field, and has an area of 200 sq. miles. The estimated available coal here is 465,000,000 tons.

Bokara coal-field is in the valley of the Damuda. Its area is about 220 sq. miles, and the estimated available coal is 1,500,000,000 tons. One seam is 88 feet. Its position renders it difficult to be worked.

Ramgarh coal-field, in Damuda valley, has an area of 40 sq. miles. The coal is mostly of poor quality, and the field is unfavourably situated.

Karanpura coal-fields, S. and N., are at the head of the Damuda valley, and have areas of 72 sq. miles and 472 sq. miles respectively. The estimated amount of coal in N. Karanpura is 8,750,000,000, and in S. Karanpura 75,000,000 tons.

Chopé, on the Hazaribagh plateau, 2000 feet above the sea, has a small coal-field of less than one square mile.

Itkuri coal-field, 25 miles N.W. of Hazaribagh has a few seams of inferior coal.

Aurung coal-field, in Lohardagga district, W. of the sources of the Damuda, in the valley of the Koel, a tributary of the Sone, has numerous seams of coal, some of large size, estimated to contain 20,000,000 tons.

Hutul coal-field, in the Koel valley, has an area of 78-6 square miles.

Daltonganj coal-field, in the valley of the Koel, in the Lohardagga district, has an area of 200 sq. miles; has a few coal-seams, estimated to contain 11,600,000 tons.

At Tattapani there is some coal, also a remarkable series of hot springs.

In S. Rewa and Sohabpur, a tract in the Sone valley, covering 8000 sq. miles, coal occurs; also at Jhilmilli (36 sq. miles), at Bisrampur, a landlocked site in the central basin of Sirugula, its area being 400 sq. miles, and 1500 feet above the sea. Lakhnapur is S. of Bisrampur, and Rampur adjoinning it.

Raigarh and Hingir, Udaipur, and Korba are in a wide extent of coal-measures, which cover an area of 1000 sq. miles, in a country difficult of access, with seams up to 188 feet thick.

Talchir coal-field is in the valley of the Brahmani river, a tributary of the Mahanadi. It has an area of 700 sq. miles in extent, but the coal is of inferior quality, chiefly carbonaceous shale.

In the Satpura region, some good coal has been found at Mopani, and has been worked for the railway; and coal also occurs at Tawa and Pench.

In the Godavery valley, there are coal-fields at Bandar, in the Chanda district at Wardha; and Mr. Hughes gives the following estimate:

752
Coal.

And there are small areas at Dumagnudna and Mudavaram.

At Kamaram, 40 miles N.E. of Warangal, is a small field; also at Singareni, 30 miles S.E. of Kamaram.

In the Darjiling district in Sikkim is a crushed coal, not of promising character; one seam is 11 feet thick.

In Assam, coal-fields have been explored at Makun, Jaipur, Janji, Nagira, and Desai. The coal is of good quality; and it has been discovered in the Khasya hills.

The coal of Durdehi, in the Jummm territory, has proved to be like the rest of Eocene origin among nummulitic limestones. A large lump of it was in E. T. Dale, Geol. Surv. India, and might pass for ‘Walsend,’ so good is its appearance.

Coal at Bumni, from the Waziri hills, has been mentioned with some hope.

Coal of good quality is obtained from the Koh-i-Meeriah, a hill a day’s journey north of the Oxs.—Wood.

The coal-fields of China occupy 400,000 sq. miles, and of Australia 240,000 sq. miles. Messrs. Medlicott and Blandford describe as follows the coal-fields of British India, according to the epochs at which they were deposited:—

Jubbulpur has jet coal.

Rajmahal hills, Hura, Chuparbhitia, and Brahman coal-fields have occasional beds of inferior coal, poor and shaly, though of considerable thickness.

Tanug, carbonaceous shales of no economic value.

Kandit Karaya field, thin 14-inch seams of coal.

Jainti or Karam field, thin coal-seams.

Karharbari, coal seams of variable thickness; coal equal to the best Raniganj coal; is the main supply for the Calcutta market.

Raniganj coal-field, rich in coal-seams, some 20 feet thick. Jhariah coal-field, 13 to 16 miles from Raniganj, large quantity of very fair coal. Bokara, 2 miles W. of Jhariah. Raniganj coal is composed of layers alternately bright and dull, as in the Barakars. The Bokara coal-field is near Hazaribagh. Ramgarh coal-field, 31 miles S. of Bokara. The S. Karanpura fields, W. of Bokara and Ramgarh. Karanpura field is second only to the Raniganj field.

Ohn, a small coal-field on the top of the Hazara plateau.

Ikturi coal-field, 25 miles N.W. of Hazaribagh; inferior coal.

Daltongar or Palenow coal-field; coal formerly worked and sent down the Son. Latinsah, 26 miles S.E. of Daltongar; a little coal.

S. Rewa coal-field.

Jhilmilli field, a very thin seam of good carbonaceous coal; several seams.

Bisarampur field, coal seams in several places, not very promising, 5 or 6 feet thick.

Lakhapar field has several seams of coal, the best 5 or 6 feet thick, of excellent quality.

Chutta Nagpur, at E. Sirigu, Palenow, Jalsaup, Udaipur, Khurea.

Korba (Bilaspur), an immense seam of coal, and in many places on the Mand and near Udaipur.

Barah, an ancient field, formerly called the Gangpur field, shaly beds, with coal-seams.

Talchir coal-field, on the Brahmani river, some beds of inferior coal.

Lametaghat.

Sungari, thin seam; useful coal in the upper Tawa, the Kanhan and Pench valleys, in thin seams, and at Mopani on the Sita.

Bandar coal-field, 30 miles N.W. of Wardha, in the Chanda district, has three seams of coal, with 35 feet of maximum thickness.

Wardha or Chanda coal-field, in the basin of the Wardha, Pranhita, and Godavery; has a seam of coal and shale between 30 and 50 feet thick, but rising up to 90 feet, with thinner seams, from which efforts have been made to supply the E. I. P. Railway.

Godavery valley has the Madaveram coal-field below Badnur, and the Belavandhol field, 35 miles N.E. of Bhadrachalam, and N. of Eluru; some poor coal has been discovered by boring.

Kamaram coal-field, 40 miles E. from Warangal, has beds of coal, with coal of fair quality, in seams 6 to 9 feet thick.

Singareni coal-field, 25 miles N. of Khammet, in the Godavery valley, has seams of coal, one of them 21 feet thick.

Kanikot group, in the Laki range, in Sind, has a bed of coal, 2 feet thick, but the seams liable to spontaneous combustion, in cretaceous rocks.

The Salt Range, amongst jurassic rocks, has thin strings and seams of tertiary lignite at Bhangalwa, Bai, and Samundri.

Subman range, thin layers of coal of no economic value.

Sabathu, in the Lower Himalaya, carbonaceous shale, has 28 per cent. of fixed carbon, and 11 per cent. of volatile matter partly hydro-carbon.

Khassya hills area, Cherrapunjee plateau, amongst cretaceous rocks is a thick seam of bright coal, found in little basins near Cherra.

Garo area, cretaceous series, has coal of serviceable quality and thickness, immediately W. of Jalu Kata, in Umi, Loharkhal, Ghatch, and in the coal basins of Rongreng and Darang, on the Upper Sumsameri, of valueless coal; also at Salkura, Champurgi, and Mirampura, S.E. of Singnari.

Assam coal-fields are in the form of basins in the low Tiyam hills, alternating shales, sandstones, and coals, known by the coal-fields of Jakpur, Makrum, and Nazira.

There is a seam 100 feet thick, containing at least 75 feet of solid coal, a true coal of superior quality.

Tenasserim, on the Len-Ya river, is a bed of coal of a laminar structure, containing amber-like mineral resin. The coal is in thin laminae in isolated basins at Thay-kyoung and Hein-lap, on the Great Tenasserim river, at places 7 feet thick of workable seam, and of fair quality, and at one place 21 feet thick. It is also found 3 feet thick on the Little Tenasserim river.

British Burma, 5 miles S. of Thayat-myo, a bed of coal of so irregular thickness as to be of no value.

Independent Burma, 50 miles above Ava, near Thin-ganda, are coal-seams 3 to 5 feet thick.

The Raniganj or Bardwan coal-field lies in the valley of the Damuda river, and is about 500 sq. miles. Some of the coal-seams are 20 feet thick, and one of the seams of the Barakar group is 33 to 35 feet; and in a section seen in the Kudia and Pasai streams, 175 feet of coal is exposed in a total thickness of 883 feet of rock, though much of it is of inferior quality. The Jeriah (Jhariah) coal-field has seams up to 60 feet in thickness.

The coal found in the Talchar group, in the Jhilmilli field in Surguja, is a very thin seam of inferior quality; and, as a rule, the Talchar formation is marked by an absence of coal-seams, and even of carbonaceous shale. Part of the Karharbari beds rests in apparent conformity on the Talchar group. Karharbari coal is dull-coloured, and tolerably homogeneous in structure, and the coal of some of the seams in the Barakar and Raniganj subdivisions of the Damuda series is more distinctly laminated, but is equal in quality to that extracted at Karharbari.

Carbonaceous shales, and one or two thin bands of jet coal, are met with in the Jubbulpur group, but it is very different from the coal of the Damuda valley.

The principal coal tracts of the rocks in the Rajmahal hills are the coal-fields of Hura, Chuparbhitia, and Brahman. Their seams are thick, but the coals are poor and shaly.

In the Godlunwa series, Tungsi and the
Kanlith Kamuya field, and the Sahajori field, have small seams of coal of no economic value.

The general characters of the S. Rewa, the Jharia coal, seams of the Bokara coal-field, and the Kanapura field, are the same as those of Raniganj. The quality of the coal is very variable; some seams yield good coal, others little better than shale.

The Ramgarh coal-field lies due S. of Bokara; the coal seams are numerous, and there are some good beds, but the quality as a rule is inferior.

The Chopé, Itkuri, and Daltonganj coal-fields are in the Hazaribagh district, and the coal of Daltonganj was formerly mined, and sent down the Sone river.

Good coal has been found in a few places in the Birsampur field, and at Lalhanpur, but that of many of their seams is poor, and the seams only 3 or 6 feet thick.

Coal occurs in Chatua Nagpur in many places on the Maid and near Uddepur, of fair thickness and average quality; and a seam 90 feet thick is exposed in the bed of the Hasslo, much of it very shaly, and yielding much ash.

The Talchir coal-field is near the Brahmanri river, and within the Mahanadi watershed.

In the Peninsula, the coal of the Wardha field is of rather inferior quality, giving 14 to 20 per cent. of ash. The Warora coal is of high mineral value. There may also be mentioned the Madavaram coal-field on the Godavery, and those of Kamaran and Singareni.

The coal beds of Tenasserim are not traceable continuously over any extensive area. The most important are at Thathay-Kyoung and Hein-lap, on the Great Tenasserim river, the workable seam at the corner place being 7 feet, and at the latter 174 and 18½ feet thick, the quality fair; and at Kan-ma-tying, nearly a mile N. of Hein-lap, is a seam 8 feet thick. A seam 3 feet thick occurs on the Little Tenasserim.

Deposits of coal have been found along the Siamese coast from Penang to the vicinity of Junk-Ceylon. In 1836, specimens of coal were brought from Trang, one of the lower provinces of Siam; and subsequently a deposit was discovered at Tama, not Gurbie. Coal was found at Sungei-Kamunning, about 16 miles above Trang, and at a place also nearly east of Pulo Mutiar, or Pearl Island, about 12 miles to the southwest of Sungei-Kamunning. It was also found at the Pulo Tiga island, lying off Pirlis, on the coast of Kedah. Another coal was found in the bay north of Tanjong Bamban, on the coast of Trang; betwixt the last place and Kamunning.

The coal in Ligor and Kedah, on the west coast of the Malay Peninsula, is identical in composition, in the proportion of volatile matter to charcoal, with some kinds of kindal coal,—sp. gr. 1.245; volatile matter, 46.746; charcoal, 52.071; ash, 1.188 = 100. That found on the southern coast of the island of Junk-Ceylon (well known for its tin), and which occurs near the bank of a river, and about two or three hundred feet from its mouth, was reported by Professor Anasted as adapted for every purpose to which coal is economically applied.

A position indicated as a deposit of coal, is in lat. 7° 44' N., and long: 99° 15' E., the southern point of Pulo Lantar bearing S.W. by E., Telebon S.S.E., and Tanjong Cotton N.E. by N. Some of it takes on the polish of fine jet. The Ligor specimens of this jet are the best.

In the coal of Ligur and Kedah, on the west coast of the Malay Peninsula, one portion of jet had a beautiful lustre and high polish. The fracture shows a fine velvet black or brownish-black.

On the Malay Peninsula, along the west coast at Katani, Ayer Ramni, and Bencoolen, at the entrance of the river Reteh, and along the banks in the Batang Gansal and the Inigrangi, with, it is supposed, the Kampar, coal occurs.

Coal has been found in Sumatra, Java, and Luzon, and in Borneo, of good quality, suited to economical uses. Coal found at Rette, on the south-east coast of Sumatra, bears a strong resemblance to that from Junk-Ceylon,—sp. gr. 1.23; volatile matter, 51.43; charcoal, 48.57 ash not determined. Coal of serviceable quality exists also in Banka and Madura (New Rotterdam Courant, Sept. 29, 1851), in Borneo proper (Lord Sarawak), on Pulo Keug Arang, near the north end of Labuan, at various places on the west, south-west, and south-east coasts of Borneo at the Bunut, on Pontianak, the country of Barjarsam, where immense deposits are found, Pagattan, and on the Koti river, mines are worked.

A small field has been found near Macassar in Celebes, but the coal is of a worthless description (Singapore Free Press, July 19, 1850, which describes the coal treasures of the Archipelago). It is said that fine specimens have been obtained from the Philippine province of Alley (Mallat, 122), but the existing notice of them are slight.

In Borneo, coal was first discovered in one of the islands in the river of Brunai, afterwards near the banks of the river, and subsequently in the island of Labuan. In these places it is mined with European skill and capital, and has been found on ample trial, superior to any Asiatic coal hitherto tried. The coal on the left bank of the Borneo river has been traced for several miles into the interior, and on the southern coast of the island in the territory of Banjarmasim, and mined by the Dutch. These may be continuations of the same field, which would make the Borneo coal fields the largest in the world, after those of North America. Steam navigation has given a value to the coals of Borneo, which, without it, is a country inhabited by rude people and covered with forest, might have lain for ages as useless as the lime and sandstones in which it is imbedded.

In Borneo, coal is associated at Pulo Chirmin which is about 200 feet high, with a ferruginous soil and overlaid by a mass of red clay and sand. At Pulo Kang Arang, again, the coal is overlaid by white sandstone. Borneo, as a mineral country, is perhaps the richest in the East, producing gold, coal, antimony, and iron while courchevel and gutta-percha are amongst its vegetable products. The coal and iron fields of the Balawi or Rajang are more extensive than any yet discovered on the island. From the river Baram, coal is traced to the upper parts of the Bintulu, and thence southward to the Rajang river, on the left bank of which, at Tujo-Nang there is a seam exposed upwards of 13 feet in thickness. At different other parts of the river and also in several of its branches, coal is found in abundance.

In China, coal is largely used for fuel. The
COBALT.

Boats on the north river, below Nau-hing, lie near the mouth of a horizontal drift worked into the mine, above which the cliffs are scraped down as the shaft advances. The mountains of Shant-si and Chih-li supply large quantities of this valuable mineral; and many boats find constant employment in bringing a coarse anthracite from Kai-chen in Lia-tung to Tsien-tsui. One locality of the mine in Liao-tung is about 25° 10' N., and 121° 25' E. Anthracite and bituminous coal have been seen in marts at the north; and coal-dust and refuse is mixed with a little moistened clay at Pe'kin, and made into cakes for the fires of the poor. That which is brought to Canton is hard, and leaves a large proportion of ashes after combustion; during ignition, it throws off a suffocating sulphurous smoke, which prevents the natives using it for cooking. It is employed in the manufacture of copperas from hepatic iron pyrites, according to Du Halde, but is less frequently employed in the arts than it would be if the people knew better how to use it.

COBALT.

Ta-ting, . . . CHIN. Pien-t'aing, . . . CHIN. Yang-t'aing, . . .

In China it is prepared by roasting the native arseniate of cobalt, said to come from Cambodia. It contains silica and potash, and is used in colouring glass, painting on porcelain, and glazing copper vessels, and in distemper. Cobalt ore occurs near Jeypore in Rajputana, and is used for colouring enamels. Cobaltic and nickel ore occur in Ceylon, at Saffragam.—Smith.

COBRA, the ordinary Urdu name of the Naja genus of venomous colubrine snakes of the family Elapidae. There is only one species, the Naja naja, which has a moderate body, with rather short tail. It has a small or moderate eye, with a round pupil, a poison fang in front of the maxillary, which is but little movable or erectile, and only one tooth behind. The anterior ribs are elongate and erectile, and the skin of the neck is dilatable. When the cobra rises in play, or for amusement, it spreads out the skin of the neck, from which it gets the Spanish name of cobra di capello, in English the hooded snake. Its bite, if the poison be fairly in, is almost certain death. It is said that the poison can be combated by injecting potash into the veins, but, owing to the rapidity of the poison's action, this, even if true, is valueless. Several instances have occurred of persons living some time after the bite of the cobra, chain, etc., or Russell's viper (Daboia elegans), simply by applying ligatures about the wound, and burning the punctures with a live coal; but the after-swelling was very painful, and lasted for some months. The cobra and chain viper are the commonest and deadliest. Notwithstanding this, the natives of Ceylon do not kill the cobra when caught, but enclose it in a mat bag with some boiled rice for food, and place it thus in a flowing stream. In Gujarat the Hindus do not kill this or any other snake. There are two varieties.

Var. a. The spectacle or binocular cobra has its neck, on the steel-brown skin, marked with a white, black-edged or < enclosing at either extremity a black ocellus. This is only seen when the hood is expanded. It is found in Southern India and in Burma(?). It grows to 5½ feet.

Var. b. The monocellular, or one-marked cobra, has a plain white ocellus, with black centre and margin, and grows to 4 feet in length. It is the cobra of Central India and Burma.

The fangs of the cobra are not perforated like those of vipers, but they have a groove or slit right down the anterior part of the fang, and although the sides of the groove may often meet in close contact about the anterior centre of the tooth, and form a sort of a channel, yet they never join or amalgamate together. The fangs of cobras are fixed to the maxillary bones, while those of vipers are erectile. 6

Permanganate of potash has been recommended in cobra bites. But, when permanganate was mixed with cobra poison and hypodermically injected, no fatal result followed, although a fatal dose of cobra poison was used, and the mixture injected into the vein. It is supposed that the mongoose is not affected by the cobra poison.

In the mythologies of India, the cobra figures as a protecting agent, spreading its hood over the lingam and over royalty. The cobra is worshipped by all Hindus; and its form, as an idol, with three to nine heads, in stone or brass, may be everywhere seen in India, often bending over the idol of the lingam. The cobra is often personified in Indian story. In many parts of Western India, after killing a cobra, the non-Aryan races give it all the honours of a cremation, assuring it, with many protestations, that they are guiltless of its blood; that they slew it by order of their master; or that they had no other way to prevent its biting the chickens.—Nicholson.

COBRA-TEL, a term applied in Ceylon to a deception of the heads of cobras and salivas of the iguana or Kabragoya, and supposed by the Singhalese to be deadly poisonous.

COCA (or Ecoca) of the Andes and Peru is Erythroxylon coca, Linn., extensively cultivated by the Indians. —the annual produce there having been estimated at 30,000,000 pounds. The leaves are either infused as tea, or, as is usual, chewed with a little unshaken lime. The immediate effect is a gentle excitement, with sensations of high enjoyment. Its use lessens the desire for food, and enables the chewer to undergo an enormous amount of fatigue, from an increased nervous energy.

COCANADA, a seaport town in the Gostavery district, in lat. 16° 57' N., long. 82° 13' E.; population, 17,839.—Imp. Gaz.

COCCIDEDE of Leach, the Gallinsecta of Latreille, a family of insects placed by Latreille and others at the end of the Homoptera. See Coccus.

This is the fruit of the Amarnita cocculus, W. and A., a powerful climbing plant, common in the mountainous parts of the Malabar coast; in commerce its fruit is obtained through Bombay, Madras, and Ceylon. The berry is highly poisonous, and is not used externally as a medicine. Even externally, as an ointment, though useful in Porridge capitis, its use requires great care. It is used to poison fish, and a weak decoction to destroy ticks in sheep. In 1850, 2859 bags were imported into Britain, value 19s. to 24s. the cwt.—O'Sh.; Rozy; | Eng. Cyc.; | M'Cull. Dict.; | W. and A.

COCCUS PALMATUS. D. C.

M. pol drum, Lam. | M. columba, Rozy.

This plant produces the culmbo root of commerce, a valuable tonic medicine. It grows in the Mozambique forests, and is cultivated in the Mauritius.—Rozy. iii. 807.

COCCUS VILLOSUS. D. C.

C. sepium, Coleb. | M. hirsutum, Linn.

A decoction of the fresh roots is given in native medicine in rheumatism, and is considered heating, laxative, and sudorific. A curl of the leaves is used for the same object. The juice of the ripe berries makes a good, durable, blue-purple ink.
The waths are woven into small baskets, and are used for cords by the cultivators.—Voigt, 331.

COCCUS, a genus of insects belonging to the family Cocidae, of the order Hemiptera. The insects belonging to this family live upon trees or plants of various kinds; they are of small size, and in the larva state have the appearance of oval or round scales. They are closely attached to the plant or bark of the tree they inhabit, and exhibit no distinct external organs. At certain seasons, when about to undergo their transformation, they become fixed to the plant, and assume the pupa state within the skin of the larva. The pupa of the male has the two anterior legs directed forwards, and the remaining four backwards; whereas in the female the whole six are directed backwards. When the males have assumed the winged or imago state, they are said to issue from the posterior extremity of their cocoon. In the spring-time the body of the female becomes greatly enlarged, and approaches more or less to a spherical form. In some the skin is smooth, and in others transverse incisions or vestiges of segments are visible. It is in this state that the
female receives the embraces of the male, after which she deposits her eggs, which are extremely numerous. In some, the eggs are deposited by the insect beneath her own body, after which she dies, and the body hardens and forms a scale-like covering, which serves to protect the eggs until the following season, when they hatch. The females of other species cover their eggs with a white cotton-like substance, which answers the same end. Of the species of this genus known in S. Asia, are the C. caeti, the cochineal insect, the C. laeae, which yields the stick-lace of commerce, and the C. manipurus of Arabia, that punctures the Tamarix gallica, and causes the exudation of the Assyrian lac. There are two varieties of Coccus caeti, the true Grama fina, and the Grana sylvestris; and, after prolonged efforts on the part of Drs. James Anderson and Barry of Madras in 1795, the C. sylvestris, or wild species of the cochineal insect, was introduced into Bengal by Captain Neilson of H.M. 74th Regiment. It throve rapidly on the Cactus Indica, the indigenous opuntia, the country Napal, and between 1800 and 1807, 74,633 l. of the cochineal, amounting to 142,916 rupees in value, were shipped to England, but at a loss, as the wild species was found greatly inferior to the true. The cochineal insect was introduced into Java about the year 1825 as a Government experiment, and apparently with more success in its production than in British India, for so long ago as 1844 it was exported from Batavia to the estimated value of 83,319 guilders. The species introduced into India swarms at certain seasons, and settles on one of the Species of cactus, which they immediately destroy. The whole neighbourhood of Homanabad was surrounded with prickly pear, but disappeared in 1865, under one of these swarms.

The fine cochineal insect differs from the wild not only in size, but also in being mealy and covered with a white powder; while the wild one is enveloped in a thick cottony down, which causes its value to diminish greatly, it being impossible to separate it from the insect in the preparation of the dye; the females only yield dye. It is the cottony covering which enables the wild kind to stand the vicissitudes of climate, while the fine or domesticated kind require to be kept under cover during the rainy season, and sheltered from high winds, as they early in their growth throw off the cottony covering.

The fine cochineal insect lives on several cultivated kinds of cactus without thorns, of which the Cactus cochiniller has been introduced into India. It will not grow on the wild prickly pear.

There are three periods of life of the cochineal insect. It is viviparous, and at its birth is a mere speck, and at that time no difference can be detected by a microscope between the sexes; they are all equally active, seeming to profit eagerly of the short period during which motion is allowed them. After a few days they attach themselves to the cactus plant, and from that moment the female never quits her hold. A cottony coat grows over her, which falls off in 13 to 15 days. This is the first period.

The male also adheres to the plant, and in about 12 days becomes enveloped in a cottony cylindrical purse, open at the bottom; the insects huddle together, one upon another to appearance, so that at a little distance nothing is seen but a white patch of cotton of uneven surface; they continually increase in bulk. After remaining in this state for a month or thereabouts, the sexes become distinctly recognisable. The male becomes a scarlet fly, with two transparent wings about three times the length of his body, which exactly cover each other, when at rest appearing only as one; he is also provided with two poisons or tails and two hairy antennae; he has six legs and six immovable eyes. He is now again become active (particularly an hour after sunrise), but rarely takes to the wing, being easily carried away by the wind; he jumps and flutters about, and, having impregnated the female, dies in a few days.

The females go on increasing in roundness. They appear generally so enormously overgrown, that their eyes and mouth are quite sunk in their ruge or wrinkles; their antennae and legs are almost covered by them, and are so impeded in their motions from the swellings about the insertions of their legs, that they can scarce move them, much less move themselves, and the insect to the casual observer looks more like a berry than an animal. When they are about three months old they begin to yield their young. In this state the insect is in a torpid state, and may be detached from the plant. She had previously formed on her extremity an amber-coloured liquid globule, varying in size according to the abundance of juice in the cactus, and this is supposed to indicate the maturity of her pregnancy.

It is remarkable that from the moment of her fixing upon the plant, she loses her eyes and the form of a male. Instead of a mouth, she has an extremely fine proboscis, which it is supposed she introduces into the imperceptible pores of the leaf she feeds on; and such is her excessive torpor, that once removed she will not attach herself again. After shedding the whole of her young, the mother dies, and becomes a mere shell, turning black. It is therefore at the time that the female commences to shed her young that measures are taken to remove the young to other cacti leaves. A nest is formed in the shape of a sausage or purse, of cotton gauze or other tissue pierced with small holes, in which 8 or 10 of the females are put, and the purse is fastened at the bottom of a leaf of cactus by a thorn. The young escape and spread themselves over the surface of the leaf. The mid-day is found to be the best time for this operation, to enable the newly-born insects to get rid of the glutinous matter which they bring from the parent. On this account nesting is not recommended in damp or cloudy days.

When the female insects are not required for breeding purposes, they are brushed off the cacti leaves at the commencement of their shedding their young, or immediately before that time, into baskets, and killed either by exposure to the sun or by immersion in boiling water, then dried and put into bags for dye.

As the cochineal insect is destroyed by heavy rains and high wind, they are reared outside only in the dry and cold season; during the rainy season a sufficient number of the females are either artificially kept in baskets shut out from light and heat, and so remain torpid till the proper weather returns, or an entire generation is raised on cactus plants under cover in the house or a shed, and the fresh young ones put out on the
COCCUS LACCA.

leaves outside when all danger from the heavy rains and wind are over.

The common belief is that the cochineal insect lays eggs; this is not the case. The young insects, whilst contained within the mother, appear to be all connected one after the other by an umbilical cord, and on hatching, in this order they are in due time brought forth as living animals, after breaking the membrane in which they were at first probably contained as eggs. Being thus brought forth, they remain in a cluster under the mother's belly for two or three days, until disengaged from the umbilical cord. Every cochineal mother produces above a hundred young ones; but the mortality is great, and three or four mothers are required to cover one side of a cactus leaf with sufficient young for cultivation.

25,000 insects dead and dry make up one pound of cochineal, the ordinary value of which is 1 rupee 12 annas.—Colonel Boddaert: Royle, Prod. Res. p. 57; Cransford, Dict. p. 112.

COCCUS LACCA, Kerry. Produces the substance called lac. It inhabits India; is found on various trees in great abundance on the Ficus religiosa, F. Indica, Croton lacciferum, Butea frondosa, and Rhamnus jujuba. When the females of this coccus have fixed themselves to a part of the branch of the trees on which they feed, a pulvular and glutinous substance begins to exude from the margins of the body, and in the end this substance covers the whole insect with a cell which, when hardened by exposure to the air, becomes lac. So numerous are these insects, and so closely crowded together, that they often entirely cover a branch, and occasionally the tree is killed; and the groups take different shapes, as squares, hexagons, etc., according to the space left round the insect which first began to form its cell. Under these cells the females deposit their eggs, which, after a certain period, are hatched, and the young ones eat their way out. It is found on various twigs and branches. The broken twigs covered with these incrustations are called 'stick-lac' in commerce. After the colour has been extracted and further purified, shell-lac results.—Kirby and Spence, iv. p. 142; Eng. Cyc.

COCCUS POLONICUS is used in dyeing a red colour. It is now chiefly employed by the Turks for dyeing wool, silk, and hair, and for staining the nails of women's fingers.—Kirby and Spence, i. p. 320; Eng. Cyc. p. 44.

COCHIN, a small feudatory state on the western side of the Peninsula of India, with a seaport of the same name, lying between lat. 9° 48' and 10° 50' N., and long. 76° 5' and 76° 58' E.; the area, 1,361 square miles, and population in 1851, 600,278 souls. It has many marine lagoons, extending for 120 miles, and communicating with the sea; and its gbat forests have much valuable p waits, etc. It is a Rajah's state, and the capital is called Cherumar. Colebrooke, in the 9th century, it became tributary to the British. By a treaty in 1791, the British guaranteed the integrity of the kingdom; but in 1809, after the overthrow of the Mysore government, a faction made common cause with the Travancore people, and carry on an unsuccessful war against the British, and in 1819 the British assumed all military control. The principal races are,—Malalei, 555,191;—Konkani, 15,113;—Tamular, 33,628;—Teling, 9605. Of the population, 140,262 are Christians, 426,922 are Hindus, 12,499 Mahomedans, and 1278 Jews; the chief Hindu castes being Brahman, Kshatriya, Ambalavasi temple servants, Nair cultivators, Pillai government servants, Ottar contractors, Kanaka-boatmen, Mopola polygars, Vallammar freshwater, and Marakan saltwater fishermen and artisans, Ezhuwan labourers, Cherumara proclial slaves, and Kada and Maleali hillmen and Jews.

The Jacobite and Nestorian Christians are under the Archbishop of Antioch, the Roman-Syrians, under the Archbishop of Malabar, and the Romish Christians under the Archbishop of Goa. The common belief is vastly exaggerated; fish is very abundant; its ornamental work in metals, and its wood and ivory carving, are famed. The raja's family claim Kshatriya descent; but follow the rule of inari maktatym, or descentus ab uto, the children of sisters succeeding. If the raja's younger brother be senior to all his nephews, he becomes elliah raja, or heir-apparent; but if the raja's eldest sister has a son older than the raja's brother, the nephew ranks in the line of succession before the uncle.

The higher castes only are permitted to approach the royal dwelling, and handsome well-fioed Brahman, etc., thus form the entire population of that locality; and these are so clean and neat in appearance, and of so fair a colour, that one seems to have been transported among an entirely new and superior nation. The princesses and their ladies wear an abundance of silver, the muslin around the hips, but no upper garment. The neck is decorated with valuable ornaments, and the ears support very large and beautifully chased pendants. The hair is either worn in a large double knot on the crown, or on the right side of the head, and a band of gold strains it off from the face. The raja and all the princes are indistinguishable, in private, from the people around, for their dress consists simply of the muslin round the middle. The cocoanut palm grows abundantly, and, while yielding large returns, allows leisure for other avocations.—Imp. Gaz.

COCHIN-CHINA, the name given in Europe to a country occupied by the Annam people. The derivation of the European name is obscure, but Chinhao is the name given by the Annam people to the capital of Tonquin; and Cochinn-China is known to the Malay navigators as Kutehi. It has been supposed by D'Anville that the Sin-hoa of Ptolemy, the geographer, is Cochinn-China, and that the Aureo Chersonesus of Ptolemy is the Malay Peninsula. Leaving out of view the vast unexplored region of Laos, the peninsula commonly denominated Cochinn-China is now composed of Cambodia in the north, French Cochinn-China in the south and west, and Annam on the eastern coast, this latter kingdom extending northwards to the Chinese provinces of Yunnan and Quang-si, its own province of Tong-king adjoining them.
French Cochín-China, conquered or annexed from Annam, comprises an area of about 30,000 square miles, and a population estimated at some 1,750,000 persons, nearly all of them of Annamese nationality. The colony is divided into four provinces,—Saigon, MyTho, Vinh-long, and Bassac. Each of these is under inspectors and administrators, who are educated for the purpose in a college at Saigon, where they are taught the native language, characters, history, and law, and are instructed generally in the principles of executive government. They are commissioned by the President of the French Republic. The revenue for the year 1878 was estimated at 14,300,000 francs. The kingdom of Annam has a population estimated at 20,000,000 persons. There is a French resident at the Court of Hue, and also one at Hanoi, the ancient capital in Tong-king, and three ports in Tong-king have been opened under treaty. Europeans are only allowed to trade in the actual open ports, but they are allowed to pass through the country by means of the great river Sang-kol (but not to land on its banks) for purposes of trade with Yunnan. The kingdom of Cambodia is an absolute monarchy, and has a population estimated at only 1,000,000, which gives but six to the square mile. It is under the protection of France, and has received from France a national flag, at Nakhon, the capital, with the title of Représentant du Protectorat Français. The revenue is estimated at 3,000,000 francs. There is but one port, Kampot, situated on the Gulf of Siam, its principal traffic being with Siam and Singapore by native vessels. In appearance, language, and most other characteristics, the Cambodians differ entirely from the Chinese, Annamites, and even Siamese. If there be any resemblance, it is to the latter.

Saigon, the capital of French Cochín-China, on the Saigon river, in lat. 10° 50' N., and long. 104° 22' E., was conquered by the Franco-Spanish fleet, 17th February 1859, by the force under Admiral Rigault de Genouilly at the close of the last Chinese war, but Lower Cochín-China was not occupied until the treaty of 1862.

About the reign of Louis xvi., the reigning emperor, Gyalong, lost his throne, and a Roman Catholic missionary, Bishop Adolphe, succeeded him in the exercise of his rights, and bestowed sovereignty on the French. On his death, the French king gave to the French a protectorate over Cochín-China.

The request was granted, on condition that France should have a right of protectorate over native Christians, and the further right to occupy certain points of Annamese territory, from whence this protectorate might be better exercised. A treaty was concluded at Versailles on the 28th of November 1878, embodying these conditions, and the prince and bishop returned to the East with French officers and appliances of war, by whose aid Gyalong was restored to power, and gave him a grant of territory, and the church flourished;

The treaty was concluded at Versailles on the 28th of November 1878, embodying these conditions, and the prince and bishop returned to the East with French officers and appliances of war, by whose aid Gyalong was restored to power, and gave him a grant of territory, and the church flourished; but his successors, jealous of its organization and influence, commenced a persecution.

On the 5th of June 1862 was signed the treaty which laid the foundation of French rule in Cochín-China. Annam is thereby ceded the three provinces of Binhien, Giaodinh, and Dinh Tuing, which constituted the original territory of Saigon. Twelve years later, the Duc Decazes, then minister for foreign affairs, was able to announce to the French Chamber the signature (on the 15th of March 1874) of a treaty by which the whole country was placed under the protectorate of France. It has been mentioned that in 1867, five years after the first treaty, Admiral du la Gralière, the then governor, had the honour of occupying the three additional provinces of Vinhlong, Chaiuoi, and Hanoi, in order to protect the colony from the incursions of 'agitators' from the neighbouring territory. The kingdom of Cambod, embossed between Siam and the new colony, fell early under its influence, and by a treaty signed in 1868, accepted the protectorate of France.

In 1866–7, under the control of M. Dondart de Lagré, an expedition explored the course and sources of the river Mei-kong, which, taking its rise amid the mountains of Tibet, impinges on the western provinces of China, flows through the whole length of the Indo-Chinese promontory, and discharges itself, in French territory, into the southern waters of the China Sea. It was hoped that in this river might be found a channel of intercourse with the west of China, and that Saigon might by its means be made to rival or eclipse the claim of Rangoon as an outlet for the commerce of those parts. The boundaries were, on the north the kingdoms of Annam and Cambodia, on the east and south the China Sea, and on the west the Gulf of Siam and the kingdom of Cambodia, 80 leagues long and 50 broad, with a population of 1¼ millions. The Mei-kong passes through French Cochín-China by two rivers, to disemnogue into the China Sea. In 1880 the revenue was 18,800,000 francs.

This valuable dye and colour material consists of the dried bodies of the female of the Coccus cacti, a native of Mexico. About 1200 tons are imported into Britain, price 3s. 6d. the pound. It forms a very fine and permanent dye of red, crimson, scarlet. It answers on wool and silk, but not on cotton. Efforts were made by the E. I. Company to introduce the insect into India, and at the close of the 19th century it was supposed that Mrs. Anderson and Barry of Madras had succeeded in doing so, but it is said that an inferior variety, C. cacti sylvestre, was the one brought, not the variety designated C. cacti grana fina. Whether from the stock introduced in 1799, or from an indigenous variety, the Coccus cacti is at seasons plentiful in many parts of India. They swarm to localities where the prickly pear grows, and in a brief time the plant wholly disappears. The fine variety was introduced into Mysore from Tenerife; and at the Madras Exhibition of 1857, the cochineal exhibited from Chittaldroog and Ossoor was said to be the silver grain, and to be procurable in several districts in Southern India; but it only destroys the plants with red flowers and few prickles, and will not propagate on the yellow-flowering prickly
pier. It has been exhibited from Java at the exhibitions in Europe. The people have also been successful in introducing it into the Canary Islands, but it has of late been much cultivated; and in 1856, 1,611,617 lbs. were exported. About 15,000 tons are imported into Britain, valued at £100 the ton. The insects are about 70,000 to the pound. They are detached from the plants on which they feed by a blunt knife; are dipped in boiling water to kill them, and then dried in the sun. The female is placed on the leaf, and kept in its position by a white rag tied round the lobe. From the travels of Lieutenant Burnes and Dr. Gerard, we learn (Journ. As. Soc. of Bengal, ii. p. 652) that an insect, supposed to be of the cocoons' genus, is found on the root of a plant which flourishes in a marsh (near Herat), but the natives being unable to dry it, import it from Bokhara and Yarkand, paying about 32 sicea rupees per Indian seer. Cocoons polonicus, the scarlet grain of Poland, is also found on the roots of a plant, the Scleranthus perennis.—Royle; Mad. Ez. 1857; Powell, Panj. p. 194; Crawford's Dict. p. 112; M'C. Dict.; Moral and Material Progress; Colonel Beddome.

COCHLOSPERMUM GOSSYPIUM. D. C.
Bombax gossypium, L. Silk-cotton tree, Eng.
Shima-punjhi, MAMEL. Tanaku maram, TAM.
Ela-imbul, SINGH. Konda gogu chettu, Tel.

This silk-cotton tree grows in Travancore, on the Coromandel coast, is common on the Arakan mountains, and occurs also in Bündelkhand, on the hills round and near Adigur and Kalingur, as well as on those near Hardwar and the Khera pass. The leaves are used for the curious rude leaf-bellows with which the natives of the hills near the Assan valley smelt iron. It has curious thick branches, which spread out somewhat awkwardly, each tipped with a cluster of golden-yellow flowers, as large as the palm of the hand, and very beautiful. The bark abounds in transparent gum, of which the white ants seem fond, for they kill many trees. This is the gum katirn of the N.W. Provinces of India, and is substituted for tragacanth. Wood soft, and only used as firewood. The cotton of its pods is used for stuffing pillows, etc.—Roxb.; O'Sh. p. 225; Stewart; Hooker, Him. Journ. i. p. 53; Voigt, p. 91.

COCK, the male of the domestic fowl of the genus Gallus. One species of Gallus is found in the wild state in the Malay Peninsula, two in Sumatra, two in Java, and one in the Philippines. The bird of the genus in the wild state is found in Borneo, Celebes, or any island of the Molucca Seas. The two of Java are distinct species: they will pair, and the progeny is a beautiful bird, kept by the wealthy Javanese as an ornament of their poultry-yards, under the name of jakiser. The wild fowl of the Philippines are sometimes tamed, are very brave, and always come off victors with the large cocks of China; and they will contend with the famous gallant breed of the Logno. Most of the advanced nations of the Asiatic islands are gamblers, and the favourite shape which gaming takes with them is cock-fighting. This includes the people of Bali, Lombok, Celebes, and all the Philippine Islands, the only material exception being the Javanese. The passion for cock-fighting is impressed in the very language of the Malays. Thus there is a specific name for cock-fighting, one for the natural spur of the cock, and another for the artificial; two names for the comb, three for the crown of the cock, two for a cockspur, and one for a professional cock-fighter. The passion is nowhere carried further than in the Spanish dominions in the Philippines. There it is licensed by the Government, which derives from it a yearly revenue of about 40,000 dols., or about £10,000. Nations of Central Asia seem, from time immemorial, to have used the cock in sacrifice, being especially sacred to the sun in the worship which it still continues. It is offered in sacrifices on the new-year's day by the old Parsee fire-worshippers. The Aryan Hindo and the non-Aryan races all sacrifice the cock at the shrines of the earth goddesses.—Crawford, Dict. p. 113. See Birds.

COCKATOO, birds of the Moluccas and Australia, of the tribe Sonoosors and sub-family Cacatuiinae. See Birds.

COCKLE, one of the mollusca. The cockle of Job xxxi. 40 is a species of Solanum. See Chamaede.

COCOA.

KO-ko, Kwo-kwau, CHIN. Kakao, GER. Cacao, FR. Cocoa, IT. Cocco, SR. Cocoa, also written Cacao, is the nut or seed of the Theobroma cacao, a plant of the W. Indies and the continent of America. Lindley mentions also T. bicolor, and T. Guineensis. T. cacao has been introduced into India, Ceylon, the Philippines, Celebes, Amboyna, and China. The cocoa tree flourishes best in the alluvial soil of mountain valleys, though it will grow well at some elevation on mountain-sides. The varieties are numerous, some producing very superior fruit to others. The plants begin to bear at from 5 to 7 years of age; during this period the inter-spaces between the rows of trees can be rendered productive by planting yams and vegetables in them. A free ventilation of air should be ensured to each tree, and this cannot well be attained with a smaller space than 30 feet. Large forest trees of favourable sorts require to be scattered amongst them, to protect them; the tree used for this purpose in the W. Indies and S. America is one of the Bombacceae. There are two crops a year. The average return, when the trees are planted close together, is from 1 to 3 lbs., but as much as from 9 to 12 lbs. can be procured by proper planting and cultivation. Great care is required in rearing the cocoa, after it is separated from the pod; and on the method of fermenting and drying depends very much the production of a good or bad article. According to its preparation, it realizes from 60s. to 120s. per cwt. in bond. 17,000,000 lbs. of cocoa were imported into Britain in 1871, upwards of 7,300,000 lbs. being entered for home consumption. Cacao seeds were made use of by the Mexicans, previous to the arrival of the Spaniards, boiled with maize, and roughly bruised between two stones, and eaten seasoned with capsicum or honey. The seeds are contained in a husk 4 or 5 inches in length; and dried, roasted, 760
COCOACEE.

and ground, they constitute cocoa; mixed with starch and finely ground, soluble cocoa. Chocolate is the same flavoured and made up into a paste. As seen in the market, cocoa is in the form of flakes, granulated, soluble, rock, dietetic, homoeopathic cocoa, broma, etc., largely adulterated with 5 to 50 per cent of sugar and starch. Flake cocoa generally contains the worthless husk, which forms about 2 per cent of the seeds; but genuine flaked cocoa of good quality cannot be purchased under tenpence or one shilling per pound, yet it is no uncommon circumstance to see, in London shop windows, samples ticketed fivepence and sixpence per pound; such samples at this price must either be damaged or adulterated. Cocoa contains the alkali theobromine, in which there is a larger amount of nitrogen than is in theine, so that tea, coffee, and cocoa may all be regarded as containing the same nutritious principle.—M. E. J. R.; Hassall; Simmonds; Crawford; New Museum; Royle.

COCOACEE, the palm tribe of plants, the Palmaeae of Lindley, are inhabitants of the tropics of both worlds, and hardly range beyond lat. 35° S. and 49° N. They are local plants; only Cocos nucifera, Arecoa scolerocarpa, and Borassus flabelliformis being found in many lands. There are supposed to be about 1000 species, but scarcely a fifth part are well-described. The Oponoa, or edible cabbage-tree of the W. Indies, has been introduced into the East. The Areca catechu is well known for its betel-nut, the Arenga saccharifera for its sago, palm-wine, sugar, and black horse-hair like fibres. Caryota urensis valuable for the immense quantity of its sap, which is fermented into toddy or palm-wine, or distilled into arrack. Canes and rattans are from the various species of Calamus. The Sagus lavia and S. farinifera yield much of the sago of commerce. The Borassus or palmyra is of great value for its palm-wine, its fruit, and its leaves, as also is the fan-palm Corypha umbraclurifera, the talipat palm of Ceylon and the Moluccas; while C. taliera is of great value for its leaves, which are formed into the palm books, on which the people write with an iron style. The date fruit, on which so many of the Arabs subsist, is from the Phoenix dactylifera; the P. sylvestris of India furnishes sap which is made into palm-wine, sugar, or arrack; and the widely-spread coconut tree, Cocos nucifera, with its multitude of uses, all belong to this order. Recently, the following have also been noticed:—Plectocorni elongata, Mart., of Java; Ceratolobus glaucescens, Bl.; Demonomorpha melanocheles, Bl.; Lodoica Seychellana, Labill., Seychelles; Hyphaene coriacea, Gaertn., of Egypt.

Cocoonut, the fruit of the Cocos nucifera, is a word supposed to come from the Portuguese term Macaco or Maccoco. Its fruit-bearing power may be considerably improved by extracting toddy from the blossom shoots for the manufacture of jagari during the first two years of its productive- ness, after which it may be discontinued. The subsequent annual produce may be safely reckoned at fifty nuts per annum. From ten to twelve large nuts may be seen on each bunch. In good situations, the fruit is gathered four or five times in the course of the year. The albuminous substance within the 'copra' or kernel is used as an article of food, and when dried is largely exported to other places; and the clear, sweet liquid which the nut encloses when young, is a very agreeable drink; it is the backbone in a liquid state. House licking, constitute an adhesive quality to this, and mix it with their white and other washes, in which lime forms a chief ingredient. The full ripe nut contains a small quantity of oily milk, and is then used for making oil. Cocoonut milk is extracted by pressure, and is used in making curries, etc. It is from the husk of the cocoonut that the well-known 'coir,' khor, or roya fibre of commerce is prepared, and used for the manufacture of coir rope, matting, brushes, etc. Cocoonut husk, from which the fibres have not been separated, is used in lieu of a scrubbing-brush for the floor, and for polishing wood; brooms, mats, and bags are likewise manufactured from it. Cocoonuts, both in the raw and dried state, form a prominent feature amongst the exports at Gall and Colombo, in value to about £14,000 yearly. Cocoonuts valued at £50 a ton are imported into Great Britain. The shell is very brittle, and its structure is somewhat fibrous; but it admits of being turned for the bodies of cups and vases, the feet and covers being made of wood or ivory. Common buttons are also made of the cocoonut shell, and are considered better than those of
COCONUT CRAB.

The coconut crab, of the Seychelles or Malhe islands, is the fruit of the Lodoicea Sechellarum. When preserved whole, and perforated in one or two places, the nut serves to carry water, and some of them hold six or eight pints; and by slicing them in different directions they are formed into plates, dishes, drinking cups, etc., known in the French islands as Vaiselle de l'Ile Praslin. The half of a coconut crab is a favourite scallop of the Mahomedan fakir in India. The crown of the trunk is eaten, like the American cabbage-palm; the down attached to the young leaves serves for filling mattresses and pillows; the ribs of the leaves and the petals are fabricated into baskets and brooms; and the young leaves are boiled in the pot of不变.

The Lodoicea attains a height of 80 or 90 feet. It might be largely introduced into India with advantage. Germinating nuts were sold in London in 1854 at £10 a-piece.—Seeman.

COCONUT FIBRE, or Cor, is obtained from the outer rind of the nut. This is bruised and steeped in water for two or three days, after which it is taken up, and the fibres separated by the fingers, scraped gently with a blunt knife, and then dried in the sun. If steeped in water too long, they get coloured.

COCONUT MILK. To make this, the kernel is grated, a little warm water is poured over it, and the liquid is then poured through an open cloth. This milk is excellent with coffee, and is indispensable for curry.

COCONUT OIL.

The kernel, having been removed from the shell and dried, is subjected to pressure in a mill, and the oil is expressed; but when prepared in small quantities, the kernel is boiled in water for a short period; it is then pounded in a mortar, taken out and pressed. The milk, as it is called, which exudes, is then boiled over a slow fire, when the oil floats to the top, and, being skimmed off, is afterwards boiled by itself. Two quarts of oil may be procured from fourteen or fifteen coconuts. When fresh, the oil has an excellent flavour. It is used as an unguent on the bodies of the natives after bathing; and as an oil for the hair; it is employed as a lamp oil, and is manufactured into soap, and it is said to have all the virtues of col-liver oil. The purest oil is obtained by grating the kernel, and depositing it in some hollow vessel, to expose it to the heat of the sun during the day, and the oil drains away through hollow spaces left for the purpose. The Malay method of making the oil is by dividing the kernels into two equal parts, which are ranged on shelves made of laths of the betel-nut palm or split bamboo, spaces of half an inch wide being left between each lath. Under these a charcoal fire is lit, and kept up for two or three days, in order to dry them, after which they are exposed to the sun on mats, and when thoroughly dried are subjected to pressure in an oil-press. The remains of the coconut, from which the oil has been extracted (Posknakull, Hind.; Tenga poonak, Tam.; Tenga pindee, Tel.; Poornak, Singh.), affords an excellent material for feeding pigs, poultry, etc. The best oil exported is from Cochin, and the neighbouring ports on the Malabar coast. It usually
COCOANUT PEARS.

fetches 20s. per ton more than the Ceylon or Coromandel coast article. In Europe it is used for the candle and soap manufacture, for lubricating machinery, etc. In India, for making soap, for cookery, lamps, and as medicine. This oil forms the foundation of Price's patent candles. It becomes solid at about 70° Fahr. It is one of the fixed or fatty oils, and consists of solid and fluid constituents, the latter, or oil, being separated from the solid parts by heating the stearine or cocoanut, used in the manufacture of the stearic candles. It is also much used by pharmaceutical manufacturers. In Borneo, the only oil used by the women in the dressing of their hair is that freshly expressed from the cocoanut; and this is perfumed by allowing the flowers of various plants to remain in it. The native oil-mill is similar in shape to the mortar and pestle of the druggist, the latter being worked by a shaft, to the end of which a pair of bullock's is attached. The cattle travel in a circle of about 18 feet diameter, and make three complete revolutions in a minute. Half a hundredweight of the dried kernel is a charge for a full-sized checkee (mortar), and a pair of stout, well-fed bullocks will get through four such charges in a day; so that twenty mills are required to get through two tons in the twenty-four hours. The man who drives has usually a boy to assist him in taking the oil, which is got out of the mortar by breaking a piece of the shell and squeezing it into an earthen vessel. The cost of the native oil-mill, with serviceable bullocks, is rather under than over Rs. 200.—M. E. Jur. Rep.; Col. Rec., Sept. 1861; Law's Sarawak, p. 145.

COCOANUT PEARS, suit to be concretions existing free in the interior of the cocoanut in the East Indies, particularly at Singapore, where the rajas esteem them as precious stones. Mr. J. Bacon published a notice of them in the Proceedings of the Boston Society of Natural History, U.S. It is said that they occur sometimes as large as a cherry; but Mr. Bacon's are about 2-5ths of an inch in diameter. These vegetable pearls are smooth and white, like animal ones, but are harder, and not quite so brilliant. Like ordinary pearls, also, they are composed of carbonate of lime, but have only a very small proportion of organic matter. The former contain considerable quantities of an albuminous animal substance. Examined microscopically, the cocoanut pearls are found to be composed of numerous regular concentric layers, which adhere to each other very energetically. Their origin is at present uncertain. In the analysis of the cocoanut milk, a little phosphate and malate of lime is found, but no carbonate, which hitherto has not been found in any part of the nut.

COCOANUT TODDY.

Cocoanut trees of vigorous growth send forth nine, ten, and even twelve clusters of buds every year. But those on which little care has been bestowed, and which are consequently feeble, produce only four or five of these spathes, called in Tamil 'palli.' The 'Sanar,' or toddy-drawer, when accoutered, has first in importance among his appointments, the arivalpatty (lit. knife-box), made from the sheath of the spathe, and bounded round tight with two binders of rattan. A strongly plaited rope is permanently fastened to one side of the arivalpatty. The short arm of it has a much smaller loop; when fastened round the waist, the longer arm is passed inside the small loop of the short arm. Through the loop of the long arm, the toddy-drawer passes the end of his waist-cloth, and ties it into a knot. Next in importance is the croppet, into which the toddy-drawer empties the toddy collected in the pot or chatty up the tree. It is made of palm-fibre closely plaited, and, when moistened, is water-tight. Two wooden collar bands are inserted to inches broad, encircle the mouth of the croppett, or draw the pot under one end outside; between them the plaited wicker-work is run up and made fast. To keep the croppett in its bulged, bottle-like form, a piece of a new half-way down is woven in, and encircles the vessel like the hoop of a barrel. The croppett hangs suspended over the hoop of a barrel. It takes nearly a year's practice to make a man master of the curious mode of climbing, after which the lowest trees are ascended in a minute with surprising ease. After a hard morning's work, the left arm always aches more than the other limb, showing that there is more strain on it than anywhere else. When an accident befalls a toddy-drawer, it is usually occasioned by his left hand missing its hold on the tree and slipping aside, which brings him to the ground instantly, often with fracture or injury of that limb.

When the spathe is a month or a month and a half of the flower is drawn, the drawer begins his labours by binding the sheath to prevent its expansion, after which he cuts about an inch off the end, then gently hammers the flowers which are thereby exposed. Finally, he binds up the end with a broad strip of fibre, and descends. This process he continues morning and evening for fifteen days, a thin slice being cut away on each occasion. During this time, also, by shaving away a little of the under part of the sheath, he trains it to bend over. It is probable that the exact term of days during which the spathe undergoes this initiatory preparation varies in different places, and depends upon surrounding circumstances. Mr. Berthold Seeman, in his Popular History of Palms, mentions five or six days as sufficient. Near Madras, a toddy-drawer gave fifteen days as the usual time; but the time when a spathe is ready to yield toddy will be easily known by the chattering of birds, the crowding of insects, the dropping of the juice, and other unmistakable signs. When ready, the end of the spathe is fixed into a kudave or small pot, and a small slip of leaf is pricked into the flowers to catch the cozing liquor, and to convey the drops, without wasting, clear into the vessel. When the spathe begins to yield toddy, he ceases to hammer it. It will give toddy for about a month, during which time, every morning and evening, he mounts the tree, empties the toddy into his croppett, binds the spathe an inch lower down, smears the end of it with his palm mattai, and shaves a little away, then pricks in the slip of leaf, and ties the kudave on again. The man who ascends the tree is generally a paid servant, receiving about Rs. 7 a month. He will attend to thirty or forty trees. Forty trees yield about twelve measures (Madras) of juice, seven in the morning and five in the evening. During the heat of the day the spathe does not yield so freely as in the night. Twelve measures for forty trees is at the rate of a little more than one-fourth of a measure to each tree.
COCONUT TREE BEETLE.

A first-rate tree in a good soil, and carefully tended, will produce one measure during the night, and three-fourths or one-half of that quantity during the day; but, taking one tree with another, a quarter of a measure is a fair average. Some trees, under favourable circumstances, continue yielding at this rate throughout the year, others only for six months. It is not prudent, however, to draw all you can from them, as they will be exhausted, and become barren. Every morning and evening, when the Sanar goes to draw the toddy, a servant or some one connected with the owner or contractor for the trees, usually accompanies him with a chatty, into which is emptied the toddy from the croppets. When all the trees have been visited, and the toddy measured into the chatty or culhu-pani, it is carried away to the bazar rented by the contractor from Government at a fixed price. In Madras there are about 58 first-class toddy shops, to each of which 330 coconut trees are allotted, the contractor paying daily Rs. 2-12-10 to Government for each such shop; also 63 second-class toddy shops, to each of which 247 coconut trees are allotted, each shop yielding daily Rs. 2-2-10 to Government; and also 205 third-class shops. There is nothing very peculiar about the habit, custom, or dress of the Sanars to separate them from other Hindu castes, apart from their occupation. Around Madras the Sanars are divided into two classes, the higher and the lower; the latter are called Pully Sanar, and permit their widows to marry.—Dr. Clegborn, in No. 28, Edinburgh New Philosophical Journal, 1861.

COCONUT TREE BEETLE, Butocera rubus. COCO-MEAL is prepared in the West Indies from the starchy tubers of Colocasia esculenta, Schott. The labouring population of the West Indies largely depend for a supply of food on this root. Long droughts may disquiet the hope of the yam crop, storms and blast may destroy the plantain walks, but neither dry nor wet weather materially injures the coco. Previous to their emigration, whole families of Negroes lived upon the produce of one provision ground, and the coco formed the main article of their support. Where the soil is congenial to the white and black Bourbon coco, the labour of one industrious person once a fortnight will raise a supply sufficient for the consumption of a family of six or seven persons. The coco begins to bear after the first year, and with common care and cultivation the same plant ought to give annually two or three returns for several years.—Simmonds.

COCOON. Indung sutra, Malay. The covering spun by the silkworm, and in which it wraps itself.

COCOS. There are three groups of islands known by this name. The Cocos Islands, in lat. 14° 10' N., and long. 93° 10' E., 45 miles distant from the north-east point of the great Andaman, are two little isles. The larger of them is six miles long and two broad, the smaller two miles and a half long and nearly a mile broad. They are sheltered by the Andamans from the heavy south-west swell of the Bay of Bengal. They are unhealthy. The Cocos, near Hog Island, in lat. 3° 6' N., and long. 95° 30' E., on the west coast of Sumatra, are two small islands covered with trees. The Cocos or Keeling Islands, south of Java, lie in two distinct divisions north and south of each other. The channel between the two is 15 miles broad; the northern division consists of one island only, in lat. 11° 49' S., and long. 95° 51' E., but the islets in the southern one are numerous.—Rec. of Cocos of India, xxv. p. 64; Harsh.

The coconut palm does not seem to have been known to the ancients, though it is said to be indigenous in the East, from which they received ambassadors; and is said by the Hindus to have been brought by Viswamitra from Ceylon to India. The first allusion to it in Ceylon is of A.D. 1153, in the time of king Prakrama. It now grows in great abundance in the Maldives and Laccadive islands, on the Malabar coast, in Ceylon, on the eastern side of the Bay of Bengal, though scarce in Arakan, whence it ascends both the Brahmaputra and Ganges rivers to a considerable distance. It grows in the Nicobars, in China to lat. 20° N., in most parts of the Eastern Archipelago, from the Sunda to the Molucca Islands, and in those of the Pacific Ocean, and is now cultivated in various tropical parts of the New World. It grows to a height of 1000 feet above the sea, though flourishing in greatest luxuriance in the vicinity of the ocean. It rises sixty to a hundred feet high; its cylindrical trunk, three feet in diameter, is crowned with numerous waving, feathery leaves, forming an elegant object of intertropical scenery. It is self-propagating. Its seed-shelled nut, protected from the salt water by its tough and thick though light covering, sails on the ocean to barren spots, where it germinates, and causes even the smallest islets to become covered with clumps of the coconut palm. They are surmounted by numerous wavy leaves, called fronds by botanists, and their footstalks are often called branches by travellers. The leaves are gigantic in size, being about 20 feet in length, with a strong tough stalk, which forms the midrib, and has a number of narrow and long leaflets ranged along the two sides.

It is a tree of great value to the people, who utilize it in upwards of a hundred ways. The
COCOS NUCIFERA.

wood is applied to various purposes, such as rafters, fences, shears, laths, slings, chairs, and ladies' work-boxes, etc.; but during the period of its most abundant bearing (considered to be between ten and thirty-five years' growth), the heart-wood is of so soft and spongy a nature, that it is then merely used for fences, water-pipes, etc. Its wood is also used for reevers, for which purpose it is, however, inferior to the palmyra, though, in Ceylon and on the western coast, hard and durable rafters are procurable. The Cochin planks are prettily striped, and of remarkable size. The wood is strong and durable; a cubie foot weighs 70 lbs., and it is esteemed to last for 20 to 50 years. It is used for ridge-poles, for temporary roofs, aqueducts, etc.; for small boats; for the beams, posts, and rafters of houses; for spear handles, paling, and walking-sticks; for fancy boxes and furniture; for boats' frames, bridges, rampsarts, water butts, conduits, gutters, and drums. It forms one of the porcine woods of commerce, and is used for fancy articles. A fraganceous substance is contained in the stem, which is readily removed. Each tree produces annually from 50 to 60 coconuts, but up to 500 nuts have been obtained from a single tree, but some trees never fruit at all. From the appearance of the flower until the fruit drop, a period of fourteen months elapses. Those are enclosed in a thick fibrous husk, from which the coir of commerce is obtained by maceration and beating. The husk is employed as a scrubbing brush and polishing brush; it is converted into cordage of various kinds, employed for the rigging of ships, fishing-nets, matting, and brushes; and in India, in its loose state, it is the usual material with which mattresses, pillows, and sofas are stuffed. Within the fibrous husk is the shell, which is very brittle, though its structure is somewhat fibrous. Cut in various ways, it is formed into cups and drinking vessels, into pitchers, funnels, and lamps. It is susceptible of a high polish, and admits of being turned in an agreeable manner. These shells which are tolerably circular are used for the bodies of casks and vases, the feet and covers being made of wood and ivory. Common buttons are also made of the coconut shell, and are considered better than those of horn, as they do not, like that material, absorb the moisture, which causes horn buttons to swell and burst. The shell forms a valuable charcoal.

In its young and green state, the coconut contains a clear albuminous fluid, with a sweetish taste and a slight degree of astringency, which makes it a very agreeable, refreshing beverage; and it is also used by house plasterers as an ingredient in their whitewashes made of pure lime. But as the nut advances to its full maturity, the fluid disappears, and the hollow is filled by the almond-like dried albumen, which is the germinating organ. This pulp or kernel, when young and fibrous, is used for the manufacture of sugar. When cut in pieces and dried in the sun, it is called copra, which forms an extensive article of commerce throughout the south and east of Asia. It is used grated in curries, or its milk is expressed from it; and from copra a valuable oil is expressed, which is employed in anointing the body, is used in lamps, is largely converted into the stearine candles of England, and forms an invaluable substitute for cod-liver oil. The refuse oilcake, "pooamme," forms an excellent manure. The white and solid albumen is often cut into ornaments of flowers and fruits, meant to represent the garlands given to visitors of distinction. They are worn by Tanjore ladies at particular festivals.

The very young or heart-leaves of this palm are called the cabbage, and form an excellent vegetable, either cooked or dressed in stews, hashes, or ragouts. In the Laccadive islands, the heart-leaves of the tree, just before they unfold, are cut out and plaited into mats of fine quality, which are there used as sails for the smaller boats, and are much esteemed when exported. In India, the leaves, dried, and called by Europeans cadjans, are plaited and used as thatch, and for the outer and inner linings of walls of houses. The leaves are also made into mats, baskets, both fancy and plain; into fans, combs, brooms, screens, buckets, and lanterns; into articles of dress; and into leaf-books, torches, and fuel. The footstalls of the farmers are used for fences, yokes, shoulder-poles, and fishing-rods. The midrib of the leaf becomes a material for fisherman's nets, but brittle, and are used as brooms. The roots of the tree are chewed as a substitute for betel-nut.

One of the beverages known to Europeans as palm-wine or toddy, is obtained from the flower spathes. Before the flowers have expanded, the spathes—and these are themselves astringent and used medicinally—are tied with the young leaves, and then cut transversely from the top downwards, and beaten daily with the handle of the knife or a piece of hard wood, and the sap, after a few days, exudes into a calabash or earthen pot. In the early morning this is a pleasant, refreshing drink; but it ferments towards night, and becomes an intoxicating fluid, which is largely drunk, and is used as a ferment. It is to a great extent artificially brought to the vinous and acetic fermentations, and, in the former state, an alcoholic spirit is distilled from it, which forms one of the arracks of commerce. One hundred to two hundred gallons of toddy produce, it is said, by distillation, twenty-five gallons of arrack; eight gallons of sweet toddy, boiled over a slow fire, yield two gallons of a luminous syrup, from which, by further boiling, a coarse brown sugar is produced, known in commerce as jagari. The net-like substance Peynadi, Tam., Jalla mitta, Hind., at the base of the petiole, when very young, is delicate, beautifully white, and transparent; but when it attains maturity, becomes coarse and tough, and changes to a brown colour. Portions of these are everywhere used as strangers and sieves, for straining fluids, sifting arrowroot, etc.; and the Tahitian fishermen convert it into a garment when fishing.

The flowers contain a powerfully astringent property, which is used medicinally; and it is from the flower and spathes, before the flower has expanded, that the toddy or palm-wine of this tree is obtained. The Tahitians extract a gummy substance, called Pia-pia, from the trunk of the tree.

George Herbert, writing of the cocoanut, has said,—

'The Indian's nut alone
Is clothing, meat and treacher, drink and can,
Boat, cable, sail and needle, all in one.'

In Malabar and Ceylon, every available spot
within the influence of the sea-breeze is being devoted to the growth of the coconuts. Along the western coast of the Madras provinces, the sandy downs near the sea borders, which have hitherto produced only a stunted and worthless crop of grass, are being everywhere levelled, broken up, and manured, so as to form the beds of future plantations. Coconuts trees have great enemies in the shape of two beetles. One of these is a large Cureulo (Rhynchophorus Sach) called the red beetle, nearly as big as the stag-beetle of Britain; the other is the Oryctes rhinoceros, so called from its projecting horn. The red beetle is so called from the red mark on the upper part of its breast. Its attacks are said to be on the nut, but those of the rhinoceros beetle are on the terminal bud of the palm stem. When so injured, the bud dies, and the crown of the leaves falling off, leave the coconuts tree a mere bare stem. The same result occurs to other palms, the palmyra, the betel, in which the top bud, or cabbage, as it is called, is destroyed.—Collingwood; Simmonds; Royle's Fl. Pl.; Madras Exh. Jury Reports; Seward on Palms; Aistle; Madras Lit. Soc. Journ.; J. Ind. Arch.; Eng. Cyc.; Elliot's Flora Indica; Cat. Rec.ve; Malcolm's Tr. ii. p. 176.

**COCOTIER DE MALDIVES.** Fr. Sea cooconut; Loddicea Seychellana.

COCOYA. MALAY. Sleeping mats made from the leaf of the Pandanus odoratissimus.

**COCUM OIL or Butter** is obtained from the seeds of Garcinia parviflora, and used in various parts of India to adulterate ghee or butter. It is said to be exported to England for the purpose of mixing with bear's grease in the manufacture of pomatum. It is a white or pale greenish-yellow solid oil, brittle, or rather friable, having a faint but not unpleasant smell, melting at about 95 degrees, and when cooled, after fusion, remaining liquid to 75 degrees.—Simmonds.

COD.

Kabla; Bakela; Dan. Baecla; Baeclare, It. Skrei torsk; Kabelja; Baukaels; Baecla; Baeclare, Lat. Babola; Babola, Port. Morue; Cabila; Babola; Babola; Babola; Babola, Sp. Babola; Babola; Babola, Sw. Babola; Bakela; Babola, Ger.

In China the consumption of salted provisions is very general. Fish, cured with salt and dried in the sun, is one of their most generally used articles of food; and on salted cod being introduced for two or three years in English ships, the somewhat decayed condition in which it reached China was anything but a drawback. But this cargo, besides its disagreeable nature and the injurious effect on some delicate articles of shipment during the voyage, bred a peculiar insect, which, from the readiness with which it bored into the planks and timbers of a ship, was considered as dangerous, and accordingly the import was greatly discontinued. Cod sounds, brought into Britain in great quantities from Newfoundland, are the salted air-bladders of these fishes. They are also largely imported into England from the east coast of Scotland. Cod-liver oil is largely in use throughout the world in cases of threatened phthisis.—McCallum's Conc. Dict. p. 502; Morrison, Compendious Summary.

CODILLA or Tow, the short fibres of hemp or flax, separated or picked out in cleaning.

COLO. HIND. Paspalum frumentaceum, Ken.

This is sown early during the rainy season. Its small grain frequently has inebriating properties, when made into bread. Such codo is known by the name of mutonna, from Mutt, drunk, intoxicated. In appearance it resembles ordinary codo; it is sown as ordinary codo, and comes up as mutonna, but only in those fields on which codo has been previously grown; and even in such case, only, perhaps, in one instance out of ten. These curious properties of codo have invested it with a degree of mystery in the eyes of the natives of India, and the Kakun Rajput of Ghazipur are said to worship it as a divinity. They never cultivate the wild codo, "Nefas violare et frangere morso;" and the reason assigned is that, while under the influence of mutonna, they were set upon by some of the neighbouring tribes, and thus lost the greater part of their once extensive possessions. Kissors (Lathyrus sativus) is another grain which is found to have injurious properties.—Elliot.

**COCCELIUS.** A family of curious reptiles of the order Batrachia apoda. The family contains two genera, Coecilia oxyura, D. et B., which is found in Malabar, and the genus Epicerium, of which E. glutinosum, Linnae., is found in Ceylon, and E. monochromus, Bleeker, in Pegu. Linnaeus gave to the Ceylon species the name Coecilia glutinosus. This is an inch in diameter, and nearly two feet in length. Its eyes are so small and imbedded as to be undistinguishable to ordinary observers, who believe the reptile to be blind. Like snakes, eels, and some salamanders, it secretes a viscous fluid from minute pores in its skin. The skin is furrowed into 350 circular folds, in which are imbedded minute scales. The head is tolerably distinct, with a double row of fine curved teeth for seizing the insects and worms on which it is supposed to live.—Sir J. E. Tennant, p. 318.

COEL. HIND. A bird of the family Cuculidae. It is the Eudynamys orientalis, and inhabits Ceylon, India, Malay countries, and China, and is called Coel, Hined, Kokil, Beng., Chule, Malay, and Cowndecoha, Singhul, all of the names being obtained from its ordinary call, which closely resembles the word Koil. Like the cuckoo of Europe, this is, in India, the harbinger of spring; and its call, though shrill and disagreeable, is associated with all the joys and labours of husbandry of that season, and is quoted in the rhymes and proverbs of the people. Thus Coel bolee, Sebundee dalee, the cry of the coel is the grief of the sebundy soldier; meaning that the disbanding of the armed men gathered together for collection of revenue depends on the coel's note,—Sebundee being a corruption of Sapah Hindee, in distinction to Moghul or foreign troops, who were always kept up. The coel, indeed, occupies much the same place in India that the cuckoo does in Europe. The European names, even, are all derived from the Sanskrit name Cuculus. Pliny says that the vine-dressers deferred cutting their vines till the cuckoo began to sing. There is the cuckoo-ale of England, which the labourers leave their work for a partake of, when the first cuckoo's note is heard. There is the old, foolish superstition in England, that it is unlucky to have no money in your pocket when the first cuckoo of the season is heard; and the amorous Hobnelia tells us that in love omens its note is equally efficacious.—Elliot.
COEL. COFFEE.

COEI, the ancient name of Alighur, where M. Perron built a fortress.

COELGOGYR, a race in Cochin who make bows, arrows, shields, and other weapons. The Cumiargogyr race teach fencing and the use of weapons. The Coelacy are trumpeters.

COELOGNE, a genus of plants belonging to the natural order Orchideae. The most gaudy of all plants, Born, and perhaps are the various species of C. sotox, called collectively by the natives the bu-uca ka-sihan, or the flowers of mercy; their white and orange-coloured flowers are exceedingly delicate and beautiful, and they are all highly fragrant. About 20 species occur at the foot of the Himalayas, Nepal, the Khassya Hills, and China, namely, angustifolia, barbata, cristata, decora, elata, fimbrata, flavida, Gardneriana, interrupta, longicaulis, maculata, media, nitida, ocellata, ovalis, praeox, procera, prolifera, rigida, undulata, Wallichiana. Borneo has C. Lowii, Paxton, pandurata, Lindley, the last with large green and black flowers.

COELOPS, a genus of the mammalia, of the sub-family Rhinolophinae, of the sub-order Chiroptera or bats.

COEPANG, a Dutch settlement in the S.W. part of the island of Timor.

COFFEA, a genus of plants belonging to the natural order Cinchonaceae. There are several species of C. arabica of Arabia, from which it has been introduced into many countries; C. Bengalensis, the Bun-kahwa or wild coffee, which grows in Assam, Nepal, and the Khassya Hills; C. elliptica, Thewedes, a small tree of Ceylon, growing to 10 or 12 feet high in the Himaldoor; C. Guianensis, Aubl., of Guiana and Trinidad; C. Manirhitiana. Lam., of Bourbon; C. Mexicana, D.C., and C. obovata of Mexico; C. Liberica, Bull., of Liberia; also C. tetandra of the Khassya mountains; and Wight describes C. alpestris, Grumeloides, and Wightiana. The Coffea Arabian trees are now grown in Abyssinia, and in tropical Africa generally; in Arabia, on the slopes of the Neelygher Hills, in the Peninsula of India, at Lohadugga in Bengal; in Ceylon, Siam, Burma, Sumatra, Java, Manilla; in Queensland, in the Mauritius; in the West India Islands, Central America, Brazil, and Peru. The seeds known as the bean, from the Arabic boon, are the economic product of this tree, and Great Britain obtains its supply of them from many of the above-mentioned countries,—from Ceylon, British India, Brazil, and Central America. In 1880 its imports reached 1,555,939 cwt., valued £7,062,016; and 290,802 cwt. were retained for home consumption. In British India, Mysore, and Cochin, there were in 1880, 47,978 coffee plantations, with 162,373 acres under mature plants. The approximate yield is 33,100,778 lbs.; and the yield per acre of mature plants ranged up to 447 lbs., being smallest in Mysore and highest in the Neelyghiers. Seven cwt. per acre have been claimed for the yield occasionally on some of the Coorg estates, but reliable information was furnished in the fifth issue of the Statistical Tables for British India. In 1879 there were 17,351 estates in British districts, with 63,799 acres under mature plants, and the average yield per acre of mature plants was 325 lbs., the greatest crop being on the Neelyghiers, where 462 lbs. or 4 cwt. 14 lbs. was the average. The crops per acre in Mysore were only 14, 22, and 30 lbs. respectively in the Kolhar, Hassau, and Shimogah districts. The plantations in these three districts numbered 10,365, and 44,116 acres were under mature plants. The Kolhar district of Mysore had 13,802 plantations, but the other data are not given. Coorg had 4,248 plantations, with 59,159 acres of mature plantations, and its yield averaged 198 lbs. In the Peninsular States of Cochin and Travancore there were 140 plantations, with 16,310 acres of mature plants, yielding 246 lbs. per acre.

COFFEE BERRY. Boon. Ail., BOMBAY. C. bun-kahwa. Kapi. Vern. A. kish. Kapi. V. Chin. A. kash. Koli. C. A. EGYPT. The coffee tree is supposed to be indigenous to the mountain regions of Enarea and Cuffa, to the south of Abyssinia, whence about the 16th century it was introduced into Arabia, in the 17th century into Ceylon and Mysore, into Mauritius and Bourbon in 1718, and Batavia in 1723, and subsequently into the West Indies. Abel al Kador Mahomed ul Azari ul Jeziri ul Abbas Ali, who wrote in Egypt about A.D. 1587, relates that in the middle of the 15th century Jamal ud Din Abul Abdulla Mahomed bin Saeed ul Dubani was Kadi of Aden, and, having occasion to visit Abyssinia, he found his countrymen there drinking coffee, and on his return to Aden introduced it, whence it passed into Arabia generally. Shaiik Allah Shaduli ibn Omar settled near the sea about A.D. 1630, on the plain now occupied by the town of Mocha, and his reputation drew people around him, till a village was formed. He greatly recommended the use of coffee, and he has ever been regarded as the patron saint of Mocha, the people having, on his demise, erected over him an elegant tomb. Tavernier, in the "Collection of Several Relations," etc., published in London in 1680, has stated (page 64) that "coffee grows neither in Persia nor in India, where it is in no request; but the Hollanders drive a great trade in it, transporting it from Oemus to Persia, as far as Great Tartary, from Balsara into Chaldea, Arabia, Mesopotamia, and the other provinces of Turkey. It was first found out by a hermit, whose name was Sherk Siudeli, about twenty years ago, before which time it was never heard of in any author either ancient or modern." Coffee has been grown in part of Mysore almost from the same time that the Arabs have known it. It was brought there from Arabia by a Mahomedan pilgrim, named Baba Boonden, who formed a college on a spur of the hills now called after him, and from there the coffee plants spread. He is said to have brought with him only seven coffee beans, which he planted, and it is now one of the most valuable of the plants which have been distributed by man. Its large, pure white, sweet-scented flowers appear in March, April, and May, and its fruits in November, December, and January. Its fruit contains an active principle called epine; which has been found to be identical with theine; and a decoction of the roasted berries, or an infusion of the berries, is a well-known article of diet, and with tea, cocoa, 767
COFFEE PLANTING.

COFFEE PLANTING.

matoo, Paraguay tea, guarana, and kola nuts, constitute the beverages of the European, American, Asiatic, and African peoples. Each of these plants contains the alkaloid theine. Different in botanical characters, varied, yet not very unlike in flavour, they all contain this valuable active principle. The theine in dried kola nuts is about 2 per cent, coffee has 0.5 to 2.0 per cent, and tea from 0.5 to 3.5 parts in 100. The coffee berry consists almost wholly of albumen, which surrounds the small embryo of the seed, and in infusion or decoction is a stimulant. In Arabia, the decoction and infusion is often prepared from the husk and the bean, and often from the husk alone. Lane says Kahwa is an old Arabic term for wine. Dr. Shortt, in his Handbook to Coffee Planting, described the process of wine and spirit making with the fresh coffee pulp, but also from the dried husks of the fruit.

Coffea Liberica, Bull., the Liberian coffee plant, is of almost arboreal growth. It has a larger leaf, and its berries also are larger, and of superior flavour to those of C. Arabica, and it is more productive. It was at one time hoped that this plant would be less affected by the Hemileia mould, known as the leaf disease, as it is said to have an immunity from the cestomata fly.

The import of coffee into Great Britain from Ceylon and other British possessions, from Brazil, Central America, and other countries, was as under:

Liberian coffee grows at elevations unsuitable to the Arabian species. At the end of 1877 there were in Ceylon about 500 acres planted with Liberian coffee. Estimates of the area under cultivation at the end of 1880 varied from 4000 to even 10,000 acres. Though not enjoying complete immunity from the attacks of leaf disease, the growth and productiveness of the trees have not so far been affected by it. London dealers are said not to appreciate its bean very highly, but it has been favourably received in America. — M'Culloch; Waring; Boyle; Birdwood; Voigt; Journ. Ind. Arch.; Statistical Tables; F. von Mueller.

COFFEE PLANTING, as a branch of agricultural industry, although only introduced into India in comparatively recent times, has attracted many persons. The outlay has been great, but both in Ceylon and Southern India the losses have been considerable, often ruinous. In Netherlands India, coffee planting has been a Government monopoly, and there has been a large exportation of coffee from Java; but the most recent information is to the effect that the monopoly is not, or was but little, remunerative. In British India coffee is grown along the summits and slopes of the Western Ghats, from the northern limits of Mysore south to Cape Comorin; in Coorg, Travancore, in the Wynad, on the slopes of the Neelgerry Hills, and also on the Shevaroy Hills and Pulney Hills. Major Bevan introduced coffee into the Wynad about the year 1822, as a curiosity. Mr. Cannon, somewhat later, formed a plantation in Mysore; Mr. Glasson, in 1840, formed a plantation at Manuortody; and in 1842 it was growing well at Belgaum. The extension has since been great; and in 1880, in the

Cochin, Travancore, Mysore, and Madras districts, and at Lohardugga in Bengal, 412,947 acres had been taken up for coffee, of which 162,847 acres had mature plants. The yield per acre on exceptional estates, in exceptional seasons, is said to be greater. The cultivation in British India has increased in extent year by year, and the exports, chiefly to Europe, have been as under:

Ceylon.—The coffee tree was introduced into Ceylon by the Arabs before the arrival of the Portuguese, who bartered for it its tender leaves for their curries, and its delicate jasmine-like flowers for ornamenting their temples and shrines. The Dutch carried the coffee tree to Batavia in 1690, and about the same time they began its cultivation in Ceylon, but again ceased in 1739. Its culture, however, continued to be prosecuted by the people; and, after the British occupation, the Mahommedans collected it in the villages, and brought it to Galle and Colombo, to be bartered for cutlery, cotton, and trinkets. It was extensively diffused over the country by the agency of birds and jackals. From 1821 the quantity of coffee shipped to Britain yearly increased,—native grown, badly prepared berry, and ranking below almost every other kind of coffee. In 1830 the first attempt at careful coffee culture was made on a considerable scale by the governor of the island, Sir Edward Barnes, and the success induced others to apply for waste forest land. During 1836 and 1837 upwards of 7000 acres of Crown lands were purchased, and partly cleared and planted; and in 1836 the crop was 60,330 cwt. It had become widely extended through the Kandyian provinces. On the Himalasgar mountains, in 1840, a small plantation was formed. In 1846 there were fifty estates there, averaging each 200 acres of planted land, and yielding an average crop of 80,000 cwt. of coffee. On the 31st December 1847, there were 50,070 acres cultivated. The gross outlay of this is said to have amounted to £5,000,000 sterling. In the seventeen years 1855 to 1872, the extent of coffee land cultivated in Ceylon increased 175 per cent., the number of plantations rising from 404 to 1087, the crop from 374,000 to 700,000 cwt.s. The cut-turn of produce increased 100 per cent., but the average yield per acre decreased from 5.5 cwt. to 4.88 cwt. (Standard, Nov. 17, 1875). In 1875 coffee was under cultivation in 37 districts of Ceylon, containing in all 1351 properties, of a total 481,639 acres, of which 249,604 acres were cultivated. From 1856 to 1875 the crops per acre have ranged from 2-75 cwt. in 1874, to 5-07 cwt. in 1868, the general average being rather under 4-25 per acre.
Coffee interests in Ceylon were injured by the over-eagerness of the early planters to obtain coffee property, leading them to pay unremunerative prices. The coffee crop of 1870-71 was generally a bumper. The season of 1871-72 was one of short crops, caused by irregular blossoming showers, and by the leaf disease, which then made its first appearance. From 1871 to 1878, on the average, 707,590 cwt. of coffee were exported from Ceylon, and the average production per acre was 3-79 cwt. In 1879 the export was 774,774 cwt., and the out-turn per acre cultivated was 3-60. In the three years 1878 to 1880, the average export was 658,575 cwt., and the average yield per acre was 3-01 cwt. Since these unremunerative results followed, the planters have been directing their attention to cacao, cinchona, and tea.

In Arabia Felix the culture is principally carried on in the kingdom of Yemen, towards the cantons of Aden and Mocha. Although these countries are very hot in the plains, they possess mountains where the air is mild, and the coffee is generally grown half-way up on their slopes. When cultivated on the lower grounds, it is always surrounded by large trees, which shelter it from the torrid sun, and prevent its fruit from withering before its maturity. The harvest is gathered at three periods; the most considerable occurs in May, when the reapers begin by spreading cloths under the trees, then shaking the branches strongly, so as to make the fruit drop, which they collect and expose upon mats to dry. They then pass over the dried berries a heavy roller, to break the envelopes, which are afterwards winnowed away with a fan. The interior bean is again dried before being laid up in store. The principal coffee districts are Henjerisa, Tarza, Ouidein, Ancizah, Bazil, and Weesaf. The nearest coffee plantations are three and a half days' journey (about 80 miles) from Aden. Coffee is brought into the Sana market in December and January from the surrounding districts. The varieties are Sherzoe best, Ouoeaim, Muttanca, Sharrazee, Hubbal from Aniss, Sherissee from Aniss. The nearest place to Sana where the coffee tree grows is at Arfis, half a day distant. The coffee plant in Arabia is mostly grown near the sides of mountains, valleys, and other sheltered situations, the soil on which has been washed down from the surrounding heights, and carefully protected by means of stone walls, so as to prevent the traveller the appearance of terraces. The plant requires a moist soil, though much rain does not appear necessary. Coffee is also found in greater luxuriance in places where there is no spring; yet an abundant supply of water to the root of the plant seems necessary for the full growth and perfection of its bean. Mr. Palgrave says the best coffee is that of Yemen, exported from Mocha, but Arabia, Syria, and Yemen consume two-thirds of it, and the other third finds its way to Europe, to the west of Constantinople, and is used by Turks and Armenians. The rounded, half-transparent, greenish-brown berries are deemed the best. It is also exported by the Red Sea into the Hejaz and Kasim in Shinner. It was stated by Niebuhr to have been brought by the Arabs from Abyssinia to Yemen, from a country similar to their own plains and mountains; that people had for ages cultivated it in the hilly range (Jabal) in a healthy temperate climate, watered by frequent rains, and abounding in wells and water tanks.

In Ceylon, the coffee plant will grow and reproduce itself on a level with the sea; and at 2000 feet above it, the trees, whilst young, will have the most luxuriant appearance, come soonest into bearing, and yield the greatest measurement quantity per acre, but the bean is light, and of an inferior quality. The best Ceylon properties are situated on the mountains at from 3000 to 4500 feet above the sea, where rain is frequent, about 100 inches annually, and the temperature moderate; the maximum 80° and minimum 15°. The average properties (and consequently final flavour) of the coffee plant are best developed in Ceylon between 3000 and 5000 feet above the ocean. The higher it is cultivated, with care, below frost, the better has been the quality of the produce, although the yield is less. The appearance of high mountain beans is long, blue, the longitudinal seam curved, with its sides close and compact; its specific gravity is greater, and its aromatic principle more abundant and finer, than that produced on low lands, which is attributed to its being grown slowly in a cold climate. The best plantations are situated in the Kandy-in province, where the thermometer ranges at noon about 76°, and in the morning not higher than 60°. The coffee berry in those elevated districts has therefore to be conveyed to Colombo, where a constant high temperature enables the merchant to complete the drying process, which the planter had but commenced. Coffee plantings failed over a considerable portion of the soil of the island. The temperature was found to be too equitable, not descending sufficiently low at any time to invigorate the plant, which, though growing luxuriantly at first, soon became weak and delicate. The chief crop ripens in October and November, and a small second gathering is looked for in May. The following have been the average quantities and values of quinquennial exports from Ceylon:

In Ceylon, suitable coffee land has been costing £8 to £20 the acre; and £25 to £30 the acre was the estimate for bringing the purchased land into bearing, and providing proper buildings, suitable roads, paths, and drains. In Ceylon it is considered better to choose an easily or northerly aspect; for though the morning sun falling on the dew is said to injure the plant, and the setting sun to improve its fruit, the advantage of shelter outweighs these considerations. The south-west monsoon is apt to exercise a blighting influence, curling up and withering the few leaves it does not beat off the trees.

In Ceylon, the best soil is of a deep chocolate colour, friable, and abounding with blocks and small pieces of stone. Such patches of land are generally found at the bottom of the escarpments of the hills, or in elevated valleys, and rarely on the slopes. Quartzose land must be carefully avoided, and clay is equally bad. A good surface soil should have at least two feet of depth, as the coffee tree has a long tap root. A nursery must be proportioned to the extent of land to be culi-
vated, and situated with regard to proximity to the extended fields. The seed-grains are sown six inches asunder; if the land become parched, it will be well to shade it with green branches, and irrigate it night and morning; should a long continuance of rain follow the sowing, the seed sometimes decays in the ground. It requires from six weeks to three months, according to moisture and warmth, before it germinates, and in four months more the seedlings are ready to be transplanted.

The labourers on the Ceylon coffee estates, about 220,000, are principally from the districts of Madura, Tinnevelly, Tanjore, Trichinopoly, and Mysore. They arrive between May and October, and return in January and April via Manar. Kandyans and the lowland Singhalese were found unsuitable for the work, besides being too few; and the arrivals at and departures from the ports of Ceylon of Tamil coolies, from 1841 to 1873, were—

During the years 1841-46 the Tamil labourers must have saved or remitted to their country from £385,000 to £400,000. But against this pecuniary advantage a great loss of life had to be placed. During the eight years above enumerated no less than 70,000 Malabar coolies died.

In Southern India, Cannon's Mysore was grown on a range of hills from 3500 to 4000 feet above the sea, having the benefit of the south-west monsoon, which very seldom falls at all, never entirely, and it has also the tail-end of the north-east monsoon. Its peculiar qualities were closeness of texture and richness of flavour. From the year 1832, Europeans entered into the agriculture, and Cannon's Mysore coffee soon attracted the attention of dealers, for it rose from 1816-47 to an average of 96 shillings the cwt., and had fetched so high as 115 shillings; and the selling price of native-grown coffee in Mysore rose from one rupee per maund of 28 lbs. to six and eight rupees per maund. The first plantations by Mr. Cannon were at Chikmoogloor, near the Baba Booden hills; the next were at the Munjerabad Ghats; and for many years the Mysore coffee districts were confined to the region of the Western Ghats and the Baba Booden hills. Attempts were made to cultivate coffee in the open country, but without success; it seemed to require forest land, and considerable elevation and moisture.

In the year 1862 the demand for coffee lands in Southern India was at its highest. Coffee plantations two years old were then selling at £12 to £14 the acre; of three years' growth, £15 to £17; of four years, £18 to £20; and in full bearing, £20 to £25,—when coffee was worth 75 to 96 shillings the cwt. From that year commenced doubts in the minds of planters, but ultimately, in some districts, the result was disastrous. From these yielding three cwt. per acre, and they were the great bulk, there were no returns. In Coorg, the enemies of the coffee tree—the bug, the rot, the borer, insufficient capital, and the want of the owner's eye—were numerous. In Coorg there were cheap labour, cheap food, and good roads, yet in the autumn of 1866 the estates were unsaleable.

In the south of India land was sold from Rs. 10 upwards to Rs. 50 per acre from Government. In 1876, some natives of Wynad asked Rs. 30,000 for 150 acres of forest land, equal to Rs. 200 per acre. In Travancore, in 1875-76, 7817 acres were sold for Rs. 2,147,761, or Rs. 28 per acre; the highest price in a single lot realized was Rs. 82 an acre. It was estimated that an acre of jungle on the Neeltgherries could be brought into bearing for Rs. 200, including all expenses. A good dwelling-house, the pulping house, machinery, and godowns, Rs. 4000 more. The entire cost of bringing 100 acres into bearing was generally reckoned at Rs. 30,000.

Soil.—In British South India the soil recommended is a good rich garden land, the situation high, and not liable to inundation, and well sheltered from prevailing storms. A hill affording shade to the shrub has been found beneficial in all tropical climates; if grown fully exposed to the sun, the berries ripen prematurely. A beautiful species of Strobilanthes, which grows in Coorg, is called the coffee plant, because thought to indicate soil suited for coffee trees. Coffee delights in a moderately warm and moist atmosphere; but Coorg is deluged with rains during six months of the year, and scorched by the sun for the other half. In hilly country, planters protect the shrub from being washed away, by terracing and cutting level drains across the hill face. Cannon is peculiarly adapted to the growth of coffee, being a mountainous island, with three sides open to a vast expanse of ocean. Droughts do occur, but even in the driest seasons the hills attract clouds, which frequently pour down refreshing showers. The heavy mists and dense clouds, which sometimes shut out the sun for days together, or roll sluggishly along the mountain-sides, are amongst the planters' best auxiliaries. The shrub luxuriates in a rarefied, temperate, and moist climate, and delights in frequent but not heavy rains on the slopes, where there is a good natural drainage, for any lodgment of water about its roots soon proves fatal.

Sowing.—The seed reserved for sowing must be put into the ground quite fresh, as it soon loses its power of germination. The quality of the seeds from young stems is not so good as that from stems four or five years old. Clean, well-formed berries, free from injury by insects or the decay of the pulp, should be selected. These berries must be sown in a nursery, either in small, well-manured beds (or in pots in a sheltered spot), not too close, as it is well to leave them where sown until they acquire a good growth; indeed, it is better if they are removed at once from the bed where they are sown, to the plantation. The seedlings appear in about a month after the seed is sown. Coffee seedlings from the nursery may be planted out in seven
COFFEE PLANTING.

months. A bushel will rear 10,000 plants, covering ten acres. Coffee trees should be planted in rows six or eight feet apart, in holes 20 inches deep by 18. They should be regularly lopped and pruned, so as to admit the sun to ripen the fruit on every branch. The trees are generally in bearing in the third or fourth year.

The coffee tree, if allowed, attains 15 feet in height, but to facilitate plucking it is kept down to 3 or 3½ feet above the ground. This makes the shrub shoot out laterally, and produce at least 25 per cent. more than it would do if permitted to attain its natural height and to occupy more land. In tapping, care must be taken to cut off the uppermost pair of branches, as their weight when in fruit would split the head of the stem. Nature is constantly throwing out young shoots, which try to grow upwards, but they must be carefully broken off, as they are a great and useless drain on the juice of the plant. Never cut a snapper or branch off a tree, but always break it. It is necessary to protect the trees from being burned up by the sun, by planting them sufficiently close to form a good cover, and protect the soil from exhaustion by systematic weeding and substantial manuring.

The age to which the coffee tree will survive has not been ascertained. Native plantings are to be found in many parts of Ceylon, Wynad, Mysore, etc., containing trees of an age far beyond the power of the oldest inhabitant to define, and which have very probably been flourishing for generations.

Fruit.—From flowering to harvest is from eight to nine months. A field in full bloom is a beautiful sight. The clusters of white blossom contrast prettily with the deep green leaves, and the whole at a distance the tree itself had been snowed on. The flower only lasts one day. If the atmosphere be dry, the bloom is sometimes lost, as it will not set without moisture: mists and light drizzling rains are the most favourable weather at this time. The fruit grows on a footstalk of half an inch, in clusters round the joints of the lateral branches, and when of full size, but still green, resembles small olives. A month before ripening it turns yellow, and through different shades to ruby red when it is ripe, and from its likeness to a European fruit is technically called 'cherry.' During the latter part of its growth, particularly, it requires a great deal of moisture, otherwise the bean will be shrivelled, not perfectly formed, light, and of inferior quality. When the fruit becomes blood red it is perfectly ripe, and should be gathered. Once ripe, the sooner it is plucked the better. Within the pulp is the parchment surrounding the two beans, then the semi-transparent silver skin, and at the latter have biconically only one single berry, generally small and deformed, called pea-berry, which realizes in Britain 10s. to 12s. per cwt. more than the best quality of the usual sort. The parchment and silver skin comprise about 1 per cent. of the fruit. The pulp has a sweet, sickly saccharine flavour. In 1875 it was proposed to ferment the pulp into a spirit.

Ceylon coffee is known in the market as washed coffee. Mocha coffee is designated husked coffee, and is perhaps a better coffee bean.

Mocha coffee is cultivated in very small fields of a few acres in extent, and on level ground; the fruit is allowed to remain on the tree until it drops or is shaken down, and is gathered from the ground. In that hot, dry climate the pulp shrinks and becomes rather hard, and then by pounding by the hand, the berries, of a bright grey colour, are separated from the silver skin, the parchment, and the dried pulp, at one operation.

In Ceylon, after the berries are plucked and brought in baskets to the warehouse, the pulp or fleshy part is removed. The berries are placed in heaps in a loft, above the pulper. They are then sent down a shoot, into which a stream of water is conducted, and are thus washed into the pulper. The pulper is a roller covered with a sheet of copper, made rough like a nutmeg grater. The berries follow it as it goes round, but there is only room for the shoot to pass, so that the pulp is squeezed off and carried away by a stream thrown by the water wheel, while the naked coffee drops on the other side. The seeds are still covered with glistening matter, to remove which they are washed in a cistern, the inferior ones floating, while the good ones sink. The coffee seeds are then laid out on the barbeces (which are square platforms of brick, plastered with chunam, with sides a foot high), where they dry in the sun for about three days, and are afterwards stored in godowns. In the moister parts of Ceylon, the curing process is not completed on the estate. After removing the pulp, the beans, enclosed in parchment, are dried for about three days, and are then forwarded to Colombo, where, by means of special machinery, the parchment and the silver skin are removed from the berries, which are of a bluish colour when they are ready for shipment.

The commercial value depends on the size, form, and colour of the beans, and their flavour. Apart from tanning, which should be done when practicable, one of the best and most simple tests by which the merits of coffee may be approximately arrived at, is the amount of aroma which arises when the berries are freshly ground. In the better qualities the bean will grind with a dark appearance. In some kinds, especially those of the Mysore and Peninsular growths, the berries when roasted are perfect, owing, in a great measure, to their hardness and thickness when in a raw state, which would account for their resisting the application of heat better than the less bulky berry of Plantation Ceylon. Mocha, on the contrary, not only presents a most ragged appearance after it has undergone the process of roasting, but often exhibits many different shades of colour.

Coffee is one of those articles of which, though the inferior qualities may be unsaleable in Europe, a superior sample will always meet with purchasers from on account, as it is consumed by a class who will have it, and who consequently must pay for it as a luxury. In 1847 and 1848, although 'Ceylon plantation' was sold from 55s. to 50s. per cwt. as a general price, a few samples from the highest estates brought 80s. and 92s.

The Abyssinian coffee berry, also excellent, is inferior in qualities to that of Yemen; it is larger. The Indian berry ranks next. In Arabia the picked berries are roasted in a ladle until they crackle, redden, and smoke a little, and are carefully withdrawn from the heat long before they are black or charred, and are then put to cool on a glass platter. They are then bruised (not powdered) in mortars, poured into hot water, and 771
boiled gently and not long, all the time stirring with a stick; add when boiling a few aromatic seeds;—

'Heyl,' and a little saffron and cloves. The liquor is then strained.

In Ceylon and Southern India, mechanical con-

trivances have been largely applied in the process of preparing the coffee bean for the market. Amongst others, Mr. Clerihew's fanners and Grieg's pea-berry machine may be mentioned.

**Manure.**—The returns obtained from manured plantations have been richly repaid by a high standard of bearing. Cattle manuring is the most generally available. A good manure is found in the decayed leaves that fall from the trees them-

elves, to which may be added the weeds produced in the plantation, dried and burnt. These, dug in, are always useful as a manure, and should be utilized. Cow-dung is the best manure for the seed-bolls. The pulps of the coffee can be added to the fertilizing mass; indeed, rotting wood, weeds, burned dolomite, and anything which will produce ammonia, should be taken care of. But it has been supposed that many of the coffee plant enemies, fungi and insects, are germinated in the decaying manure. The manuring of a whole estate at one time is seldom required, but every part of the plantation should be brought under its operation every second or third year. One Ceylon estate, which was wholly manured without limit as to expense, is said to have returned about 20 cwt. to the acre; lime, cattle manure, and mould from the neigh-

bouring forest were used in a compost, and the soil turned up everywhere round the plant to apply it to (Cooffee Planting in Ceylon, p. 62). The richest mould can make a yield crop after crop for years, unless a proportionate return be made to it. The plant and its fruits are differently composed, and it is more necessary to provide for the fruit than the stem which supports it. A large proportion of the bean is nitrogen, which science teaches may be produced by certain phosphates, etc., under particular circumstances. A chemist can in a few days and at trifling cost produce what the uninstructed might spend a lifetime and a fortune over without attaining.

About 1849, Mr. Herepath gave the following analysis of 150 grains of fine West India coffee berries, for the purpose of determining the best manure for the West India coffee estates. Deducting the carbonic acid, 100 grains of ash gave,—

phosphate of lime, 45.551; phosphoric acid, 12.801; potash, 16.512; soda, 6.757; magnesia, 5.942; lime, 2.329; sulphate of lime, 1.751; with small quantities of sulphuric acid, chloride of sodium, and silicate acid.

In searching for a manure, where bone-dust, cow-dung, and wood ashes can be cheaply procured and applied, nothing can be better; a little powdered guese might be an improvement. Failing bone-dust and cow-dung, recourse must be had to ammoniacal manures, such as guano, and to lime. The dolomite of the interior of Ceylon contains, according to Dr. Gyngax, the proper proportion of phosphoric acid, in the shape of apatite or phosphate of lime. Dolomite is plentiful in Southern India.

In a subsequent communication from Mr. Here-

path, of date 13th June 1858, addressed to Mr. Walters, regarding a chemical analysis of Ceylon coffee, he reported that 1000 pounds of raw coffee

berries of Ceylon plantation's growth, contained the following mineral ingredients:—Potash, 37 lbs.; lime, 22 lbs.; magnesia, 57 lbs.; peroxide of iron, 4 lbs.; sulphuric acid, 24 lbs.; chlorfine, 3 lbs.; carbonic acid, 11.5 lbs.; phosphoric acid, 7 lbs. And he mentioned phosphoric acid, sulphate of lime, and carbonate of magnesia as the principal ingredients required for manure. About 100 pounds of Peruvian guano, with 7 or 8 pounds of ground gypsum, 10 pounds of magnesian limestone, and 1 pound of salt, mixed up with Ceylon vegetable mould or the ashes of the wood clearances and some pounded granite or quartz, would make a good manure for 1000 pounds of raw berries. (Bom. Stand. Jan. 1859.)

**Profits—Losses.**—In Southern India and in

Ceylon there has been money made in coffee planting by Europeans, but chiefly in their land speculations. But there have been great and general losses, sweeping away the little savings of servants of Government and speculative persons, and in 1880-81 and 1882 there was a general loss. The yield of coffee varies greatly with the seasons; but the trees have insect and vegetable enemies which have caused ruin,—the white, brown, and black bug, the black and white grub, the leaf disease, the coffee rat, the mole cricket. The first regularly worked Ceylon estate was opened in 1825, but the bug does not seem to have appeared in large quantities till 1845; then, how-

ever, it spread with such rapidity, that in 1847 a very general alarm was taken by the planters, about the same time that the potato, vine, and olive diseases began to create alarm in Europe. The coffee bugs seem, however, to be natives of Ceylon, for the white bug has been found on orange, guava, and other trees, as also on beetroot and other vegetables; and the brown bug attacks the guava, ibiscus, ixora, justicia, and orange trees,—indeed, every plant and tree, and even the weeds, on a coffee estate, particularly such as are in gardens.

When a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, while the fungus, which never fails to attend on the bug, prevents restoration, by closing the stomates through which the tree breathes and respires. Bug, Mr. Nielter tells us, exists on all the estates; none are believed by Mr. Nielter to be quite free from it, and he reasonably asks, 'Am I wrong in saying that if there was no bug in Ceylon, it would, at a rough guess, produce 50,000 cwt. of coffee more than it actually does,' and that quantity represents a value of £293,000. The brown and white bugs, and the black and white grub, he adds, are the only important enemies of the coffee tree, and the destruction caused by airlines, lianodes, zeuzera, phylates, strachia, and the coffee rat appear to be of a more local and occasional nature. The three chief pests are the white bug, the brown bug, and the black bug.

The appearance and disappearance of the coffee bug is most capricious. It comes and goes, now rapidly spreading over a whole estate, now confining itself to a single tree amongst thousands; here, leaving an estate in the course of a twelve-month, there remaining permanently; sometimes spreading over a whole estate, sometimes attacking a single field, then leaving it for another and another. But the white bug prefers dry, and the brown damp localities, the latter being found.
COFFEE PLANTING.

more plentiful in close ravines and amongst heavy
rotting timbers than on open hillsides, and it is
probably to this predestination that the shifting of
the insect is attributable. The bug seeks out the
softest and most sheltered parts of the tree, the
young shoots, the under-sides of the leaves, and
the clusters of berries.

The injury done by the white bug seems more
severe than that from the brown, but, not being so
plentiful as the latter, it is of less general im-
portance. The white bug is especially fond of
congregating amongst the clusters of berries, which
drop off from the injury they receive, and trees
often lose their entire crop in this manner. The
injury produced by the brown bug is the weaken-
ing of the tree, and is thus more general, but the
crop does not drop off altogether nor so suddenly.
With white bug on an estate, the crop can hardly
be estimated; with brown bug it can.

The White or Meaty Bug is the Pseudococcus
adonidum. The male insect is of a dirty brownish
colour, and slightly hairy. It is very minute (very
much smaller than the female, only about half
a line long), and resembles certain small Ephemer-
idae or May-flies. The female is oval, brownish-
purple, covered with a white mealy powder, which
forms a stiff fringe at the margin, and at the
extremity of the abdomen two sete. The larve
and pupae are active, and move about. The insects,
in all stages of development, are found in Ceylon
all the year round, chiefly in dry and hot localities,
on the branches of trees, and on the roots to one
foot under ground. Mr. Nietner says it is identical
with the species naturalized in the conservatories
of Europe. It is preyed upon by the Sceymnsus
rotundatus, a minute beetle of the ladybird tribe,
of the size of a pin's head, black and pubescent;
also the yellow-coloured and common Eneyrtus
Nietneri and the black-coloured scarce Charto-
coccus musciformis, two minute Hymenoptera
(wasps), only 1/2" long, and the minute whitish
mite, Aecurus translacon. Of the members of this
family of insects, the Coccide, some, as the
echneal and lac insects, are of great economical
importance, but others, as the sugar-cane blight of
the Mauritius, the Aspidiotus, and the coffee
bug, are excessively baneful to the gardener and
agriculturist.

The Common Coffee Bug, Lecanum coffee, Walker, establishes itself on the young shoots and
buds, which it covers with a noisome incrustation
of scales, enclosing its larve, from the pernicious
influence of which the fruit shrivels and drops off.
It is a Coccus, and a number of brownish wart-like
bodies may be seen studding the young roots, and
occasionally the margins on the outside of the
leaves. Each of these warts is a transformed
female, containing a large number of eggs (700),
which are hatched within it. When the young
ones come out of their nest, they may be observed
running about on the plant, looking like wood-
lice; but shortly after being hatched, the males
seek the under-sides of the leaves, while the females
prefer the young shoots as their place of abode.
The larve of the males undergo transformation
into pupae beneath their own skins, and their
wings are horizontal, and their possession of
wings may possibly explain the comparatively
rare presence of the male on the bushes. The
female retains her powers of locomotion until
nearly of full size, and it is about this time that
her impregnation takes place. The pest does not
produce great injury until it has been two or three
years on an estate; but at length the scales on
the plants become numerous, the clusters of berries
assume a black, sooty look, and a great number of
them fall off before they are mature. The
young shoots have a disgusting look from the number of yellow posterior bodies forming on them, the leaves
get shrivelled, and on many of the young shoots
the berry forms. The coffee bug first appeared
in 1843 on the Lupalli Galla estates, and it, or a
closely-allied species, has been observed on the
Citrus aicida, Psidium pomeriforme, Myrtus Zey-
lanica, Rosa Indica, Careya arborea, Vetex negundo,
and other plants, and most abundantly on the
coffee bushes in moist places. It reappears though
eradicated, and is easily conveyed on cloths from
one place to another. Dr. Gardner, whom Sir J.
E. Tennent quotes (ii. p. 246), was of opinion that
all remedies had failed, and that it must
wear itself out, as other blights do. The male
of the brown or scaly bug, Lecanum coffee, is
of a clear light pinkish-brown colour, slightly
hairv, and very pretty. It is more delicate
than the male Pseudococcus. The females when
young are yellowish, marked with grey or light
brown; and old individuals are light brown, with
a dark margin. It affects cold, damp, and close
localities, on the lower part of the tree, and the props around, as in the white bug, is continuous. The brown
bug is much infected with parasites, amongst
which the most common are eight minute Hymeno-
ptera (wasp5), with brilliant colours; but a mite,
the Acarus translacon, and the larva of the
Chilocorus circundatus, a kind of ladybird, also
feeds on the bug. In the larva state, the male
and female brown bug are not distinguishable.
The number of eggs produced by a female brown
bug is about 700. Those of the white bug are
not so numerous, but their propagation in Ceylon
is continuous throughout the year, and this
explains their great abundance compared with
cold countries, where the produce is one genera-
tion of young annually. The brown bug, par-
cularly the full-grown female, is dreadfully infested
with parasites, which thus greatly help the planter.
Indeed, it is a question whether coffee planting
could be carried on without their aid in the
destruction of the bug.

The Black Bug is Lecanum nigrum, but
the female only is known. In colour it is from yellow-

ish-grey to deep brown, and almost black in age,
and of a shield-like shape. It occurs alone, but
also intermixed with the brown bug; but it is
much less abundant, and therefore not demanding
the planter's attention. Its occupation of a coffee
or any other tree gives rise to the appearance of
a glutinous saccharine substance, which has received
the name of honey-dew. This is either a secretion
of the bug, or the extravasated sap which flows
from the wounded tree, or probably a combination
of both. A fungus, or two fungi, the Synchadum
Nietneri and Triposporium Gardneri, seem to
depend on this for vegetation, as the honey-dew
and the fungus disappear with the bug.

Another bug, the Stenochus geometrici, of a
yellowish colour, but marked with grey and
brown posterior bodies forming on it, was found at Badulla. It feeds upon the juice of the young berries, three
per cent. or more of which were said to have
suffered from it. It is allied to the green or foxtid
COFFEE PLANTING.

COFFEE PLANTING.

bug; but though it may occasionally cause destruction, there is no fear of it ever becoming a serious nuisance.

One of the Aphidie, *Aphis coffee*, the Coffee Louse, is found in small communities on the young shoots and on the under-side of the leaves of the cocoa nut tree, but the injuries it occasions are insignificant.

Several caterpillars, the *Acoa lactinea*, the *Orgyia Ceylanica*, *Eneprocetus virguncula*, the *Trichia exiguus*, *Nasus conspersa*, the *Limacodes graciosa*, and a species of *Drupana*, are found on the coffee trees, but they do not cause much injury. Another caterpillar, however, though fortunately not abundant, the *Zeuzera coffee*, destroyed many trees, both young and old, by eating out the heart. It resembles the caterpillar of the goat moth, of England, and is as thick as a goose quill. It generally enters the tree 6" or 12" from the ground, ascending upwards. The sickly drooping of the tree marks its presence.

Black Grub.—The larva of the moth called *Agrostis segetum* is the very destructive black grub. This pest is about an inch long, and is most abundant from August to October. The caterpillar lives in the ground, but comes out at night to feed, and is very common and injurious. It attacks not only coffee trees, but all sorts of vegetables and flowers, and is very destructive to gardens and in the field, as it eats everything that is artificially raised, despising grass and weeds. It generally appears only on certain fields, and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and in Europe, where it injures the grain and beetroot crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off, and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated, when it is mentioned that Mr. Nieter lost through them in one season, in certain fields, as many as twenty-five per cent. of the young trees he had planted.

The larva of a little moth, the *Gallerionompha lichenoides*, and three caterpillars of the *Boarmia leucostigmia*, *B. Ceylanica*, and *Empithacia coffearia*, are found on coffee trees and other plants from September to December.

The larva of the *Gracillaria coffeifolii* mines the coffee leaves; it is very common, but of no importance to the planter.

The ravages of the large, well-known, beautiful locust, the *Phymata punctata*, with its scarlet abdomen and yellow and bronze above, are not continuous in the coffee trees, but occasionally very annoying. A swarm sets on, impaling one-year-old coffee, and gnawing the succor off the stem, causing them to throw out many shoots and permanently disfigured five per cent. of the trees. They do not touch the illuk grass, *Saccharum Konigii*, *Retz.*; but seem only to attack cultivated plants and trees. At Tanglela they destroyed tobacco plantations, and at Matillee in Kandy the native grain crops were injured by those locusts. The larva and pupa are as destructive as the perfect insects; but this seems, fortunately, the only species of locust that does any real injury in Ceylon, and this injury is in importance not to be compared with that done by other species in other countries.

White Grub.—Under this name are included the larvae of various Melolonthidae, the cockchafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodda considered the white grub to be by far the greatest enemy of the coffee trees which the planter had to contend with, as he never knew a single tree recover after their attack; and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand trees of fine old coffee. Mr. Gordon used to dig up the soil at the foot of the trees, and take out such grubs as he could find.

Weevils.—The family of the weevils is one of the most extensive amongst the beetles; and in Ceylon, as in Europe, many of its members do much injury to agricultural produce. Mr. Nieter had seen nearly the whole crop of sweet potato (Batatas edulis) of the Negombo district destroyed by one of them, the *Cylas stenopennis*. The common rice weevil, *Sitophilus oryzae*, is another instance; and one of the coconuts, *Mandevilla stenopennis*. The coffee weevil, *Sitophilus coffeae*, is another instance; and one of the coffee weevils, *Sitophilus coffeae*.

The Acurus *coffee*, or *coffee mite*, is so small as to be hardly perceptible to the naked eye. It is closely allied to the Red Spider of the hothouses of Europe. Nearly all the year round, but chiefly from November to April, it feeds on the upper side of the coffee leaves, giving them a brownish, sunburnt appearance. Individual trees suffer from it. in the evening, but the aggregate damage from it is not great.

The *Coffee Rat* of Ceylon, the *Golunda Elliotti*, occasionally commits much damage, seemingly to get the bark, for they do not seem to eat the berries. With their long sharp incisors they bite off with great smoothness the smaller and younger branches, generally an inch from the stem; and should the plants be quite young, just taken from the nursery, they bite them right off a few inches from the ground, and carry them to their nests in hollow trees. They appear irregularly, at intervals, from the jungles, and there is hardly an estate in Ceylon that does not now and then receive a visit from them. The natives of Ceylon say that their food in the jungles is a species of Strobilanthus, called *Nils* in Singhalese, and that the rats only are from their forest residence and attack the coffee estates when their forest food fails.

The injuries from other animals is not serious. A *squirrel*, the *Sciurus Lasiati*, which eats the coffee berries, is common on Ceylon estates; the pulp alone is digestible, and the coffee beans are dropped on logs of wood and on the ground. Jackals and monkeys occasionally do the same;
this is called parchment coffee. A deer will now and then come from the forest and nibble the tops of the young trees.

Mantis tricolor, Nietner, the Mantis of the coffee tree, is green, lower wings reddish, with large blackish spot at the posterior margin. The female is 1 inch long, with ½ inch of an expanse of wings. The male is considerably smaller. The eggs are deposited upon coffee leaves, in cocoon-like masses of ½ of an inch in length, but drawn out further at each end.

And what are the remedies to all these coffee plagues?

Mr. Nietner tells us that several means of checking the extension of the bug have been proposed and tried. Amongst these, the introduction of the red ant; but their bites are so fierce and painful, that the cooies refused to go amongst the trees while the ants were there. Rubbing off the bug by hand has been tried, but it can only be attempted upon young trees without crop; and Mr. Nietner, although allowing that an immense quantity of bug is thus destroyed, is nevertheless of opinion that the effect is but trifling. He thinks that the application of tar to the roots is a good suggestion, although he is obliged to admit that hitherto no important results have been achieved by it. He adds that high cultivation seems to have the effect of throwing it off. But as the bug seems to depend on locality, Mr. Nietner does not look for any beneficial result so long as the physical aspect is unchanged. He thinks that if the open, warm, airy patterns were cultivated, which the experiments on a large scale, tried at Passelawa, show that they can be, the brown bug, which is the great destroyer, would not find the conditions favourable to its existence; or perhaps, if estates as a rule were made smaller than they generally are, if the reduction in acreage were counterbalanced by a higher system of cultivation, universally carried out, the bug would not be so numerous as it now is in the "Indian coffee."

In the southern parts of the Peninsula of India, the Borer is a name given to the larva of a coleopterous beetle, the Xylotrechus quadripes of Chevrolat, which injures coffee trees. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the female near the root of the tree, and the pupa borers tunnel up the heart of the plant. It does not stop short at the destruction of crop, but actually kills the trees. This enemy has been confined to the Madras Presidency and Mysore, leaving Ceylon unscathed. The borer carries on the work of destruction entirely in the interior of the stem, the wood of which it rapidly reduces to a saw-dust-like powder, leaving the bark intact. At first the outer signs of the presence of the bug are a few small round holes in the bark, but gradually these holes increase in number as the grubs get more numerous, the leaves get sickly and fall off, and finally the tree withers and dies. If this devastation were confined to a hundred or even a thousand or two of trees, the planter could afford to grin and bear his loss; but instances are numerous in which an entire estate has been completely denuded of trees by this tiny but formidable insect. For a time the borer seemed destined to

defy all attempts to arrest its ravages; but it was observed that the beetle, which is the eggs from which the grubs are hatched, avoided shaded, and affected light and sunshine. Thus much known of the habits of the foe, the protection of the coffee plants by the shade of larger trees naturally suggested itself, and has been found a most effectual remedy.

The Leaf Disease, or Coffee Leaf Disease, of the coffee plant seems first to have appeared in Ceylon in 1869, and prominently in S. India in 1870. It is the Hemileia vastatrix, a fungus which fixes on the under-sides of the leaves, causing spots or blotches, at first yellow, but subsequently turning black. These blotches are covered with a pale orange-coloured dust, which is easily rubbed off. The blotches gradually increase in size, until at last they have spread over the entire leaf, which then drops off, leaving the trees in a short time perfectly bare. The trees seem to recover in the spring of the year, but the fresh growth is never as good as the old, and the crop falls off. The yearly crop in Ceylon is said to have diminished 300,000 cwt.s. since its appearance, causing a loss of about 1½ millions sterling. The leaf disease is a true endophyte, developing in the tissues of the leaf, and expanding onwards, as is the case with red rust of corn and grapes. Sir Joseph Hooker, writing to the Colonial Office, 6th August 1874, says the Hemileia belongs to a class of most minute parasitic plants, which includes the oidiom of the vine and peronospor of the potato. Recent observations appear to establish the fact that similar plants are also present in the tissues of sheep affected with small-poxx, and may probably be found to be sources of some familiar diseases in man and the lower animals. Hitherto no means have been discovered of exterminating these plants, whose seeds, of inconceivable minuteness, float in inconceivable numbers in the air, and whose growing parts are of such tenacity, that they can penetrate the most delicate living tissue, and drive the insect by feeding on their substance. The spread of some of the kinds has, however, been effectually checked by the use of flower of sulphur, which it would not be difficult to apply to the coffee plant in Ceylon.

The Hemileia vastatrix has been termed the coffee leaf disease, as it confines its depredations to the leaves of the shrub. When suffering from this, the leaves are on their upper surface speckled with brownish spots, while the under surfaces are covered with orange-coloured dust, which consists of the spores of the fungus, or bodies by which it is propagated. The fungus itself consists of fine myceloid filaments, which permeate and live amongst the tissues of the leaf. When the spores are ripe, the shaking of the leaves by the wind is sufficient to disperse them, and each spore thus liberated is capable of germinating, and may become a fresh focus of the disease. Dr. Twanight watched this process of propagation. For some time the presence of the leaf disease caused little or no anxiety in India; but as its disastrous effects on crops became apparent, the planters began to realize the serious character of the distemper. Nearly all are now in accord in the view that manuring is the best remedy. Confident hopes were at one time entertained that the Liberian plant, which has been recently introduced, would defy the enemy, but unfortu-
nately this expectation has not been realized. It is very destructive in localities. It comes most subtly and unaccountably in an estate, and disappears apparently without any reason. The effects of it are obvious: the leaf of the tree alone is attacked, after a little drops off, leaving the bough bare and unsheltered. The disease does not seem to attack the health and vitality of the tree; but when the shade afforded by the leaf to the berry is removed, the bud, blossom, or fruit is unduly exposed to the searching sun, or to the wind, and the crop is lost. The disease often affects whole plantations simultaneously. Up to 1872 the Ceylon estates had suffered but little from this fungus. In Wynad, however, scarcely an estate escaped this leaf disease, whilst in the fifty-two estates of Travancore only one suffered, and that in a most insignificant degree.

Mr. G. Anderson, writing from Munzerabad in 1880, gave the opinion that potash, magnesia, and ammonia, in the form of sulphates, check and destroy Hemileia in coffee. He said he had used it in his experiments with excellent results, ½ to ¾ potash, ¼ to ½ magnesia, and ½ to ¾ ammonia—and thinks that the cessation of growth which precedes an attack of leaf disease, is caused by a want of ammonia and other valuable food-constituents in an available form; that lime exerts a marvellous effect in setting free all the alkalies, and in converting nitrogen into ammonia; that potash, magnesia, and lime are required for the production of coffee, and are therefore removed from the soil, and that certain forms of potash and magnesia (especially those combined with sulphur) are injurious to the growth of fungi. He concludes that sulphates of potash, magnesia, and ammonia should be used immediately before the occurrence of disease; and lime should be employed early in the season to sweeten the soil, and set free its resources. He also recommends that phosphonitrogenous manures, combined with other forms of potash, be applied to sustain and invigorate the trees.

Several learned botanists have suggested remedies for these plagues.

Baron F. von Mueller says that in 1878 the parasitic fungus growth on coffee plants in Ceylon caused a loss of £2,000,000.

In America the coffee plantations suffered not only from cryptophyta fungi, but also from the cimicostoma fly.

In the Kolen hills, experimental cultivation of tea and coffee was introduced north-east of Tonghoo. Mr. J. Petley says in his report: 'Towards the end of the rains of 1880 large numbers of the Mole Cricket made their appearance, and much destruction was done amongst young tea and coffee plants, killing them by nipping off the tops, principally amongst the coffee, and boys were employed to catch and kill these destructive insects.'

Dr. Thwaites, in his report for 1874, says: 'Judicious cultivation enables the coffee tree to produce a succession of profitable crops, notwithstanding it may suffer from periodical attacks of leaf disease.' Nowhere has the disease committed such havoc as in native plantations, where cultivation is almost entirely neglected. Previously to 1870, planters were divided into two opposite camps—the party that advocated manuring and the party that opposed it. The inroads of leaf disease have led to the matter being speedily and practically settled in favour of high cultivation.

In Ceylon, leaf disease first showed itself in 1869, in Madulasima, in the extreme eastern division of the coffee districts. Next year it spread to the Kandy side, and in 1871 it became general. During the seven years previous to 1870, the out-turn ranged from 4½ cwt. per acre in 1864, to 5½ in 1869. In 1870 the export was nearly 900,000 cwt., and the average per acre 5½ cwt. In 1871, 1873, 1875, and 1877, the export rose above 800,000 cwt.; but (1881) the average per acre has never again reached 5 cwt., while in four years it has fallen below 3 cwt. The leaf disease has undoubtedly caused a falling off of production.

Judicious, the Conservator of Forests, is of opinion that the remedies proposed by Mr. Anderson in his Essay on Fungoid Diseases might be tried on small given areas, but considers the expense attending the trial prohibitive as regards large estates.

Leaf Rot, the Kole Roga of the Tamil race, is from another fungus, to which the name 'Pellicularia koleroga' has been given. It appeared on the coffee trees of Mysore. It is an epiphyte, growing and developing upon the leaf, and only superficially attached to it. This enemy has been long in existence, although it is only quite recently that it has attracted attention. This disease is most common during the rains; and the leaves of the plants affected by it turn black and fall off, on which many of the berries also fall down, and those which remain are imperfectly ripened. After examining one of these leaves, the under surface will be seen covered with irregular greyish-white blotches, which, on being put under the microscope, are found to be filmy fungus patches, with the filaments of the fungus inter-woven into a sort of web. This fungus has received from Mr. Cooke the name of Pellicularia koleroga, but it seems very doubtful whether it is not rather a result than the cause of the black rot. There can be little doubt that rot is partly caused by imperfect drainage, and overcrowding of the branches; and such being the case, the remedies will obviously be improved drainage and free pruning.

Stump.—Mr. Hull mentions that between 1860 and 1870, in Coorg, a blight appeared on the coffee plants, to which the name of stump was given, because of it being due to the stump of a particular forest tree peculiar to that district, felled in the process of clearing. Sooner or later all the coffee trees in the immediate neighbourhood of these stumps began mysteriously to die out, and the only remedy for the mischief was to remove the offending stumps as quickly as possible (Hull, p. 274). It has not been examined by any entomologist; but a great habitat of the coleopterous insects is below the bark of decaying wood, and such homes should not be left to them.

Dr. Shortt, a scientific planter, recommends carbolic acid as a protective agent against the leaf disease and other enemies of the coffee plants.

The Gardener's Chronicle also mentions having received from Dr. Thwaites of Ceylon a specimen of a minute fungus. A few trees were first noticed to be infected in May, but at the time of Dr. Thwaites' communication (24th July) two or
three acres were showing the fungus upon the leaves. These latter fall off before their proper time. Amongst more than a thousand species of fungi received from Ceylon, this does not occur; and it is not only quite new, but with difficulty referable to any recognised section of fungi. Indeed, it seems just intermediate between true mould and Ureidio, allied on the one hand to Triehobas, and on the other to Rhinotrichium. Though the fungus was developed from the pore-chym of the leaf, there is not any covering to the little heaps, such as is so obvious in Ureido and its immediate allies, while the mode of attachment reminds one of Rhinotrichium. A new genus for its reception was therefore proposed. As the fungus is confined to the under surface of the leaves, and the mycelium is not superficial, it may be difficult to apply a remedy; but sulphur applied by means of one of the instruments which are used in the hop grounds in Kent, or syringing with one of the sulphureous solutions which have been recommended for the extirpation of the hop mildew, has been suggested.—Rev. M. J. Berkeley; Colombo Observer.

The Sydney Morning Herald describes an experiment on the aphis or coffee-moth, which shows that a very simple application coffee plants may be freed from these destructive insects. A number of the insects were placed on a leaf under a powerful microscope. A drop of a simple solution of soda in water was let fall among them. They instantly left their hold on the leaf and fell dead. Such a solution could be applied without injury to coffee plants. Sulphur has hitherto been the favourite treatment.

The following is a list by Mr. Nielsen of some of the enemies of the coffee plant in Ceylon:—

1. Pseudococcus adonidum, White or Meal Bug. *Parasites.*
   Scymnus rotundatus, Motch. *E. Ent. 1859.
   Encyritus Ninieteri, Motch.
   Charcocerus musimorphius, Motch.
   Acarus tranules, N.

   Scutellista oxana, Motch.
   Cephalita purpurocentaria, Motch.

with woolly hair and something of the African features, and file their front teeth to a point. The women wear enormous circles of pith in the lobes of their ears, which they distend down to their shoulders. A black monkey is their greatest dainty.

The other hill and forest tribes, chiefly residing on the Animalay, are the Malai Arnas, Irular, Puliya, and Madurali, subsisting precariously on wild fruits and roots, by the chase, or the sale of jungle produce. 40/8 per cent. of the population were Vellalar cultivators, 19/7 per cent. Pariahs, 8 per cent. Vannian or day-labourers, 6/3 per cent. Kukkar or weavers, with artisans (Kamman), Brahmins, washermen (Vannan), potters (Kusavan), fishermen (Sambadavan), barbers (Ambatian), and writers (Kanakan).

Coimbatore land is many times more valuable than it was forty years ago; and wheeled carriages, which were 603 in 1846–7, in 1867 were 4500. In Coimbatore two very different minerals pass under the common name of corundum. The one is true corundum of lamellar structure; the other softer and amorphous, but christature in its composition, apparently some form of hornblende. The mineral is abundant in the district, and easily procured at a small cost. Localities in Coimbatore supply the beryl, and are also supposed to have yielded the emerald, though Tavernier was not able to ascertain that any part of India, in his day, was yielding emeralds.—Tavernier’s Travels, p. 144; Lt.-Col. Hamilton, in litteris. See India, p. 324; Korumbur; Narapati.

The Hindus altogether neglected history, and, after the Greek occupation of Bactria until the advent of the Mahomeans, the coins of the rulers furnish almost the sole evidence of the dynastic changes and their individual rulers in the country of the Kophones river, i.e. Bactria, Asia, and Kábul. The earlier of the Greek successors of Alexander used Greek. This was adhered to by Theodotus I., b.c. 286, of the time of Arses i.; of Theodotus II., b.c. 240, who reigned in the Kábul valley. Euthydemus, b.c. 229, reigned in the time of the expedition of Antiochus the Great, and was defeated in battle near Merv by the united Syrian and Parthian armies. He then urged Antiochus to receive him in alliance, and so extend the Greek influence to the Indus. A peace was concluded, and Euthydemus led the Syrian army through Bactria, i.e. by the route north of the mountains to the Kábul valley, and across the Indus, in b.c. 206. There Antiochus made peace with Sophaganesus (Asoka), which that sovereign recorded by edicts on rocks and pillars in various parts of India, in characters exactly resembling those on the coins of Agathocles. In b.c. 206, Antiochus returned by way of Arachota. Agathocles, b.c. 190, coined with Greek and Sanskrit; is supposed by Lassen to have ruled Kábulistan to the Indus; and Mr. H. T. Prinsep supposes him to have been the governor left by Antiochus in Kábul, after his treaty with Asoka. Pantaleon, b.c. 195, coined in Greek and Sanskrit. Eukratides, b.c. 178 (Prinsep, b.c. 181; Bayer, Wilson, b.c. 165; Visconti, Lassen, b.c. 175). He seems to have made an expedition to India in 165 b.c., and on his return from it to have been murdered by his son. Numerous of his coins have been found in Bactria and Afghanistan; and Mr. H. T. Prinsep considers that he ruled originally in Bactria, subsequently made conquests in and south of Parapamisus in Kábul, and was the first of all the Greeks who coined in the bilingual Aryan inscription. The first use of two languages, however, is also ascribed to Agathocles, who used Greek and Sanskrit, while Eukratides used Greek and Aryan. Eukratides was certainly amongst the earliest of the Greek kings of Bactria, Kábul, and Arya, who adopted bilingual inscriptions on his coins, and his so doing is supposed consequent on his conquest of the Parapamisus, after assumption of the title of Great King. On his death, his wide dominion is supposed to have been broken into several independent kingdoms. Helioeoes, b.c. 155, the parricide of Eukratides, used bilingual inscriptions on coins in pure Greek and Aryan. His rule, though short, extended over Bactria and the Parapamisus.

Antimachus, b.c. 150, coined with Greek and Aryan. Bactria seems to have then passed under the sway of various Saca and Parthian and so-called Indo-Sceythian rulers, and during the first six or seven centuries of the Christian era it was one of the most important centres of Buddhist monasticism. As early as the second century b.c., the coins of Eukratides had the Bactrian–Pali, a language cognate with Sanskrit, but written with characters of seemingly Phoenician origin.

On the coins of the Parthian, Sassanian, Kanerki, Bactrian, Persian, Macedonian, Syrian, Indo-Sceythic or Buddhist rulers are Greek or Pehlevi inscriptions, several of them in both languages. The coins have been found of upwards of thirty Bactro-Indian rulers whose names were not Grecian, but who used Greek on their coins. They have been described in Prinsep’s Antiquities, Wilson’s Ariana Antiqua, and Bactrian Coins by Edward Thomas. The larger number are known as the Azes series, and the Kadphises and Turushka series.

The Hindu coins of the Andhra, Rajputana, Canauj, Indraprastha, and perhaps Magadhha or Belar rulers, are subsequent to Alexander’s invasion. The earliest forms in use in India and Central Asia were adopted from the Bactrian Greeks about b.c. 200. The earliest extant are the group of the Sah dynasty, b.c. 180 or 170 to about b.c. 50.

The Arabian khilafis and the governors of Persia on their coins used Pehlevi characters, and subsequently the Kufic. Their coins have been found struck at Balkh, Basra, Darabjird, Herat, Kerman, Khuzistan, Merw, Merw - ul - Rud, Nahr (van) Seistan, and Yazd.

The capital coins of Dehli, from the time of Altamish (A.D. 1211–1236) to the accession of Muhammad Taghalaq (A.D. 1328), were a gold and silver piece of equal weight, approximating to a standard of 175 grains troy (properly 100 rati). These coins appear to have been officially termed respectively Sikka and Filizat, but both seem eventually to have had the popular name of Ten-khwa. Sikka, a corruption of Hebrew origin, in India originally appears to have been a debased, and applied to the coin struck. At an early date the word gave a name to the Zecca or Cecca, or mint, of the Italian Republics; thence to the Zecchino or Cezzino which issued therefrom,
COINS.

and in this shape the word travelled back to the East, where the term Chicken or Chick survived to our own day, as a comprehensive Anglo-Indian expression for the sum of four rupees. Filizzat means 'metallic.'

The coinage of British India is regulated by Acts ii. and xvi. of 1855 and xii. and xiii. of 1862. Acts xii. of 1856 and xii. of 1844 declared that Sicas rupees, and Bhoons, Farrikahbal, and Trisaw Sycees, are not a legal tender. Other Acts of xxi. of 1837, xxi. of 1838, vi. of 1847, and xi. of 1844.

The silver coins coined and current in British India are the silver rupee of 180 grains, with its portions in half, quarter, and eighth.

By Act xxi. of 1835, the copper coinage consists of a double piece or half anna, weighing 200 grains troy, a quarter anna or piece of 100 grains, a half piece or one-eighth of anna of 50 grains, and a pie, being 1/12 of anna or one-third of a piece, 33 grains troy. The silver fractions and the copper coins are legal tender for fractions of a rupee. Gold has not been coined in the mints of India since the early part of the 19th century. Till then, the gold mohur, value 16 rupees, and the pagoda or bun, value 34 rupees, were current.

All the people of the east coast of Africa, Southern India, Siam, and Japan have the cowry shell, Cypraea moneta, for small change; and the radical character in the Chinese for silver, money, riches, property, and currency, is 'pooi,' or shell. Tavernier found pieces of twisted metal wire, called Lari (from the province of Lur, in Persia), current on the Malabar coast; and Thunberg likewise saw them current in Ceylon; and Knox tells of a coin (p. 197) 'like a fish-hook.' These have a resemblance to the Celtic rings of Britain and to the oboli of the Greeks, which were kabab-skewers, (oboloj) ረፋፋ, a handful of which made a drachma, from ከፋ, to grasp with the hand.

In assay reports from the Bombay mint in 1852 on Panjab coins, the average of 190 old Mohurkee rupees was equal to 90662 Company's rupees; that of 190 new was 88792; 190 Gondashai rupees averaged equal to 78961; 190 Jacobanisi, equal to 92781; and 190 Nanakshali, equal to 929657 Company's rupees. 190 old Farrakhabad rupees averaged 98837, and 190 new, equal to 98847 Company's rupees. 90 Khypur rupees averaged 87123 Company's rupees, and 90 Nadri rupees 106558 Company's rupees.

Southern India had a coinage of gold, and a small coinage of silver and copper, under the Hindus prior to the Mahomedan rule, and the maharajas of Travancore still coin in gold.

The Mahomedan silver (rupa) rupee was first struck at Dehli about A.D. 1541, in the time of Sher Shah, but was not made current in the south of India till 1654.

In 1601 the English introduced India money specially struck for India in the London mint. The coins had on them a portcullis. In 1660-61 the English established a mint at Madras. In 1770 there were in Bengal so many sorts of rupees, and rupees intrinsically of the same value differed so much in nominal value, which was regulated by the date of coinage, that no one but a scharf or money-changer could value the current coin, and the Government were forced to establish an ideal standard, called the current rupee, to which all calculations were made.

Most of the Feudatory States of India continue to coin in their own rulers' names, and under an Act of 1872 the coins of Native States of India are admissible as currency, under certain conditions. In the Hyderabad State there are several rupees, the Hali Sicee, and others, all of less weight than the rupees of British India. In Amrooti, the bankers used to pass sealed bags of money. In the Hyderabad State the copper coins in use are shapeless lumps, with some obscure marks on them. In reality these copper coins are the chief part of the currency, the value of the several silver coins being various, and each varying daily in the exchange of the bazaar. The reckoning is by four, which is called a ganda.

4 cowries (gavvalu) = 1 ganda.
14, 16, or 15 ganda = 1 thoodi or Pissa copper.
4 thoodi or doodi = 1 ganda of copper.
16 or 17 copper ganda = 1 rupee.

Nepal was conquered by the Gurkhas in the Newar year 888, corresponding with A.D. 1768. Prior to this epoch, the valley of Khatmandu was divided into three sovereignties, Patan, Bhatgaon, and Khatmandu, each governed by a raja. Hence, on the Newar coins, three series of rajas' names are found, those of Bhatgaon being generally distinguished by a shell, those of Patan by a risal, and those of Khatmandu by a sword. The old coins of the Mal or Newar rajas are much valued for their purity, and are worn by the women, strung to necklaces or armlets, as a memorial of their ancestors.

All money current north of the valley of Nepal, as far as the boundaries of Chinese Tartary, was formerly coined by one or more of the Nepal rajas. This was a source of considerable profit to them, the Bhutia giving them weight for weight in silver and gold-dust; but Ranjit Mal, the last reigning raja of Bhatgaon, sent them such base coins as to occasion a decrease of nearly one-half of their intrinsic value, which was no sooner discovered by the Bhutia than a desertion of the mint took place, and there has been no more Bhutia coinage made in Nepal.

The Nepalese procure all their silver from China, in the form of stamped lumps, as they are current in Lhasa, for the Tibetans generally follow the Chinese custom in their money transactions, of paying and receiving by weight, and the merchants carry scales with them for the purpose. Since the Gurkha conquest, the Vikrama era has superseded that of Nepal for ordinary purposes, and the Saka, commonly used in Hindustan, has been introduced upon the Nipalese coins.

A Kashmiri rupee was coined in 1840 by the late maharaja Partab Singh, bearing a Christian cross, and the letters 'I.H.S.' These were coined shortly after the annexation of the Panjab, when the maharaja was very anxious to show his loyalty in a way which he supposed likely to be most gratifying to a Christian Government.

Up to the beginning of the 19th century, the trans-Gangetic nations used lumps of silver like the sycee of the Chinese.

In the Straits Settlements the rupee is current, but there and throughout the Archipelego and the sea-coast of China the dollar is largely in use, and the Spanish dollar is the more valuable.

Chinese Currency.—Sycee silver, in Chinese Wan yin, is their only approach to a silver currency. In it the Government taxes and duties, and the salaries of officers, are paid; and
it is also current among merchants in general.

The term Sycee is derived from two Chinese words, Sc-soo, fine floss silk; which expression is synonymous with the designation of the term Wan. This silver is formed into ingots (by the Chinese called shoes, and by the natives of India, khuri, or hoofs), which are stamped with the mark of the office that issues them, and the date of their issue. The ingots are of various weights, but most commonly of ten taels each.

Sycee silver is divided into several classes, according to its fineness and freedom from alloy. The sole Chinese coin is of bronze, the silver and gold in China being sold by weight. An ounce of silver is the equivalent of from 1700 to 1800 of these bronze coins, which are also used by Europeans. They have some pieces of brass, called tsian, and in Mongol tcho, of which the inhabitants of Siberia make tchok and tchek; they are of less value than a copee. A kind of notes are in circulation among private persons. In China, smooth pieces of metal, which served rather for weights than for currency, date from Kieng-Wang, who reigned B.C. 524. But the earliest known piece is attributed to the emperor Wen-ti, of the lesser Sung dynasty, A.D. 465.

The kopang of the Japanese is simply an oblong plate of gold with the angles rounded off.

In Arabia and the Persian Gulf, the silver real and the copper fan are current; but the Indian rupee and the Spanish dollar also pass current. In Arabia, the Spanish or German dollar, worth about 4s. 6d., is the silver coin; but in the exchange with India, 100 dollars range from 212 to 226 rupees. The Indian rupee also passes current everywhere. British gold is becoming well known. The copper-piece of India are current, but exchange varies with the supply. Arabia has not any national coinage. According to Mardaen, it was not until the khilafat of Abdul Malik, in the year of the Hijira 76 (A.D. 695), that a distinct coinage was instituted with a view of superseding the currency of Greek or Byzantine and Persian gold and silver.

The dinar, under the khilafis, was about equal to 10s. 8d. About A.D. 1440-1450, in Ibn Batuta's time, a western dinar was to an eastern as 4 to 1; and an eastern dinar seems to have been 1/4th of a tankha, which, even supposing the tankha of that day to be equal to a rupee of Akbar, would be only 2½d. A dinar at Kâbul in the early part of the 19th century was so small that 200 made one abas; a coin of less value than a shilling. The tankha in Ala-ud-Din's time is said to have been equal to 50 jital (a copper coin which some said was equal to a paisa), and in Muhammad Taghalaq's time it was so debased as to be worth not more than 16 paisa. The tankha appears to be the coin represented by the modern rupee, and perhaps, when at its proper standard, was about the same value.

The rupee of Akbar contained 174½ grains of pure silver, and was divided into 40 dam or paisa (of 19½ grains of copper each). The dam was subdivided into 25 jital. Queen Elizabeth's shilling contained 88½ grains of pure silver; so that Akbar's rupee was worth 1s. 11½d. of English money at the time. Akbar's standard remained almost unaltered all over the Moghul dominions, until the breaking up of the empire in the middle of the 18th century. The rupee of India now contains 176 grains of pure silver, and exchanges for 64 paisa, containing 100 grains of copper each. Akbar had a four-cornered rupee, called Char-yari by the people, this being a term applied to the four immediate successors of Mahomed, viz. Abubakar, Usman, and Ali.

The current coin of Persia is the karan, a silver coin of which 209 are equal to 100 rupees, or about 11½d. each. The gold toman is worth 10 karan. 50 copper gau are equal to one karan.

The coins of Kâdphees, called Kâdphees Kor-nos, to distinguish him from Kâdphees (Kâdphees), the conqueror of Kâbul, and those of Kanerki, his successor, have been found throughout the whole of Upper India; two or three of them have been obtained from Mânlapâ, and one from Tânjore. In the Manikylâ tope, General Ventura found shell money, the cowry, the spherical flat ingot, Indo-Scevthian and Sassanian coins, all of which had been deposited at the same time. In another tope, opened by General Court, were found Roman denarii of Antony and Julius Caesar, and coins of some Roman families associated with Indo-Scevthian pieces of Kâdphees. In August 1856 there was discovered a pot of very beautiful gold coins of the time of Augustus and other emperors, near Callimpootoor, in the Iyupully taluk of Madura.

Symbols.—In the south of India, the figures of animals, the dog, the fish, a serpent or cobra, the lion, the bull, the elephant, the anika or elephant-goad, also weapons, sword, bow and arrow, a mace, an hymba or pines, were largely used on old coins as symbols. The dogs are brachying on fore legs or plays. The fish was the ensign of the Pandyan dynasty, but is also found on Buddhist seals. The chakram or wheel, the chaitya, the Ficus religiosa or pipal leaf, also a bow and arrow, a hand, and the swastika cross.

The old Mada and Tanka coins are all of gold, and generally cup-shaped, the reverse convex, the obverse concave, with fine impressions in relief, or with a lotus or padma and chank or shell.

In the ancient coins of India, lead was used for smaller denominations. These have been found of all weights and sizes near Amaravati, with a lion or the tree symbol. The lion is the most favourite symbol represented on Buddhist sculptures. It forms the crowning ornament of the celebrated laths or obelisks of Northern India, the most remarkable of which are the Allahabad column, those of Bettiah, Bakra, etc. It occurs prominently amongst the ornaments of ancient and modern degrop, and is a favourite symbol on the ancient coins of Bactria and S. India.

The elephant appeared conjointly with the lion on the Buddhist coins of Bactria and S. India; but in other S. Indian coins the elephant appears on the obverse, with some Buddhist symbol on the reverse.

The bull, both in Buddhist and Sâiva mythology, is a favourite symbol with both sects on many of their coins. It was early adopted by the successors of the Greek coins of Bactria, and with the extension of the Sâiva creed in India its symbolic adoption became almost general. The Indian coins with it are of lead, copper, and white metal.

The horse was a favourite symbol on Buddhist coins of S. India, of lead, copper, and white metal.
COIX.

The boar type of coin is the best known of all the old coinage of the S. of India. It was originally the badge of the Chalukya families of Kalyan and Rajamundry, from whom it passed to the later Chola dynasty, was subsequently adopted by the Kayar dynasty of Bijanagar, and is still found on the seals of some of the petty local chiefs in the Carnatic.

About 150 coins with symbols have been discovered, 27 of them have flowers (phul), dots, or stars; 14 have varieties of the lotus (padma) or trefoil; 12 have varieties of the trident (trisula) or spear (bala); 10 have flower (phul) or knot (padma phul); 4 with the bar/cha spear, or the guda scythe or mace; 15 have the jhar or thulhar, a tree or sprig; 6 the suraj or sun; 7 shamshiri dagger; 4 the katar dagger; 1 the ankus or goad; 13 with numerals or letters; and 13 with the shell, panja, or hand, the Hindu deities. Hanuman, elephant, the royal umbrella or chhata, or the swastika. — Yule, Catkay, i. p. cxvii.; Fraser's Journey into Khorasan, p. 74; Elph. pp. 420, 430; Mr. Walter Elliot in Mad. Journ. Lit. and Sc., Jan. to Mar. 1858; Mr. Edward Thomas' Princep's Useful Tables.

COIR is the fibre from the rind of the coconut, and is a corruption either from the Tamil Kayer, a rope, or the Maldivie Kauber, the name given to the corda with which the inhabitants, according to Abul Fazl, sewed together the planks of their ships. It is largely used in India, and the exports during the years 1850-51 to 1860-61 from India ranged between 2393 and 5882 tons, value £20,909 and £357,284. Between 1868 and 1878, the exports of coir and coir rope ranged up to 10,821 tons. Coir appears in the market in various degrees of fineness, depending upon the age at which the coconut is cut and the husk separated, and the care bestowed in steeping and cleaning. In order to remove this husk, an iron spike or sharp piece of hard wood is fixed in the ground. The nut is then forced upon the point, which passes through the fibres, and thereby separates the rind from the shell. In this manner a man can clear 1000 nuts daily. For the best coir, the outer rind of the nuts is bruised and steeped in water for two or three days, when it is taken up, and the fibres separated by the fingers and scraped gently with a blunt knife, and dried in the sun. If steeped in water too long, they get dark-coloured. Mr. Robinson thus describes the method of making coir in the Laccadives. The husk, he says, gets hard and woody if the fruit be allowed to become quite ripe, therefore the proper time for cutting it is about the tenth month. If cut before this, the coir is weak; if later, it becomes coarse and hard, and more difficult to twist, and requires to be longer in the soaking-pits, and thus becomes darker. When cut, the husk is severed from the nut and thrown into soaking-pits. These, in some of the islands, are merely holes in the sand, just within the influence of the salt water. Here they lie buried for a year, and are kept down by heaps of stones thrown over them to protect them from the ripple. In others the soaking pits are fresh-water tanks behind the crest of coral. In these the water, not being changed, becomes foul and dark-coloured, which affects the colour of the coir. When thoroughly soaked, the fibrous parts are easily separated from the woody by beating. If taken out of the pits too early, it is difficult to free the coir from impurities. If left in too long, the fibre is weakened, as is said to be the case also with that soaked in fresh water. The coir from the Laccadive Islands, Kadmat, Kiltan, and Chetlatt, is said to be of the best description. In the Laccadives the manufacture into cordage of the coir is entirely in the hands of the women. When soaked sufficiently long, it is taken out of the pit and beaten with a heavy mallet, and rubbed with the hands until all the interstitial cellular substance is separated from the fibrous portion. When quite clean, it is arranged into a loose roving, preparatory to being twisted, which is done between the palms of the hands in a very ingenious way, so as to produce a yarn of two strands at once. In these islands coir is one of the chief commodities of barter for the necessaries of life, as rice, salt, tobacco, etc. The coir is made up for the market in short 'kute' of a mixed length and weight, and at the end of the year these are collected and made up into lengths of 70 to 75 fathoms, as received by the Government. 40 coconuts are said to yield 6 lbs. of coir in Ceylon. Mr. Robinson says three large coast Laccadive nuts will yield 1 lb. of coir, measuring 22 fathoms, whereas ten small fine island nuts go to about 1 lb. of coir, but this will measure 35 fathoms. 2 lbs. of such yarn, measuring from 70 to 75 fathoms, are made up into soote, of which there are 14 to a bundle, averaging about a maund of 28 lbs. A Mangalore candy of 560 lbs. will thus be the produce of 5600 nuts, and should contain about 20,000 fathoms of yarn. The value of the coir produce of a tree is calculated to be from 2 to 2½ annas; and that of the produce of 100 trees, from 14 to 15 rupees. The average value of the total raw produce of a tree bearing fruit would then be 7 annas or 2½ rupees; and that of a p.y. traffic of 100 trees 45 rupees. The annual export of coir from the Laccadives to Madras ports is about 200 tons. In Ceylon, at Calpentsry and the Akkara-pattoo, the natives separate the coir by burying the husks along the border of the extensive salt-water lake, and when, after six months or more, they are dug out very clean, the fibres easily separate from the cellular tissue of the husk. This mode of preparing the fibre prevents the offensive smell emanated by macerating the husk, so common along the road from Colombo to Matura.

China imports coir from the Archipelago. Coir is made into cordage, both ropes and cables, for the produce of a tree, and which may be used for making ropes, as a substitute for oakum in caulking ships. The fibre is also made into brushes and gromms, as a substitute for bristles; is cleaned, cured, and dyed to resemble horse-hair; and made into matting, door-mats, and netting for sheep-folds, woven into stair carpets and floor-matting, bonnets, hats.— Loud. E. of 1862; Royle, Feb. Pl.; Robinson's Report on the Laccadives; Hon. Mr. Morrison; Oudatje.

COIX BARBATA. Rozb.

Adavi godhumulu. — Tel. Golive, Korimidi. — Tel. Gilla gaddi, Golu miilli. — Kokilakshamunu. — Grow.s in India. The Coix is a genus of plants belonging to the order Panicaceae. Several species are known in India, — aquatica, barbata, gigantea, heterocella, herima, pumilla; and the following are
Burman names for undetermined species,—Ka le poon poon, Ka le hmen, Ka le shee, Ka le theing, Lin ma, Thy doa.

COLEBROOKE, L. Job's tears, Coix millet.

The Burman names of Job's tears have large exument seeds, which are packed for sale in the bazar. A great deal of coix is cultivated in the Khasya Hills about Moulon; it is of a dull greenishpurple, and, though planted in drills and carefully hoed and weeded, is a very ragged crop. The shell of the cultivated sort is soft, and the kernel is sweet; whereas the wild coix is so hard that it cannot be broken by the teeth. Each plant branches two or three times from the base, and from seven to nine plants grow in each square yard of soil; the produce is small, not above thirty or forty fold.—Hooker, ii. p. 293; Manson; Williams.

COHIA, written Khojiah, Cojah. See Khajar.

COLABA. In the spacious harbour formed by the islands of Caramja, Colaba, Bombay, Salsette, and the continent, several smaller rocky islands are scattered, bearing different names. Of these are Bombay, Elephanta, and a little island close to the latter that Europeans call Butcher Island, but known to the people as Deipdeva, Holy Island, the island of the gods. Colaba island in ancient times formed a shelter for the pirate fleets of Western India. In 1662 Sivaji fortified it; in the 18th century Angria made it his stronghold.

Colaba is also a point or spur of rock protecting the entrance to Bombay harbour on the north; it was originally a chain of islets, which have been connected with each other and with the island of Bombay. On its S. and W. are extensive and dangerous reefs of rocks, called the Prongs. It is still the scene of many wrecks.

COLA NUT of the Cola acuminata, west tropical Africa. The seeds are much esteemed by the natives for their bitter flavour, and are said to enhance the taste of whatever is eaten after them. It might be largely cultivated in India.

COLAPORE. See Kolapore.

COLAR LAKE, a marine lagoon of great extent, lying between Ellore town and the sea. Several marine lagoons, known in India as backwaters, stretch around both sides of the Peninsula of India; north of Madras are the Ennore and Chilka and Ceder lakes, and there are several south of Madras and on the Malabar coast. Several streams flow into the Colar; and one, the Upputeru, is a tidal river. In the hot season, many routes are passable on foot or on horseback, which in the rainy season become part of the lake, and have to be crossed on pack rafts. The principal route across the lake is from Ellore to Kyakalare. From these two places palmyra rafts ply regularly to convey goods and passengers. The Colar does not extend to Ellore itself, but its edge in the rainy season comes within three or four miles of the town, to which there is a fairly good road. The lake abounds with fish.

COLEBROOK, HENRY THOMAS.

COLECHICUM. Linn.

Colchicum, the Hamsa Suranjan-talk, Pebs. J'yi-jin, Arab.

The Colchicum of the later Greeks and Arabs, and the sweet and bitter sorinjan of the Arabs, were no doubt species of this genus, perhaps C. variegatum, Planch.—O.S.; Royle.

COLENIA PROCOUMBENS. Linn.

Tripunkhi, T'yu-jin, HIND. | Hamas pudi., Tel. | Siru pudi., TAM. | Hama pudi., Arab.

A small plant growing in Southern India, used as a poultice fresh, also when dried, in powder with fenugreek seeds, to promote suppuration in boils.—Roxb.

COLE, ROBERT, Principal Inspector-General of the Medical Department of the Madras army; he wrote On the Laterite Formation, and Laterite of the Red Hills, in the Madras Lit. Soc. J. iv. 100.

COLE, COLONEL ROBERT, a military officer of the Madras army, eldest son of the above Dr. Robert Cole, author of an elementary grammar of the Corong language.

COLEBROOKE, HENRY THOMAS, was the first to give a tolerable sketch of the character and contents of the Vedas in 1805; and in 1823-1827 he expounded the principles of the different systems of Hindu philosophy. His father, Sir George Colebrooke, Bart., was for many years chairman of the E. I. Company. Henry Thomas was born in London, 15th June 1765, and died there 10th March 1837, aged 73. He arrived at Madras in 1783, from which he went on to Calcutta, where his elder brother was established. In 1786 he was appointed Assistant Collector in Tirhut. In 1801 he attained to the judicial line as First Judge in the High Court of Appeal, afterwards called the Sudder Diwani and Nizamat Adalat, and in 1807 he became a member of Council. He left India in 1813, at the age of 50: His principal writings were,—

On the Husbandry and Commerce of Bengal, Calcutta 1795.

Hindu Law on Contracts and Successions, Calcutta 1798, and London 1818; Sanskrit Grammar, Calcutta 1805; Amara Kosh, a Sanskrit Lexicon, Calcutta 1808; Translation of the Dayabhage of Jimutavahana and Yajnavalkya.

Two Treatises on the Hindu Law of Inheritance, Calcutta 1810; Algebra from the Sanskrit of Brahmagupta and Bhacara, London 1817.

In the Asiatic Researches, between 1795 and 1816, he wrote on the Duties of a Hindu Widow, Enumeration of Indian Classes, Indian Weights and Measures (1798), Religious Ceremonies of the Hindus, on the Sanskrit and Prakrit Languages and their Poetry, on the Vedas, on the Jaina Sect, on the Source of the Ganges, on the Gyal, on Oltamun, on the Dryobalanops camphora, on the Indian and Arabian Divisions of the Zodiac, on the Procession of the Equinoxes.

In the Transactions of the Royal As. Society, 1823 to 1828, on the Philosophy of the Hindus, on the Jaina Sect.

He was one of the original founders of the Astronomical Society, and of the Society for the Promotion of Oriental Literature, now known as the Royal Asiatic Society. His Sanskrit ms., which cost him about £10,000, he presented to the E. I. Co. At the time of his death he was a Fellow of the Royal Societies of London and Edinburgh, of the Astronomical, Geological, Liunesian, and Zoological Societies of London, of the Royal Academies of Paris and Munich, and of the Imperial Academy of St. Petersburg.—Jo. R. As. Soc. v. 1859; Ed. Review, 1872; Sir J. E.
COLEBROOKE, LIEUTENANT R. H.

COLEBROOKE'S Life of H. T. Colebrooke, Lond., 1872; Max Müller's Chips, pp. 377-417.

COLEBROOKIA OPPOSITIFOLIA. Smith. Panara, Hind. A large shrub of the Siwalik hills and Salt Range, growing up to 4000 feet; wood used as fuel, also to make gunpowder charcoal; and the leaves as fodder for cattle, and are applied to wounds and bruises. C. ternifolia, Roxb., grows in the Peninsula.

COLEHAN, a part of Singhbum occupied by the Ho as their proper country. The Colehan is divided into Pirhi or districts, each under a manki or chief, and each village has its mundal or headman.—Dalton, p. 163.

COLEOPTERA. See Insects.

COLEGROON, the most northern and largest branch of the delta of the Cauary river. The Coleeroon debouches in lat. 11° 25' 20'' N., and long. 79° 52' 10'' E. Its entrance is marked by a gap in the trees, and by the four porticos of the pagoda of Chellambur. The Coleeroon branch of the Cauary is separated from the Cauary below the island of Seringham, near Trichinopoly, and after a course of 80 miles (of which it is the boundary of this district) falls into the sea near Devicottah. An anicut or dam was in the year 1836 constructed across the Coleeroon, by which means a large supply of water is turned into the two southern tanks of Mannargoody and Chellambur, and is of material service to the cultivation. The Coleeroon anicutus are said to have been originally formed in the second century of the Christian era.

COLEUS AMBIGUCUS. Lour. C. crassifolius, Benth. Plectranthus aromaticus, Roxb.

Pathur chur, ... Beng. Karpura valli, ... Tel. Country borage is a delightfully fragrant plant of the Molucias and the Peninsula of India, and grown in gardens. Its leaves are eaten with bread and butter, or bruised and mixed with food, drink, or medicine.—Voigt.

A shrubby plant, with a strong but not disagreeable smell. Cultivated in gardens all over India as greens. The roots are pickled.—O'Sh. p. 191.

COLEUS OSIRIRHIZON. Elliot. Hrebera; Valuks, Sansk. | Iribeli Kuru-veru, ... Tel. It grows in Southern India, where it is cultivated in gardens. Hindu women use the scented roots to ornament their hair; and it is used as a drug, and as an offering to idols.

COLEWORT, a variety of cabbage, Brassica oleracea, of little value.—Jaffrey.

COLLADDI or Kolilady, a fort on the island of Seringham.

COLLIER, a race occupying the country south of Trichinopoly, until the 19th century, so predatory, that in the south of the Peninsula of India, Colleri became the ordinary designation of a thief; derived from Kallara, thieves, plunderers.

In ancient times they seem to have inhabited the woods from Trichinopoly to Cape Comorin. Orme describes them in the middle of the 18th century as expert thieves and plunderers; and the Jesuit Father Martin says they were very cruel. Pennant, in the 18th century, says 'the adjacent countries are covered with thick forests, and little cultivated by reason of the savage inhabitants, the Polugars and Colleries, who may be truly styled "sylvestres homines."' The Colleries, he adds, were predatory, and their government, as also that of the Polugars, feudal. The Collgeries are in number thirty or forty thousand. Their country is hilly. They generally sided with Mahommedans in the British wars against the French in the times of Clive and Duplex. Their chieftain is the Maharrja of Puducotthah.—Pennant's Hindostan; Orme's Hindustan.

COLLICHTHYE PAMA. B. Ham. The whiting fish.

COLOCAILIA, a genus of birds belonging to the family Cypselidae. C. linechi is the swiftlet that produces the edible birds' nests used in China as a restorative food. The other species is C. nilifica. See Bird's Nest; Birds.

COLOCASIA. Ray. A genus of plants of the family Araceae. Several species grow in the south and east of Asia, viz. C. antiquorum, cucullata, esculenta, fornicata, odor, Indica, bicolore, arborescent, montana, mucronata, nymphazia, virosa, macrorrhiza of Ceylon, and C. Himalensis of the Himalaya, all of them remarkable for containing a milky juice. They are grown in S. Europe, the East and West Indies, and in Polynesia, where the leaves and roots, under the name of yam, cocoa, tara, are and food. Colocasia and its allies are remarkable for the distillation of water from the extremities of their leaves. This process generally takes place at night or in a damp atmosphere, and supplements the evaporation which takes place from the surface of the leaves when the air is dry. Another curious physiological phenomenon, well shown by many Aroids, which have their numerous small flowers enclosed in a sheathing leaf (spathe), is the rise of temperature at the time of flowering in the floral organs, due to chemical changes in their tissues. In these plants the sheathing spathe prevents the dispersion of the heat, so that the temperature inside sometimes rises many degrees above that of the air outside. C. grandifolia, the great-leaved Caladium, is the Alu of Bombay.

COLOCASIA ANTIQUORUM. Schott. Arum colocasia, Linn. | A. Egyptianum, Rumph.

There are five varieties of this plant,—

1. Goori kuchoo, Beng. 2. Ashoo kuchoo, Beng. Shema kalengu, ... Tam. | Chema, Chama dumpa, Chema, Chama naoura, Tel. | Tel.

These are cultivated in most parts of India and Burma. Small offshoots from the tubers are, like potatoes, planted in well-manured friable rich soil. The roots of the Goori kuchoo are taken up in about nine months, and those of Ashoo kuchoo after seven months.

2. Kalo kuchoo. The roots send out numerous runners, but do not swell into tubers like the cultivated varieties. The leaves and petioles are used as greens.

3. Char kuchoo and

4. Bun kuchoo are not cultivated, and seldom
COLOPHONIA.

The roots is 2 lbs., and the crops are raised from November to April. It requires irrigation. The young stalks and leaves are used like spinach, or in soup. The root is employed for making the mindra or native bread. It contains much starch.

COLOASIA TRYPHONIFOLIA. Royle. Arum tryphonifolium, Caladium tryphonifolium, Roeb.

Colocynth, Citrullus colocynthis, Schr. Kansiel, Arab. Makhal, BENG. Bepunum pulpa exsicca, LATIN.

Bitter apple, DUT. Bak, BENG. Bepunum pulpa exsicca, LATIN.

Bitter apple, ENG. Tita commodo, SINGH.

Bitter cucumber, FRI. Coloquintida, SP.

Citrullus colocynthis, GER. Peycoomuti-kai, TARO.

Indray, Varzeocoloynthis, INDO.

Coloquintida, IT. Poost-kai, TEL.

Colocynthis, the Kanzil of the Arabs, has been used in medicine from the earliest times, and is one of the plants supposed to be the papyroth or wild gourd of Scripture. It grows on the sandy lands of the Dekhan, Gujerat, Kaira, Dehli. Dr. Burn states that two kinds of colocynthis occur in Gujerat, the Cucumis colocynthis, and the C. pseudo-colocynthis. The colocynthis of commerce is the dried fruit, peeled and unpeeled, and is brought from the Levant, north of Africa, and south of Spain. Colocynthis is useful for protecting shawls and feathers against insects. The colocynthis used in medicine as a hydrogogue cathartic is an extract from the fruit. That known in India by the Arabic names Indrayn and Bilamba, is said to be obtained from the Citrullus pseudo-colocynthis of Royle. Colocynthis oil is prepared in India from colocynthis seeds.—*His. Bot.*; *ROyle, Mat. Med.; Spry.*

COLOMBO, the seat of government in Ceylon, has a population of about 40,000. It is on the west coast of the island, in lat. 6° 56' N., long. 79° 53' E., and exports largely to Europe. Colombo is mentioned in Singahaless historical annals so early as a.d. 496; the name is said to signify a seaport. But this and Colove, south of Madras, and Quilon of the western coast, are all the same name, *Kulam.* It was visited by the Portuguese a.d. 1505, and occupied by them in 1638; but they were expelled by the Dutch in 1656, who in turn surrendered it to the British on the 16th February 1796.

COLOMBO ROOT. 

Colomborwels, DUT. Raiz de Calumba, PORT.

Racine de Calombo, FRI. Kaalambo khu, SINGH.

Kolumba wurzel, GER. Raiz de Colombo, SP.

Kalumb-ki-Jar, HIND, COLUMBA ver, TAM.

Kaloche di Colombo, IT. Columbus ver, TEL.

Colombo, the comlobo plant is the Cocculus palmutans. It grows wild on the coast of Mozambique, and at Oribo in East Africa, and is much cultivated in the Mauritius. The root is imported into Bombay for re-export to Europe, and is much esteemed in medicine for its powerful antisetic, tonic, and astringent properties.—*McCutcheon; Voigt.*

COLOPHONIA is in French, Bois de Colophane. To this genus De Candolle refers the tree produc-
COLOSSCHELYS ATLAS.

COLOSSCHELYS ATLAS, a huge fossil land tortoise, discovered by Dr. Falconer and Sir Proby Cantley in 1835 in the tertiary strata of the Siwalik Hills, skirting the southern foot of the great Himalayan chain. They were found associated with the remains of four extinct species of mastodon and elephant, species of rhinoceros, hippopatamus, horse, anoplotherium, camel, giraffe, sivatherium, and a vast number of other mammalia, including four or five species of quadruprana; also a great number of reptilian forms, such as crocodiles and lizards and fresh-water tortoises. Some of the crocodiles belong to extinct species, but others appear to be absolutely identical with species now living in the rivers of India, in particular, to the Crocodilus longirostris, between the existing forms of which, and heads dug out of the Siwalik Hills, no difference is detected. The same result applies to the existing Emys tectum, a common species in all parts of India. A very perfect fossil specimen, presenting the greater part of the evidence of the dermal scutes, is undistinguishable from the living forms, not varying more from these than they do among each other. Prof. Thomas Bell considers that there are no characters shown by the fossil, to justify its separation from the living. Emys tectum, now a common species found in all parts of India. There are therefore fair grounds for entertaining the belief as probable, that the Colosschelys atlas may have lived down to an early period of the human epoch, and become extinct since,—1st, from the fact that other Cheloneian species and crocodiles, contemporaries of the Colosschelys in the Siwalik fauna, have survived; 2d, from the indications of mythology in regard to a gigantic species of tortoise in India. One in the British Museum is 14 feet in transverse circumference, and is 9 feet long.—Journ. As. Soc. Beng. No. 247 of 1855. See Tortoise.

COLOUR.

White is the mourning colour of the Mahomedans of Persia and in India, and of the Hindus, Parsees, and Chinese. Blue with Hindus is an unlucky colour. No one will buy a ruby or garnet with a bluish tinge. But the celestial blue is the imperial colour of the Mongols and Chinese. The colour affected by Hindu, and in Burma by Buddhist, religious mendicants, is a dull orange. In the ceremonies of marriages of Hindus, and on other similar happy occasions, red-coloured clothes must be worn, and the invitation cards must be red-coloured.

Sir George Birdwood tells us that of all artistic powers that of colour, in the highest harmonies, is the most difficult to teach. Though general principles can be imparted by scientific rules, the power of colouring beautifully is undoubtedly one rarely attained. It seems to prevail in races as a special gift. It exists where the knowledge of form is unknown. It accompanies an unconscious sympathy with nature. Many actually savage nations colour their clothes or wraps or mats harmoniously, though absolutely devoid of social or mental cultivation. Europe may cultivate the study of colour, and understand its laws; but in textiles of all kinds, from carpets to gossamer muslins, and gold and silver tissues, the traditional taste of oriental nations remains unattainable by Europeans. In their silk and woollen fabrics, their metal work and other manufactures, there is an inherent feeling for, and power of producing harmony in, the distribution of colour, and in surface decoration. He tells us that in the colouring of carpets of India, full Indian red, broken by flowers or conventional leaves, in which orange predominates, forms a leading feature. A cool, low blue, a green of similar gravity of hue, and soft creamy white, complete the palette of the Indian designers of these fabrics. European purchasers have introduced changes into these oriental designs, but only to occasion losses of the exquisite harmony of the native arrangements of form and colour. Oriental colouring in textile fabrics seems to result from a gift to the various races that produce them. The native designers proceed in accordance with immemorial traditions, and with a certainty that resembles instinct. Their shaws are the finest textures, if not the most artistic products, of the loom. As studies of colour, the shaws of India have no rivals in the range of textile fabrics. The most celebrated of these productions are produced in Kashmir from the finest wool. The fineness and softness of its fibre retain colours of the most intense and delicate hue. Lakes, yellows, blues, orange, greens of several tints, rich and vivid; white, soft and low of tone, and absolute black, enable the designers to make up endless combinations. The designs in all Kashmir shaws are very similar to each other, with a cone or an occasional peacock amongst the rolling curves, and with the borders of the brightest colours. India also, though not manufacturing shaws, produces woven tissues, some embroidered, and some the work of the loom only, of a splendour unknown to European weavers. The gold and white, gold and purple, white and silver muslins, for colour, taste, and delicacy of arrangement, are amongst the artistic triumphs of the Indian loom. Some of them are of a gossamer transparency, intended for ladies' dresses.

Colour-sticks for the lacquer-ware of India are used in the Panjab by the kharati or wood-turner, to colour his ware when the turning process is complete. The stick consists of shell-lac, melted down with a certain proportion of wax and sulphur, and coloured by various simple or compound colours. They are applied by the hand. The operator holds the colour-stick against the turned wood object while revolving rapidly; the heat produced by the friction melts the lac, and the colour is deposited on the surface of the wood. The skill and fancy of the operator directs him either in laying on a uniform layer of colour, or else putting it on in little spots or touches, by allowing the colour-stick only very lightly to touch the revolving wood, thus producing either a smooth uniform colour, or the pretty mottled appearance so often observed in lacquered ware. Two or three different colour-sticks are often applied, giving the whole a marbled appearance of great beauty. The colour thus applied is spread, dried, and polished, by pressing the edge against the turned object while revolving. The final polish is given by a rag with a little oil. The principal colours are of lac, crimson, orpiment, red lead,
green made of orpiment and Prussian blue, dark blue, indigo or Prussian, black, white, brown or gold colour, light-blue or ultramarine.

**Colours for enamels.—**Vitreous masses are employed by the minakar, or enameller on silver, etc. The colours are principally green and blue, salts of iron and copper diffused through vitreous matter; a yellowish colour also is produced by litharge. The manufacture consists in taking a silver or metal vessel, having the pattern of leaves or flowers worked on it in relief, and filling the hollows with enamel in a melted state. The colours used are blue, green, and red. The art of making this material is known in Lahore, Multan, and other places.

**Chinese red colour** is made from Taow-fau, or copperas. Their mode of preparation is by putting a pound of copperas into a crucible, over which another crucible is luted, having a small hole in it, which is lightly covered over; around these they pile charcoal, and enclose the whole within bricks, when they fire the charcoal, and as soon as the fumes issuing from the aperture in the crucible become of a light colour, a small quantity of the copperas is taken therefrom, laid upon fir-wood, and moistened with water; if the colour then prove to be a bright red, they remove the fire; if not, they allow the copperas to remain subjected to the heat until it assumes that colour, and then remove the fire. When the crucibles are cool, a cake is found in the lower one, but the finest colour is encrusted on its sides and on the bottom of the upper crucible, which is kept separate from the cake; the pound of copperas produces about four ounces of colour.

**Chinese white colour** is made from calcined translucent flint, to an ounce of the powder of which they add an equal quantity of white lead.

**Chinese green** is beautiful. It is prepared with one part of powdered calcined flint, two parts of white lead, and six parts of the scales of well-hammered copper.

**Chinese violet** is produced by adding an additional quantity of the prepared white to the green.

**Chinese yellow** is made by combining equal portions of prepared white and red. *Liu* is the proper name of Chinese commerce. It is the Pi-en-tsing stone, an azure mineral, probably arseniuret of cobalt, roasted and powdered.

All these various colours are used by the china-ware painters, having been previously dissolved in gum-water, to which they occasionally add saltpetre, copperas, or white lead. The colours are laid on after the first baking and varnishing of the china-ware, but the beauty and depth of the colouring is imperceptible until after the second baking.

**Black china-ware**, the Ow-mi-ew, ornamented with gold, is very much prized in China. To make it, they mix three ounces of azure and seven of the oil of stones; this is laid on the ware, and when perfectly dry it is baked, after which the gold is laid on, and the vessel is re-baked.

**Cracked porcelain**, the To-wi-kie, is a porcelain prepared simply by varnishing the vessels with a whitish ash-coloured varnish, made from calcined translucent white pebbles; this has the property of marbling and veining the ware, and giving it an appearance as if it had been fractured into many pieces, which had been carefully reunited.

**COLOSFoot.**

In China two varieties occur, one with large flowers,
which, as also the leaves, are smoked in lieu of tobacco.—Smith.

COLUMBRIDE, a family of snakes, the last of the sub-order Colubrina of Dr. J. E. Gray. The Colubridae include the families Hydridae, Boidae, and Colubridae. See Reptiles.

COLUMBINA ASIATICA. R. Brown.
Cnemothus asiaticus, Linn. | C. capsularis, Forst.

The Asiatic red-wood is a large shrub with pale greenish flowers, belonging to the natural order Rhamnaceae. Other two shrubs of this genus are C. nepalensis of Nepal and C. magnifica of Martaban.—R. Brown; Voigt.

COLUMBA, a genus of birds belonging to the family Columbidae and order Geminotarsi. C. intermedia, C. rupestris, C. leucoma, occur in India, C. aromatica, C. coromana, and C. carphophaga have been referred to other genera. The most common in India is the—

Columba intermedia, the blue pigeon or pagoda pigeon.

C. livia, var., Blyth.
Kabutar , Hind. | Kovil pora, Tam.
Parivi, | Makh. | Gadai purai, Tel.

They congregate in large numbers, and breed wherever they can find suitable spots, on pagoda mosques, and tombs. The Indian blue pigeon differs from the C. livia of Europe, North Asia to Japan, and N. Africa, only in having an ash-coloured instead of a pure white rump. The C. livia of Europe, or rock pigeon, with its subspecies, is the parent form of all domesticated pigeons. Of these there are at least 150 varieties, in four groups.

The first group consisting of the German, Dutch, and English pouters.

A second group includes the Kali-par, Murassa, Bussora, dragon, and English carrier; the Bagdot hen, Scanderoon pigeon, eygne rient, the Tromfo, and the Bank.

The third group includes the Java and English fantail, the Turbit and African owl; the Persian Lotan; common and short-faced tumblers, the Indian frill-back and jacolin.

The fourth group includes the dovecot pigeon, swallow, spot, nun, English frill-back, laugher, and trumpeter.

Dr. Jerdon thus arranges the Geminotarsi or pigeons, syn. Columba, Latham:—

Fam. Ternonidae.
Sub-fam. Green pigeons; genus, Treron, Crocopus, Osmoteron, Sphenopereu.
Sub-fam. Carpodiplaga, fruit pigeons; genus, Carphophaga.
Fam. Columbidae.
Sub-fam. Palumbus, wood pigeons; genus, Azoconus, Otamibbus, Palumbina, Columba.
Sub-fam. Macropygina, Cuckoo doves; genus, Macropige.
Sub-fam. Turturina, turtle-doves; genus, Turtur.
Sub-fam. Gourida, ground doves.
Sub-fam. Phainopia, ground doves; genus, Calcopups Indeius.

Pigeons, doves, and turdes are abundant in Southern Asia and the Indian Archipelago.— Jordon; Blyth; Darwin.

COLUMBUS. Christopher Columbus, a Genoese, and famous navigator, with a fleet fitted out by the king of Spain, discovered America on the 12th October 1492. America had been discovered A.D. 986 by Bjarni Herjulfson; and in A.D. 994 Leif Erikson afterwards reached its shores, somewhere between Boston and New York. But the memory of those discoveries had passed away; and on Friday, August 2, 1492, Columbus set sail from Palos, steering to the west, to reach, in his belief, the East Indies. It was chiefly by the sail of the Pinzon family, a seafaring Spanish house, that he was able to get up the expedition. At midnight of the 11th October, a sailor discovered the island, on which Columbus landed at daybreak of the 12th, and named it San Salvador. It is now called Watling Island. He had carried with him a letter to the khan of Tartary from the king of Spain, and he died in the belief that he had reached the eastern shores of Asia, and hence gave it the name of 'West Indies.' By an ordnance of 4th May 1493, the Pope confirmed the king of Spain in the sovereignty of America, and strictly prohibited all persons to touch at any port within a line drawn from pole to pole 100 leagues westward of the Azores; and the Portuguese were to possess all eastward of this line. But when Magellan, sailing westward as a servant of the king of Spain, discovered the Philippine Islands in 1521, the Pope's demarcation was rendered useless, and Spain and Portugal came into collision.

COLVILLE, W. H., author of Notes on the Geology and Botany of the Coast between Bandar Abbas and Jaalik; do. between Shiraz and Bushahr; do. island of Kishm; do. around the head of the Persian Gulf, in 1863.

COLUMBIDE, a family of swimming birds, now classed with the Natatorides as Podicipides. The species of Podiceps are called Grebes. They haunt the sea as well as the rivers, are excellent swimmers, and dive frequently. They feed on small fishes, frogs, crustaceans, and insects; and their nests, formed of a large quantity of grass, etc., are generally placed among reeds and carices, and rise and fall with the water.

COLZA, oils of Brassica campestris and B. oleifera.

COMALA or Kamala. Hind. The lotus; pronounced Kawal. Aran-kawal, the lotus of the desert, from Aranya (Sanskrit), a waste, and Comala, lotus. By the spelling it should be called Aranakomal, but the pronunciation is as above.

COMANES, a city mentioned by Ptolemy, supposed to be Nagara, near Cambay, but in ruins. COMALI, known of the Khati tribe of Surashtra, whose pallia, or funeral monumental pillars, are seen in groups at every town and village. Abul Ghazi describes a famous tribe in Khiraram, the ancient Chorasma, called Comani, the remains of which were expelled by Chengiz Khan; and the royal author adds, 'Urgens was not always the capital; and Abulfeda tells us Cath, also spelt Kaht, in lat. 41° 45' N., was formerly the metropolis.—Rossi manhã, i. p. 59.

COMARASAMY, a hill south of Ramanallai hill, 30 miles west of Bellary, overlooking the valley of Sundur, used as a sanatorium.

COMARI, mentioned in the Periplus, is Cape Comorin. See Kumari.

COMATRESWARA, a colossal Jain figure, known by this name, stands in front of a temple at Sravana Belgoda; another colossal Jaina statue is at Karkala in S. Canara.

COMATULIDE, the feather stars of naturalists, found in the Eastern seas.—Coll.

COMBACONUM, in Tanjore, 175 miles S. from Madras, a large, populous town. In ancient times the Chola kings were settled in Tanjore and Com-
baconum, in and near the Caufvery and Colenu rivers, and, as some suppose, gave their name to the Coromandel coast. This town is built close to the river Caufvery. It has 12 pagodas, and in Hindo estimation is a very sacred place, celebrated for its learning. Brick remains of the palace of the Chola are found near Combaconum.

COMBERMERE. Stapleton Cotton, afterwards Lord Combermere, accompanied his regiment, the 6th Dragoon Guards, to Flanders in 1798. From the conquest of the Cape he returned to India, and he was in command of the 16th Light Dragoons in the year 1796, and was present at Mallavelly and Seringapatam. Returning as a colonel after ten years' service, he married the eldest daughter of the third Duke of Newcastle in 1801; and was at the head of his brigade of the 14th and 16th Light Dragoons at Oporto and Talavera. In 1809 Sir Stapleton Cotton was created locally a Lieutenant-General, and placed at the head of the whole allied cavalry. He was in the retreat from Almeida, and subsequently at Busaco, Fuentes d'Onor, Salamanca, El Botsont, the Pyrenees, Orthes, and at the battle of Toulouse. For his services in the Peninsula he was created a peer, and received the thanks of the British Parliament. In 1814 he married a second time, Miss Greville. Lord Combermere went to the West Indies as Governor of Barbadoes in 1817, and as Commander-in-chief of the forces in the islands at the end of the American war. He served in India as Commander-in-chief; and in 1825-26 he stormed and took Bhupert.

COMBOY. SINGH. A waist-cloth resembling a petticoat, worn by the Singalese.

COMBRETACEÆ. R. Br. The myrrabolan tribe of plants, consisting of trees or shrubs, simple or climbing, of 22 genera, and about 140 species in Madagascar, Bourbon, Mauritius, the Society Islands, China, and 64 in the East Indies, viz. 23 Terminalia, 25 Combretum, 2 Poivre, 2 Geotonia, 2 Quisqualis, 4 Anogeissus, 2 Lumnitzera. The various species of Terminalia yield several valuable economic products; the Anogeissus and Lumnitzera useful woods, and Quisqualis fruits excellent vermifuge. Terminalia bellerica gives a good serviceable wood where elasticity and strength are required. The withes of two species of the Combretum are extensively employed in the place of iron stretchers for the mouths of the leathern buckets used in drawing water from wells. Combretum ovalifolium, rotundifolium, costatum, acuminatum, Chines, and extensum occur in India.—Mason; Veit; Rosb.

COMBS. Kamm., DUT. Sisir, Gur, MALAY. Peignes, FR. Pentes, PORT. Kamme, GER. Grieben, RUS. Kunghi, HIND. Poines, SP. Pelzini, IT. Ships, TAM. Pectines, LAT. Duvenna, TEL.

Combs for cleaning and adjusting the hair are formed of horn, bone, tortoiseshell, wood, etc. In Ceylon, the marginal pieces of tortoiseshell are also used at Point de Galile in the manufacture of Decocts; and necklaces, formed of a chain of shell resembling anehve appearance, bear a higher price than such as are formed of the darker shell. In Ceylon, tortoiseshell combs are worn by men as well as women. In the numerous excesses into which European costume has been carried, the size of the back comb worn by ladies has never attained that of the Singhalese men, who also wear a narrow, long, bent comb across the fore part of the head. Five pounds even is a moderate price for a tortoiseshell back comb, which increases in value according to the size and quality of the shell. Hair-pins of tortoiseshell are worn by the women, gold and silver being substituted for full dress. These hair-pins are among the articles purchased by passengers. A comb is always part of the belongings of the darvesh of Central Asia.—Faulkner; Rohde, MS.; M'Culloch.

COMILLAH, the chief civil station of Tiperah.

COMMANDMENTS of the southern Buddhists are ten in number. Amongst them,—Kill not, Steal not, Commit not adultery, Lie not, Take nothing that intoxicates.

COMMELYNACEÆ, the spider-wort tribe of plants, comprising the genera Anellema, Campbellia, Commelyna, Cyonitis, Mauritania, Pollia, and Tradescantia. Wight describes Commelyna Bengalenis, criystata, nana, papillacena, polyspatha, and scapiflora. C. caspitosæ occurs in Burma; and Dr. Honigberger received C. nudiflora from the Himalayas under the name of Kandoolee. The rhizomes of some species are starchy, and are eaten. C. Rumphii is used in India as an emmenagogue.—W. Jc.; Riddell.

COMMELLYNA BENGALENSIS. Morrison. Ho-tan-t'su, CHIN. | Kan churu, kanuraka, ID.

Has small blue flowers.—Smith.

COMMELLYNA COMMUNIS. Linn. Calt grass, EXG. | Venna-devi kura, TEL. Vataxprim, IND. | Niru kasaun, TAM. Kanang kirati, TAM. | Venna mudra, TEL. Kunnu katti pili, TAM. | Venna vedara, TEL.

Its succulent leaves are used by the Hindus for feeding young calves when they wish to wean them from their milk. The plant has a small delicate blue flower, and is found growing on the banks of watercourses, along which it spreads rapidly, sending suckers into the ground. Found in lawns. The leaves are used by the natives mixed with other greens.—Ainslie; Jaffrey.

COMMELLYNA MEDICA. Smith. The Tsun- tung of the Chinese. Its tubers are used as a cooling medicine. The same name is given to the roots of the Ophiopogon Japonicus, and of a species of Anellema.—Smith.

COMMELLYNA OBLIQUA. — Is the Xanjuara and Kana of Hindustan. The root of this plant is edible.

COMMELLYNA POLYGAMA. Smith. Yah-chih-t'sau, CHIN. | Chuh-yeh-t'a1, CHIN.

The duck's foot grass or spider-wort. In China is much cultivated as a pot herb, which is eaten in spring. The juice of the flower is used as a bluish pigment in painting upon transparencies.—Smith.

COMMERCE. From the earliest historic times, products from the S.E. of Asia have been carried to the west by the same sea routes as are now followed, or have been, as now, carried across the deserts of Central Asia and through the passes in its mountain ranges.

The earliest route between Europe and India of which there is any record in the works of Herodotus, Strabo, Pliny, and others, was by the Red Sea. Even before the building of Troy, spices, drugs, and many other kinds of merchandise were
COMMERCE OF INDIA.

sent from the East by this route. The ships coming from the Indian seas landed their cargoes at Arsinoe (Suez), from whence they were carried by caravans to Cassou, a city on the coast of the Mediterranean. The distance from Arsinoe to Cassou was about 105 miles. According to Strabo, this route was twice altered in search of a more commodious one. Sesostris of Egypt started the idea to which M. de Lesseps in the Christian year of 1869 gave effect. The Egyptian monarch caused a canal to be cut from the Red Sea to a branch of the Nile, and had ships built for carrying the traffic, but for some reason the enterprise did not succeed. In 1 Kings ix. 26, also, it is mentioned that about 1000 B.C., Solomon king of Israel 'made a navy of ships in Ezion-gaber, which is beside Elath, on the shore of the Red Sea, in the land of Edom.' And these ships brought gold, silver, and precious stones from Ophir and Tarshish in such quantities, that king Solomon 'exceeded all the kings of the earth for riches.' Silver was so plentiful at his court, that he accounted nothing of it.' The king's drinking-cups were made of pure gold, and his shields were covered with beaten gold. We are distinctly told that the navy of Tarshish brought 'gold and silver, ivory and apes and peacocks,' and Ophir has been supposed to have been some district or port in India. The Tarshish fleet is said to have arrived at Ezion-gaber only once every three years, from which we may infer that the voyage was a considerable one, or that the ships had to go with the S.W. monsoon and return with the N.E. winds, or made a trafficing voyage from one place to another, until the one cargo was sold and another shipped. Neither place has been identified. Had the ships visited the Malay Peninsula, Sumatra, Java, or Borneo, they would have known of the Simia stryus (the orang-utan of Malacca and Sumatra), the mia of Borneo), or seen the Siamanga syndactylic, the long arms of which measure five feet six inches across in an adult about three feet high. As at the present day, the ancient navigators boldly crossed the Arabian Sea, and reached Muziris, a port on the Malabar coast of India, in a voyage of forty days, or about the middle of September, and they left India on their return at the end of December. The races ruling in Mesopotamia, on the shores of the Persian Gulf, the Akkad and the Phenicians, also prosecuted the Eastern trade. The land routes have varied with the revolutions that have raised and swept away the military rulers. They have, at times, led through the deserts of Africa, have crossed the immense steppes of High Asia, and over the passes in its mountain ranges, and, as at the present day, caravans of camels, with their bales and chests bound with cords, as described in Ezekiel, trailed their long length along. Piny (lib. vi. c. 4) particularly describes one route. 'Having arrived at Bactra,' he observes, 'the merchandise then descends the Indus, as far as the Oxus, and thence are carried down to the Caspian. They then cross that sea to the mouth of the Cyrus (the Kure), where they ascend that river, and, on going on shore, are transported by land for five days to the banks of the Phasis (Rion), where they once more embark, and are conveyed down to the Euxine.'

In the days of Augustus, Aulus Gallius described the caravans of Arabia as being like armies in magnitude. The time and course of each caravan was marked by the convenience of merchants and the position of waterings-places. Each had its fixed time of starting, its variable daily halting-places, its entrepots, and its points of junction with other caravans who would join it for protection.

At one time two great lines of caravans started from Yemen. The one proceeded from Hadramaut by Oman, and took the line of the Persian Gulf; the other came by the Hejaz along the coast of the Red Sea, and arrived at Petra, and from hence bifurcated off into two roads, the one going to Gaza and the other to Damascus. From Yemen to Petra the time of the caravan march was seventy days; and the stations of the present day are the same as those described by Athenodoros, and were probably the same in the days of Ismael and Abraham. The Maadite tribes found in this traffic an immense field of employment. Some let their camels for hire, some acted as guides, some engaged protection in return for payments of money, some engaged themselves in traffic. Some revolution interrupted this caravan trade; the vast cities which maintained their enormous prosperity by the passage of caravans fell into decay; but remains of colonnades, temples, and amphitheatres excite the traveller's admiration and surprise, amid the sands of the Hauran and the deserts east of the Dead Sea and the Lake of Tiberias. Palmyra, Philadelphia, and the cities of the Decapolis were the northern stations or termini of the great caravan road from Petra to Damascus. But the position of Petra was peculiarly adapted to advance it to that incredible degree of opulence which won the admiration of visitors in the days of Greece and Rome, which was described by Athenodoros the Stoic, and which, after having been forgotten in the desert for centuries, still exists, within its rock ramparts and its richly chiselled and stately pillars and edifices, to remind and instruct the modern traveller. Petra, in fact, was one of the chief points of junction of the great caravan traffic, and it was here that the cargo of the caravan changed hands from the carriers of the southern to those of the northern merchants.

With the fall of the mighty Roman empire, the routes by the Red Sea and Arabia seem to have been abandoned; and centuries afterwards, when the Genoese engaged in commerce and navigation, a former trade route had been reopened up between India and Europe. The merchandise from the western part of India was now carried up the river Indus as far as it was navigable, and then across country, through Samarcand, to the river Oxus, down which it was shipped to the Caspian Sea. In like manner the merchandise from China and the Moluccas was shipped across the Bay of Bengal, and up the rivers Ganges and Jamna, and then carried overland to the Oxus. Samarcand was then a great emporium, and the merchants of India, Turkey, and Persia met there to exchange their wares. The ships sailed across the Caspian to the port of Astracan, at the mouth of the Volga. Thence the goods were carried up the river to the city of Novgorod, in the province of Reizan (a city that must have been considerably to the south of the famous Nijni Novgorod of to-day), then overland for some miles to the river Don, where they were loaded in barges and carried down stream to the Sea of Azof, and on to the port of Caffa or
Theodosia, in the Crimea. Caffa belonged at that time to the Genoese, and they came there in their galleys to fetch Indian commodities, which they distributed throughout Europe. In the reign of Commodita, emperor of Armenia, a better route was followed, by the merchandise being transported from the Caspian Sea through Georgia to the city of Trebizond on the Black Sea, whence it was shipped to all parts of Europe. This was doubtless the origin of the connection of the Armenians with the trade of India. So highly was this route approved of, that another Armenian emperor is said to have actually begun to cut a canal, 120 miles in length, from the Caspian to the Black Sea, for the greater convenience of the trade, but the author of this scheme was slain and the enterprise fell through.

After a time the Venetians came upon the scene, and took up a new and much shorter trade route to India, that down the river Ephrates,—a route which even at the present day is believed by some to be the best that could be selected for communication between India and Europe. The Venetian merchants sailed from Venice to Tripoli; thence their goods were carried in caravans to Aleppo, which was a famous mart, and whose reputation Shakespeare did not fail to notice. From Aleppo the caravans made their way to Bir on the banks of the Euphrates. Here the merchandise was transferred to boats, and conveyed down the river to a point near Baghdad on the Tigris. Baghdad being reached, the merchandise was then transferred to boats on the Tigris, and carried down to Bassora and the island of Ormus in the Persian Gulf. In those daysOrmuz was the greatest emporium in the south of Asia. Here all the velvets, cloths, and manufactures of the West were exchanged for the spices, drugs, and precious stones of the East.

The wealth acquired by the merchants of Venice in their trade with the East excited the envy of the whole of Europe. The Portuguese especially spared no expense in their endeavours to discover a new route to India, and in the latter part of the 16th century they found their way to Calicut by the Cape of Good Hope; and the cheapest route between Europe and India was the high sea. But after making use of the Cape sea route for 400 years, the world has returned to that by the Red Sea, which was followed by the ships of king Solomon and Hiram king of Tyre.

Along the eastern coast of Africa, merchants from Great Britain, France, Portugal, and Germany are now settled, but Asiaties form a connecting link between the Europeans and the African races, and Hindus from Sind and from Cutch, have from time immemorial traded on that coast, and the Arab dynasties of Johanna and of neighbouring places gave accounts of their arrival on the coast, which was long prior to that of the Portuguese, having been far back in the middle ages, and there appears to have been settlements on the coast of powerful Arab and Persian emigrants in the early centuries of the Christian era.

The arrival of the Portuguese revolutionized the trade. It was not only that a stop was put by their discovery to the Venetian and Genoese trade with India, but its effect was very nearly to drive away from the coast of Africa the Indian and Arab traders who had carried on commerce in this region. Vasco da Gama and the early Portuguese traders describe in these regions a state of things much superior to what we have since known of them.

They describe the region near the coast north of the limits of Cape Colony as occupied by well-settled kingdoms, some ruled over by Arabs, some by natives, and all enjoying a tolerably advanced state of civilization. The European traders did not contribute to the peace and happiness of this region. The stronghold of Captain Kny is shown still in the neighbourhood of Johanna, and his castle was certainly built about that time. A system of plunder prevailed. The power of the Portuguese was much crippled by their rivals, but when they were on the mainland they did nothing but turn their attention to the capture and sale of slaves; commerce dwindled, and the country sank. The early Portuguese maps show that the country which in those older maps was represented as filled with towns, has in the later ones been set down as almost unknown.

The people who have now the most influence in commerce, and carry on by far the largest trade, are the Asiatics from the north-west coast of India. They are of different tribes. None of them can tell very accurately when they began to come to Africa to trade. They do not bring their wives and families with them, but are generally young men who trade on the coast for some years, and return to India to manage the same trade in its home branches. During the Portuguese domination, they were very nearly expelled. The Bhatia and Banya, who form a large number of these traders, are Hindus, and are very strict ones; yet it is remarkable that they may leave India and live in Africa for years, without incurring the penalty of loss of caste which is enforced against Hindus residing in India.

Several land routes through Central and High Asia continue to be followed. The present channels of trade between Afghanistan, Persia, Western Turkestan, and India, are the passes of the Sulimani range and those leading to and from Peshawur. The Moolla pass near Gandava, level throughout, may be traversed in all seasons. Through the Bolan pass the trade passes from Kandahar into Sind, a distance of 400 miles. The Guleri pass, opposite Dehra Ismail Khan, is the chief trade route between Afghanistan and the Punjab; the trade through it is in the hands of Povindah, a hereditary clan of merchants. The Tataras and Akhkanas passes, leading from Kâbul to Peshawur, are practicable all the year. The Suliman mountains form the western frontier of the Punjab and Sind. The Bolan pass collects the trade both of Kandahar and Kalat, and other passes that of Shirkapan, whose merchants have direct dealings with the remote cities of Central Asia. The Gonal pass, leading from Ghazni to Dehra Ismail Khan, is followed by the half-military, half-trading clan of Povиндahs, who bring their own caravans of camels into the heart of India. The Khaibar pass leads from Kâbul to Peshawur. The aggregate value of the annual trade with Afghanistan cannot be less than one million sterling each way, or a total of two millions. In 1875-76 the total imports from Kâbul were valued at £914,000, consisting chiefly of raw silk, dried fruits and nuts, manjist or madder, and other dyes, charrus (an intoxicating preparation of hemp), and other drugs, wool, and furs. The total exports were valued at £281,000, chiefly cotton goods both
of native and European manufacture, Indian tea, indigo, and salt.

The Punjab also conducts a considerable business, via Kashmir, with Yarkand, Kashgar, and Chinese Tibet, estimated at about one million sterling altogether. The chief marts on the side of India are Amritsar and Jullundur, from which latter place the route runs northwards past Kangra and Palampur to Lahore, where a British official has stationed since 1867, in which year also a fair was established at Palampur, to attract the Yarkand merchants. Merchandise is usually conveyed across the Himalayan passes on the backs of sheep and yaks; but British enterprise has successfully taken mules as far as Lahore. In 1875-76, the total imports from Kashmir were valued at £484,000, chiefly pashmina or shawl-wool, charras, raw silk, gold dust, silver ingots, and borax; the exports were valued at £342,000, chiefly cotton goods, food-grains, metals, salt, tea, and indigo.

In this land traffic the difficulties to contend with are partly from the social and political state of the nations through which the trade passes, and partly the physical difficulties of the countries which it has to traverse. Every skin of Bohara silk in the market of Amritsar, has to traverse upwards of 1000 miles over unbridged rivers and mountain passes, one of them 11,700 feet above the level of the sea; every fabric from Europe exposed in the bazaar at Yarkand, has to perform a journey of 325 miles from the Panj, over passes of 11,300, 12,570, 13,446 feet in height, to Lahore, thence over still loftier mountains and through an inhospitable route for 573 miles. Nevertheless, to combat these difficulties, we find in existence an indomitable mercantile energy, hereditary in certain tribes, as the Babi of South Afghanistan, the Povindah of the Guleri pass, the Parasha of Turkestan, and the Kyrakash of Yarkand. Year after year their caravans stream into the Panj, from Mashed, Kabul, Bokhara, and Yarkand, bringing tales of perils overcome; native ballads bewailing the hardships of the travelling merchant, but they still stream on.

Afghanistan, a mountainous region lying between lat. 30° and 36° N., and long. 60° to 68° E., with a population estimated at 4,200,000, contains within its limits three great entrepôts of trade between Europe, Persia, Turkestan, and India,—Herat, Kabul, and Kandahar,—where the silk of Bokhara and Khotan, the shawl-wool of Kirman on the south-west, and Khokand, are exchanged for the fabrics of Europe and for the indigo and the spices of the east. Passing the well-watered plains of Mughlab and the petty Uzbek states to the north-west of the Bamian hills and the Kunduz districts, in whose eastern frontier are the ruby mines of Badakshshan, and the lapis-lazuli quarries of the valley of the Kokeh, we come to the plains of the Oxus and Jaxartes, the Amu Dariya and the Syr Dariya, into which Russia has passed, but formerly divided politically into the three Uzbek khanate states of Khiva, Bokhara, and Khokand. Of these, Khiva khانate has a population estimated at 2,500,000; Bokhara, one of 2,000,000; but Bokhara is at once the most productive, and its capital is the great depot for the trade of Central Asia, occupying the position held in more ancient times by Balkh and Samarcand. Its silk is used throughout the north-west of India; its cotton is exported largely to the north; and the black lambkin wool of Karakul, one of its provinces, is a staple article of trade; while it imports considerable quantities of tea, fur skins, iron, and cotton goods. Caravans leave yearly for Russia via Orenberg and other frontier towns, and the trade with that country is estimated at upwards of £300,000 per annum; it has also a considerable trade with Western China via Yarkand, with Persia via Meshed, and with India via Kâbul and Peshawur. Under Russian supremacy, Samarcand is resuming its former position as the more important mercantile site.

Proceeding eastward to the borders of Chinese Turkestan, including the provinces of Yarkand, Kashgar, and Khotan, we find the former the entrepôt of trade between China and Bokhara, and the latter celebrated from the time of Ctesias for its mineral products, its jade and emeralds, its shawl-wool and flax; a considerable importer of furs, broadcloth, leather, and sugar, and at one time the entrepôt of a vast trade with Hindustan.

Turning south, we come to the kingdom of Kashmir, including its outlying province of Ladakh, the former sending its valuable shawls to all parts of the world, while the latter supplies shawl-wool in exchange for opium, the produce of the Kul hills, otter-skins, cotton piece-goods, spices, and drugs. The Quetta trade goes on to Kandahar, but not much further west, as the maritime trade from Bombay up the Persian Gulf carries articles more cheaply than they can be conveyed by any land route.

The trade into Kashmir is conducted with the districts of Hazeru, Rawalpindi, Jhelum, Gujerat, Sialkot, and Gurdaspur.

With Kâbul the trade passes through Peshawur, Kohat, Dehra Ismail Khan, and Bannu. That through Peshawur is by the Khâibar, Tatta, Albhana, and Gandal routes; that from Kohat is by the Thul and the Kurrum valley; that by the Dehra Ismail Khan district goes by the Gomal pass, and Sewastan is reached by this.

The Bajaur trade is via Peshawur and Hazara; to Yarkand, via Amritsar; and to Ladakh, through Kulu.

The route to the west from Kâbul to Bokhara runs via Bamiian, Saighan, Doala, Hibark, Haarak Sultan, Kuhm, Balkh, Kilif-ford, and Karshi. Bokhara is the great centre mart to which merchants resort from Samarcand, Tashkand, and Khokand.

The Chinese Tibet trade goes via the Hindustan Tibet road, the several routes converging at Wango, where the Sutlej crosses the road. At Gartekh town, in Chinese Tibet, a commercial fair is held twice a year, at which traders meet from Ladakh, Nepal, Kashmir, and Hindustan.

The routes to Tibet are by five passes, viz. the Nilanghat, at the eastern corner of Native Garwhal (Tehtri); the Mana and Niti passes in British Garwhal; and the Johar, the Darna, and the Byans passes in Kamaon.

The routes into Nepal are by Kamaon, Philibbit, Kheri, Bahraitch, Gouda, Basti, and Gorakhpur.

Nepal Trade Routes.—From Chhaimandu two routes branch off over the central range of the Himalaya, which both ultimately come down into the valley of the Tsangpo, or great river of Tibet. In 1877-78 the registered trade with Nepal (which is doubtless under-estimated) amounted to a total of £1,687,000, of which more than
two-thirds was conducted by Bengal. The exports from Nepal were valued at £1,054,000, the principal items being food-grains and oil-seeds, cattle, timber, and horns. Other articles of export are musk, borax, chiretta, madder, cardamons, chaurn or yak tails, ginger, balchar or scented grass, furs, and hawks.

British India is geographically adapted to maritime trade, and an Indian nation might have been a naval power almost as easily as the British themselves have become so. The coast of India offers a ready means of intercourse with foreign countries. The mountains on the north are a great barrier to trade with Central Asia. But to the south-east and west are countries and people with whom the nates of India have established independent relations. India possesses a long coast-line of over 2000 miles and about 300 harbours; but the foreign trade of the Indian empire is practically confined to Akyah, Cacanada, Chittagong, Corings, Negapatam, Bepur, Calcutta, Bombay, Madras, Rangoon, Moulmein, Colombo, Trincomalee, Galle, Tuticorin, and Kurschee, all of which, excepting Madras, are excellently situated as central marts for the distribution of articles of commerce. To Rangoon, Moulmein, and Bassein naturally flow the Irawadi all the products of Upper Burma and of Pegu; while the railway between Rangoon and Prome offers further facilities for the conveyance of merchandise. Calcutta is the most convenient point of distribution of the trade conveyed by water through Bengal, while it is also the terminus of the two main railway systems of Bengal. The river, too (formerly dangerous to navigation), is now carefully charted, while the Parsee Trust has provided conveniences for shipping which are probably unequalled in the whole world for the case with which cargo is loaded and discharged. The Northern Bengal State Railway has opened out rich tracts, producing tobacco, jute, and other valuable commodities in great abundance, and rendering trade to some extent independent of the rivers in that region, which cease to be available highways for the conveyance of goods when the waters are low.

Sir John Strachey has remarked that 'India is a country of unbounded material resources, but her people are poor. Their characteristics are great power of production, but almost total absence of accumulated capital. On this account alone the prosperity of the country essentially depends on its being able to secure a large and favourable outlet for its superfluous produce. But her connection with Britain and the financial results of that connection compel her to send to Europe every year about 29 millions worth of her products, without receiving in return any direct commercial equivalent. This excess of exports over imports is, he adds, the return for the foreign capital, which is invested in India, including under capital not only money, but all advantages, which have to be paid for, such as intelligence, strength, and energy, on which good administration and commercial prosperity depend. From these causes, he says, the trade of India is in an abnormal position, preventing her receiving the full commercial benefit which would spring from her vast material resources.' In the thirty-six years between 1855 and 1871, the value of merchandise exported from India amounted to £1,012,000,000; the value of merchandise imported into India, to £533,000,000, showing an excess of £429,000,000 on the exports. The value of treasure imported in the same period was £312,000,000 against £37,000,000 re-exported, being a nett import of £275,000,000. In 1880, India sold to foreign nations £66,000,000 worth of strictly Indian produce, which the Indian husbandman had raised, and for which he was paid. In the year 1881-82 the total trade of India, including exports and imports, exceeded £141,000,000.

The commercial transactions of British India with foreign countries are chiefly with the United Kingdom of Great Britain and Ireland, and with China. In the year 1881-82, the total value of the imported merchandise and treasure was £58,314,865, and that of the exports £82,999,946. Cotton piece-goods, twist and yarn, thread and other sorts, imported were of value Rs. 29,99,41,683. The values of sugar, refined and unrefined, and of woollen goods, were each above a million sterling; metals, raw and manufactured, 31 millions; while of the exported articles the opium was valued at Rs. 12,43,21,418; rice, grain, pulse, wheat, seeds, £17,240,750; tea and coffee, £5,056,601; raw cotton, cotton goods, twist and yarn, £16,946,475. In that year twenty-five of the most important imports were—

The opening of the Suez Canal in 1869 stimulated every department of eastern trade into greater activity, but has not materially changed
still retains its supremacy as the centre of at least 60 per cent. of the trade of the Indian Empire; but Trieste, Venice, Genoa, and Marseilles play an increasingly important part in the commercial race.

The imports of merchandise via the Suez Canal from Europe, Egypt, and the Levantine coast of Asiatic Turkey, increase year by year. The route is not so largely used for exports of Indian produce, the reason being that large quantities of these, such as opium and rice, find their way to China and the Straits, Mauritius, Ceylon, Arabia, and other countries.

China trade with India is practically confined to the opium traffic, though, within the last few years, that country has become an important consumer of Indian-made twist, which no doubt displaces to some extent in the Chinese markets the spinnings of Manchester. The time will come when the Chinese will spin for themselves, and then India will have to contend with her own local markets for her goods. In all respects but one the Chinese are better adapted than the people of India for the profitable manufacture of cotton: they are capable of longer and more sustained exertion, they are more ingenious and skilful as operatives, and their commercial classes are at least as acute and bold in speculation as those of India. But China is compelled to import cotton, and India will have a good market in China and Japan for a portion of the out-turn of her mills. The imports from China, even with the addition of treasure, amount to hardly a fifth of the exports thither, the truth being that the opium is paid for by China through Great Britain. The chief articles imported into India from China are copper (supposed, however, to be Japanese, imported via China), raw silk and silk piece-goods, and sugar and tea in small quantities. The imports of raw silk reach the comparatively high figure of 41½ lakhs (£415,000). The sugar brought from China is landed in Bombay, where it supplements or competes with Mauritian sugar. The tea imported from China is of inferior quality.

Straits Settlements trade must be regarded in connection with the trade with China. The goods imported are of little consequence, tin excepted.

Ceylon trade with India is identical in character with the coasting trade carried on from port to port. Crowds of Tamil labourers flock to Ceylon every year from the Madras Presidency, to work on the coffee plantations, and over two-thirds of the exports consist of grains for their sustenance. The imports from Ceylon are hardly a sixth of the exports.

Between India and France the articles chiefly consist of apparel and millinery, brandy and wines, and silk goods; while the exports comprise cotton, coffee, indigo, oil-seeds, especially rape and gingelly, raw silk, and raw jute.

After France, the United States do the most trade with India. Imports are small, and practically were confined to ice and kerosene oil; but ice is now manufactured and sold in India at half the rate hitherto charged by the Tudor Ice Company. In kerosene the value rose from 3,18,985 rupees in 1876–77 to 16,37,966 rupees, and 21,07,907 rupees in the two following years. The imports of grey cotton goods from America are increasing. Indian exports to the United States consist mainly
of indigo, hides, skins, raw jute, gunny bags and cloth, lac, saltpetre, and linseed.

Mauritius sends sugar very largely to India. The most important export to Mauritius is rice, which with other food-grains amounted to nearly a kror of rupees in value.

Italy's trade includes corals, glass beads, false pearls, spirits and wines, and silk goods. The exports to Italy consist mainly of raw cotton, hides, oil-seeds, sesame, and raw silk. The total value of the import and export trade with Italy in 1878-79 was about two krore of rupees.

India is rich in raw products, mineral, vegetable, and animal. It supplied all its own people's wants until the maritime intercourse with foreign nations, and particularly since the construction of the lines of railway allowed the delivery of many articles in the Indian ports, and even in its remote provinces, at lower rates than the native products could be obtained. Its marketable mineral substances useful in the arts, are,—alum, agates, amber, antimony, arsenic, asbestos, barytes, beryl, bismuth, bloodstone, borax, cornelian, chrome ore, coal, cobalt, copper, corundum, diamond, emerald, fluor spar, garnet, gold, graphite, gypsum, iron ores, jade, jasper, kao-lin, kyanite, lapiz-lazuli, lead, lithographic stone, magnesite, manganese, marbles, meerschaum, mercury, mica, mineral oils, petroleum, platinum, potstone, rock-crystal, rubies, salt, salt-petre, sapphire, turpentine, silver, sodium compounds, spindel, sulphur, talc, tin, topaz, turquoise, zinc. The chief of the vegetable exports are,—coffee, cotton, indigo, grain, and pulse, jute, oils, opium, seeds, sugar, tea, and wood; and of animal produce are,—living animals, feathers, hides and skins, horns, ivory, lac, musk, oils, saltpetre, silk, wax, wool.

The chief imports into British India are,—apparel, coal, cotton twist and manufactures, liquors, machinery and mill-work, metals, provisions, railway plant and rolling stock, silk, raw and manufactured, spices, sugar, and woolen goods. In the progress since the opening of the Suez Canal, British India is now competing with some of these. Indian mills have taken strong hold of the market for the lower qualities of twist. Of metals nearly 80 per cent. consisted of iron, which always forms the largest item in this category. Sugar comes third in the list of imports, the value being 1,48,08,805 rupees. Indian beer costs but 54 rupees a dozen at Simla, as against 9 rupees a dozen charged for English beer. Imports of various light German beer have largely increased. The imports of raw silk and silk goods amount to nearly a kror and a half (about £1,500,000), the raw silk being valued at about 56,75,000 rupees. This may be due to a decline in the silk-weaving industry in India. The import of coal, coke, and patent fuel has fallen off. Very little coal is landed in Calcutta, the bulk of it going to Bombay, which is too far from the deposits of Central India to be able to avail itself of its product with profit.

In 1881-82 the value of the foreign merchandise re-exported from India was 2,64,67,165 rupees.

The re-exports are mainly goods consigned in the first instance to Bombay, and then re-exported to ports in the Persian Gulf and Red Sea, Zanziber, and the eastern coast of Africa. More than half of these consist of cotton twist and piece-goods (chintz and prints), amounting to 1,32,47,706 rupees in value.

In 1881-82, the declared value of the opium exported was 14,32,33,143 rupees, the largest sum it had attained. Grain and pulse were valued at 17,24,07,506 rupees, the two most important of these being rice and wheat. The exports of raw cotton, twist, yarn, and manufactured, were 16,94,64,755. The first mill for the manufacture of cotton yarn and cloth by steam machinery was opened in Bombay in 1854. Since then others have been established in various parts of India, but mostly in the city of Bombay and in the cotton-growing districts of Gujarat. In 1878-79 there were 58 cotton mills in India, containing 11 million spindles and 12,000 looms, which employed upwards of 40,000 persons,—men, women, and children. India commits enormous waste by exporting rapeseed, linseed, and til (Sesamum orientale) in a crude condition, instead of expressing it on the spot, and obtaining thereby a valuable food for cattle and land fertilizer in the shape of oilcake. The manufacture of jute on a large scale was unknown until 1857, but there were 21 jute mills in India in 1881.

Indian tea exported was 48,60,725 lbs., valued at 3,60,91,360 rupees. The cultivation of tea and coffee has taken deep root in India, and a large amount of European capital and indigenous labour is absorbed by these industries. No less than 664,326 acres were taken up in 1878 in connection with tea cultivation, though only 206,000 acres were actually planted with it. The quantities of coffee exported have hardly increased during the last 11 years, prices have largely augmented, coffee being now worth nearly double what it was at that time. The quantity exported in 1881-82 was
Agriculture.—The extent to which the population of India are dependent upon the land, may be realized partly from the census returns, which show us that 74 per cent of the adult male population derive their support from the land either directly or indirectly.

Merchants.—The internal trade of India has been very much extended; it greatly exceeds the external commerce. In the interior of the Bombay Presidency, business is mainly divided between two classes, the Bhatta or Banya of Gujerat, and the Marwari from Rajputana. The former are Vaishnava Hindus of the Valabhacharya sect, the latter are Jainis. In the central parts of the Dekhan and Mysore, their place is taken by Lingacets, who follow the Vira Saiva form of Hinduisum; but along the eastern seaboard the predominating classes of Hindu traders are the castes named Chettiar, Komati, and Natha Cottiyar. Many of the trading castes of Hindu still claim Vaisyas descent.

In Bengal, many of the upper classes of Sudras have devoted themselves to wholesale trade; although there, also, the Jain Marwari from Rajputana and the north-west occupy the front rank. Their headquarters are in Murshidabad district; and Jain Marwari are found throughout the valley of the Brahmaputra as far up as the unexplored frontier of China. They penetrate everywhere among the wild tribes; and it is said that the natives of the Khassia Hills are the only hillmen who do their own business of buying and selling. In the North-Western Provinces and Oudh, the traders are generally called Banya; and in the Punjab are found the Khatri (Kshatriya), who have perhaps the best title of any to regard themselves as descendants of the original Vaisyas.

Not inferior to any Hindus as active, intelligent traders, are the Labbi, a Mahomedan race, who also speak Tamil; another Mahomedan race, the Khoja, have spread from Sind to the western and central parts of the Peninsula of India, and along the shores of Arabia and of eastern Africa as far south as the Portuguese dominions. The Borah and Memon Mahomedans are keen traders. The Mopla Mahomedans are but little engaged in inland traffic. Other Mahomedans from Persia are trading in all the ports of Southern Asia; and Arab Mahomedans, as merchants and missionaries, are occupying all the eastern and northern parts of Africa, and have gone eastwards through the Indian Ocean to the islands of the Archipelago. Another race of Aryan descent, the Parsees, are seen throughout all the south and east of Asia, and with mercantile men of Indo-Germanic race, from Great Britain, France, Germany, and America, and possibly even from the ancient parts of the foreign trade.

The bold, self-reliant non-Aryan tribes of British India have emigrated largely as labourers to Ceylon, the Straits Settlements, and Burma; to the West Indies, to S. America, S. Africa, the Mauritius, and Bourbon; but as skilled producers they have been far outstripped by the Chinese, whose numbers in Borneo, in Australia, Mauritius, and the western parts of the United States, have assumed political importance; and to the east, in the Archipelago, the Bugi or Macassar men traverse the seas from Sumatra to New Guinea.—Rich's Koristan; Madras Mail, 7th June 1870; Imp. Gaz.; Stat. Abstract; Maritime Trade of British India; Foreign and Inland Trade Reports; Accounts of Trade and Navigation; Moral and Mat. Prog.; Miscellaneous; Statistics; Trade and Nav. Accts.

COMMIA COCHIN-CHINENSIS, a small tree of Cochinn-China, with a resinous juice. It yields a gum which possesses emetic and purgative properties, recommended in dropsy.

COMMISSIONER, an appellation generally given in India to officials invested with full revenue and judicial powers. In the Punjab, Sind, Burma, etc., are styled chief commissioners, and have commissioners under them. In the Bengal Presidency, a commissioner is a revenue officer who has the superintendence of several collectoratest, with collectors under his control.

COMORAH, a bay on the Malabar coast, 51 miles north of Severndrug.

COMORIN, or Cape Comorin, in lat. 8° 4' 20" N., and long. 77° 35' 55" E. The Greek writers refer to a bathing festival here, which is still continued.—Imp. Gaz. See Cape Comorin.

COMORO, a group of volcanic islands midway between the N. extremity of Madagascar and the coast of Africa. Great Comoro is an active volcano 8500 feet high. They rise over a submarine bank of 500 fathoms.

COMPASS.

Siekompas, ... DAN. ... Puduman, ... MALAY. ... Zeckompas, ... DUT. ... Compas do mare, ... PORT. ... Compa de mer, ... F.R. ... Kompas korablni, ... RUS. ... Iouosole, ... SIjoompas, ... S.R. ... Kompass, ... GER. ... Agua de marc, ... Bussola, ... IT. ... Kompasi, ... TEL. ... 

The compass is used for nautical purposes by the principal native traders of Southern and Eastern Asia, and of the Archipelago. The Bugis of Celebes use small rude compasses, made expressly for them by the Chinese of Batavia, at the very moderate cost of from one shilling to eighteen pence a-piece. The directive power of the magnet is said to have been known to the Chinese for many ages,—by their own account, no less than 2634 years B.C. Their knowledge of the magnet is supposed to have led them to a knowledge of the compass; and the mariner's compass was invented by the Chinese in the reign of Hoang-Ti. The subdivisions of this nautical instrument, as
made by the Arabs, the Chinese, and the Malays, all vary. The Malay comstock is divided into sixteen parts, twelve of which are multiples of the four cardinal points. For the cardinal points the different nations have native terms; but for nautical purposes, those of the Malay language are used throughout, as in the case of the nations of Celebes, the most expert native navigators of the present day. The introduction of iron ships has materially affected the value of the compasses on board of them, the variation being as much as five points, even up to 243 and 35°. The sole apparent remedy for this, but it is one of easy application, is to erect a high platform, 15 feet high, over the taffrail, on which to place the compass, and to examine repeatedly.—Craw-fford’s Dict.; Bunsen, ill. p. 389; M'C. Dict.

COMPOUND. This Anglo-Malay word is a corruption of the Malay Compound or village, and properly applies to the outhouses of the servants, which are erected within the enclosure. It is applied in almost the same sense all over British India, where, however, some suppose it to be derived from the Portuguese word Campagna; and another writer says it is from the Portuguese word Componze, and still another Complio. It is also applied by the Europeans of India to the grounds or enclosure in which a house stands.—Earl; Surr.

COMPRADORE. Anglo-Indian. A purveyor; in China, an accountant.

COMPTI, Kompti, Kamatti, Mahr., Tam., Tel., in the Peninsula of India, persons engaged in trade, as shopkeepers and general merchants, and commonly recognised to be Vaisha Hindus; they wear the sacred string or zoner. They are, amongst the Teling and Tamul people, what the termus Gujarati, Banya, Marwari, and Vais are amongst the traders from Raiputana and Gujarat; they are never soldiers.

CONAJI ANGRIA, a person of low origin who long carried on a piratical warfare on the western coast of India, and rose to princely power. Gheriah was his headquarters, but Severndrug and every creek were fortified. After he acknowledged raja Saho, he remained in nominal dependence on the Mahrrata state, but employed his own resources with little or no control. His piracies, which he called levying chou’t on the sea, rendered him formidable to all his neighbours. The British made repeated attacks on him with considerable naval forces, and on one occasion (A.D. 1719) in co-operation with the Portuguese, yet failed in all their attempts. The Dutch also sent a strong force under Dusmans Lang and Dusmans Derme, with equal ill success. The Peshwa interposed in a dispute between two brothers of the family, and received from one of the brothers two forts situated in the Ghats (about A.D. 1734). The contest, however, continued, and the Peshwa, though latterly assisted by a British fleet, was unable to bring it to a conclusion till the time of Baji Rao’s death. Long afterwards, Gheriah was captured by Clive and Admiral Watson in 1755. —Elphin., p. 641.

CONGAN, a small, narrow strip of land lying between the Western Ghats and the sea-coast. The low land in the Conean, Gujarat, and Malabar is traversed by many rivers and smaller streams running to the sea, and is indentcd by numerous creeks and channels of the ocean. The cold weather is clear and bracing, but the hot season of April and May is succeeded by the deluging rains of the south-west monsoon, when 150 inches fall from June to September, and render much of the already humid lands impassable swamps; the atmosphere is then very damp. The Conean districts extend from Goa to Daman, or very nearly to the Tapri river. In the northern parts of the Bombay Presidency, the chain separating the Conean from the Dekhan is called the Northern Ghats, or Sahyadra mountains. See Konkan.

CONCH or Chank, species of Turbinella. See Shank.

CONCRETE. Dana terms this calcareous sand rock, ‘drift sand rock.’ Major-General Nelson terms it Æolian formation. It occurs on the coast near Bombay, and at the Bermudas Islands. CONCUBINAGE is very common all over India amongst all religiousists. It is more particularly prevalent in great cities, and in places where, from any cause, the people are necessarily absent from their families and birthplaces.

CONDA-CUPI. TAM. A necklace.

CONDAPILLY, CONCUBINAGE, in lat. 16° 37’ N., and long. 80° 33’ E., is a town in the Masulipatam district in the Northern Circars. The rocks of the hills near contain garnets, and diamond mines are near.

CONDA-PUCHI. TAM. A head ornament.

CONDIMENT. A substance used as a condiment or spice; also a spice used as a condiment.

CONDOLOOLO. Tel. Cajanus Indicus; dhal. One kind of dhal is condooloo conda, Tel., malatovari; TAMIL; another variety is condi-puppoo, Tel., tovarai-puppo, TAM. See Dhal.

CONDYLODERA TRICONDYLOIDES, a cricket of the Philippines. It is exactly like a tricondyla, one of the tiger beetles. Both insects run along the trunks of trees. The tricondyla...
CONFUCIUS.

are very plentiful; the insect that mimics it is, as in all other cases, very rare. It is a remarkable instance of an insect of another order mimicking a beetle.

CONFUCIUS BARK, Tellicherry bark.

Curajia; Curajia. Hnk. Cheere; Kutaja, SANSK. Palapatta... MaiLAX. Veppalei,... TAM. Codaga pala,... PAL. Veppalei, Manopaula, CRU-de-pala,... PORT. Tel.

Consci bark is the produce of the Wrightia antidysenterica, belonging to the natural order Apocynaceae, a native of most parts of India. It is astringent and bitter, and is considered febrifuge; it are termed Indrajov.

Consci seed.

Lisan ul nasafeer, ARAB. Indrajava,... SANSK. Indrajov, GUS, HIND. Veppalei arisee, TAM. Ahir,... PERS.

The seeds of Wrightia antidysenterica.—Faulkner, Eng. C13.; O'Sh.

CONF. Palmmontologists have pointed out the curious fact that the Hyrax Syriacus, called 'cone)' in the Bible, Lev. xi. 5, Deut. xiv. 7, Ps. civ. 18, is really only a diminutive and hornless rhinoceros. Remains have been found at Eppelheim which indicate an animal more like a gigantic hyrax than any of the existing rhinoceroses. To this the name of Acerotherium (hornless beast) has been given. Sha-phan or Dama, as it is termed in the hyrax of Scripture, is confined to Srdy. Every bush fever has been found in the warm waters of the hot springs of Surajkhand, in Behar; and two species, one ochreous brown and the other green, occur on the margin of the tanks themselves, and in the hottest water; the brown is capable of bearing the greatest heat, and forms a belt in deeper water than the green. Both appear in broad luxuriant strata wherever the temperature is cooled down to 168°, and as low as 90°.—Hooker, Him. Jour. i. p. 21.

CONFLUENCE or fork of two rivers is the Sangam of the Hindus, who esteem all such unions sacred, and make pilgrimages to them. That at the junction of the Jumna and Ganges, at Allahabad, is one of the holiest spots in Hindu estimation; and until the early part of the 19th century many of this faith voluntarily drowned themselves there.

CONFIUS, Kung-fu-tze, was born B.c. 551 in Tsaw, a district of the province of Shan-tung. He died in the year 479 B.C., at the age of 72 or 73. He was of a ducal house, descended from a brother of Chow, the last sovereign of the Yin dynasty. His father, Shuh-leang-heih, was a soldier of great bravery; and Confucius was the child of a second marriage when he was upwards of seventy years of age.—Gray, p. 76. Confucius married when nineteen years of age. He was almost contemporary with Pythagoras, Thales, Solon, Buddha, and Herodotus, in an epoch of philosophical and literary activity equally important for the west, which commenced with Pythagoras, as contemporary of Confucius, embraced Zeno, Empedocles, Herodotus, Thucydides, Socrates, and Plato, and ended with Aristotle, who died about the same time as the Mencius (Mang-tsze) of the Chinese. Confucius devoted himself to reducing the traditions and rough records of antiquity into a perfect form, and he succeeded before his death in compiling and editing the five King,—five canonical books which are revered as embodying the truth, upon the highest subjects, from those whom they venerate as holy and wise men. He was the founder of the school of philosophy in China, which contains injunctions as to conduct, and may be termed the moral code of China, in which learning (Wen), courtesy, good-breeding, and propriety (Li), doing as you would be done by (Shu), sincerity in worship of the deity (Tsien), are everywhere inculcated, and form a recognised state religion. Every word he uttered has become in China a maxim, a proverb, and an aphorism; and in the fact that his language is intelligible to every Chinaman at the present day, his injunctions are of greater power than any in the Latin or the Greek, both of which are unknown to their descendants. Once he was asked whether there were one word which represented all the duties of life, he answered 'Shu,' a word which Confucius and his commentators have explained to mean, 'As I would that others should injure me, so would I not injure them also.' And, certainly, to seek the good of others equally with your own, is to fill a large portion of the field of virtue. The number of his disciples was about 3000, of whom about 72 were his more intimate associates. All his teaching consists of a few simple words. One of his aphorisms, 'Chu chung sin,' verbally, 'Head, faithful, sincere,' mean that fidelity and sincerity are the paramount or primary virtues. Another is that Wen and Li make up the whole sum of it, which is termed 'Lun yu,' 'Judge others indulgently, yourself, severely.'

Confucius was a sage and a statesman. He and Lao-tze were contemporaries, and Lao-tze was the founder of the Taoist or Reason Sect. But Lao-tze was an ascetic, who discouraged acceptance of public employments. He made reason the groundwork of his doctrines, and they have much to recommend them; but his teachings have merged into gross idolatrous rites, the study of astrology and necromancy, fanatical observances, self-inflictions, such as dancing in flames, mutilating the body, practising abstinence and seclusion.

Among other celebrated literary labours undertaken by Confucius in B.C. 490 and the following years, he edited the Yih-king, and appended those annotations which have given the work its subsequent value. What philosophical views may have been attached to the Yih-king of Wan-wong and Chou-kung by the contemporaries of Confucius, we know not. That work, together with the other three works edited or compiled by Confucius, viz. the Shu-king and the Le-ke, constitute the whole of the ancient literature of China which has come down to posterity, and who have it only, as it was explained, arranged or modified in passing through his hands. It is well known that he expressly repudiated portions of it, as containing doctrines adverse to the views which he held and strove to diffuse. The names only of some celebrated ancient books, one dating from the times of Fuh-ho himself, have been preserved. It is these circumstances which constitute the labours of Confucius the commencement of a distinct literary epoch. Apart from the labours of Confucius himself, the permanent literary results of this, the first of the two great philosophic or literary epochs of China, are contained in the collection of works called the Four Books, composed by different members of the school which he founded. The last contains record of the ethical and political teachings of Mencius (Mang-tsze), a philosopher who died in
CONFUCIUS.

B.C. 317, and closed the first epoch. The Chinese people are in nowise prohibited from worshipping in the Buddhist and Taoist temples; in other words, they may regulate their purely religious life by the tenets of these, or indeed of any other sect. But where Taoism or Buddhism would leave the region of religion, and, in the form of philosophy or morality, extend their direct influence into the domain of the social science and art, there Confucianism peremptorily and effectually prohibits their action. Not only are the national legislation and administration formed exclusively on Confucian principles; it is by them also that the more important acts of the private life of the Chinese are regulated, as for instance marriages. The cause of the prevalence of Mahommedanism in China, in spite of discouragements, lies in the fact that Confucianism says little or nothing of a supernatural world or of a future existence. Hence it leaves almost unsatisfied those ineradicable cravings of human nature, the desire to revere, and the longing for immortality. That it has, notwithstanding its want of holds on the human heart, maintained itself not simply in existence, but as the ruling system, is a fact that must, as soon as it is perceived, form for every true thinker a decisive proof of the existence of great and vital truths in its theories, as well as thorough soundness and wholesomeness in the practical rules which it dictates. By Chinese philosophy must be understood Confucian philosophy, and by Chinese morality the moral principles rooted in that philosophy.

The works of Confucius, which are used by his followers, are called the 'five canonical books,' and are held in the greatest veneration. The whole tenor of these works indicate morality and sound political views. One political extract must suffice. Let those who produce revenue be many, and those who consume it few; let the producers have hourly and monthly profit, and let the consumers practise economy; and thus there will be at all times a sufficiency of revenue.

It is the fact that, though the authors of the first and second epochs, Confucius himself included, professed to teach only what was contained in pre-existing sacred books, and though they possibly themselves believed that they did only teach what was virtually contained in such pre-existing books, they nevertheless did, in each case, originate some entirely new views and doctrines.

It is now impossible to ascertain what part of his writings was original, and what obtained from previous writers; but it is generally recognized that he largely annotated the ancient work, Yih-kung, and bequeathed five classics and four books. His works, Shu-king and Shih-king, contain the historical records of the country and the poems then extant. His Book of Rites regulates the manners and customs and outward forms of the whole society, and constitutes a part of his moral code. Confucius is described by one of his disciples as wise, affable, condescending, just. Another says, gentle, but inspiring respect; grave, but not austere; venerable, yet pleasing. In the troubles that occurred from the efforts at arroganziment which the several kings made, he was sometimes in high employ, but once at least a fugitive; but at the close of his long life he left about three thousand followers of his doctrines. The smaller states were annexed by the race of Tsin, of which dynasty the first emperor was Ch'ü- Hoang, who built the Great Wall. The Chinese have no existing records of the interval from the time of the race of Chou, in whose reign Confucius lived, and from his time authentic history commences. In the first of his four books, Confucius traces a system of government from that of a family to that of a province, and from a province to a kingdom, making the family the foundation of the government. Indeed, the Chinese religion has never advanced beyond a love of parents, obeying and reverencing them while alive, and worshipping them when dead. It is rather a system of morality and moral philosophy, than a religion; and inculcates rather the duties of men to one another, than to a Supreme Being. Their books teach that the true principles of virtue and social order are obedience to parents, elders, and rulers, and acting towards others as they would be done by. They regulate the duties alike of the sovereign and of private families. It does not deny the existence of a Supreme Being, but neither admits this fundamental article of every rational creed, nor inculcates the necessity of worshipping the only God. He inculcates polytheism, by enjoining the worship of heaven and earth, the spirits of hills, rivers, winds, and fire; in fact, all nature, except nature's omnipotent God. His doctrines, called in Chinese Ju-kea-su, the religion of scholars, is the orthodox creed of the state. To the founder divine honour is paid by all his followers, who are not very scrupulous in worshipping one idol more or less, and have long maintained the most absurd pantheon.

The followers of Confucius are, by some authors, called the sect of Ju-kea-su. In reality, the religion, or rather the doctrine of the disciples of Confucius, is positivism. They care nothing about the origin, the creation, or the end of the world, and very little about long philosophical theories. Although the emperor builds and endows temples belonging to the two other sects, the Confucian is the religion of the state, and the court pretend to follow the scheme of ethics and politics laid down by Confucius.

Confucius taught the providential government of an overruling Providence, and that in this world the good are rewarded and the wicked punished. He evidently attached great importance to the solemn public worship of Shang-te by the head of the state in person, assisted by his ministers. He said to his disciples that by the ceremonies of the sacrifices to heaven and earth they served God, and by the ceremonies of the ancestral temple they sacrifice to their ancestors. He who understands the ceremonies of the sacrifices to heaven and earth, and the meaning of the several sacrifices to ancestors, would find the government of a kingdom as easy as to look into his palm.

Confucianism does not provide for the spiritual wants and desires of man's nature. He adhered to the worship of heaven and earth as he found it in the classical books of the ancient empire. His moral teaching was far inferior to that of Buddha. He said, 'Thou shalt not do unto others that which thou wilt not that they should do unto thee.' Also, 'Requite injury with justice, and benevolence with benevolence.' But he inculcated the avenging of murder with murder.
CONGANI.

His descendants are still numerous in the province of Shan-tung, and have hereditary titles.—

Gray's China; Sirr's China; Bowring: Bunsen's God in History; Gutzlaff's Chinese History; Huc's Christianity; Professor E. Douglas, Confucianism and Taoism.

CONGANI. TAM. In the western parts of Tinnevelly, a hood or penthouse, made of reeds, to protect the person from rain.

CONGEA. In the neighbourhood of Moulin and Amherst, the forest scenery is often ornamented with the numerous large purple bracts surrounding the small inconspicuous flowers of a species of conega. There are three different species in the Tenasserim Provinces, C. azurea, C. tomentosa, C. velutina, all called ka-yau, the same Burmese name. The leaves of C. villosa have a heavy smell, and are used medicinally.

Mason; W. J.; O'sh. p. 486.

CONGEE. ANGLO-HIND. Rice gruel.

CONICOPOLY. TAM. An accountant; from Kanika, an account, and Kapila, a collector or subtender.

CONIDE, the Cone family of molluscs, comprising the genera Conus and Pleurotomaria, with several sub-genera.

CONIFER. A natural order of Gymnosper-rous, exogans, called by Dr. Lindley Pinaeae, consisting of resinous, mostly evergreen, hard-leaved trees or shrubs, inhabiting all those parts of the world in which arborescent plants can exist. The following names embrace the better known coniferous plants of Southern and Eastern Asia, with a few of Australia:—

A. dumosa, Loudon, Nepal.
A. Smithiana, Wall., Himalaya.
Araucaria bidwillii, Hook. N. E. Australia.
A. Cookii, R. Br., N. Caledonia.
A. Cunninghamiana, R. Br., N. Holland.
A. excelsa, R. Br., N. Holland.
Callitris quadrivalvis, Algeria.
Cedrus deodora, Loudon, Himalaya.
Cunninghamia Sinensis, Rich., China.
Cupressus funebris, Endl., Bhutan.
C. gianu, Lamb.
C. sempervirens, Wiltde, Himalaya.
C. torulosa, Don, Himalaya.
Daeryllum elatum, Wall, Tenasserim.
Dammara Australis, Lamb., kauri pine, Norfolk Isld.
D. orientalis, Lamb, Ambeyna.
Juniperus aquatica, Roxb., China.
J. ceaia, Roxb., China.
J. cernua, Roxb., China.
J. Chinenalis, Linna., China.
J. communis, Linna., China, a shrub.
J. dimorpha, Roxb., China.
J. excelsa, Bieb., Himalaya.
J. patens, Roxb., China.
J. nana, Don, Himalaya, a shrub.
J. Wallischi, Hook., Himalaya.
Larix Griffithi, Hooker, Nepal.
Picea Webbi ani, Lamb, Himalaya.

var. a. Pinnow.
var. b. Kuthrow.

Pinus excelsa, Wall., Himalaya.
P. Gerardiana, Wall., Himalaya.
P. Litteri, Mason, Burma.
P. longifolia, Roth, Himalaya, the chir.
P. massoniana, Lamb, China.
P. Merkusii, Jungh., Burma.
P. Sinensis, Lamb, China.
Podocarpus abies, Bh., Cachar.
P. latifolia, Wall., Tinnevelly.

CONIFERAE.

P. nitens, Lamb, Sikkim.
Salsiburiana adiantiformia, —? China, Japan.
Taxodiurn muellerum, Drag., Japan, Nepal.
Taxus buschii, Hook, Himalaya, Tong-si of Sikkim.
Thuja orientalis, Livan., Nepal, China, Japan.

The coniferous of the Himalaya were described by Major Maddon in 1846 to 1849.

No order of plants can be named of more general importance to mankind than this. The pitch, tar, resins, and turpentine of commerce are products of the plants of this order. Their timber is known as deal, fir, pine, and cedar; and that known to Great Britain and other parts of Europe is principally the wood of the spruce, larch, Scotch fir, Weymouth pine, and Virginian cedar.

The Norfolk Island pine, Araucaria excelsa, is an immense tree, rising to 150 feet; the kauri tree of New Zealand, Dammara Australis, attains to 200 feet in height. Pinus Lambertiana, and Abies douglasii of N.W. America, rise to 250 feet. The seeds of the Pinus Gerardiana, Wall., are used as food in Kuma war, as are the cones of the Bunya-bunya pine (A. Bidwilli, Hooker), by the aborigines of Moreton Bay, Australia.

Thunberg mentions many pines in Japan, and they are numerous in the fucuses of Sikkim and Bhutan there are twelve coniferae, viz. juniper, yew, Cupressus funebri, Abies Webbi ani, A. Brunnoniana, and A. Smithiana, larch, Pinus excelsa and longifolia, and Podocarpus neriifolia. Four of these, viz. larch, Cupressus funebri, Podocarpus neriifolia, and Abies Brunoniania, are not common to the N.W. Himalaya, west of Nepal, but the other eight are common. Of the 13 natives of the N.W. mountains, again, only the following five, Juniperus communis, the deodar, Pinus Gerardiana, P. excelsa, and Cupressus torulosa are not found in Sikkim. Dr. Masson mentions the P. Litteri as growing in Tenasserim, and Dr. Brandis adds P. Massoniania, Lamb, and P. Khassiana.

Dr. Clegern described the following:—

Cedrus deodara, Loudon, deodar or Himalayan cedar, Kela; grows on the north slope of Dhaola Dhar, and in Kulu.
Pinus excelsa, Wall., Kail; grows in Kulu, not in Kaungra.
P. longifolia, Roeb, chill or chir; grows luxuriantly on north slopes; timber best at 4000 to 5000 feet.
P. Gerardiana, Wall., edible pine, Neco; a few trees across the Dhaola Dhar, near Glasma on the Kavi.
Picea Webbi ani, Lamb, silver-fir, Tos; the wood is not much valued; shingles are laid on the roofs of houses. Var. a. Pinnow. Var. b. Kuthrow.
Abies Smithiana, Wall., Himalayan spruce, Rai; often 100 ft. high, and 5 ft. in diameter.
Cupressus torulosa, Don, twisted cypress; at the head of the Parbatii.
Taxus baccata, common yew, Bramhi or Rakhab; in Kulu very scarce.
Juniperus excelsa, Bieb., pencil cedar, Leuri or Suri; on the crest of Dhola Dhar and in Lahul.

The deodar has not been seen east of Nepal, nor the Pinus Geradrana, Cupresus torulosa, or Juniperus communis. On the other hand, Podocarpus is confined to the east of Khatmandu. Abies Brunoniania does not occur west of the Gogra, nor the larch west of the Cosi, nor funereal cypress (an introduced plant, however) west of the Tista in Sikkim. That the deodar is possibly a variety of the cedar of Lebanon, is now a prevalent opinion, which is strengthened by the fact that so many more Himalayan plants are now ascertained to be European than had been supposed before they

Hooker, | A Burm. A Anogeissus John Account such timber Mahr. |

Dr. Royle says there is little doubt of this being the sàvár of the Greeks and the Ciuta of the Romans; but it must not, from the similarity of name, be confounded with Ciuta maculata. Ciuta virosa occurs in Kashmir, where it is called Zahr-gugal, poison turnip, and Salep-i-Shaitan, Pers., or devil’s sable. Spotted hemlock is the Shokran of the Arabs, who give Kunun as the Greek name. It is found in Europe, east of Asia, and America. It derives celebrity from being considered to have been used as the Athenian state poison, by which Socrates and Phocion perished. The extract of hemlock is employed as an anodyne in scrofulous or cancerous affections, in rheumatism, neuralgia, and painful ulcers.

O. N. | Royle.
CONJEE MARAM. Tam. | A light, red-coloured wood of Travancore, sp. gr. 0.650, used for furniture, etc.

CONJEVERAM, or Kanchi-varam, a town and taluk, in the Chingleput district of the Madras Presidency, in lat. 12° 49’ 45” N., long. 79° 45’ E., and in 1871 the town had a population of 55,396. It is one of the seven sacred cities of the Hindus in Southern India, and in the time of Hiwen Thsang, in the 7th century, was the capital of the Dravida country, ruled by the Chola dynasty. It was then a great Buddhist centre; subsequently professed the Jaina creed, followed by Hinduism. Two of its Hindu temples are the largest in Southern India; one of them belongs to the Saiva, the other to the Vaishnava sect. During the wars of the Karnatik, the town repeatedly changed hands, was taken by Clive on the 28th August, and again in December 1751, and again in 1752. Since 1758 it has been in the hands of the British. Many Jaina sculptures have been discovered there. The Chola held sway in the south of India from the eighth to the sixteenth centuries, when Sha-ji, the father of Sivaji, totally annihilated every vestige of their once great power. It was one of the most ancient and prolonged of all the Indian dynasties.

CON-MOO. Bum. A tree of Tavoy; timber good, used for buildings and boats.

CONNARIUS CHAMPIONI. Thew. A tree of the central province of Ceylon, growing up to an elevation of 4000 feet.—Thew. p. 80.

CONNARUS MONOCARPUS. Linn.
Doke-ka-det. BU. Raddleya-gass, Singh. A tree of Burma, and very abundant in the hot, drier parts of Ceylon.—Thew. p. 80.

CONNARUS NITIDUS. Roxb. A small tree of Sylhet. In British Burma it is a shrub about ten feet high, very plentiful, especially in the Rangoon districts, and affords an oil-cake of small size, but rich in a sweet oil. C. paniculatus, Roxb., is a large timber tree of Chittagong.—Voigt; M’Clelland.

CONNARUS SPECIOSA. M’Clelland.
Gwai-douk. BU. Kadon kadeeth. BU. Khwas touk, | A large tree, very plentiful throughout the Rangoon, Pegu, and Toungoo districts. Growing in all the forests scattered with teak. It has a large, heavy, and strong timber, white-coloured, adapted to every purpose of house-building. It is remarkable for the quantity of its seeds, which are of large size, abounding in sweet oil.—Dr. M’Clell. it

CONNARUS LATICOLIA. Thew. A moderate-sized tree of the central province of Ceylon, growing at an elevation of 3000 to 4000 feet, rather rare.—Thew.

CONNELLY. Four distinguished brothers of this name served in India, Captain Edward Connelly, Captain Arthur Connelly, Captain John Connelly, and Henry Valentine Connelly. Edward was killed at Toolian Durrah (Purwan Durrah?), October 1840; Arthur, the traveller, went on a mission to Bokhara in August 1840, and is believed to have been murdered in prison along with Colonel Stoddard; John was killed at the capture of Kabul in July 1842. Their brother, Henry Valentine Connelly, of the Madras Civil Service, was murdered 11th September 1855, at the instigation of Mopla fanatics.

Captain A. Connelly wrote on the White-haired Angorn Gout, Lond. As. Trans. vi. p. 159; Overland Journey through Persia and Afghanistan to India, Lond. 1834, 2 vols.

CONOCARPUS ACUMINATUS. Roxb.

This is a large, very valuable, and plentiful timber tree, growing throughout the southern forests, along with Conocarpus latifolia. In British Burma it is almost equal to the Terminalia microcarpa in size and the regular growth of its stem. Its wood is reddish-brown, hard and strong, its breaking weight being 262 lbs. A cubic foot weighs 50 to 57 lbs.; and in a full-grown tree on good soil the average length of the trunk to the first branch is 80 feet, and average girth, measured at six feet from the ground, is 12 feet. It sells in Burma at 12 annas per cubic foot. It flowers during the cold season. Its wood is exceedingly light, and fully as strong and durable, if kept dry, as the C. latifolia, but, exposed to the water, it soon decays. It is thus unfit for the marine yard, but is equally fit for house-building when it can be obtained straight, which is seldom the case. But for its weight, it would be most excellent timber.—Dr. M’Cl. and Brandis; Mr. Rohde’s MSS.; Voigt; Roxb. ii. 443.

CONOCARPUS LATIFOLIA. Roxb.
CONVOLVULACEÆ

This large timber tree grows in the Dehla Doon, in the Kenneri jungles, valleys of the Konkan rivers, on the inland Dekhan hills at Chilimale, and on the mountains which separate the Circars from the Nizam's dominions. It grows in Ceylon, to the north of Kandy, up to 1500 feet. It flowers during the cold season, in January and February. Its trunk is erect, straight, varying in length and thickness, the largest being 35 feet to the branches, and about 6 feet in circumference. In Coimbatore the specimens sustained 500 lbs. It also grows in Chittagong. Its timber is esteemed for almost every economical purpose, house-building, shafts, and vales, in general use for railway purposes, and it makes very good cabinet furniture. Towards the centre, it is of a chocolate colour. For house and ship building the natives reckon it superior to every other sort, Pentaptera tomentosa and teak excepted. Captain Sankey, writing from Nagpur, says it is a white wood with a heart of a dark colour, and somewhat like rosewood. Its average length there is 12 feet, and girth 7 feet. It is so much prized by the natives of Nagpur for axletrees, that but few trees are permitted to attain their proper growth. By all accounts, in Nagpur, about 20,000 axletrees are made from this wood yearly. It is attacked by white ants. It ranks high as a rafting timber.

CONVOLVULACEÆ. R. Br. The bindweed tribe of plants, in which there are about 28 genera and more than 450 species in the west and east of Asia. The more important genera are avisia, argyryca, batatas, Blinkworthia, Breweria, caloce, calystegia, convolvulus, cressa, evolvulus, Havittia, ipomsea, Moorerofia, neopetals, pharbitis, porana, quamoclit, rivea, sepiostemon, skinuma, etc. Convulvulus arvensis, Linnaeus. C. arvensis, Linn., Corn bindweed. It is native throughout Europe in sandy fields and by-roads, also in China, Persia, and some parts of India; it is abundant as a weed all over the plains of the Panjab, and up to 10,000 feet in the Panjab Himalaya. The official hirn-padi (deer's foot) appears to be from this plant. It is said to possess a purgative quality, as also C. soldanella, C. maritimus, and C. macrocarpus.

CONTINUOUS, a term applied in British India to designate the armies which, by treaty, the feudatory princes were required to keep. The Mysore contingent of 4000 soldiers has been enrolled since the treaty of Seringapatam. The Nizam of Hyderabad's contingent of 7498 men, in six regiments, of four, of cavalry, and of four batteries of artillery, was established by the treaty of 1798. The contingent of H.H. the maharaja Sindia, of 5000 cavalry, whose capital is Gwalior, was arranged for by the treaty of Gwalior of November 1817. In the same year a contingent of 300 men was arranged for from the Gaekwar at Baroda. The treaty of Bhojal of February 1818 provided for a contingent of 600 cavalry and 400 infantry; and by the treaty of the 6th January 1818, maharaja Man Singh of Jodhpur undertook to furnish 1500 cavalry for service with the British Indian Army. The Indore contingent of 3000 cavalry horses by the maharaja Holkar, by the xi. article of the treaty of Munderas, was agreed to be provided ready for service. See British India, p. 464.

CONUS, the Common genus of Gasteropodus Molusca, founded by Linnaeus. The species are found in southern and tropical seas. Lamarck records 181 recent species and varieties. C. textilis, Linnaeus, found at Ancyrium of the N. Hebrides, is a poisonous acid fluid into the wound, occasioning the heart to swell, and often endangering life.
1834, and he died in Britain in 1862. The Kodaga had successfully opposed Hyder Ali and his son Tipu; but Vira Rajendra (Doddla), who died in 1809, was guilty of about 5000 summary executions; his successor, Linga, died 1820, was greedy, cunning, and cowardly. The aspect of Coorg (Kurg or Kodagu, meaning steep mountain), presents an entire forest; the long and narrow cultivated valleys enclosed within it serve but to render the vast woods more striking. The country is intersected in every direction by culldungs or breast-works, estimated at 600 miles in extent, many 12 feet deep and 10 or 15 feet across the ditch. They cross the ranges of hills and each other with little appearance of order, and defy conjecture as to their object. The prevailing languages are Coorg, Kodaga, Canarese, Malealam, Tamili, Tulu, Hindustani, and English. There are about 40,000 native Coorgs (Kodaga) scattered throughout the country. They are tall, muscular, broad-chested, well-favoured race of mountaineers, far superior in physique to the inhabitants of the plains, whom they greatly despise. They are far advanced in civilisation, and very intelligent. The vice of drinking has a deep and widely-spread hold upon them. They marry at a ripe age, but the wives of brothers are considered as common property. They generally retain the old devil-worship of the Dravidian race. The raja's palace is supposed to have been built by an Italian, who is said to have been bricked up in a wall as soon as the building was finished. The tribes and races of the population in 1881 was 178,302 souls, comprised, besides the Coorg or Kodaga proper,—

Amna or Amna Kodaga or Kaveri Brahmanas.
Ambakula, goara or herds.
Higgade, cultivators.
Aimaya Badage, artisans in iron and wood.
Kavati, jungle cultivators.
Paleya, farm labourers from the Tulu and Malela districts.
Kurubar, two tribes, the Jennu and Betta.
Yerava, slave emigrants from Malealam.
Med, the umbrellas makers.
Holey, viz. Keinbati Holey, who speak Kodaga, and Badaga Holey, who speak Canarese.

There are also someMahattas, Rajputs, Rache- war, and Rajpinde, the last being connections of the late rulers. The out-castes number 34,100, and the wild tribes 14,783.

In 1837 there was a rebellion in the British district of Canara, adjoining Coorg. The Coorgs at once marched there, quelled the rebellion, and recaptured for the British the treasures carried off by the insurgents. The Governor-General directed that the recovered treasure should, as a reward, be divided amongst the Coorgs, but they to a man refused to receive it, and proudly declared that they had not fought for loot. The British Government, awoken to a sense of the spirit of these rude warriors, then directed juggars and omali lands to be conferred on them, and presented their chiefs with horses, rifles, knives and umbrellas of mother of pearl. Later still, when British supremacy in India had been shaken to its foundation, a body of Coorgs, armed to the teeth, suddenly made their appearance at Periyapatna in Mysore, under the secret instructions of the late Sir Mark Cubbon, and by their presence tended to suppress the growing insolence and dissatisfaction of the Mahomedan classes of Seringapatam and the adjacent parts of that province.
leaping vigorously into the air. The Coorg or Kodagu language has been regarded as Canarese, modified by the Tulu. But Mr. Moelinger states that it is more nearly allied to the Tamil and Malelau to the Canarese. Caupans or tumuli are in great numbers. They conceal kistvaens. There are also Kolle Kalu, or sculptured tombstones in honour of warriors slain in battle. Raja Virajendra Raja's daughter Gauramma, whom he brought with him to London, was baptized as Victoria, Queen Victoria being the sponsor, and she married a British army officer, but shortly after he and her daughter disappeared, and she died in 1864.

—C. Coory; Bowering's Eastern Experiences; Rice, Coory; Coory Gazetteer; Moelinger's Coory.

COORMEE or Koomree, a race of cultivators under the different names of Coormee, Kumbhi, Kunaib, Koombhee, extend throughout the greater part of Hindustan, Berar, and the Western Dekhan. They are famous as agriculturists, but frequently engage in other occupations. The Coormee women, like the Jatii, assist the men in husbandry, and have passed into a proverb for industry.—Experiences.

'Chhudee jat koombin kee khooppee hath
Ekh per naawane apne pee he sah.'
The Coormee of the provinces are said to have seven subdivisions, which are usually enumerated as Khurrencebind, Puturya, Ghorchurula, Jyswar, Canoujea, Kewut, and Jhoooneya.—Eliot, p. 227.

COOROOKOO, oil of prickly poppy, or Jamaic yellow thistle, pale yellow, limpid oil, from the round corrugated seeds of the Argemone Mexicana, is sometimes expressed by the natives and used in lamps, but is doubtless adapted to more important uses.—Madras Ech. 1855.

COOROOMBAR or Kurumbar, properly Kuruba, a shepherd, from the Canarese Kuru, a sheep.

COOROOMBAR, a race of Wynad, very docile, quick of imitation, and slavishly submissive to their moody or head, who exercises undisputed power over his own family, numerically containing about a hundred or seventy being. Those employed by the coffee-planters are a little civilized, appreciating the comforts of life in a slight degree higher than their more savage brethren. They erect rude huts for themselves and family, on elevated ground, surrounded by jungles, and about six in number; they touch one another, and the whole present the form of a crescent. One larger than the rest, styled the cutcherry, is erected in the middle, in the shape of a hall, for the sojourn of casual strangers; it is dedicated to their village deity, and the place cannot be contaminated by a shod foot. The presence of a suspected stranger in their vicinity, sickness, or other trembling but natural cause, make them emigrate from one place to another, sometimes miles away, but always preferring lonesome localities and dense jungles. Some are partly civilized. Government possess some forest lands towards Periah and Teriante, and in some spots over Wynad. In the teak belt are several bands of Cooroombars, some of the Jani, and others of Moolla clan. The former live entirely in the forest. They are the only axe men, and without them it would be difficult to work a forest. Other tribes are the Panniar, Puliar, Gurchea, Chetty, and squatters. The Cooroombar, through their headmen, are held responsible, and the Chetty are also responsible for their Panniar or farm slaves. The

COOROOMBAR's services are constantly called for by the wood contractor and the planter. They will not leave their haunts in the forests for any time. During the gold speculations of the western coast from 1876 to 1881, the Cooroombar were found useful labourers.—C. H. S. in Newspaper; Clough, Forest Report. See Kurumbar.

COOROOMBRANADA, a district of Malabar.

COOROMINGA. TAM. A bee, the Butocera rubus, which penetrates the trunk of young cocoanut trees near the ground, and deposits its eggs near the centre. The grubs eat their way up and destroy the tree.

COORTALLUM, not very far from Cape Comorin, is a large place, with several bungalows close into the hills. Of the cataracts close at hand, the lowest falls from a height of 200 feet. The scenery is splendid. There are in all three falls, the highest being 2000 feet above the sea. The average temperature of the water is 72° to 75°, and invalids derive great benefit from bathing in it. The bathing place is under a shelving rock, affording the most delightful shower-bath possible. The climate is particularly enjoyable to Europeans in June, July, and August.

COOSSUMB. SANSK. Carthamus tinctorius.

COOSY, a tributary to the Hoogly, also written Coosi and Kosi. It rises in the Rangpur district, lat. 23° 55', long. 86° 58', runs S.E. to the Hoogly. Its length is 240 miles.

COOTANAD, a district of Malabar.

COOTE, SIR EYRE, K.C.B., a distinguished British officer, who served in India from the middle of the 18th century, and in command in the Karnatic from 1759 during the contests for supremacy between the British and French. At the battle of Plassey in 1757, while a Major in rank, he had commanded the third division of the army, and he seems to have taken command in the Karnatic in 1759. He was out-manoeuvred on the Palar river, but in 1760, after defeating Lally at Wandiwash, and driving him back to Pondicherry, he took easy possession of Cuddalore in April 1760, of Chellumbrum, and other French garrisons. He took Pondicherry on the 4th Jan. 1761. The French shortly before had destroyed Fort St. David, and in retaliation Coote razed the fortifications to the ground. On the 18th June 1781, Colonel Coote had been repulsed with loss by Hyder in a night attack on Chellumbrum. After forcing his way through two or three enclosures, and when falling back to Cuddalore, and he had passed on a few miles from Porto Novo, he found his march intercepted by the whole army of Hyder Ali, 60,000 strong. Hyder had made a rapid march, and had thrown up batteries across Coote's line of retreat; he had his left protected by a range of sandhills, and his right by the sea. Coote made two determined assaults, one on the batteries, which were carried, the other through a passage in the sandhills left unprotected by Hyder, which flank became thus exposed. A war schooner at the same time appeared in sight, and, anchoring close in, poured her broadsides on the enemy, causing great confusion. Hyder's army was completely routed. Coote's strength was 7878 men, including artillerymen. It was known as the battle of Metapoliam, and was fought on the 1st July 1781. In June 1782, while Coote was advancing rapidly on Arne, where Hyder had treasure and military stores, Hyder overtook and
COFFEE.*

but in Sw. Malay. but at DuT. Pkrs. found dissolved imbedded occasionally portionported. London respects temperature Africa, from lying by kinds resembling copal. — Faulkner; Royle, p. 364.

COPAL, Pa-na-yu, CHIN., Chandras, HIND.

This very important resin is obtained from trees of America, Africa, Madagascar, India, and Australia. It exudes spontaneously from Rhus copalum and Elaeocarpus copalifer, the first being an American and W. Indian; and the second an E. Indian tree. Another copal is obtained from the coasts of Guinea; and several species of Hymenaea, on the Amazons, are said to produce kinds of copal, one of the plants being Hymenaea verrucosa. Vateria Indica furnishes the resin called in India copal, which is said to be inferior by the Japanese to the true copal of America and Africa, and not permitted to be exported. Another copal is said to be found in Surinam.*

This semi-fossil copal is called copalline. Specimens of the leaf, flower, etc., obtained from the semi-fossil gum, agree in all respects with those of the living tree. The peculiar and more valuable properties of the buried gum animate are supposed to be from a chemical action, the result of a long retention in the earth. It is classed as raw or jackass copal, and ripe or true copal. The value of the latter is estimated by its colour, the clearest and most transparent pieces being the highest prices, after them the light amber, lemon, dark yellow, and red. Sometimes the gum, like amber, contains drops of water, bees, bees, flies, and other insects. The diggers do not excavate more than the depth of a man's waist, and the copal occurs in a red sand underlying blue clay.

Copal is generally imported into England in lumps about the size of small potatoes, of a slightly yellow tint, and often including insects and animal remains. It is often covered with a clay-like substance, from which it is freed by the dealers by scraping. The finest and palest lumps are selected for what is called body-gum; the next best forms carriage-gum; and the remainder, being fired from wood and stones, forms what is called third, or worst quality, and is used for gold-size or Japan-black. Fracture conchoidal; it is transparent, and tasteless. Copal is liable to be confounded with angle, when the latter is clear and good; but the solubility in alcohol furnishes a useful test,—the angle being readily soluble in this fluid, while copal is sparingly so. Copal is also brittle between the teeth, whereas angle softens in the mouth. The American copal occurs in commerce in flat fragments; whereas the East Indian is generally obtained in roundish masses. The latter furnishes the finest varnishes.

—Dr. Kirk, in Madras Agri.-Horticul. Proc.

COPALM BALSAM is a product of the Liquidambar styraciflua.

COPAL, VARNISH is a solution of copal gum resin in linseed oil, oil of turpentine, spirits of wine or alcohol; it is used for japanning autufboxes, tea-boards, and similar articles. Copal varnish and amber varnish are also much employed by the artist and by the photographer for the preservation of their works. Fresh essence of turpentine dissolves copal completely, but old turpentine will not do so. It is stated that essence of turpentine, digested upon sulphur, will dissolve double its own weight without letting any fall. The oil of rosemary also dissolves copal with great readiness. An excellent varnish may be made by dissolving one part of copal and one of essence of rosemary, with two to three parts of pure alcohol.

COPAUDROOG, taken by the British, by storm, on the 14th May 1819.

COPPHONES of Arrian, supposed to be the Kabul river.

Nehass, ARAB. Nehass, BURM. Tambara, MALAY. Nehas, CUPRUM.

Chi-tung; Tung, CHIN. Tanbaga, MANG. Chitung, Misa, PERS. Tse-jen-tung; Chi-kin,*. Cobre, Miedz, POL. Cobb., Dan. Kopper, DUT. Krasnoi'mjed, Mied.; REN. Copper, DUT. Kopper, GEI. Copper, SW. Kumpe, GER. Kopper, SAK. Kupfer, Shembe, TAM. Nehes, HEIL. Tambram; Raghi, TEL. Nehes, Kine, IR.

Copper ore is abundantly diffused in nature, being found native as an oxide, a sulphuret, a sulphate, carbonate, arseniate, and phosphate, in Persia, Baluchistan, Nal, Kashmir, Tibet, India, Sumatra, Borneo, China, and Japan. Copper ore in the form of sulphuret is abundant in Rangun in Beshkawati. Near Ajmir, carbonate of copper is found in small veins, and in connection with ores of iron (Gen. Med. Top. p. 169). A silicate of copper occurs in Nellore and Onogale, but not in workable lodes. Copper ores are found in the Jeypore dominions, and in the vicinity of Nejeebabad, Nagpur, and Dumphur. Copper has been pointed out near Beila, in the province of Luz, on the western frontier of Lower Sind, by Captain Del Hoste and Captain Harris; in Kamaon, by Lieutenant Gasfurd and Captain Durand; at Porke and Dumphur, by Captain Richards; at Almorah and in Afghanistan, by Captain Drummond. It is said to have been worked in Cutch.

From Gurgaon there was sent to the Panjab Exhibition a piece of copper pyrites, also specimens of good copper ore from the Hissar district, and of the metal got from it; from Pelang in Kali, 805.
COPPER.

and from Manikarn near Kuhn, in the Kangra district, some copper pyrites, and with blue carbonate of copper from Spiti. Copper is found in Himachal, but it is not an article of trade.

Iron and copper mines occur at Marna, S.E. of Byana, and the people bring copper pots to barter with the Chaudansi and Byansi races. Copper mines in Kamaon, Garhwal, Nepal, and Sikkim, are worked by the natives on a small scale.

Copper has been discovered in Singhah; in mines in Kamaon and Garhwal. Copper mines occur at Papulee, Pringlapamni, Murbuggetee, and old mines at Kerraye, Belar, Rae, Seera, Toma Cottee, Dobere, and Dhumpore. The Beng. As. Soc. Journ., No. 1 of 1851, p. 1, mentions the copper of Deoghor or Byjnath, a small town in zillah Bhirbug. The surface veins run east and west, and present the ore in irregular masses of 3ths of an inch broad, so much corroded by atmospheric influence as to appear in a soft, friable, red, yellow, and liver-coloured or gemet-coloured crust, but can digested a couple of feet below the surface of the ground, the veins become a compact liver-coloured mass, spangled with shining particles of copper; the whole enclosed in a soft, friable apple-green, yellow, or white felspathic rock. Traversing the copper from north to south, small veins of lead appear, which occasionally form the containing walls to the copper. Mr. Vincent traced the vein of copper for about 100 feet east and west, and dug to the depth of 2 feet only. With the aid of coal dug from Banslee Kullah in the Rajmahal hills, he smelted some of the ore, which gave a return of 30 per cent. of good copper; inferior specimens, mostly water-worn pieces picked up on the surface, gave 25 per cent.

The mountainous parts of Nepal are rich in mines of iron and copper. The produce of the former is smelted. The copper is of a very superior kind, and was at one time preferred for consumption in the territories of the King of Oudh to that exported from Britain.

In Singhbhum, copper ore is found extending over 80 miles to the westward of Midnapur. Three slabs, weighing about 139 lbs., were subjected to lamination, and proved to be well suited in all respects for purposes of coinage. The quality of this metal is decidedly superior to imported copper.

The copper ore of the Nellore collectorate of the Madras Presidency, was called by Dr. Thomson an anhydrous carbonate of copper, containing 60-73 per cent. of black oxide of copper. It occurs in hornblende schist at Bungeral Mettah, and the carbonate, passing into malachite and mountain blue there, and at Gurumanny Pentah, Salgherri, and Yerrapally.

The occurrence of copper ore in the Callastri, Venkatagiri, and Nellore districts, was ascertained by Dr. Heynes about the year 1797, and he described that of Wangapadu.

Copper ore is found about 20 miles east of Kurnool, about 2 miles from the village of Gunny, in the centre of a low range of hills; also at Sidhout and Badawal.

Dr. Helfer said that the copper on the Lampaee islands is worthy of attention. Mr. O'Riley stated that the copper ore from several islands of the Mergui Archipelago, is the grey copper ore, containing from 40 to 50 parts of the metal, in combination with antimony, iron, and sulphur. Dr. Mason had a fine specimen of the green carbonate, or malachite, found near the headwaters of the Atrara; and natives assured him that the same mineral exists up the Salwin. He had also seen specimens from Cheduba, near the coast of Arakan.

Copper is found in the Shan States, also at Kolen-myo and Sagaing; at Bawmyne and Kolen-myo the malachite appears to be of a rich description, and the deposits seem to be abundant. The Sagaing mines were worked in former times by Chinese. The surface ore is not promising. Most of the copper used in Upper Burma is imported from China. It is plentiful in the province of Yunnan. Serpentine mines are said to occur at the Ur river, about 45 miles north and 30 west from the modern town of Moun-goung, in native Burma, and about 30 miles from Seesagur in Upper Assam; carbonate of copper was, however, mistaken for it. But the serpentine rocks above Bamo appear to imbed oxides of copper. Copper and antimony occur in Shwe-green, and in the hill country of Togia.

Copper ores have been found in Siamatra, Celebes, and Timur. In the two former, mines of it are said to be worked.

Copper abounds throughout the whole Japanese group, and some of it is said to be not surpassed by any in the world. The natives refine it, and cast into cylinders about a foot long and an inch thick. The coarser kinds they cast into round lumps or cakes. Quicksilver also is said to be abundant. Lead also is plentiful. Tin in small quantities, and of a quality so fine and white that it almost equals silver. Iron is found in three of the provinces, of which they make steel unsurpassed in excellency. The copper ore found in Japan contains gold in alloy; it occurs in the market in small red bars, six inches long, flat on one side, and convex on the other, weighing 4 or 5 lbs. each; this copper is the most valuable of any found in Asia. The Chinese and Dutch exported upwards of 2000 tons annually.

A natural alloy found in China, known under the name of white copper, is used in great quantities. It seems peculiar to China, and was supposed by Dr. Black to owe its distinguishing colour, to an alloy of nickel (Ains. Mat. Metd. p. 53). It is used for dish-covers, candlesticks, tripods, plates, etc., which, when new and polished, look almost as well as silver.

Copper ores have been found as long ago as 1802 at Port Curtis, near the southern extremity of the range which extends along the north-east coast of Australia. Flinders met with indications of copper at Good's Island in Torres Strait. Lead and copper mines have been worked in South Australia for some years past, and others have been opened recently in the western coast range. A little to the north-west of Swan River, Hematite and peculiar iron ore and copper pyrites have been found on the north-west coast near Admiralty Gulf.—Kime®s Geog. Memoir; M'CuUoch's Dict.; Piddington in B. As. S. J.; Crawford's Dict.; Mason's Ten.; Irvine's Ajmee; O' Bh. Beng. As. Soc. Tr., 1841 to 1844; Heyne's Tracts, Bomb. Geog. Soc. Tr. vi. 117; Friend of India, 28th Feb. 1850; Flinders' Voyage; Powell, Handbook; Smith, Nepal; Smith's Report on Singrowee.

COPPER, ACETATE OF.

Theng-twa, . . . BURM. Taibembaga, . . . MALAY. Piria, . . . HIND. Zangar, . . . PERS. Senan, . . . MALAY. Vangals patchi, . . . TAM.
COPTI8 TEETEA.

Tapirobanes, West.  
Copris, Geoffr.  
Pirim, Fabr.  
Onthophagus, Latr.

COPRIDE and Dynastidae correspond to the dung beetles. In some of them are of great size, with immense horn-like protuberances on the head and thorax of the males, and, combined with their polished or rugose metallic colors, render them perhaps the most conspicuous of all the beetle tribe. See Insects.

COPTUS, a genus of birds of the order Insessores, Fam. Merulidae, and sub-family Saxicolinae. C. sularis is the dial bird, common in Ceylon.

COIT, a race in Egypt, about 150,000 souls, following Christianity. Though now more or less mixed with other races, they are the undoubted descendants of the ancient Egyptians. The Coptic language became almost extinct as a living tongue in A.D. 1700. They now for the most part speak Arabic. It was found, when the hieroglyphic letters were written in English letters, that the words formed were in the main Coptic, with a slight admixture from the Hebrew and other tongues; and that the language of the ancient Pharaohs did not differ so much from the language of their modern descendants, as modern English does from that of Alfred the Great. This, and the fact, that it is known from some, now nearly exterminated, Coptics, that they have little credit to the sovereignty of ancient Egypt. Of the diminution of the numbers of the Copys, some idea may be formed from the reduction of the number of their bishops. They were seventy in number at the period of the Arabian conquest. They are now only twelve, and most of these are settled in Upper Egypt.—Dunson's Egypt; Cal. Rev., No. 75. Sept. 1861, p. 119; Niebuhr's Travels, p. 104; Sharpe's Egypt, i. p. 133.

COPTIS TEETA. Wallach.

The golden thread root plant of Assam, is a native of the mountainous regions bordering on Upper Assam, and its root is in high repute among the Mishmee, Lamas, and Assamese. Quantities are sent down to Assam in neat little baskets with open meshes, made of narrow strips of rattan, and measuring 3 to 4 inches in length, by 21 in breadth and 11 in thickness; each basket contains about an ounce of small pieces of the root, from 1 to 3 inches long. The taste is intensely and purely bitter, very lasting, with only a slight aroma. On mastication, the root tingles the saliva yellow. In North America, the Coptis trifolia is much employed as a bitter tonic. Coptis teeta root brings a very high price, and is deemed a tonic remedy of the greatest value. It's influence in restoring appetite, and increasing the digestive powers, are very remarkable. It did not seem to excite any febrifuge virtue, but under its influence several patients recovered from acute diseases, manifestly and very rapidly improved in strength. The dose

COPTERAS.

Acetate of copper (argus, verdigris) is a common bazar article in India, and is prepared on a large scale, by stewing copper plates with grape husks or tamarind pulp. During the fermentation of the tracer of sugar in the husk, the copper combines with oxygen, and the oxide with acetic acid formed by the grape sugar. The process is extremely tedious.—Beng. Pharr. p. 324.

COPTERAS, Ts'ing-fan, Chln., an impure sulphate of iron.

COPPER PASTILLES. Pastilles containing sulphate of copper, when burned, destroy bags, mosquitoes, and fleas, using three or four in a day.

COPPERSMITH is the small green barbet, Megalaima viridac, Gmel. (Xantholeuma Indica), common in the Peninsula of India. It generally perches on the top branch of a tree, and the sound of its voice is Took, took, took, continuously, almost identical with that of striking a metal vessel.

COOPER, SULPHATE OF. Blue-stone.

Tung-lo, . . . . | Capri sulphus, . . . Lat. 
Sulfate de Cuivre, . Fr. | Turushu, Nila tutum, Tam.

This salt is produced naturally in the water of copper mines, and is manufactured in many parts of India and the eastern islands. It is easily prepared, by heating copper to redness in contact with the air, removing the black scales which form, and dissolving these in dilute and boiling sulphuric acid, and crystallizing. In the refining of silver it is incidentally prepared in very large quantities (Beng. Pharr. p. 322). It is much used in dyeing operations, in the printing of cotton and linen, and for various other purposes in the arts. It has been employed to prevent dry-rot by steeping wood in its solution, and it is a powerful preservative of animal substances; when imbued with it and dried, they remain unaltered. It is obtained by the decomposition of copper pyrites, in the same manner as green vitriol from iron pyrites. It is manufactured for the arts from old copper sheeting, copper turnings, and copper refinery scales. A little sulphate of copper or blue vitriol mixed with the rice or flour paste used for joining papers, very effectually keeps these destructive pests at a distance. It is made at Amritsar by boiling sheet copper in oil of vitriol. Sells at 8d. per lb.—Royce; Beng. Pharr.

COPPER-WARE and tatanague utensils, with coral and glass beads, form small portions of the Chinese trade to India; the Chinese seldom use glass beads as ornaments.

COPRA. Hind.

Kobara tengai, . . . Tam. | 

This is the dried albumen or kernel of the coconut. In preparing it, the kernel is taken out when fully ripe, divided in the middle, and dried. It is used as an ingredient in curries and in medicine, and is largely exported from India. The kernel of the coconut has much the taste of a filbert, and is a valuable ingredient in curries. It is considered as very nutritious. The correct Hindi word is Khopra.—Ainslie; Faulkner; Scaman.

COPRICA. Leach. A family of coprophagous beetles, or dung beetles, containing the genera—

Ateuchus, Weber.  
Sisyphus, Latr.  
Gymnopleurus, Illig.  
Orcipanaecus, Kirby.
COQUILLA NUTS.

was 5 to 10 grs. of the powder, or an ounce of the infusion thrice only. Latterly, medical officers have used it as a substitute for quinine, both in remittent fever and in common agues. The tincture is a bitter tonic, and its flavour and colour are much more agreeable than the tincture of colombe.—Beng. Phar.; Beng. Disp.; Voigt.

COQUILLA NUTS are produced in the Brazil by Attalea funifera, Martius, the Cocos lapidea of Guttent, and the latter title is highly descriptive. The plant might advantageously be introduced into S. Asia. The coquilla nut shell is nearly solid, with two separate cavities, each containing a hard, flattened, greasy kernel, generally of a disagreeable flavour; the cells occasionally envelope a grub or chrysals, which consumes the fruit. The passages leading into the chambers are lined with filaments or bristles, and this end of the shell terminates externally in a covering of these bristles, which conceal the passages; this end is consequently almost useless, but the opposite is entirely solid, and terminates in the pointed attachment of the stalk. Sometimes the shell contains three kernels, less frequently but one only, and a coquilla nut has been seen entirely solid. The substance of the shell is brittle, hard, close, and of a hazel brown, sometimes marked and dotted, but generally uniform. Under the action of sharp turning tools it is very agreeable to turn, more so than the coconut shell; it may be eccentric turned, cut into excellent screws, and it admits of an admirable polish and of being lacquered. They are extensively used for the handles of bell-pulls, small tops, the knobs of walking-sticks, umbrellas, and other articles. In addition to the nuts, a coarse black fibre is obtained from the dilated base of the petals. It is partly used for consumption, partly exported to Europe, tied up in bundles of several feet in length, and sold in London under this name at about £14 the ton. It is manufactured into cordage in its native countries, and as it is light, cables made of it do not sink in the water. In 1850, about 250,000 nuts were imported into England, and sold at 30s. to 40s. the 1000.—Seeman; Holtzapfel; Poole’s Stat. of Com. p. 98.

COKA, also Kora. Hind. New, raw, fresh. Hence the Hindi Ghilek, and the Greek Koree, a virgin.—Pop. Poetry of Persia, p. 542; Elliot. See Corn.

CORACIAD,E, a family of birds of the order Incessores, consisting of 2 gen., 7 sp., viz. Coracias pileata, garrula, Indica, affinis; Eurystomus gularis, orientalis, and pacificus. C. Bengalensis is seen in this country. This and the king crow habitually perch on the telegraph wires to watch for their insect prey, the former displaying his gaily-painted wings to advantage as he whisks and flutters about. C. Bengalensis meets in the Panjeb, etc., the European C. garrula; in Assam, Sylhet, Tipperah, and more rarely in Lower Bengal, it coexists with the C. affinis. C. garrula, the roller of Europe, Africa, W. Asia, Afghanistan, Kashmir, Sind, and the Panjeb, is migratory. Celebes has the Coracias Temminckii.—Wallace, p. 284. See Birds.

CORACLE. For crossing the rivers in the S. of Asia, on the Tigris, Euphrates, the Upper Indus, and its affluents, the practice of three thousand years still continues. Xenophon’s ten thousand were ferried over on inflated skins; and three slabs in the British Museum show the representation of the king of Assyria crossing the Euphrates in this mode. Canoes are of common use on rivers; and two pieces of the hole of a palm tree, scooped out and blocked with clay at the end, and fastened together, are used in the Circars. The coracles of Tibet and all India are circular wicker baskets, six or eight feet in diameter, covered with green hides; when laden, they float lightly on the water, and, presenting but little obstruction to the current, are easily paddled. The wicker and leather coracles traverse most of the rivers in the Peninsula of India. The ferrymen on the Kistna river in the Peninsula are the Koli race, stalwart men. The Kili-katr or Maddakapore race are also Kabi-gira or ferrymen. See Boat.

CORAL-GFERA. See Java.

CORAIL, also written Cora, the mercurial name of plain silk cloth undyed. Bandanna is the same article dyed. This word is derived from Bandanna, to tie, because in dyeing the materials, the portions to be left white are tied into knots. See Cor; also Cotton Piece-Goods.

CORAL

| Bussud, | Arab. | Corale, | It. |
| Gulli | DUKH. | Poalam; Karang, MALAY. | Lat. |
| Keradon, | DUT. | Koralli, | Russ. |
| Corsil, | P. | Vidruma, SANSK. | |
| Koralen, | GER. | Prabala, | |
| Ramuth, | Heb. | Bubalo, | SING. |
| Marjan, H., MALAY. Pers. | | Pavalam, | TAM. |
| Munga, | HIND. | Pagadam, | Tel. |

Coral, as seen in the market, is the calcareous cell of a mollusc, whose flesh has been removed. It is merely carbonate of lime secreted by species of polyp; its particles cemented together by a gelatinous secretion from these animals. Marselli, an Italian naturalist, thought coral to be a marine plant, and the polype animal its flower, and Dr. Parsons entertained similar views; hence the name zoophytes, or plant animals. The polyp which makes the coral so much used for ornament and jewellery, are chiefly Antipathes globelilla, Madrepora corymbosa, M. pociilfera, Gorgonia tuberculata, two species of Astraea, Leioptes globelilla, and L. Lamarkii. When still alive in the sea, the rough surface is seen dotted with red spots, and a minute examination detects thousands of the polypi or coral insects, each inhabiting permanently a little cell of its own. Many of the polypi or coral insects have a little parasol-shaped cover for the head; the arms are furnished with eight claws, are long compared with the body, and are generally seen extended, and carried for food. Some to the kinds of coral resemble gigantic plants, with flowers and leaves. Some grow like a tree with leafless branches, and others spread out, fan-like, into broad, flat surfaces. Coral is in great abundance in the Red Sea, in the Persian and Arabian Gulfs, in various parts of the Mediterranean, at the Mauritius, on the coast of Sumatra, in Japan, etc. It is carried to China from all the islands of the Indian Archipelago in native vessels, and there is wrought into ornaments and official knobs or buttons. It sells from 40 to 60 dollars per pikul, according to the colour, density, and size of the fragments. The red or precious coral, Corallium rubrum, is gathered from the rocky bottoms of the borders of the Mediterranean or its islands, and most
abundantly at 15 to 20 feet, though occurring at 1000 feet. There are independent coral fisheries on the coast of Southern Italy, off Ponza Island; off the Gulf of Gaeta; off Sicily, especially at Trapani, its western extremity; off Corsica and Sardinia, and the islands off Bonifacio; off Algeria, south of Sardinia, near Bona, Oran; off the Marseilles coast, and other places, which in 1853 afforded 80,000 pounds of coral. It is imported to some extent into India, where the most esteemed is the red coral. The pale, delicate pink colour is the most valued in England.

The coral polyp of the E. Indies, Red Sea, Zanzibar, and Central Pacific comprise genera of the Atræacea, Fungiacea, Oculinaea, Madreporae, Aleyonoida, Milleporeae, and Nulliporeae. In the Fiji Islands, Atræas and Menudinas or brain corals, are abundant. Madreporae add flowering shrubbery of many kinds, besides large vases and spreading fowla, some of these fowla being over six feet in expanse. Many and related species produce clumps of large flowers; Menumæ, Echinopora, Gemmipora, and Monipora form groups of gracefully infolded or spreading leaves; Pavonie, Piccölipora, Seriatopore, and Pories, branching tufts of a great variety of forms; Tubipora and Xerna, beds or masses of the most delicately tinted pinks; Spongiolidae, large pendent clusters of orange and crimson; and Fungiæ display their broad discs in the spaces among other kinds. It will suffice here to name the more beautiful of the coral polyps:—

Aleyopora verrilliama, Dana, Fiji.  
Atræa pallida, Dana, Fiji.  
Aleyonum, sp.  
Anthelia lineata, Stimpson, Hong-Kong.  
Cancerseca expansa, Stimpson, China Seas.  
Dendrophyllæa nigrescens, Dana, Fiji.  
Fungi lacera, V., Fiji.  
Goniopora columnæ, Dana, Pacific.  
Madrepora ebrirzida, Dana, Fiji.  
Madreporsa Formosa, Dana, Fiji.  
Porites moldax, Dana, Fiji.  
Telesio ramlussa, V., Hong-Kong.  
Xema elongata, Dana, Fiji.

Coral reef corals comprise species of the Atræa tribe, and all but two of the Fungiæ tribe.  
Of the Oculina tribe, all of the Orbicellids and Piccölipora, parts of the Oculinds, Stylistides, Caryophyllids, Astrangidae and, Stylophorids.  
In the Madrepore tribe, all of the Madreporids and Poritids, many of the Dendrophyllæa family, or Eupasammids.

Among Aleyonoids, numerous species of the Alcyonum and Gorgonia, and some of the Penitulaceæ.  
Among Hydroïds, the Millepores and Helioporeæ.  
Among Alzeæ, many Nullipores and Coralines.  
The corals of colder waters are mostly solitary polyps, either outside the coral reef seas, or at considerable depths, within them, and comprise a few Fungiæ, some Oculinds, many Eupasammids, some of the Gorgons and Penatulaceæ, and a few of the Aleyonium tribe; a few Millepores of the genus Plocobothros.

Coral Reefs are classed by most authors into lagoon islands or atolls, barrier or encircling reefs, and fringing or shore reefs.

The Atoll or Lagoon Reefs are vast rings of coral rock, often many leagues in diameter, here and there surmounted by a low verdant island, with dazzling white shores, bathed on the outside by the foaming breakers of the ocean, and on the inside surrounding a calm expanse of water, which, from reflection, is generally of a bright but pale green colour. These are raised by soft and almost gelatinous coral polypiers, which work on increasing the outer edge of the reef, which day and night is lashed by the breakers of an ocean never at rest.

Barrier Reefs are little less marvellous than atolls. In rare places, the whole of the part of the reef that is visible is converted into land; but more usually the barrier reef is shown by a snow-white line of breakers, with here and there an islet crowned by cocoanut trees, and separating the smooth waters of the lagoon-like channel from the waves of the open sea. There are many such outside the small islands in the Pacific Ocean, but the Barrier Reefs of Australia and New Caledonia have excited much attention from their proprietors.

Fringing Reefs or Shore Reefs differ from barrier reefs in not lying far off shore, and in not having within them a broad channel of deep water.  
Darwin supposes that as the reef-building polypiers can flourish only at limited depths, the foundation on which the coral was primarily attached has subsided, alike in the case of the atoll as in that of the barrier reef.

Sometimes the barrier reef recedes from the shore, and forms wide channels or inland seas, where ships find ample room and depth of water, exposed, however, to the danger of hidden reefs. The reef on the north-east coast of Australia and New Caledonia extends 400 miles, at a distance varying from 30 to 60 miles from the shore, and having many fathoms of depth in the channel. West of the large Fiji Islands, the channel is in some parts 25 miles wide, and twelve to forty fathoms in depth. The sloop-of-war Peacock sailed along the west coast of both Viti Lebu and Vanna Lebu, within the inner reefs, a distance exceeding 200 miles. A barrier reef, enclosing a lagoon, is the general formation of the coral islands, though there are some of small size in which the lagoon is wanting. These are found in all stages of development; in some the reef is narrow and broken, forming a succession of narrow islets with openings into the lagoon; in others there only remains a depression of surface in the centre to indicate where the lagoon originally was. The most beautiful are those where the lagoon is completely enclosed, and rests within a quiet lake. Marake, one of the Kingsmill group, is one of the prettiest coral islands of the Pacific. The line of vegetation is unbroken, and, seen from the mast-head, it lies like a garland thrown around it. It is in 30° 30’ S. on the Pacific Ocean that coral reefs and coral islands are seen in the greatest perfection. The largest known coral reef is the Great Barrier Reef, that runs for 1000 miles parallel to the coast of Australia, and at a distance from the shore of from 20 to 60 miles. The barrier reef of New Caledonia is 40 miles long.—Dana, Corals and Coral Islands; Darwin, Naturalist’s Voyage; Darwin, Structure of Coral Reefs; Goss, Natural History; Macgillivray’s Voyage; Figuier, Ocean World; Maury, Physical Geog.; Hartwig; Jansen; Collingwood.

CORALLINACEAE, a family of marine plants, belonging to the order Alzeæ. According to
Cordage.

Harvey's definition, it includes the Corallinae and Spongiteae of Kutting, and the Corallinidae and Nulliporidae of Dr. Johnston. They secrete a dense skeleton of carbonate of lime.—Eng. Cyc.

Coral Plant.

Cultivated in India and China as a fibrous plant, like C. olitorius. Jute is sown in good land, well ploughed and drained. It needs damp soil, but requires no irrigation. It is ripe in three, four, or five months, when the flowers turn into fruit capsules. Jute, like hemp, sow around cotton fields protects them from insects and caterpillars; 5000 lbs. to 7000 lbs. may be obtained from an acre. 100,000 tons were woven in Dundee in 1876, and 50 million gunny bags were exported from Britain in one year.—Roxb. ii. p. 581; V. Mueller.

Corychorus olitorius. Linn. Jute. C. decem-angulairis, Roxb. Gania, &c. Ambin. Kowria of. Cuttack. Pat; Ban-pat, Beng. Jew's mallow. Eng. Bhungu-pat; kooshta, Rami tuin, Malay. Pat-cut-wn, Burma. Putta, &c. Sansk. Omos, Ch. Parinta; Perintakura, Tel. An annual plant. In Bengal there are two varieties,—the green (Pat, Beng.), the reddish (Bun-pat, Beng.); both are used for their fibres, which are called jute and used in the jute of commerce. A coarse kind of cloth (tatt) is woven from the jute, and affords the material for the well-known gunny bags. An infusion of the leaf is much employed as a fever drink among the natives of the Lower Provinces. It grows wild about Rangoon during the rainy season, though not to the extent that it occurs in the native plants. The leaves of this plant are used in Egypt as a pot herb, and under the name of Nurcha or Sag greens; they are in common use amongst the natives of India. Both C. capsularis and C. olitorius afford the jute of commerce, which, both in the raw and manufactured form, is exported from India. The plant is known to be grown under cultivation. Every farmer requires rope and twine, and so grows a little jute. The fibre is extracted similarly by the sun's hemp. Mr. Le Franc of New Orleans constructed a machine for cleaning jute and other fibre plants. With it four men in a day produced a ton of fibre, and it leaves no butt or refuse.—Roxb. ii. 582; Voigt; Jeffrey; Rolle; M'Clelland; O'Sh. p. 229; Cuttack Local Committee. See Jute.

Corychorus Trilocularis. Linn. The plant—Bà-phälli, H. The seeds—Island, Hind. Grows wild in the Panjab; seeds are given in rheumatism; it is a C. acutangulus. Lam.—Stewart.

Cordage.

Cordage is the commercial term for cord or rope of every kind. Cordage of excellent quality is manufactured in India, and plants of Southern and Eastern Asia yielding fibre are as under:—

Abelmoschus esculentus, Veddoo fibre.
A. ficifolius.
Abutlon Indium, Toottee.
A. polyandrum.
A. tomintus.
CORDIA

Aacula Aréica.
A. leucopéloa.

Aeschyménènome canabánína.
Agave Americani, Fitá fibre or great aloc.
A. viargy, Kathala.
Alliantus Malebaricus, Poror maram.—Inner bark.
Aloc Indica or A. vulgaris, Kutallya nar.
A. perfoliata, aloc fibre.
Anamasa sávia, pine-apple fibre.
Andropogón schenánthus, Camsyche pillo.
A. intolatum.
Antíaris saadícóra, Aresgée.
Arundo donax.
Bauhlinía racemosa.
B. difíphylla.
B. Vahli, Vepé tree bark.
B. tomentosa, Vellay ateé nar.
Bignonia coronarías.
Bochémia; several species.
Borassus fíbheîlfíformis, Palmyra fibre.
Butea fréema.
Callacápa lanatá, Thondy nar.—Inner bark.
Calotropis gigantea, Ak, Mudar, Yerceu.
C. procéra.

Cannabis sátiva, hemp.
Carex Indica.
Chamorropó Ritébeiana, hemp pálmp.
Cordia obliqua, Pothóoverócosen nar.
Crotaláriá Burhía.
C. vanços, Sunn, Wuckoo nar, Canamboo.
C. tennifolia.
Cocos mucoféa, coir.
Corchorús olítórius, jute.
C. capsularis, jute.
Cyprésus textíllis, mat-grass, or Cooray.
Decáphisía crotonífolia.
Declámólium argenteum.
D. nilacásfólium.
Dennía exténsa, Ootrum.
Eriechónoa Cánólólli.
Eriodendró anfractósum, bast.
Eroóphórum cósósmus.
Erytrínía Indica.
Fícis régerias, Arasa nar.
F. rómoos, Attí dar.
F. Indica, Aulamara nar, Aalen nar.
F. opétífolía, Bódda nar.
F. Mysórecas, Kul-aíln nar.—Not much used.
F. Róxburghii; F. venosa.
Fouroorsy géantás, Seemay Kathałay.
Girárindía Leschénuáltia, Néigherly nelttle.
Gosseyrión Indiče, Indían cotton.
G. áccinátum, Brazil cotton.
G. Barodáneas, Peruviánum, religíósum.
Grewía Asiatíca, bast.
G. opótolífolia.
G. tálífolia.
G. rotundófolia, Oomó.—Moderate strength.
Guazuma tómentosa.
Hímaláus cánnábus, Polychay fibre.
H. mácropyllús.
H. sábádárrif, Rosèe fibre.
H. vásícárius, wild ambara.
I. Chénúmía, shoe plant fibre.
I. étífolía; I. lánáma; H. mácropyllus.
I. osa corylifólia, Valumbríkai, Kywen nar.—The most valuable fibre in Travancore. The plant grows abundantly at the base of the hills.
Fíbre is from the same.
Línum usitásiósimum, flax.
Marádenia Roylii.
Mímoos intía, Eény nar.
Missíssyea.
Musa paradísiácea, plantain fibre.
M. textíllis, Manílla hemp.

ORTHANHTHA VÍMINES.
Pandanus odorátióisus, fragrant screw-pine.
Parítium mácropyllíum.
P. hílácum.
Phádélphus, sp.
Phóéáx acánís.
P. dactylífera.
P. sylvestris.
Rhinus.
Saccharum spontáneum.

CORDIA LATIFOLIA.

S. sara, Sára.
Sáusevícera Zelynáncia, Margheé or Maroó.
Sálánialía Malebarica, Élumavo paróosty.
Sébbánía canabánína.
Sílah výpallá.—Used for cordage, etc.
Stycíños potámátorum, Kathavén nar.
Simlax oválifólia, Knúndddy nar.—Used for tying bundles, etc.
Sterculia gútta; S. ornánta; S. rános; S. villoésa.
Sterculia alata, Moróochen nar. Bark very strong, and lasts many years; used for dragging timber, cordage, etc. Common in the forests.
T. béleri, Umbróothée nar.
Tylophóra astmástica, Koórinja.
Typhicus angúla, Ma.
Uínia campestrías.
Urtica heterophylla.
Vernonia antihémbííntia, Cánt Secargráam.
Wluxramía salátíífla.
Yúca graéiosa, Píla or Adám's neelle.
Y. aloéfolia.

The exports of cordage, excluding jute, from British India, were as under:—

1877-78, . . . . . . . 30,216 cwt. Rs. 3,38,673
1876-77, . . . . . . . 24,193 . . . . . . . 2,65,603
1877-78, . . . . . . . 46,087 . . . . . . . 3,55,790
1878-79, . . . . . . . 32,812 . . . . . . . 3,55,577

It still requires to be determined whether tanning or tarring is the better mode of preserving cordage in India, and whether a substitute for tar might not be discovered in some of the numerous resins and gum-elastic from Southern India.

CORDIACEAE, an order of plants comprising the genera Cordia, Cordiopsis, and Erycbe. The chief species of Cordia known are,—angustífolia, cuneata, domesticia, fulvus, geracanthus, grandis, latifolia, Leschenaultií, monoeica, myxa, obliqua, orientalis, Perrotettii, polygama, prionodes, Rothii, sebestana, serrata, tectonáfolia, tomentosa, trichostemon, wallichii. C. fragrantíssima, Kurz, is of Burma; C. Nepálensis, Wall., also occurs in Simla; C. obliqua, Tách, is a tree of Ceylon; C. tomentosa is confined to the southern parts. In the Delura and Khera jungles is C. látora, Húm., Buch., perhaps only a variety of C. myxa, and a new species, C. ínæca. The bark of some of the Cordia, when young, may be found to yield a useful fibre.—Voigt, p. 441; W. Jc.; M. E. J. Rep.; Royle, Itt. Hin. Bot.

CORDIA ANGUSTIFOLIA. Royb.
C. reticuItata, Royb. | Narrow-leaved sepdanp.
Gund; Goondi; HINT. | Navavalli; M. | TAM.
Gundli; Goochni, " | Chínna botukú, " | Tel.
Líyar, . . . . . . . SÍND. | Nukkeru, . . . .

This tree grows from 30 to 40 feet high in Hurdvar, Gujerát, and the Dekhán; the wood is very tough, is used for carriage poles, posts, and is recommended for gunstocks. It is common about villages in the Circars, but never seen in the jungles. Fruit the size of a large pea, round and smooth, the pulp yellow and gelatinous, edible, but tasteless.—Royb.; Royle; Riddell; Bedlome; Voigt; Bird.

CORDIA LATIFOLIA, Royb. Sepiáíst.
Bhuhari, . . . BENG. | Pisar-sug, . . . PERS.

Sepistan plum tree, Eng. Nakkeru; Iriki, Tel.
Lasura, Gondhi, | Hind. Peldu botuki, ....
Kendal, .... | JAY. Moookoom, Barra, ....

A pretty large tree, a native of Egypt, Persia, Arabia, Ceylon, the forests of the Godavry, Hindustan, and Nepal. It grows wild in the Siwalk up to 4000 feet, and it is common throughout the Konkan, Pegu, and the Malay Peninsula. The trunk is from 8 to 12 or 15 feet high, generally crooked, but as thick as, or thicker than, a man's body, with numerous spreading branches bent in every possible direction, and forming a dense shad sy wood. The wood is soft, and of little use except for fuel. In Sind, fuse is prepared from the grey cracked bark. It is reckoned one of the best kinds of wood for kindling fire by friction, and is thought to have furnished the wood from which the Egyptians constructed their mummy cases. The wood and bark are said by Dr. Royce to be accounted a mild tonic. Its dried fruit is the smaller sebestans or lobateons of European medicine; it is a yellow berry, with a strong, sweetish taste, and serves as a preserve; the juice of that fruit is excellent. The root is said to be purgative. The larger fruit is called lasur, and the smaller variety lasuri; its seeds are the Chakoon ki binj, Hind., used in powder mixed with oil as an application in ringworm.—Roxb.; O'Sh.; Stewart; Royle; Brandis; Riddell; Bird; Powell; Eng. Cy.; Pl. And.; Voigt; Thw.

CORDIA OBJUQUA. Wild.
C. tomentosa, Wall. | C. domestica? Roth.
C. Wallchelli, G. Don. | Gondhi; Lasura, Hind. | Sela; Naruwalli, Tam.

This is a large, handsome tree, common in the lower provinces of India, with a small, round, reddiay-coloured, pleasant-tasted, but glutinous fruit; furnishes a fibre, Pothoveroosen nar, of moderate strength.—Ainstie, p. 228.

CORDIA POLYGAMA. Roxb. i. p. 494.
Botta kuru chettu, . Tel. | Pach-cha botaku, . Tel.
A strong, close-grained wood, small and crooked, found in the Circars.

CORDIA ROTHII. Roxb. et Sch. C. cuneata, Heyne.
Bokur, .... | MAH. | Narvilli maram, .... | TAM.
Dr. Wight believes the wood is very inferior, the trees being usually small; and Dr. Gibson says that C. Rothii, C. fulvosa, and C. obliqua do not yield timber fit for anything but firewood. They are not uncommon in the Bombay forests, but are more generally met with near cultivated lands and villages.—Roxb. i. 591; Wight; Gibson.

CORDIA VESTITA. H. f. et Th.
C. incana, Rouyle. | Gymnion vestitum, D. C. Kambi of, .... | BEAS. Karuk of, .... | SUTLEJ.

A small tree of Garhwal, rare in the Siwalk tract, nearly as far as the Jhelum, and in the Salt Range to 3000 feet. Common in N.W. Provinces. The wood is valued for wheel-work. The fruit is eaten, and said to be sweet.—Stewart; V. Mueller.

CORDIA WALICHII, G. Don. C. tomentosum, Wall., is a small sized tree, rare and common throughout the Madras' western forests, also in Mysore and the Bombay Presidency. Technically it is hardly distinct from the common Cordia myxa, but the densely woolly leaves will distinguish it. The timber is serviceable, and in use with the natives.—Beddome, Pl. Sylv. p. 245.

CORDYCEPS SINENSIS. Smith. Hia-taunt-Ch'ung. This fungus, the Sperma of some writers, grows upon the head of a caterpillar, as a disease of the insect; supposed to be a species of Hepialus. It is said to be common in Southern Tibet; it occurs in Sze-chuen, Hu-kwang, Hu-peh, and Hu-nan. It is reported to be as good as ginseng, and to be worth four times its weight of silver.—Smith.

CORDYLES, the Zonuridae family of the lizards. See Reptiles.

CORDYLLA PALMARUM, the grub of the palm weevle; is eaten roasted in the West Indies. It is the size of the thumb.

CORDYLINE BANKSHI. J. D. Hooker. The long-leaved palm lily of New Zealand. Its leaves furnish a superior fibre for ropes. C. Baueri, J. D. Hooker, of Norfolk Island, rises 40 feet high; and C. indivisa, Kuanth, of New Zealand, also furnishes the toi fibre.

COREA or Korea, the Koali of the Chinese, called Chaou Seen by the natives. Corea is a kingdom in a large peninsula, stretching from lat. 42° 19' N., southwards to the Straits of Corea, area 91,000 square miles.

The peninsula of Corea bears a strong resemblance in its physical aspects to Italy. An axial range of mountains runs close to and parallel with the east coast; the rivers which flow westward from it, and fall into the China Sea, being of considerable length, and those that flow eastward into the Sea of Japan, small and unimportant. Regarding the west coast but little is known. It is for the most part a flat and uninteresting coast, inhabited by a class of people reported to be rude and inhospitable, and dangerous to navigation on account of rapids and high tides. The east coast, on the contrary, is a magnificently wooded series of mountain spurs, running down from the axial range of the country close to the water's edge, and
CORINA.

They are polygamic, and purchase their wives.

Their women are seduced. The dead are buried in wooden coffins or wrapt in sheets. Rice is the chief article of diet; they eat largely, and drink much alcoholic fluid; are fond of music, honest, good-natured.—Ernest Offler's Forbidden Land: Yule, Cathey, ii. 268.

CORIGE. Twenty pieces of cloth.

CORIANDER SEED.

Kezirah, ... Arab. Coriandrum. 
Nan nan, ... Bum. Coriandr seed. 
Cottimhry, ... Can. Cottamalli.

Coriander saanan, ... Ger. Dhanjia. 
Korion, ... Gkt. Dhanjia. 
Gad, ... Heb. Dhanjai. 
Coriandro, ... It. Dhanjai. 

This is the fruit or seed of the annual plant. Coriandrum sativum, cultivated in the East and in Europe, and procurable in all Indian bazaars. When fresh, their smell is strong and disagreeable, but by drying it becomes sufficiently graceful. They are used as an ingredient in curries in India, and medicinally as a stimulant and stomachic. In Europe, coriander seed is chiefly used by distillers to produce an aromatic oil. The quantity imported annually into Britain is about fifty tons, and sells at 24s. the cwt.—M. E. J. H.; Simmonds; M'C.: Birdwood; Waring.

CORIANDRUM SATIVUM. Linn. The coriander plant is found in the cornfields of Tartary, the Levant, Greece, Turkey, and south of Europe, and it is grown in every part of South Asia, where the leaves are used by the natives for chatnis and curries; the fruits being also carminative and aromatic, are used in decoction, in sweetmeats, in certain stomachic liqueurs, and in some countries in cookery; they are little esteemed in England. During the unripe state, the odour resembles that of bugs, but this changes rapidly as ripening proceeds. Fee derives Coriandrum from ζεϊς, a bug.—O'Sh.; Robz.; Voigt; Lindley.

CORIARIA MYRTIFOLIA, Linn., is used in tanning leather, and also for staining black. It is worth £9 to £10 per ton.

Shaha, Baulu, ... Kashmir. 
Guch, ... Hind. Kadu, Bala, Ray, Baut. 
Massorie, Majuri, ... Archalwa, ... Slejed, ... Schere, Liechako. 

Grows all along the Himalaya, from 5000 to 7000 feet, and, from its abundance, has bestowed its name on Mussoori hill station. The fruit formed by the junction of several pistils is eaten in the hills, although that of the European species is poisonous, inducing narcism and tetanus.—O'Sh.; Clegh.; Stewart; Voigt; Ryle; Powell, Handbook, i. 336.

CORINGA, a town at the northern mouth of the Godavery river, on a branch generally called the Corings river. It is a seaport town, where ships are built, and is in Bay from the Bay of Bengal: population, 56,00.

The district has been repeatedly inundated. In May 1787, after a long and very violent gale from the northward, the sea rushed over the site of the town, and in a moment destroyed nearly the whole of the people, 4000 in number. A similar catastrophe occurred in 1837, when 15,000 people and 100,000 head of
cattle were destroyed; and the ships in the bay and on the stocks were swept far inland. It is 9 miles S.W. of Coeanada, in lat. 16° 48' 25" N., and long. 82° 16' 20" E. It is the only harbour between Trincomalee and Calcutta, where ships can be docked.

COR. Kork, Vlothout, DUT., GER. Coriaceae, (de Soovere), PORT. Liege, FR. Korkowoe, Derewe, RUS. Bhuj, HIND. Coreho, SP. Sughero, Suvero, IR. Karko, TAM. Suber, LAT. Birula, TEL.

Cork is the outer bark of Quercus suber, an evergreen oak growing in Portugal, Italy, the south of France, Corsica, and in Spain throughout the whole extent of the Tierra Caliente, but most abundant in Catalonia and Valencia, whence the principal exports have been made. This substance is developed on other plants, but on none in so large quantity as in the Quercus suber. It is light, porous, compressible, and elastic, and many articles are cut out of it. As soon as the bark dies, it falls off in flakes, which correspond to the layers that are formed annually. These outer layers the Spaniards collect; the inner living bark should be spared. In Corsica and Spain, where the tree is abundant, this bark is removed for tanning, and contains twice as much tannin as oak-bark of average quality. The tannin appears to resemble that of catechu; it affords scarcely any bloom, and gives a dark colour to the leather.

At the Madrid Exhibition of 1855, two specimens of a cork-like substance were exhibited, one good, from the 'Western Coast Jungles,' and another inferior, from Cimbatore; the trees producing the samples were not mentioned. The deeply cracked spongy bark of the Bignonia suberosa, the country cork tree, yields an inferior kind of cork.—M. E. J. R.; Eng. Cyc.; M. C. Dict. of Com.; ROyle, Arts and Manufacturers, p. 484.

CORK TREE of China. Smith. Fan-Sha, CHII. Its bark resembles that of Quercus suber.

CORMORANT. Salach, HEB. Cormorants are trained in great numbers, in the eastern Chinese provinces, to capture fish, and are sometimes under such good order that they will disperse at a given signal, and return with their prey without the precaution of a neck-ring. A single bontman can easily oversee twelve or fifteen of these birds; and although hundreds may be out upon the water, each one knows its own master. If one seize a fish too heavy for it alone, another comes to his assistance, and the two carry it away. The birds themselves are fed on bœuf, and eels or fish. They lay eggs when three years old, which are often hatched under barn-yard hens, and the chickens fed with eels’ blood and hash. They do not fish during the summer months. The price of a pair varies from 5 to 8 dollars. See Fisheries.

CORNWALLIS, CHARLES, MARQUIS.

has white flowers; slender, supple branches, with long pointed leaves, downy on the under surface. Its fruits are astringent, and leaves used in coughs.—Smith.

CORNWALLIS, CHARLES, MARQUIS, was twice Governor-General and Commander-in-Chief in India. He served successfully in Ireland, but subsequently in America with great disasters. He was sent out by Mr. Pitt to India, and the Act of Parliament of 1784 and 1786 was passed to give him supreme power. He arrived in Calcutta on the 12th September 1786, and re-embarked on the 10th October 1789. During this period the second war with Mysore occurred. He was the first to bring about a spirit of action between the Indian and Home Government, and the first to recognise the duty of paying Indian servants well, and to abolish all distinctions between the King's and Company's military officers. In 1788 he received power to bestow local commissions on the latter. His care was directed alike to financial and administrative measures, but also to the moral and social condition of the Anglo-Indian community; and in 1793 he issued regulations which for 38 years formed the basis of the administration of justice in India, and were changed only in 1851 during Lord William Bentinck's administration. He gave effect to the long-discussed subject of perpetual settlement under a zamindar class, a system which has since been greatly condemned. In 1793 he went from India to Ireland. He received the title of Marquis, and returned to India on the 30th July 1805, from which date, till his death at Ghazipur on the 6th October 1805, he was a second time Governor-General. A monument was erected to his memory at Ghazipur, and a statue at Madras.

COROMANDEL, with Europeans a geographical designation of the coast-line in the south of the Peninsula of India washed by the Bay of Bengal. It extends from Point Calimere near the mouth of the Kistna river. Its revenue districts are Tanjore, S. Arcot, Chingleput, N. Arcot, and Nellore. The name is not known to the people, and has been supposed to have its origin from the village of Coroimandel, on the Pulicat marine lagoon north of Madras, and to give its name to the entire eastern coast of the Peninsula. It has also been derived from Cholamandalam, which Paolin the Carmelite explained to mean the middle country, but which scholars interpret as the dominion of the Chola race, one of three Hindu dynasties who anciently held the Tamil country in the south. It is not impossible, however, that the general name has been connected with this particular village of Kurr-mandlum, Tax., meaning 'Black Sand.' It is situated on the north-west of the Pulicat lake, about 35 miles north of Madras, and formerly held by the Dutch. It is in the Chingleput district, in lat. 13° 26' 10" N., long. 80° 20' 36" E. Population, 3050 in 1871. See Chola-Mandaloor.

COROMANDEL WOOD is the produce of the Diospyros hirsuta, a Ceylon tree of great size, having a dingy ground, and sometimes running into white streaks. The figure is between that of rosewood and zebra-wood; the colour of the ground is usually of a red hazel-brown, described also as chocolate brown, with black stripes and marks. It is hard, but veneer saws cut it without particular difficulty; it is a very handsome furniture wood, and turns well. Mr. Layard says there are three varieties,—the Calamander or Coromandel, which is the darkest, and the most commonly seen in England; the Calemberri, which is lighter-coloured, and striped; and the Omnander, the ground of which is as light as English yew, but of a redder cast, with a few slight veins and marks of darker tints. He says the wood is scarce, and limited to Ceylon; that it grows between the clefts of rocks; this renders it difficult to extract the roots, which are the most beautiful part of the trees. Its names are corruptions of two Singhalese words, Kalu mederiyer,—Paikker; Medius; Tredgold; Holtzopfel; Ferguson.

COROSOS, or Ivory Nut, is produced by the Phytelephas macrocarpa, growing in Central America and Columbia (Humboldt). The tree is a genus allied to the Pandanaceae, or screw-pines, and also to the palms. They are seeds with oosomas albumen. The nuts are of irregular shape, from one to two inches diameter, and when enclosed in their thin husks they resemble small potatoes covered with light-brown earth; the coat of the nut itself is of a darker brown, with a few loose filaments folded upon it. The internal substance of the ivory nut resembles white wax rather than ivory. It has, when dried, a faint and somewhat transparent tint between yellow and blue; but when opened, it is often almost grey from the quantity of moisture it contains, and in losing which it contracts considerably. Each nut has a hole which leads into a small central angular cavity; this, joined to the irregularity of the external form, limits the purposes to which they are applied, principally the knots of walking-sticks, and a few other small works. It might be introduced into India.—Holtzopfel.

COROXYLON GRIFFITHI. Soda is made from this plant by burning and levigating; three kinds are recognised,—Chao-sajji, the purest; Hat'ha-sajji, second sort; K'bara-sajji, third sort.

CORFULENCE is a state of body very frequently seen amongst the richer of the Hindus. A tabular statement, taken from a mean average of 2648 healthy Englishmen, was formed and arranged for an insurance company by the late Dr. John Hutchinson. His calculations were made upon the volume of air passing in and out of the lungs, and this was his guide as to how far the various organs of the body were in health, and the lungs in particular. It may be viewed as an average, some in health weighing more by many pounds than others:

This is largely made in India, but in an imperfect manner, and used in native medicine. Some very fine specimens were shown at the Panjab Exhibition from Amritsar and Lahore.—Powell. See Mercury; Racapurar.

CORSICAN MOSS. See Edible Seaweed; Fucus.

CORTES. Hernan Cortes, a Spanish navigator, who, in A.D. 1528, endeavoured to follow up the discoveries of Magellan. He took possession of the Marianas and Ladrone Islands, but, with all the members of his expedition, fell victims to the climate and the hostility of the Portuguese.

CORTINARIUS EMODENSIS, Berkley, and also C. Violaceus Fr. are two beautiful fungi, the Onglan of the Tibetans and the Yungla s'chenmo of the Bhot, a favourite article of food.—Hook. 

CORUNDUM.

Kit-kang-shih, Chin. Samada, Ghi. 

Several substances, differing considerably in colour and sometimes in form, but nearly agreeing in composition, are classed together under the name of kuruudu by the natives of India. This mineral is, with the exception of the diamond, the hardest substance known. It is generally of a pale grey or greenish colour, but sometimes of red and brown tints. It is found in India, China, and in some parts of Europe. The Indian variety is whiter than the Chinese, and is considered the purer. In India, diamond dust is very rarely used in polishing gems, marbles, and metals, corundum being the chief material employed. This mineral is found in granite, or the detritus of granite rocks in the Mysore country and in the neighbourhood of the S.W. Ghats. Though excessively hard, it is by no means tough,—it flies in pieces after a few strokes of the hammer, and is easily pulverized in a mortar. The natives generally powder it on an anvil or stone, keeping it from flying about by a collar of cotton rope. The fine particles are separated from the coarse by siftmg; the European process of lixiviation is not so seemingly resorted to. For sharpening swords or burnishing metals, it is generally used like a whet-

stone or burnisher; for polishing gems, it is either made up into a cake with lac, or into a paste with oil or grease. It is never employed for the manufacture of emery paper or anything resembling it. For polishing marble or other stone, it is used in two forms, viz. that of a cake of about eight inches long, three across, and two deep. This is used by an individual in the hand. For heavier purposes, a cake a foot square or so is employed, placed in a frame. Two men work at this, and the reducing process is very rapidly accomplished by it; it is in fact a file with a lac body and corundum teeth.

The corundums of the Madras Presidency are well known to the people, who use them in mass or mixed in lac; they are used by cutters, etc., in the form of discs for lps, or wheel grindstones, also, in the form of whets, and hone, and rags, for sharpening the finer and coarser cutting implements used by farriers, etc. The first specimens sent to Europe were forwarded by Dr. James Anderson to Mr. Berry, a lapidary in Edinburgh, as the substance used by the people of India to polish masses of stone, crystal, and all gems, except the diamond, and it was then examined by Dr. Black, who named it adamantine spar.

The sites where corundum occur are—

Nammanal, Viralimodos.—On the north bank of the Cauvery, in the Permuttta taluk.—Newbold.

Sholasigamay (probably Scholasaermen).—Trichingode taluk, near the village in a low hill, in great abundance.—Newbold.

Caronel, Aupore, Mallapolly, and at various localities up the river Cauvery as far as Corcorambodi in Permutt, where it is dug by the natives in the fields, and remains of many ancient excavations are to be traced.—Newbold.

Gopalchetty pollium, 50 miles north of Salem. Yalaurry. 

Goundapady, French Rocks.—Captain Lowdon.

Golhushally, in the division of Noogullu.—Newbold.

Kulkairi, in the division of Chirnayapatnam.—Burkunhulli, in the division of Chinrayapatnam.—Newbold.

Kundeo, in the division of Chinrayapatnam.—Newbold.

Yedgunkul, in the division of Chinrayapatnam.—Newbold.

Noritik, in the division of Narsapur.—Newbold.

Deysoni Carbonhully, in the division of Banswaram. Appanully, in the division of Haranally.—Newbold.

Nullapady, on the road to Bangalore, Mysore. 

Mundum, in the Astagram division. 

Cuddoes, in the Nugar division. 

Nugur, in the Nugar division.

It occurs also at Gudjehnatty in Coimbatore, at the Tapoor Ghat in Salem, at Chennimully in Coimbatore, and in Cuttack. At Namallu and at Viralimodos on the north bank of the Cauvery; in the Permutttaluk, Salem district, it occurs embedded in gneiss and a greyish earth, resulting in part from the disintegration of that rock. It is found in great abundance in a low hill near the village of Sholasigamay, Trichingode taluk, Caronel, Aupore, Mallapolly, and at various localities up the river Cauvery, as far as Corcorambodi, where it is dug for by the natives in the fields; and there are the remains of many ancient excavations still to be traced. The ore is usually employed in collecting it is the Vittawav. At the Madras Exhibition of 1855, Mr. Rohde exhibited specimens from Guntur, and remarked of them that experienced jewellers would pick out stones suited for common jewellery from it, and the refuse cannot be worth less than £15 and £20 a ton at home. From Hyderabad was received a very excellent sample of picked stones, possessing an irregularly crystalline structure. Professor Thomson mentions (Mineralogy, i. 213) that fibro-

lite is found accompanying crystals of corundum in the Karntic, and that it is a component part of the granite which is the matrix of the corundum of China. Professor Jameson, in his Geognosy of Peninsular India (Ed. Cab. Lib. No. viii. p. 349-50), states that the corundum of Southern India occurs embedded in granite and sienite in the district of Salem. In the Nalgonda country, associated with Cleavelandite, Indianite, and fribroite; but near Gram at Golhushally and Kulkairi, at which good corundum is obtained, the mineral occurs in decomposed beds of a talcose slate, to which gneiss is subordinate, associated with nodules of indurated talc, and of a poor quartz iron ore; asbestos, chlorite, actinolite, and schorl were
CORUNDUM.

found in the talcose slate. Newbold mentions that in the Salem district, also, this mineral occurs embedded in gneiss and a greyish earth, resulting in part from the disintegration of that rock. Rubies, sapphires, emeralds, and topaz have from time to time been discovered in many of the corundum localities just enumerated, associated with this mineral, particularly in the gneiss at Viralimodos and Sholasirmany in the Trichingole taluk and at Mallapollye, though, comparatively speaking, rare. The formation around Gram is gneiss associated with protogene. Proceeding from it in a westerly direction, the northern shoulder of the imbricated range, south of the village of Beladaira, running nearly north and south, is crossed, and the soil suddenly changes from a light sandy colour to a deep red. The surface of this soil is covered with fragments of a ferro-silicious schist, with quartz in alternate layers. The natives have a tradition that gold was formerly got from this hill, which is not at all improbable, as it is found in similar gange near Baitmangulam. The corundum mines of Golhushully lie four or five miles north-east of this place, and those of Kulkairi about a mile farther. The surrounding country is a succession of smooth, slightly convex plains, except to the south-east, where the gneiss rises above the soil in a rocky ridge, terminating in a knoll about 700 yards to the east by south of the mines, to which it descends, rising again into a slope to west north-west of the mines, on which lie fragments of a light brown compact quartz iron ore. Nearly at the bottom of this stone are the mines, from which the ground descends on both sides to the north-west to a tank, and towards the south-east to the village of Golhushully, about a mile distant.

The chert and a dark-red ferruginous jasper are used by the natives as flints. Salt springs occur in the vicinity. The wells about Gram are both sweet and brackish within a short distance, and a fragment of rock-salt was found in the green earth of the mine. A little to the east of Kulkairi is a low plain nearly covered with a white travertine, partly compact, partly cellular, resembling that found in the bowl of the Cauvery at Seringapatam. The corundum mines at Kulkairi are situated both near the summit and at the foot of the excavations of the rising ground there. There are a series of excavations varying from two to twelve feet in depth, sunk perpendicularly though similar strata to those just described. The corundum is thrown out, cleansed, and separated by the miners into four classes, viz. the red, the white, the grey, and the refuse. The three first form the article of commerce.

The corundum of Battagamman is frequently found in large six-sided prisms, is commonly of a brown colour, whence it is called by the natives Curyat galle, cinnamon stone; occasionally it is to be met with partially or entirely covered with a black crust, and is merely the stone with an unusual proportion of iron.

Corundum is found about eight miles S. from Sahapur, in the Singraula territory, about 120 miles from Mirzapore. It is found in masses as large as a man's head, on a ridge. Common corundum occurs, like the sapphire and ruby, commonly in the secondary form of six-sided prisms, but usually much larger. It is sometimes nearly colourless, and rather translucent; it presents great variety, greyish, occasionally brown or red, rarely blue. It occurs also in acute and obtuse double six-sided pyramids. Corundum pebbles are found in the gem-sand of Ava river.

Prismatic corundum, or chrysoberyl, is found among the Torra hills near Rajmahal, on the Bunias in irregular rolled pieces, small, and generally of a light green colour; these stones are considered by the natives as emeralds, and pass under the name of panna, but they are aware that they are softer than the real emerald.—Bunias, Engl. Cyc.; Edward Balfour, Report on 1856 on the Government of Ceylon, Madras, &c. Ed. 1855. E. Jur. Rep.; Dr. Mason; Captain Newbold; Irvine, Gen. Med. Top. of Ajmir; Jameson, Ed. Journ. ii. 1820, p. 305.

CORUNGA MUNJJI-MARAM. TAM. Rottlera tinctoria.

CORUITT. TAM. Tricosanthes palmata.

CORVIDE, the crow family of birds, sub-fam. Corvina, crows, magpies, nutcrackers. Corvus culminatus, corone, corax, splendens, intermedius, Thetanus, tenuirostris, and frugilegus, occur in India. The genus corvus has no representative in all South America, nor in New Zealand, nor in the numerous archipelagoes of the Pacific, and there is one species only in Australia. Corvus corax, the raven, takes the circuit of the northern regions; rare in N. Africa, Panjeb, Kashmir, Afghanistan. The true raven is pre-eminently a bird of the coldest climates; though a few occur so far southward as in the Barbary States, in America so low as the Carolinas, and in India within the Panjab only. The raven, remarks Sir John Ross, is one of the few birds that are capable of braving the severity of an arctic winter. In the fearful cold of a northern Siberian winter, Von Wrangel says, the raven still cleaves the icy air with slow and heavy wing, leaving behind him a long line of thin vapour, marking the track of his solitary flight. The Tibetan raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Canino seems to incline; it may be presumed to inhabit the lofty mountains of Bhutan to the north. The smaller crow of Southern Asia is the C. splendens; the common black crow of all India is C. culminatus. The true rook, C. frugilegus, is known to visit the Peshawur valley, Afghanistan, Kashmir (the rook of China and Japan being considered a distinct species, C. pastinator of Gould); and the jackdaw, C. monedula, accompanies it in those countries. C. advena is a rare black and white crow, occurs along with Cittura cynoetes, the forest kingfisher of Celebes. C. corone is the carion crow of Europe. Afghanistan, Japan; C. cornix, hooded crow of Europe, Asia Minor, Afghanistan, Japan (Temminck); Barbary; C. monedula, the jackdaw of Europe, Siberia, Barbary, W. Asia, Peshawur valley, Kashmir. A nutcracker and a magpie occur in the Himalaya.

CORVINUS, a genus of fishes, several species of which, C. boha, C. chapias, and C. coitor, furnish isinglass. C. boha, M'Clett., Bolo chapias, Buch., furnished the isinglass which Mr. O' Riley sent to Calcutta from Amherst. It is closely allied to C. niger, but of monstrous dimensions compared with the European species. The jawbone of this fish is described as Boalee.—Mason; M'Clett.

CORYATE, THOMAS, a native of Britain, a
CORYDALIS AMBIGUA.

most singular traveller. After publishing, in 1611, his most portable travels, styled Coryate, His Crudities, prefixed by above forty copies of verses by the waggitish wits of the time (amongst which is one in the ancient British language), he set out on his greater travels, and seems to have been buried at the port of Swally, near Surat, in December 1617.—Pennant's Hiudostan., i. p. 73.

CORYDALIS AMBIGUA. Smith.

Yam-hu-soh., CHIN. [Huan-hu-soh., CHIN.]

A Chinese plant belonging to the sub-order Fumariaceae, the fumitory tribe; its tubers are used medicinally in heamaturia. —Smith.

CORYDALIS GOVANIANA. Wall. Bhootkes, HIND.

Is common above 8000 feet of elevation in the Choor mountains, where it is regarded as a charm against evil spirits. The roots sent by Dr. Falconer were long, fibrous, tough, and exceedingly bitter, dark brown externally, yellow within. —O'Shaughnessy.

CORYDON SUMATRANUS, a singular and rare bird; it is crepuscular, very likely diurnal as well, and so stupid or tame as to allow itself to be pelted without moving.

CORYGAUM, a small village on the left bank of the Bhina river, half-way between Poona and Seroor on the Gor-naddi. It is memorable for the defence made on the 1st of January 1819, by a small body of Madras artillery and native infantry about 500 strong, against the entire army of Raja Rao, Peshwa. About 4000 Arabs continued the attack from daybreak till dark.

Surgeon, afterwards Sir James Wylie, of the Madras Medical Department, greatly aided in their repulse. Captain Staunton of the Bombay army, with the 2d battalion of the 1st Bombay Native Infantry, mustering 600 bayonets, 26 of the Madras Artillery under Lieut. Chisholm, and 300 Auxiliary Horse under Lieut. Swanston, in all 296 strong, on New Year's eve were ordered to Poona to join Colonel Burr's brigade. On New Year's morning of 1818, as he approached Corygaum, he saw the army of the Peshwa, consisting of 20,000 horse and 8000 foot, covering the plain beyond. Both parties made a rush to seize the village, but entered it together at different ends. All day long the strife was kept up, fresh bodies of Arabs coming from the enemy to take the place of those who fell. Of the eight officers, Lieutenants T. Pattinson and Chisholm and Dr. Wingate were killed or mortally wounded. Captain Staunton and Dr. Wylie were amongst those who survived, but 175 had fallen. The E. I. Company voted Captain Staunton a purse of 500 guineas and a sword of honour, and afterwards erected a granite obelisk, 70 feet in height, with the names of all the brave men who fell, engraved on it in English, Persian, and Marhatta. Assistant-Surgeon Wylie was afterwards created a K.C.B.

CORYLUS AVEIILANA, the European hazel, is abundant in the Himaalaya. Fruits (nuts), called Bindik and Finduk in bazaars, are grouped in clusters together; inodorous, taste sweet and agreeable, become rancid very quickly. By expression the kernel yields a very agreeable oil, nearly in the proportion of half its weight. The wood of the hazel was the material of the dividing rods of the magicians and snake enchanters, who, even in modern times have had their believers in Europe. The Japan hazel is C. heterophylla, Fischer; C. ferox, Wall., is a plant of the Simla hills. —O'Sh.

CORYLUS COLUMNA. Linn. Hazel.

C. Jacquemontii, Dne.

Hazel, Urvrj, Umii, Geh., PANj. Sharoi, Sharoli.,

Ivrni, Ivrni, War., Shurlie, Bankins. (Eng.)

This tree grows to a height of 40 feet at elevations of 5500 to 10,500 feet in the Panjib Himalaya. Wood elastic, light and compact, used for hoops and small articles. The nuts edible. —Dr. Cleghorn and J. L. Stewart.

CORYNOCARPUS LEVIGATA, a New Zealand tree with beautiful evergreen foliage; the pulpy portion of the fruit is eaten by the natives. CORYPHA, a genus of palms of the order Coccoaceae. Sec. D. Coryphe, C. elata and C. taliera grow in Bengal; C. rotundifolia and C. utan, in the Moluccas; C. umbraclifera in Ceylon and the Moluccas, and C. gebanga in Java. It seems to be C. gebanga which Mr. Wallace (p. 158) describes as a great species in Lombok, called Gabbong, which grows there in great abundance. He says it has a lofty cylindrical stem, about a hundred feet high and two or three feet in diameter. C. taliera, the Tara of Bengal, and the Talipat of the Peninsula, is much employed for making leaf hats and leaf umbrellas; the leaves, when smoothed, are much used for writing on, and also for tying the rafters of houses, as they are strong and durable. C. umbraclifera, the cobba-panna of Madras and the talipat of Ceylon, and very like the former, is common in Ceylon, and found also on the Malabar coast. The dried leaf is very strong and limber (Knox's Ceylon). The Burmanee books are all made of the leaf of a species of Corypha. C. australis is the cabbage-palm of the northern part of Australia to Port Jackson. It rises erect to 70 or 100 feet, with a diameter of 1 foot.—G. Bennett; Seemann; Royle, Fl. Pl.; Voigt; Wallace, 155.

CORYPHA ELATA. Roxb.

Tallera elata, Wall. —Bajoor, Bujar, Batool, Beng.

This stately palm grows in Bengal, and, according to Mr. Mason, in the Tenasserim Provinces. It has a straight trunk, but often varying in thickness. A tree about thirty years old, when in flower, was seventy feet to the base of the inflorescence, another about sixty; circumference near the root, eight feet, and about the middle of the tree five and a half or six; their whole length strongly marked with rough, dark-coloured spiral ridges and furrows, which plainly point out the spiral arrangement of the leaves. The ligneous filars, as in the order, are on the outside, forming a tube for the soft spongy substance within, of a dark chocolate colour, tough and hard, but by no means equal, in either quantity or quality, to the very serviceable wood of Borassus flabelligerum. This palm, in Bengal flowering in March and April,—the seeds require about twelve months to ripen,—is to be at once recognised by its black spirally-marked trunk. From the other species of Corypha it is abundantly distinct by its long obviously spirally placed ex auriculate petioles, and by the smaller dark-green flat lamina, with narrow linear-ensiform segments. The fruit is smaller.—Voigt; Mason, Proc. I. 376.

CORYPHA GEGBANGA. Brot. it is one of the most useful of all the palms of South-Eastern Asia. Its pith furnishes a sort of sago. In Java, thousands of boys and girls are employed in
fabricating its leaves into baskets and bags; thatched and broad-trimmed hats are made of them; fishing-nets and linen shirts are woven from its fibres, and ropes from its twisted leaf-stalks; the root is both emollient and slightly astringent; and Waitz says it is a valuable remedy for the periodical diarrhoea which in the East Indies attacks Europeans. It flowers in a huge terminal spike, on which are produced masses of a small round fruit, of a green colour, and about an inch in diameter. When these ripen and fall, the tree dies, and, after standing a year or two, it too dies. Flocks of green pigeons and troops of the Macacus cynomolgus monkeys resort to the trees when fruiting, the latter chattering and showering down the ripe fruit. Kurz joins C. elata to this.

CORYPHA TALIERA. Roxb. ii. 174.

An elegant, stately palm of Bengal, has a trunk, perfectly straight, about thirty feet high, and, as near as the eye can judge, equally thick throughout, of a dark brown colour, and somewhat rough with the marks left by the impression of the fallen leaves. It is a native of Bengal, but it is scarce in the vicinity of Calcutta. The flowers at the beginning of the hot season, the second or third month afterwards. It is so closely allied to C. umbraulifera, as to be difficult to distinguish when out of flower. The leaves are much employed for making leaf hats and leaf umbrellas, and for tying the rafters of houses. They are in about 80 divisions, each 6 feet long by 4 inches broad, radiating from the point of a leaf-stalk from 5 to 10 feet long, and covered with strong spines at its edge. Roxburgh describes the spadix as decomposed, issuing in the month of February from the apex of the tree and centre of the leaves, forming an immense diffuse ovate panicle of about 20 or more feet in height. The fruit is the size of a crab-apple, wrinkled, dark olive, or greenish-yellow. The leaves are used by the natives of India to write upon with steel styles; it is known as the book palm, and is not unfrequent in the neighbourhood of religious edifices in the Tenasserim Provinces.—Roxb. ii. 174; Voigt, Eng. Cyc.; Mason.

CORYPHA UMBRAULIFERA. Linn.

The talipat palm of the Moluccas, Malay coast, Malabar, and Ceylon, is similar in appearance to, but its leaves are not so round as, those of C. taliera, the divisions in the centre being shorter than those at the sides. It has a stem 60 or 70 feet high, crowned with enormous fan-shaped leaves, forming a head 40 feet in diameter, each leaf with 40 or 50 pairs of segments. These frouds, when dried, are very strong, and are used for hats and umbrellas. The petiole is 7 feet long, and the blade 6 feet long and 15 feet broad. Fans of enormous size are manufactured from this plant in Ceylon. The bole is wholly pithy, which furnishes a sort of flour, of which bread is made; the leaves make excellent thatch, and are also used for writing on, like those of the C. taliera. Griffith met with trees in flower at Mergui, which he thought belonged to this species; and Dr. Mason saw trees in Tavoy, which he regarded as probably talipat palms. The dark-coloured roundish seeds of these trees are used as beads by the Tadar or Dsari religious mendicants. C. umbraulifera is found also on the Malabar coast. The dried leaf is very strong and limber, and, according to Knox, is "most wonderfully made for men's consumption to chew along with them; for though this leaf be thus broad enough to cover fifteen or twenty men when it is open, yet it will fold close like a lady's fan, and then it is no bigger than a man's arm; it is wonderfully light."—Knox's Ceylon, in Royse's Fl. Pl.; Seeem; Eng. Cyc.; Mason; Roxb.; Voigt. Kurz joins C. taliera to this.

CORYPHA UTAN. Lam.

A palm of the Moluccas.—Roxb. ii. 178.

CORYPHAEA, a genus of fishes belonging to the section Acanthopterygi, family Scornbride, and fifth group Coryphana. There are nine genera in the group; one of them, Coryphana, has six species. C. hippurus, Linn., is the dolphin or dorado, and is often confused with the delphinus or porpoise, from its bearing the same name. Its colours when swimming are very lively, and tail of a golden hue. When dying it presents a greatly varied play of colours. It is good for eating.—Bennett.

CORYPHODON BLUMENBACHII, the 1st snake of Ceylon, is almost domesticated in households.—Tennent, p. 42.

COS, a little Dorian island on the coast of Asia Minor, which fell under the power of Ptolemy. It was the first spot in Europe into which the manufacture of silk was introduced, which it probably gained under the power of Persia before the overthrow of Darius. The luxury of the Egyptian ladies, who affected to be overheated by any clothing that could conceal their limbs, had long previously introduced a light thin dress; and for this, silk, when it could be obtained, was much valued; and Pumphila of Cos had the glory of having woven webs so transparent, that the Egyptian women were enabled to display their fair forms yet more openly by means of this clothing. Occasionally, also, they sent their children and their children's children there as a place of safety from Alexandrian rebellion; and there the silk manufacture flourished in secret for two or three centuries. When it ceased is unknown, as it was part of the merchants' craft to endeavour to keep each branch of trade to themselves.—Sharpe's Aristotle, Hist. An. V. 19; Hist. Egypt, i. p. 263.

COSCIUM FENESTRATUM. Coleb.

Mansiopsema fenestratum, Gartn.

COSI, a river of the Himalayas, is formed from seven alpine feeders, the Sapt Cosi of the Nepalese, which unite within the Himalaya mountains. Bengal has a river of the same name, with the town of Midnapur on its bank.

COSMAS, called from his maritime experiences Indicoleucus, was apparently an Alexandrian Greek, who wrote between 530 and 550. He was the first Greek or Roman writer who speaks of China in a matter-of-fact manner, by a name which no one has ever disputed to mean China.

He was a monk when he composed the work.
which has come down to us, but in his earlier days
he had been a merchant, and in that capacity had
sailed on the Red Sea and the Indian Ocean,
visiting the coasts of Ethiopia, and apparently
also the Persian Gulf, and the western coasts of
India, as well as Ceylon. His book was written at
Alexandria (A.D. 535), and is termed Topographia
Christian a (Universal Christian Topography),
the great object of it being to show that the tabernacle
in the wilderness is a pattern or model of the
universe. Sir J. E. Tennant (Ceylon, i. p. 542) says
that Cosmas got his accounts of Ceylon from
Sopatrus, whom he met at Adule; and Lassen
ascribes all Cosmas says of India to the same
authority (i. 773). But they have not given the
ground of these opinions. One anecdote is
ascribed to Sopatrus, no more. He gives a clear
account of the commerce between India and
Egypt in his day. He says that the produce of
Kalliana was brass, sesame logs, and cotton
stuff; of Sindus, castorin and spikenard; of
Male (Malabar), pepper; and that from Tanitza
(China) and other countries beyond Sieldba or
Taprobane, came silk, aloes-wood, cloves, nutmegs,
and sandal-wood. Writing of the island of Tapro-
banie in Further India, Cosmas says where the
Indian Sea is, there is a church of Christians, with
certain monks, who believe that I know not if there be
any Christians further on in
direction. And such also is the case in the
land called Male, where the pepper grows. And
in the place called Kalliana there is a bishop
appointed from Persia, as well as in the island
which they call the Isle of Dioscoris, in the same
Indian Sea. The inhabitants of that island speak
Greek, having been originally settled there by the
Ptolemies, who ruled after Alexander of Macedon.
This Male is evidently Malabar, probably the
Kalliana of the Peripus, which Lassen identifies
with the still existing Kalyani on the mainland
near Bombay. Father Paolina, indeed, will have
it to be a place still called Kalyanapuri on
the banks of a river two miles north of Mangalore,
but unreasonably. Via Guida, Indie Orientale,
p. 100, in Yule Cathay, i. p. 171.

COSMETIC BARK.

Cosmetic Bark, Dusting-powders.
Puh-fen, Shuwei-fen, CHN. Fu-yung-fen, . . . CHN.
P'ing-hie-kung-fen, . . .

In China, the shells of several molluscs are
washed, scraped, calcined, and levigated, and
scented with musk or other ingredients. The
addition of Borneo camphor makes these powders
exquisitely cooling to the skin, especially if
troubled with prickly heat. Water is used with
the Shuwei-fen, in laying it on the face. An inferior
cosmetic wood of Burma, is the tuberole of some
plant. The Burmese appear from their name to
regard the tree as a medicinal one, but it is
rarely used except by the Chinese, for they call
them erythrina thorns; but Mr. Mason suspected that it is a
toddalia aculeata and T. floribunda. The cosmetic wood of Mergui from
one of the Xanthoxylaceae? is fragrant. It is
sold in the bazar.—Mason; Smith. See Abir.

Coss, the traditional measure of India, of
which the precise value has been much disputed,
chiefly on account of the difficulties which attend
the determination of the exact length of the
guz or yard. The Ayin-i-Akbar lays down distinctly
that the coss consists of 100 cords (tunab),
each cord of 50 guz; also of 400 poles (bans), each
of 123 guz; either of which will give to the coss the
length of 5000 guz. The distances in English yards
between the old minars or coss pillars may be con-
sidered to afford the correctest means we have of
ascertaining the true standard, viz.:

By Road, Direct.

Octagonal minar to Nurelah in Delhi,. . . 4513 4498
Minar between Nurelah and Shapurgur, . . . 4554 4591
Minar opposite Alipur, . . . 4522 4579
Minar opposite Sirpar, . . . 4579 4573
Ruins of Minar opposite to Shalimar, . . . 4610 4591

Length of the coss, 2 miles 4 furlongs 158
yards. It is important to observe that the length of the
Ihaee guz, deduced from the measurements,
is 32.818 inches, showing how very nearly correct
is the length of 33 inches assumed by the British
Government. The Chinese li is the distance
which can be attained by a man’s voice exerted in
a plain surface; and the same may be remarked of
the oriental meel, as well as the European mile
and league. The two former evidently derive
their names from the Roman milliare, and the
difference of their value in different places proves
that the more natures was borrowed, without any
reference to its etymological signification. Cos
is an Indian word; the equivalent word in Persian
is Kuroh, the same as the Sanskrit Koroa, of which
four go to the yojan. Malcolm says the coss is
in general estimated at forty-two to the degree;
but its length differs in almost every province
of India. It may be computed as never under
a mile and a half, and never (except in that intro-
duced by the mandate of the late Tipu Sultan
in Mysore) more than two miles. In Gujerat they
estimate the coss by the laying of kine (gao),
which in a still day may be heard at the distance of
a mile and a quarter. Thus twelve coss is barn-
ago.—Elliot, Supp.; Malcolm's Central India, i. p.
20. See Ihaee Guz.

Cossack, an irregular soldiery whom the
Russian Government recruited from the country at
the foot of the Caucasus, known as Little Kabarda
and Great Kabard, bordering on the Maka
and Kuma rivers. Cossack (Kazak) is also a term
by which the Malarrattas described their own
mode of warfare. In their language, the word Cossakee,
borrowed, like many of their terms, from the
Maghuls, means predatory.—Malcolm’s Central
India, i. p. 69. See Kabarda.

Cossaya or Cissia is the name by which the
Greeks knew the tract east of the Tigris. It was
also called Elam or Elymas. It is now called
Khuzistan. Cossaya is supposed to be derived
from Koh-siah, or Black Mountain. The people
spread their conquest over Susiana and the districts
eastward. See Luristan.

Cossair or Cossair, a town and harbour on the
western side of the Red Sea. It was occupied by
the French in their expedition to Egypt, and
then by the English, under their last crown on
the east, but on the north reefs advance into the
sea; on the south is a chain of mountains of
some elevation. The bottom is rocky.

Cossid, Pers. properly Kassid. A mounted
messenger.

Cossya Hills, or Khassia Hills, estimated
area 7290 sq. miles, 80 miles in length from N.
to S., and 40 in breadth, extend from lat. 24° 35'
COTTON, General Sir Willoughby.

COTTON, General Sir WILLWOUGHBY.

COTTON, General Sir WILLWOUGHBY, K.C.B. and G.C.B., born 1783, died in London on May 1848, only son of Admiral Cotton, cousin of Lord Combermere. In his 16th year he entered the 3rd Guards as ensign. He commanded a division of Sir Archibald Campbell's army in the Burmese war. He commanded the 1st division of the Bengal army in the Afghan war in 1838-39, under General Sir Henry Fane, and afterwards under General Sir John Keane. He was present at the storming and capture of Ghalzi on the 23rd of July 1839, at which he commanded the reserve which entered the city after the storming party had established themselves inside. He received the Order of the Bath of all the grades, being nominated a Grand Cross of that order in 1840. He was made a Knight Commander of the Royal Hanoverian Guelphic Order in 1830, and had conferred upon him the Order of the Durance.

Gossypium; LAT. 

Cotton consists of the delicate, tubular, hair-like cells which clothe the seeds of species of gossypium. Its commercial value depends on the length and tenacity of these tubular hairs, which, in drying, become flattened, and are transparent, without joints, and twisted like a corkscrew. Under water, they appear like distinct, flat, narrow ribbons, with occasionally a transverse, line which indicates the end of cells.

In America, two distinct varieties are indigenous—G. Barbadense, yielding the cotton from the United States, and G. Peruvianum or acuminatum, that which is produced in South America. India also has two distinct species, —G. herbaceum, or the common cotton of India, which has spread to the south of Europe, and G. arboreum, or tree cotton, which yields none of the cotton of commerce.

Cotton plants have been characteristic of India from the earliest times; and at the present day, the majority of its people are clothed with fabrics made from cotton, which is woven to a large extent in India, but more largely in Europe and America. Indigenous varieties in the tropical regions of Asia, Africa, and America, and in the southern provinces of the United States, have been cultivated with such success, that its produce is an important article of commerce.

Dr. Cleghorn compared all the species of gossypium in the herbarium of the Botanical Society (comprising the collections of Buchanan Hamilton and Lady Dalhousie, with contributions from Drs. Wight, Campbell, etc.), and also those in the herbarium of Professor Balfour, with a view to explicate the specific characters by which to discriminate them from one another. The series showed the striking difference which soil, climate, and culture produce in species, and which may appear in nature, giving rise to a multiplication of species. But the whole group of so-called species seemed to him referable to G. herbaceum, Linn., G. arboreum, Linn., G. Barbadense, Linn., and G. acuminatum, Roxb.

Since 1790, efforts to improve the Indian cotton crops have been almost continuous. Experienced planters from America were employed, and Drs. Wight and Watson were long engaged in experiments in Coimbatore, Gujerat, and Dharwar. The plant has always been grown in almost every district of India, for local use or export, in soils suitable and unsuitable to its growth; and at the London Exhibition of 1862, the values of 138 samples exhibited ranged from sixpence to three shillings the pound.

Mr. Shaw (p. 186, Cotton Report) cotton cultivation in India would not be a profitable speculation for Europeans; the natives can grow it much cheaper. Our function is simply that of buyer. We have no local market for the American cotton. It does not answer for native spinning so well as their own.

The use of cotton dates from a very early period. Sanskrit records carry it back at least 2600 years, while in Peruvian sepulchres cotton cloth and seeds have been found. It is noticed in the book of Esther, i. 6, where its Sanskrit name Karpas is translated 'greens' in the English Bible. Herodotus and Ctesias notice it; but it was not till the invasion of India by Alexander that the Greeks were acquainted with the plant, as may be seen in Theophrastus, and also in Pliny.

Pliny, writing about 500 years subsequent to the time of Herodotus, mentions (lib. 19, c. 1) that the upper part of Egypt, verging towards Arabia, produces a small shrub which some call gossypion, others xylon, and from the latter the cloth made from it, xylina, bearing a fruit like a nut, from the interior of which a kind of wool is produced, from which cloths are manufactured inferior to none for whiteness and softness and therefore much used by the Egyptian priesthood.

The varieties of cotton known in the commercial world may be referred to three distinct species, each having several sub-varieties. The Gossypium Barbadense is the species cultivated in the West Indies, North America, and in one or two parts of the Peninsula of India. Gossypium Peruvianum yields the cotton of Brazil, Pernambuco, Peru, etc. Gossypium Indicum is the species which, in a number of varieties, produces the great bulk of the cotton of India and China. The Gossypium arboreum, or tree-cotton of India, and peculiar to India alone, is unfitted for manufacturing purposes, and is unknown to commerce, though yielding a beautifully soft and silky fibre, admirably adapted for padding cushions, pillows, etc. In commerce, Indian cotton has usually been known under the names of the locality of its growth or place of shipment. The staple of these sorts appears to range from 0'85 to 1'1 of an inch in length; the staple of the celebrated Sea Island cotton being usually 1'5 in length.

The three qualities by which the value of cottons are determined are, length of staple, strength of fibre, and cleanliness of sample. Colour, which at one time was thought much of, is no longer looked upon as a matter of moment. The respective lengths of the different kinds of cottons are given by Mr. Clements Markham as under:

The cotton of India is allowed to be inferior as regards its staple and purity, but in durability it at least equals the produce of any part of America, and of this fact the Hindus are themselves perfectly aware. Dr. Royle gives 3 distinct varieties of cotton, all indigenous to Hindustan. The common description is found scattered more or less throughout India, reared as a triennial or annual. It reaches the height of 5 or 6 feet in warm, moist climates. The seeds are five in number, clothed with a short greyish down. In the Peninsula there are two distinct varieties of this sort, known amongst
COTTON.

the natives as Opopum and Nadum. The first thrives only on the richest black soil, and is an annual, producing a fine staple; the latter is a triennial plant, and grows on the poorer red soil, yielding small crops of inferior quality.

Second.—Dacca cotton is a distinct variety of the Gossypium Indicum. It differs from the previous variety in the plant being more erect, with fewer branches, and tinged with a reddish hue, whilst the cotton is finer, softer, and longer. This variety is reared more or less extensively throughout Bengal, especially in the Dacca district, where it is employed in the manufacture of the exceedingly fine muslin cloths known over a great part of the world as Dacca muslins, and whose delicacy of texture so long defied the imitation of the art-manufacturers of the West.

A third variety is the cotton grown in Berar, in the northern provinces of the Madras Presidency, and in Surat and Broach. This plant attains a greater size than the preceding, bears for a longer period, and produces a fibre of a finer quality than the former. It appears to thrive best on a light black soil.

Soil.—The soil in which all these Indian varieties thrive may be classed under two distinct heads, the black cotton soil and the red soil. The former of these, as its name indicates, is of a black or deep brown colour, absorbs and retains much rain, forming in the rains a heavy tenacious mass, and drying into solid lumps in the hot months. An analysis of this gives 74 per cent. of silex, 12 of carbonate of lime, 71 protoxide of iron, 3 of alumina, 2 of vegetable matter, and 3 salts, with a trace of magnesia. The red soil of India has been found in some localities better suited to the growth of cotton than the black earth. It is a rather coarse yellowish red soil, commingled with particles of the granitic rocks,—silex, felspar, and aluminous earth. It mainly differs in composition from the preceding in the iron existing in the state of peroxyde or red oxide, whilst the carbonate of lime is found present in greater abundance. Analyses of the best cotton soils of America prove that they differ from those of India chiefly in the large proportion of peaty matter which they contain.

Cotton-wool bears value according to its colour, length, strength, and fineness of fibre. Pure whiteness is generally held to denote a secondary quality; whilst a yellowish tinge, provided it be not the result of casual exposure to damp, or the natural effect of an unfavourable season, is indicative of superior fineness. Many varieties of raw cotton are seen in commerce, each sort being distinguished by the name of the locality where it is produced. American, Bourbon, Egyptian, Aramoti, Dacca, Opopum, Nadum, Orleans, Sea Island, etc. etc.; but the main distinction recognized is that between the long and short-stapled qualities; though of these, again, there are different degrees of excellence. The 'Sea Island' cotton of Georgia (so named from being raised on certain narrow sandy islets lying along the coast of that province) is esteemed the best of the long-stapled kind; and the upland produce of the same state excels amongst the short-stapled classes. The indigenous Asiatic cotton is exclusively of the latter class.

The indigenous plant of India is an annual, and succeeds best in the rich black soil that characterizes various districts. The American plant, though in reality perennial, is practically an annual in India; for in India neither native nor foreign cotton is cultivated on the same ground more than one year in three, its properties being found to exhaust the productive powers of the soil. American cotton grows well on the black soil of India, but thrives still better on the light red lands. Each of these species possesses advantages peculiar to itself. The Indian variety is capable of being manufactured into fabrics of extraordinary durability and wonderful fineness; its colour, too, is superior, but the staple short. The American species, on the other hand, excels in length of staple. The plant yields more flowers, and each flower a larger pod, whilst the quantity of seed contained in the pod is smaller, and more readily separated from the fibre.

Mr. Laing, in a letter to The Times as to the future supply of Indian cotton, showed that Sir C. Wood makes it entirely a question of price, citing the authority of Lord Hardinge. Mr. Laing thinks that both climate and soil are so much against India, that its average produce per acre will never approach that of America. But Mr. A. N. Shaw, collector of Dharwar, has expressed an opinion that while Mr. Laing's facts may hold good of indigenous cotton, there are few parts of India where American cotton will not grow as luxuriantly as in Alabama, the best cotton-field in America.

Mr. Talboys Wheeler, who wrote the Cotton Handbook for the Madras Presidency, drew the following four general conclusions, viz.:

1st. American cotton can be grown, but the profit is questionable.
2d. Indian cotton may be improved, but only to a degree.
3d. American cotton must always command a higher price than Indian.
4th. The demand for Indian cotton must always depend on the supply of American.

But a superior cotton can undoubtedly be raised in the Karnatic at a cost not exceeding the production of the common native fibre. The tenure of land in the Madras Presidency leaves the ryot free to grow what crop he pleases; there is no export duty or special tax on cotton, and the assessment is nowhere heavy. The exports of cotton from the Madras Presidency have increased of late years; and if cotton be still not grown in the quantity or the quality desired, the cause must be that some other crop is more remunerative to the ryot. A steady market at a remunerative price is the great want, and this the mercantile community alone can supply. There is grown in India a vast supply of cotton, and it is capable of increase by extended cultivation consequent on increased demand. A large portion of the existing supply is absorbed by the local manufacturers, but is capable of diversion if increased prices are offered by exporters. The diversion to other markets may be immediate; but an increase requires the lapse of at least one season after the demand arises, and some prospect of a continuance of that demand. Every rise in price of Indian cotton in England, however small, if likely to be permanent, exercises an immediate effect on the export of cotton from India to England. The quality is capable of great improvement, but by a more tedious process. The American cotton plant
COTTON.

cannot withstand so much drought as the Indian. The ordinary native cotton-cleaning machine, for freeing the cotton fibre from the seeds, has not yet been equalled by all the mechanical skill of Europe.

Native Indian cotton is a small-podded, small-seeded, short-stapled variety; but in picking the seed, in carefully gathering and ginning, it may be much improved.

Indian cotton is somewhat difficult to spin from its often breaking, and requiring more turns of the spindle, and from its shortness of fibre, than that of America. But the yarn made from a pound of East Indian cotton, which costs 3d. sterling, will sell for 7d., while from the American, which costs 4½d. the pound, the yarn sells for 7½d.

The largest consumption of cotton-wool is in the tropical countries. Americans consume 11½ pounds per head; and it has been calculated that the British Indian people consume 10 pounds per head, but Great Britain only 4½ pounds per head.

In America, for the cultivation of cotton, the ground is well ploughed, and cast into ridges about 10 inches in height, and from 6 to 7 feet apart, according to the richness of the soil or the kind of cotton to be cultivated. In poorer soils the ridges are narrower, so that the plants, which do not grow so large, may yet be able to cover the ground. The ridges allow superfluous moisture to be carried off by the water furrow, which in low situations is made into a trench. The soil is allowed to settle for a few days before sowing, as the young plants take root more vigorously than when they spring up in freshly ploughed and loose earth. Sometimes the ground is manured by running a deep furrow early in the spring between the old rows of cotton stalks, which are beaten down into it by women and children, who follow the ploughman; or well-rotted cotton seed is added as manure, and well covered up by forming a slight ridge over it. When the ground is quite prepared, a one-hole drill makes a slight furrow, from 1½ to 2 inches deep, along the centre of the ridge. The sower follows, and drops in the seeds pretty thickly. These are immediately covered by a light harrow, which also smooths the ridge. Sometimes five or six seeds are dropped into holes, which are made at intervals of about 15 inches on the top of the ridge. In favourable weather the plants make their appearance in five or six days, and are thinned out as soon as they put forth the third or fourth leaf. This operation is performed by scraping out with the hoe all the superfluous plants and weeds, leaving three or four together, with spaces of 12 or 14 inches between them. When the plants are sufficiently established, they are reduced to a single one, and care is taken to remove every particle of grass or weed. A light furrow is then run with a one-horse plough within 5 or 6 inches of the plants, turning the earth inwards towards the roots, and even drawing it around them with the hoe, in order to supply the place of that previously removed by scraping. Hoeing and ploughing are frequently repeated, so as to keep the ground free from weeds; and this is considered essential towards obtaining a good crop. The above processes, besides loosening the soil and keeping it clean, must assist in drying it, at the same time that they prevent much lateral extension of the roots. Lopping or pinching off an inch or two of the top of the plant is not always necessary, but is useful when there is a tendency to the production of wood and leaves, to the detriment of flowers and buds.

In S. India the land should be well ploughed two or three times, and the deeper the better. All the weeds should be collected into heaps on the ploughed land and burnt, as the ashes make the best manure for cotton, and burning the soil improves its quality. Salt and lime are also good additions to a soil, as cotton requires chiefly alkali and silicates for its nourishment. Animal
and vegetable manures are injurious, as they breed insects, which destroy the roots, leaves, and young pods of the cotton. After the land has been well and deeply ploughed, it should be left for three or four days to get well aired; it may again be ploughed into long ridges from five to five feet apart. The seed is to be planted on the tops of these ridges carefully, at the depth of an inch or two, and at the distance of five feet between successive seeds for Cotton, Nadum, or religious cotton; six to seven feet apart for Bourbon, New Orleans, or Havanna; ten feet apart for Sea Island, Peruvian, Egyptian, or Queensland; and fifteen feet apart for Brazil or Pernambuco cotton. Cotton seed may be sown in any month of the year, but if there is no rain, it requires to be watered about three times; it germinates about the fifth day. If sown during the monsoon, the ridges must be eight inches high, and the water must be led away from the young plants, or they rot; the seed must be sown on the top of the ridges. If the leaves begin to get pale or to shrivel up, the remedy is to dig trenches between the plants so as to let air in about the roots, but must not injure them. The uncultivated cotton plant lives for three or four years; but it becomes dwarfed, and produces smaller leaves and smaller pods each year till it dies. In clay or cotton soils the plants do not attain nearly the size, nor do they produce such fine leaves or pods as in the other loose soils. The cotton plants require sun, air, and moisture, but not so much of the last as of sun, light, and air at the roots; the lighter and looser the soil, the more healthy is the plant. The best soil for cotton is a sandy soil with iron and salt; or, if far from the sea, ashes of plants or of firewood may be used as a substitute for salt. When the cotton plants have attained the height of a foot, they do not require to be much watered; once in ten days will be sufficient. Opopum or common cotton cotton varies from one to six feet in height, and covers from two to five feet of ground; on cotton soils it seldom grows to more than two feet in height. The Pernambuco and Brazil cottons attain a height of thirty feet on favourable loose soils, and the stem grows to ten inches in diameter. They yield crops for twelve or fourteen years, but hardly any produce the first year. They bend over in the second year, and do not afterwards stand higher than eight or nine feet.

Irrigation, in Assam, is generally unnecessary, though it may be found partialy beneficial in dry and sandy soils, if judiciously applied. Irrigation is not resorted to in the Benares, Allahabad, and Jubbulpur divisions, and the feeling is against its employment. In the N.W. Provinces the cotton crop is invariably irrigated, where a want of rain is likely to prove detrimental to the plant, and the process is not supposed to be in any way injurious to the fibre.

In most parts of the Madras Presidency artificial irrigation is not carried on; this remark applies more particularly to Coimbatore, Madura, South Arcot, Bellary, Western Mysore, and Nellore. In Vizagapatam, on the other hand, the opinion is that irrigation would prove beneficial rather than injurious in seasons when rains fail or vary in their supplies.

Artificial irrigation is almost unknown in the Bombay Presidency, Berar, and British Burma.

In some parts of the Panjab, cotton is irrigated from wells, and well water is considered better for the purpose than river or canal water. In other parts, more especially in the Jullundur Doab, the best cotton is produced upon unirrigated lands, irrigation being very sparingly resorted to in tracts where water is abundant.

Artificial irrigation to cotton is rather the exception than the rule in most parts of India; it is not considered serviceable to exotic than to indigenous kinds; and in heavy black soil cotton will seldom flourish under irrigation, even of the most careful kind, while in sandy and light red sorts it might be much benefited.

Maure.—Salt marsh mud is used for manure in various parts of the cotton-growing districts of the United States, more especially in Edisto island, one of the largest of the South Carolina group, about 30 miles S.W. of Charleston, which yields the finest cotton in the world. As much as 40 cartloads of this mud is used to the acre. Some compost it, others put it in the cattle pens. Some dry it before hauling, and then spread upon the land; while others prefer to use it as soon as dug, spread upon the land wet, and ploughed in. It is supposed that the Sea Island qualities owe their superiority to the use of marsh mud, which is rich in alkalies and alkaline earths.

In the Panjab, the localities best suited for the growth of cotton are the two plains of districts of Ambala, Hoshiarpur, Gujerat, and Peshawur. The time of sowing varies from February in the south, to the middle of June in some of the northern districts. The flowering commences according to locality, between August and December; the picking following about a month after the flowering, and continues at intervals for two months.

There the average produce per acre, after the cotton is cleaned from its seed, is a little over one maund (or 80 lbs.), the rate varying from three maunds (240 lbs.) of raw cotton in the Hoshiarpur, to 16 seers (32 lbs.) of cleaned cotton in the Kangra district.

The Nurna-bau cotton is cultivated in small quantities all over Hindustan, and its produce is in great request for the manufacture of the best kind of Brahmanical thread. It is a bushy plant, grows to the height of about seven feet, and lasts about six years. It is cultivated all over Orissah, usually as a mixed crop, in light soils, with arhar (Cajanus Indica), or with kodo (Paspalum scrobiculatum), and often with maize. It is sown in the month of June. It is sown broadcast with the above, and nothing is done to it, till it begins to ripen the pods. The cotton is picked out of the shell, which is left on the tree. The proportion of staple produced is very small. It is generally on high lands, on which the rain water does not lie.

Agra, Rohilkhand, Meerut, and Allahabad are the great cotton-producing districts of the N.W. Provinces, and their average yield per acre is moderate. In Aligur the sowing is in June and July, and gathering from October to end of December.

In Gorakhpur and the neighbouring districts, the indigenous sorts are called Kuki, Murwa, and Desi. The Kuki kind is sown in February, in calcareous soils, when the ground has been but slightly prepared; it is picked in September and October. It is an annual, and the same ground is never used in two consecutive seasons.

Murwa cotton, if carefully tended, is triennial,
COTTON.

or even quinquennial; it is generally grown both in silicious (bangur) or calcareous (bhat) soils, as a border round sugar-cane or vegetable plots.

The Desi or indigenous variety is common to all Gorakhpur and its neighbouring districts. It is sown in June, in ground but little prepared for its reception, and does not yield till the following April. It is an annual; bears poda for six weeks only, and is then cut down.

In Bundelkhand cotton grows to great perfection, and its produce is of a softer texture and of a whiter colour than that of the Doab.

The mor or maura black soil of the first quality is the most productive, yielding on the average 286 lbs. per acre.

The parea soil of Bundelkhand is reddish, a mixture of sand and clay, and yields 191 lbs. per acre, 2-7ths being the proportion of cleaned cotton.

Bunkar is a light-coloured, sandy, gravelly soil, which yields 143 lbs. per acre, 1-5th of the produce being cleaned cotton.

In Bundelkhand cotton is sown as a mixed crop, at the beginning of the rains, and if the season is favourable, picking begins in the middle of September in the poorer soils, but not till the middle or end of October in the rich ones. Two ploughings and three weodings are necessary. The seed is rubbed in moist cow-dung, to serve as manure, and is sown broadcast. The cost of cultivation per acre is Rs. 9. After the removal of the fibre, the seed (binouna) finds a ready sale in E. Oudh at 50 or 60 seers the rupee.

Jaloun, Jhansi, and Bundelkhand lie to the westward of the Jumna, and have always been famed among the natives for their cotton.

Central India cotton has always been esteemed. The soil in many places is the black cotton soil. In some parts of Nagpur the field is tilled and manured with ashes and cow-dung before sowing. In pargana Boondoo, besides the common Kappas, there are two other sorts of cotton, called Turee and Guteh. The former is sown in October, and picked in April and May, the field being tilled ten or twelve times before sowing. The latter is sown in July; cotton is picked two or three times in April; the trees last from three to four years, producing cotton every year, and they are 2½ yards high. This is grown by the poorest class in their own premises. The time of picking, speaking generally, is the whole of November and December, excepting in pargana Boondoo, where, as already stated above, the Turee and Guteh or Gujar are picked in the months of April and May.

In Berar, the Chundeleer, a very fine cotton fabric of India, so costly as to be used only in native courts, was made from Ammoti cotton. The chief cast bestowed was on the preparation of the June, which, when of very fine quality, sold for its weight in silver. The weavers worked in a dark under-ground room, the walls of which are kept purposely damp, to prevent dust from flying about.

Mr. Terry has stated that the Ammoti cotton, if well prepared, is equal to any American cotton for the great bulk of the manufactures of England.

Hinginghat cotton is not exclusively produced in the neighbourhood of the town, but is grown elsewhere, attracted to Hinginghat by the ready market there found; thus some of inferior quality goes into the market at Hinginghat. The best foreign cotton is that brought from Edalabad in the Hyderabad territory, where the growth of the Pain Ganga valley is collected. This cotton is reckoned quite as good as the Hinginghat staple, and is eagerly sought after.

The Bombay Presidency's best cotton districts are the Southern Mahratta country, about 16° N., where experimental farms were established. In Gujerat and Kattyayardistricts, superior cotton has long been grown by the natives; in consequence of which, these were selected as the sites of the northern experimental farms, much favourable land for the purpose being found between the latitudes of 21° and 24° N. The causes which favour the growth of cotton, esteemed both in India and England, in the tract of country extending from Surat and Ahmedabad, or from about lat. 21° and 23°, in a broad band across Malwa to Banda and Rajakhaira, in about 25° and 27°, near the banks of the Jumna, are no doubt physical. The black cotton soil which is spread over a great portion of this tract, has undoubtedly a considerable share in producing the result; but good crops of cotton are produced in some parts where there is no black soil, as immediately on the banks of the Jumna and in the Doab.

In the Kanadeh model farm in 1875-76, the average yield was 50 lbs. of clean cotton per acre of the Hinginghat variety, the maximum being 150 lbs. per acre. The average in the Nagpur model farm was 50-6 lbs. per acre. On unmanured land only 28 lbs. per acre. On Syedapet farm, the western variety yielded 353 lbs. per acre, and in the Sind Hyderaband collectorate the yield was 316-94 lbs. per acre of uncleaned cotton.

Cotton, wheat, and bajra (Penicillaria aphaca) all ripen in Gujerat at the same period of the year, about the end of February, and the cotton-picking continues to the middle of April. The first picking of cotton affords the best kind, the second is the most abundant, and the third is greatly inferior to the other two, both in quantity and in quality.

In Cuttack and Orissa there are two highland or upland varieties, the one called the Daloona, because the plants throw out numerous branches. The second kind of upland is called yellow, from the colour of the flowers; the flower of the Daloona being white. A third variety may be called the lowland, and is known locally as the Kela. The upland varieties are grown more or less all over the Gutjuto or Hill States, wherever a virgin forest soil exists. They are grown generally in the Sambulpore district and its dependencies, throughout the Tributary States, and in Dhenkanal and Khoordah. A virgin forest soil is the only requisite for the successful cultivation of these varieties. The jungle is cut down, all the brushwood cleared, heaped and burnt on the spot, the stems and roots of the larger trees being left in the ground, which then receives a superficial ploughing. These clearings are called tala, and the cotton grown in them Tela cotton. These preparatory processes are attended to in Sambulpore, Khoordah, and Dhenkanal, just before and during the first falls of rain, in the latter half of May and the first half of June, so that the plants
COTTON.

shoot and grow and arrive at maturity through the rainy months. Dwarf paddy, sooa, Panicum italicum, Eleusine coracana, bajar, or castor-oil, are sown with the cotton seed broadcast. The edible-seed-crops in the third or fourth month are gathered as they ripen, then the ground is weeded and turned about. In January and February the cotton plants yield the first picking, and a month after the castor-oil seed ripens, and its plants are plucked and removed. Dalooona cotton plants last for two or three years, and yield three pickings annually, and reach a height of 9 to 12 feet. With the yellow upland, it is not so generally the practice of sowing other crops.

The cultivation of the Keda or lowland variety of cotton is confined almost to the settled and open districts of Cuttack, Puri, and Balasore; a little is raised in Dhenkanal and Khordah. The best soil selected for this variety is dune, or double crop. It is generally a light sandy soil, handy for irrigation purposes. The seed used in the district for lowland cotton is procured from Khordah and Dhenkanal, it being alleged that none other will germinate in the lowland districts. It is placed in a pot, and soaked in dung and water for a night, and then dried by exposure to the sun on the following day. It is afterwards laid on straw, contained in an earthen vessel covered over with castor-oil leaves and placed near a fire. So soon as the seed splits and shoots it is planted, and watered at intervals of two, three, and four days. November and December are the usual months for the planting. The plants are annual, and attain a height of 4 to 6 feet. The cold weather showers falling occasionally in December, January, and February, favour the plants, and when plentiful, constitute a good season. The pickings are obtained continuously in April, May, and June. In the latter month all the bolls are picked off the plants, and after exposure to the sun, open. After the month of June, the lowland cotton plants are plucked up, and they are cleared for a paddy crop.

Madras Presidency.—Dr. Anderson was employed in sending Mauritius cotton seeds, as well as brown cotton seeds, imported from Malta, to different parts of the Peninsula; and Dr. Roxburgh, who left Samulcotta in the Northern Circars, and took charge of the Calcutta Botanic Garden in 1793, had already ascertained that the elevated, dry, and less fertile soil of Coromandel was better suited than that of Bengal to the Bourbon cotton. He obtained its seeds from Mr. Hughes, who had for some time been engaged in the culture of cotton in the Tinnevelly district, and whose success was so considerable with Bourbon cotton, that for twenty years Hughes Tinnevelly cotton continued to be quoted in the Liverpool market as the best from India, and sold at higher prices than the American short-staple cottons, and 9d. per pound above the best Suratis. The fact is important, as accounts of the latter of Tinnevelly being only 84°, and because the success was evidently the result of skill applied to the culture. The produce, only 100 lbs. per acre, was fine in quality and much esteemed. The cottons of the Madras Presidency are more largely grown in the valley of the Kistna, and in the Bellary, Kurnool, Tinnevelly, and Coimbatore districts.

At Coimbatore, the Oopum or best indigenous cotton is raised in rotation of two years, with cumboo, Panicum spicatum, Pennicillaria spicata, and cholom or Sorgum vulgare. The Oopum cotton is raised on black soil.

In Bellary, cotton is grown in drills along with cholom or millet; with the former, the drills are about six feet apart, and have from four to six rows of sorgum between each one of cotton; with the latter, the drills of cotton are only three feet apart, and have two rows of millet between them. When the crop of the millet is cut down, a very singular and sudden change occurs; one day nothing is seen but yellow grain, which on the next disappears, and a thick crop of green cotton plants, about half a yard high, remains. None of the fields are enclosed, but they are generally protected at the sides of the road by rows of the prickly Jamaica yellow thistle, Argemone Mexicana.

In Vizagapatam, about lat. 17° N., very liberal pruning is practised, and the return is much greater than in any other of the Madras districts. In the sandy soil near the sea, the Oopum cotton yields the more largely.

In Mysore, large belts of land in the northern and central taluks are deemed excellent for cotton culture.

For a series of years up to 1850, Dr. Wight, an eminent botanist, was employed in experimental cotton-growing in the collectarates of Tanjore, Coimbatore, and Tinnevelly, and he formed the opinion that the less yield of the cottons ripening there in January, was owing to the insufficient warmth of that season of the year.

In Ceylon, cotton is grown very generally both by the Singhalese and Tamil races, but upon no regular plan nor to any extent.

Bengal Presidency.—The indigenous cotton of Dacca has long been celebrated for its superior quality. It is cultivated along the banks of the Megna from Feringhybazar to Edilpore in Bakarganj, a distance of about forty miles, on the banks of the Brahmauttra creek (the ancient channel of the river of the same name), and along the Luckia and Banar. It presents different shades of quality, the finest of which is named Photee, and is the material of which the delicate muslins are made. It was described by Roxburgh as differing from the common herbaceous cotton plant of Bengal in several particulars, chiefly in having a longer, finer, and softer fibre. It has, however, often been doubted whether the superiority of the Dacca manufacture was dependent on the skill of the workmen or the goodness of the cotton; but, from Mr. Lamb's account, it appears to have been carefully cultivated. Probably both had some influence; and it is certain that the workmen prefer the Dacca cotton, because, as Mr. Webb long ago explained, its thread does not swell in bleaching, in the case with the cotton grown in North-western and Central India.

In Burdwan the Websbee or native cotton plant is sown in the month Ashar. The soil is ploughed four or five times, the seed is kept in water for three or four days, is taken out on the day before it has to be sown, and is then mixed with ashes and cow-dung, and in this state is scattered over the ground, which is then again ploughed. Some cultivators, however, put four or five seeds in
COTTON.

small holes at the interval of about 1½ cubits. In
the month of Magh (January—February), when
the plants become ½ cubit high, they are watered.
The picking of the Wescooe cotton is commenced
in the month of Cheyt, corresponding with April,
and finished in June and July (Joyte). Nurna
cotton is cultivated in the month of Ashar, cor-
responding with June. The roots of the plants
are well covered with earth. No irrigation is
required, as nurna cotton is a rainy season plant.
Its cotton is picked in November and December.

The Garo, Tiperah, and Chittagong hills pro-
duce a large quantity of inferior cotton, called
Bhogia. It is used in the manufacture of the
inferior kinds of humnum, bafta, boonoo, saree,
jore, etc., also for making ropes and tapes, and
the coarsest of all fabrics, viz. garha and guzzeh,
which are commonly used for packing other
cloths, and for covering dead bodies, for which
purpose a large quantity of them is consumed
annually both by Hindus and Mahomedans.
A piece of guzzeh cloth, measuring 10 yards, could
be purchased for 12 annas (eighteenpence), which
is the one hundred and twenty-fifth part of the
price paid for a piece of mulmul-i-khas of the
same dimensions.

In Tirhut the cottons produced are of the kinds
called Bhodra, Bhogla, and Kooktee; the two
former ripen in April and May, the Kooktee ripens
in September. The fabric manufactured from
Kooktee cotton is not white, but of a stained white
colour, white cotton being produced only from the
Bhodra and Bhogla kinds.

The finest of the cottons cultivated in Bengal
is called Cheh-hwa. It is sown in April and
May, produces white cotton, and ripens between
the middle and end of July. The cotton, when
ripe, is gathered, and is bleached and bleached
with a liquor of white earth. The bleaching
process continues eleven days, and during this
time the cotton is subjected to the rays of the
sun. It is then dried, and is ready for market.

In Burmah, the cotton grown is Gossypium
herbaceum, and it reaches a very fair staple. The
soil on which it thrives best is the alluvial deposit
left by the numerous mountain streams and
rivulets on their subsidence at the close of the
south-west monsoon. It also grows very well on
recent forest clearings, where, often, soils contain-
ing a considerable portion of peaty matter and
lignite are met with, and appear very suitable for
the good of the plant. It appears to thrive also
in a limestone soil, which abounds in these pro-
vinces.

Cotton grows all over China. The Nankin
variety is called Tsz-hwa. The Kiang-hwa plant
grows in Central China. The cotton plant of
Shan-tung and Peh-chi-li is called Peh-hwa, and
Cheh-hwa is that of Che-hiang. China has ever
been a largely importing country. The cotton-growing
area in that country is, however,
very large. The yellow cotton from which the
beautiful Nankin cloth is manufactured, is called
Tze-mie-wha by the Chinese. Although the
yellow variety has a more stunted habit than the
other, it has no characters which constitute a
distinct species. It is merely an accidental variety;
and although its seeds may generally produce the
same kind, they doubtless frequently yield the
white variety, and vice versa. Hence specimens
of the yellow cotton are frequently found growing
amongst the white in the immediate vicinity of
Shang-hai; and again, a few miles northward, in
fields near the city of Poo-shan, on the banks of the
Yang-tze-kiang, where the yellow cotton
abounds. Mr. Fortune often gathered specimens
of the white variety. Nankin cotton is chiefly
cultivated in the level ground around Shang-hai,
where it forms the staple summer production of
the country. This district, which is part of the
great plain of the Yang-tze-kiang, although flat,
is yet several feet above the level of the water in the
rivers and canals, and is consequently much better
fitted for cotton cultivation than the plain of
Ningpo, where the ground is either wet and
marshy, or liable at times to be completely over-
flowed. The soil is a strong rich loam, capable of
yielding immense crops year after year, although
it receives but a small portion of manure. The
manure applied to the cotton lands of the Chinese
is obtained from the canals, ponds, and ditches,
which intersect the country in every direction,
and consists of mud which has been formed partly
by the decay of long grass, reeds, and succulent
water plants, and partly by the surface soil which
has been washed off the mountains by the heavy
rains. In the end of April and beginning of May, the
land having been prepared in the manner just described, the cotton seeds are
carried in baskets to the fields, and the sowing
commences. They are generally sown broadcast,
and then the labourers go over the whole surface
with their feet and tread them carefully in. The
cotton plant produces its flowers in succession
from August to the end of October; but sometimes,
when the autumn is mild, blooms are produced
even up to November. As the pods are bursting
every day, it is necessary to have them gathered
with great regularity. When perfectly dry, the
process of separating it from the seeds commences.
This is done by the well-known wheel with two
rollers, which when turned round draws in the
cotton, and rejects the seeds. It is a simple and
beautiful contrivance, and answers well the end
for which it is designed.—Reports of East Indian

COTTON BALES.

COTTON BALES weigh—

In America, 440 lbs.
In China, 240 lbs.
In Brazil, 180 lbs.
In Bengal, 300 lbs.
In Egypt, 280 lbs.
In Madras, 300 lbs.
In Bombay, 284 lbs.

COTTON GATHERER.

Binaian, Pinjara, Hindo, Phyrana of Bunderkhand, Phyrana of Beemun, Phyrana of Dera, Pooree of Delhi.

In India generally these receive one-tenth of the gross produce as well as a share, sometimes equal to a fourth, of the ordained compensation.

COTTON - GRASS, Eriophorum cannnabinum. Its seeds are clothed at their base with a silky or cotton-like substance, with which pillows are stuffed, and wicks of candles, as well as paper, made. Its name is bhabhur and bhabhuree, and it is made into ropes by the Hindus. An old writer says, 'The wind-trees of that country bear fleeces as their fruit, surpassing those of sheep in beauty and excellence; and the Indians use cloth made from those trees.'—Birdwood.

COTTON MANUFACTURES. Amongst the goods which appear to have been brought to Europe from the Indian sea, in the days when Arab traders were the only medium of intercourse between the eastern and western worlds, we find mentioned cloths of silk and cotton of various colours and devices. It does not appear, however, that there existed in Europe any great demand for cotton,—the consumption of the Roman people, who were then the customers for all luxuries, being chiefly confined to cloths of silk and wool. During the trade of Europeans with India by the long sea route, the calicis and fine muslins of that country came into general notice; and until the production of machine-made fabrics in Britain, they continued to rise in public estimation. It was deemed a great thing with the Lancashire manufacturers, when, by the aid of mechanical and artistic skill, combined with the potent agency of steam, they found themselves able to produce an article which was considered equal to that which the unlettered Hindoo had manipulated in his little mud hut on the remote banks of the Ganges, and which had been produced of like excellence by their ancestors, when the 'father of history' penned his observations upon their countries. That the Hindoo paid considerable attention to the details of this manufacture in the most remote ages, there remains sufficient proof on record. In the Indian work of highest antiquity, the Rig Veda, believed to have been written fifteen centuries previous to the Christian era, the occurs the following passage: 'Cares consume me, Satakrah! although thy worshipper, as a rat gnaws a weaver's threads,—the temptation to the rat being evidently the starch employed by the spinner to impart tenacity to the thread; nor can there be any doubt that cotton was the thread alluded to. Again, in the Institutes of Menu, we find it directed as follows: 'Let the weaver who has received ten palas of cotton thread, give them back increased to eleven by the rice-water (starch) and the like used in weaving; he who does otherwise shall pay a fine of twelve palas.' In recent times the cotton fabrics of India formed a considerable item in the exports from the East, during the early days of British Indian commerce; the delicacy of their fabric, the elegance of their design, and the brilliancy of their colours, rendered them as attractive to the better classes of consumers in Great Britain, as are, in the present day, the shawls of Kashmir or the silks of Lyons. So much superior, indeed, were the productions of the Indian spinning-wheel and handloom, to those turned out by the manufacturers of Lancashire in the middle of the 18th century, that not only were Indian calicoes and Indian prints preferred to the British-made articles, but the Manchester and Blackburn weavers actually imported Indian yarns in large quantities for employment in their factories. It was about the year 1771-72 that the Blackweavers, taking advantage of the discoveries and improvements of Arkwright, Hargreaves, and others, found themselves in a position to produce plain cotton goods, which, if they did not quite equal the fabrics of the East, at any rate found their way very rapidly into general consumption in Europe. The invention of the mule jenny in 1779 was the commencement of a new era in the history of the cotton manufacture of Great Britain; and when, six years later, Arkwright's machines were thrown open to the public, a revolution was effected in the production of all kinds of yarns. Great Britain found herself able not only to supply all her own wants with cotton goods of every variety of quality, but also to carry the produce of her looms 10,000 miles across the sea, and, placing them at the doors of the Indian consumer, undersell some kinds of the goods made by his own hands from cotton grown in his own garden. No other country in the world was so early in the market as India, and the West are able to beat out of their own markets the weaver of the East. There have been masters in their craft who produced fabrics more exquisitely delicate and light in texture than those beautiful muslins of Dacca, so long and justly celebrated with a world-wide fame. Although in some particulars these latter fabrics claim a certain degree of superiority, many of the Hindus prefer much of their own woven goods to those of Manchester and Glasgow; and the cotton manufactures of British India have been steadily advancing in the out-turn of twist and yarn and piece-goods. It is generally believed that Manchester will fail to contend with the Indian mills in respect to the precise class of goods they are in the habit of turning out. The cotton mills of Bombay have made, since the date of their first starting in 1854, very rapid progress.

In the 25 years between 1857-58 and 1881-82, the value of all the cotton goods imported into British India from foreign countries rose from £5,726,618 to £20,772,998. Since 1868-69 the values of the twist and yarn and of the piece-goods have but little increased. In 1881-82 the twist and yarn was of value £32,220,648. British India has been latterly holding its own. The exports have consisted of cotton goods, including twist and yarn, and have risen from £637,651 in 1850-51, to £1,906,686 in 1881-82.

The yearly increasing exports from Europe milled exporters, for Europe had seldom been able to compete either with the delicate hand-made fibres which the Hindus and Mahomedans have been producing, or with the strong, coarse fabrics which the village weavers produce during the slack time of their agricultural pursuits. In the middle of the 19th century, British India also began to use machinery. In 1880 there were 58 cotton mills at work in British India, with 1,471,730
spindles, mules, and throstles, and 13,283 looms, turning out twist and yarn and cotton cloths, with a nominal capital of four millions sterling.

With their rude implements the Hindus of Dacca formerly manufactured muslins, 'to which,' as Dr. Ure observed, 'European ingenuity can afford no parallel,'—such, indeed, as has led a competent judge to say it is beyond his conception how this yarn, greatly finer than the highest number made in England, can be spun by the distaff and spindle or woven by any machinery' (Ure's Cotton Manufacture of Great Britain, i, p. 54). The jawbone of the codfish (Silurus bosilis), the teeth of which being fine, re-curved, and closely set, serves as a fine comb in removing minute particles of earthy and vegetable matter from the cotton. The Hindoo spinner, with that inexhaustible patience which characterizes the race, sits down to the laborious task of cleaning with this instrument the fibres of each seed of cotton. Having accomplished this, she then separates the wool from the seeds by means of a small iron roller (dullun kathee), which is worked with the hands backward and forward, on a small quantity of the cotton seeds placed upon a flat board. The cotton is next bowed or teased with a small bow of bamboo, strung with a double row of catgut, muga silk, or the fibres of the plantain tree twisted together; and, having been reduced by this instrument to a state of light downy fleece, it is made up into a small cylindrical roll (pun), which is held in the hand during the process of spinning. The spinning apparatus is contained in a small basket or tray, not unlike the cathetometer of the ancient Greeks. It consists of a delicate iron spindle (tukooa), having a small ball of clay attached to it, in order to give it sufficient weight in turning; and of a piece of hard shell imbedded in a little clay, on which the point of the spindle revolves during the process of spinning. With this instrument the Hindoo women almost rival Aramelie's fabled skill in spinning: The thread which they make with it is exquisite fine; and doubtless it is to their delicate organization and the sensibility with which they are endowed by nature, that their inimitable skill in their art is to be ascribed. The finest thread is spun early in the morning, before the rising sun dissipates the dew on the grass, for such is the tenacity of its fibre, that it would break if an attempt were made to manufacture it during a drier and warmer portion of the day. The cohesive property of the filaments of cotton is impaired by high temperature accompanied with dryness of the air; and, hence, when there is no dew on the ground in the morning to indicate the presence of moisture in the atmosphere, the spinners impart the requisite degree of humidity to the cotton, by making the thread over a shallow vessel of water. A specimen which Dr. Taylor examined at Dacca in 1816 measured 1549 yards, and weighed only 22 grains, which is in the proportion of upwards of 250 miles to a pound weight of staple. During the process of preparing the thread, and before it is waxed, it is steeped for a couple of days in fine charcoal powder, soot, or lampblack, mixed with water, and, after being well rinsed in clear water, wrung out, and dried in the shade, it is rubbed with a sizing made of parched rice (the husk of which has been removed by heated sand), fine lime, and water. The loom is light and portable; its cloth and yarn beans, batten, temple, and shuttle are the appurtenances requisite for weaving.

Dacca was the seat of a manufacture of muslins known by its name, and spoken of by the ancients as 'woven webs of air.' The principal varieties of plain muslins manufactured at Dacca were Mulmuli-i-Khas, Ab-rawan, Siab-nam, Khas, Jhuna, Sircar Ali, Tazeb, Alabulbee, Nyan-rook, Raddan Khas, Turandam, Sarbinte, and Sarband, all names which, either denote fineness, beauty, or transparency of texture, or refer to the origin of the manufacture of the fabrics, or the uses to which they are applied as articles of dress. The finest of all was the Mulmuli-i-Khas (literally, muslin made for the special use of a prince or great personage). It was woven in half-pieces, measuring 10 yards in length and 1 yard in breadth, having 1900 threads in the warp, and weighing 10 seccas (about 3½ ounces avoirdupois). The finest half-piece was weighed 9 seccas, priced 100 rupees. Some of the other muslins were also beautiful productions of the loom, as Ab-rawan, compared by the natives from its clear pellucid texture to running water. Shab-nam, so named from its resemblance, when it is wetted and spread upon the bleaching field, to the evening dew on the grass, impregna, a light transparent net-like fabric, made for natives of rank and wealth, worn by the inmates of zenanas and dancars, and apparently the cloth referred to in the classics under the figurative names of Tela aremarum, Ventus textilis. All these muslins were made in full pieces of 20 yards in length by 1 yard in breadth, but varying considerably in the number of threads in the warp, and consequently in their weight. Of figured fabrics, as striped Dooria, chequered Charkhanee, and flowered Jandance, there exists a considerable variety, both in regard to quality and pattern. The flowered muslin was formerly in great demand both in India and Europe, and was the most expensive manufacture of the Dacca Urung. There was a monopoly of the finer fabrics for the court of Delhi; those made for the emperor Aurangzeb cost 250 rupees per piece. This muslin is now seldom manufactured of a quality higher than 9 or 10 seccas per piece.

For the masses of the people the British manufacturer sends to India the plain and striped Dooria, Mulmuli, Aghabani, and other figured fabrics, which have established themselves there, and which, both from their good quality and moderate prices, are acceptable to the numerous classes who make use of them. Some of the chintzes of Musulipatam and of the south of India are as beautiful in design as they are chaste and elegant in colour.

Printed cloths are worn occasionally, as in Berar and Bundelkhund, for saris; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the poorer classes in Upper India; but the greatest need of printed cloths is for the kind of bedcover called palampore (palangpash), or single quilts.

In the costlier cloths woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the saree or women's cloths, made at Berun, Pytam, and Burhanpur, in Gujerat, at Naraingpat and Dhanvarum in the Hyderabad territory, at Yeokla in
COTTON MANUFACTURES.

Khandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black shot with crimson or yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They use colours and effects which suit the dark or fair complexions of the people of the country; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair—as any lady of England or France. Another exquisitely beautiful article of Indian costume for men and women is the do-patta or scarf, worn more frequently by Mahomedan women than Hindu, and by the latter only when they have adopted the Mahomedan lunga or petticoat; but invariably by men in dress costume. By women this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head; by men, across the chest only.

The do-pattas, especially those of Benares, are perhaps the most exquisitely beautiful of all the ornamental fabrics of India; and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and dainty descriptions, imagined in brocaded, rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns of the ribbon borders or broad stripes. How such articles are woven at all, and how they are woven with their exquisite finish and strength, fine as their quality is, in the rude handlooms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colour—the creamy white, and shades of pink, yellow, green, mauve, violet, and blue, are clear yet subdued, and always accord with the thread used, and the style of ornamentation, whether in gold or silver, or both combined. Many are of more decided colours—black, scarlet, and crimson, chocolate, dark green, and madder; but whatever the colour may be, the ornamentation is chastest and suitable. For the most part, the fabrics of Benares are not intended for ordinary wearing; but the dyers and scouers of India have a process by which the form of flower can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restoried, if not to its original beauty, at least to a very wearable condition. The do-pattas of Pytun, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Dekhan,—not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares.

Scarfs are in use by every one.—plain muslins, or muslins with figured fields and borders without colour, plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called selha in India, are in everyday use among millions of Hindus and Mahomedans, men and women. They are always open-textured muslins, and the quality ranges from very ordinary yarn to that of the finest Dacca fibres. Comparatively few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But what all classes wear are coloured cloths,—black, red, blue, occasionally orange and green, violet, and grey. All through Western, Central, and Southern India, sarces are striped and dotted in an infinite variety of patterns. Nannaimp, Dhanwar, and Mukul, in the Nizam's territories; Guldak and Bettigerry in Dharwar; Kolhapur, Nasik, Yeoka, and many other manufacturing towns in the Dekhan; Arnee in the south, and elsewhere, send out articles of excellent texture, with bountifully arranged colours and patterns, both in stripes and checks. The costly and superb fabrics of cloths of gold and silver (kimkhab), and the classes of washing satins (mushroo and hemroo), even if European skill could imitate them by the handloom, it would be impossible to obtain the gold and silver thread unless they were imported from India. The native mode of making this thread is known, but the result achieved by the Indian workman is simply the effect of skilful and delicate manipulation. The gold and silver cloths (kimkhab) are used for state dresses and trousers, the latter by men and women; and only of rank usually possesses petticoats or skirts in these gorgeous fabrics. Mushroom and hemroo are not used for tunics, but for men's and women's trousers, and women's skirts; as also for covering bedding and pillows. They are very strong and durable fabrics, wash well, and preserve their colour, however long worn or roughly used; but they can hardly be compared with English satins, which, however, if more delicate in colour and texture, are unfitted for the purposes to which the Indian fabrics are applied. For example, a labada or dressing-gown, made of scarlet mushroom in 1812, has been washed over and over again, and subjected to all kinds of rough usage, yet the satin is still unfrayed, and the colour and gloss as bright as ever. Many of the borders of louchees, dhotees, and sarces are like plain silk ribbons, in some instances corded or ribbed, in others flat.

In Europe, it has been usual to name particular fabrics after the place of their manufacture, and this practice was extended to eastern products, as calico from Calicut, gauze from Gazz, muslin from Musul from Soosi, chintz from the Hindi chinte, spotted. In British India, however, the people name their woven fabrics from the form of their construction, their appearance, or the use to which they are applied. The cotton goods sent from Bombay to the Paris Exhibition of 1855, comprised batia, boonee, carpets, chandni, choli, dastarkhan, dhoti, ek-patta, do-patta, dunagi, khadi, lungee, peshigir, phakta, pagga, quilts, razai, sailcloth, saree, soosi, turban, tablecloth, table napkins, and towels.

Omitting the second-rate kinds of cloth, which constitute the great bulk of the Dacca cotton manufacture, a class worthy of attention is that of fabrics of a mixed texture of cotton and silk. They are designated by various names, as now-butee, kutan, roomee ajpoola, and lucka; and, when embroidered with the needle, as many of

831
them frequently are, they are called kusheda. The silk used in their manufacture is the indigenous muga silk of Assam and Sylhet; but the cotton thread employed is now almost entirely English yarn, of qualities varying from Nos. 30 to 80. These cloths are made exclusively for the Jodda and Bussora market; and a considerable stock is yearly exported in the Arab vessels that trade between Calcutta and these ports. Pilgrims, too, from the vicinity of Decca not unfrequently take an investment of them, which they dispose of at the great annual fair held at Meena, near Mecca. They are used by the Arabs chiefly for turbans and gowns. The golden colour of the muga silk gives to some of these a rich lustrous appearance. Pieces made of native-spun cotton thread and of the best kind of muga silk, would be admired in England.

In Ganjam is fabricated a cotton cloth, each side of a different colour. This effect is produced not by dyeing the cloth after it is woven, but by a dexterous manner of throwing the wool across the warp on either side. Madapolam and Ingeram used to be famous for cotton cloths, but since the abolition of the Company's trade, the finer panjangs have not been made. Palampores, as bed coverings, of the former place deserve attention. Very fine muslins are made at Ongola, north of Cocanada, and handsome turbans, with gold thread interwoven; but all these things are far surpassed by the Bengal fabrics. The Chincacole muslins are, however, prized by European ladies. Cotton cloths from Nellore consist of manufactured articles which find a ready sale in the markets of this Presidency.—Madras Exh. Jar. Rep. 1855, 1857; Dr. Taylor of Dacca, Reports of Great Ex. of 1851; Cal. Cot. Ex. of 1862; Juries' Report, Ex. of 1862; Royce, Arts of India; Royce, Prod. Res. of India; Bombay Times.

COTTON SEED is the Binour, Binoula of Hindustan. It is chiefly used in India for feeding cattle, and also sometimes as manure for cotton plants. In the year 1878, 175,000 tons were imported into Great Britain, and sold there at from 7½. 17s. 6d. to 8½. 10s. Cotton seed oil is expressed from cotton seeds. It is used for burning in lamps, and is also considered to have, in a peculiar manner, the virtue, when externally applied, of clearing the skin of spots and freckles. It is a drying oil, and therefore unfit for lubricating. When obtained by pressure, its colour, owing to the presence of a resinous substance, is of a very dark red, and 10 to 15 per cent. is lost in bleaching it. When prepared by steaming the seeds and collecting the oil by skimming it from the surface of the water, it has a bland, light-coloured appearance.—Faulkner.

COTTON, SIK. The silk-cotton trees of India are the Eriodendron afrafruitosum, D.C., and the red cotton tree, Salmalia Malabarica, Schott. The seeds of E. afrafruitosum are embedded in silky cotton. The capsules, on bursting, discharge flocculent down, which is about as much as cotton, and named silk-cotton. It differs also in not spinning like cotton. Mr. Williams of Jubbulpur, however, succeeded in spinning and weaving some of it, so as to form a very good coverlet. It is used for stuffing pillows, muffs, and coverlets; for wadding, or for conversion into half stuff for papermakers. In the Trans. of the Agri-Hortic. Soc. iii. p. 274, there is a report from the Society of Arts on two pieces of cloth made from the simal or silk-cotton tree; but from the shortness of the staple of the down, and its elasticity, it cannot be spun by ordinary cotton-spinning machinery. A silk-cotton surrounds the seeds of Bombax ceiba, L., a South American tree, and is used for stuffing cushions and the like, but not suited to work into cloth fabrics. Another beautiful silk-cotton (West Indian name the Turkey Jackson) —Fig., Pl. COTTON SOIL, or Black Cotton Soil, is the name given to the 'regar.' See Soil.

COTTON THIEF, a name applied in Ceylon to the beautiful long-tailed bird, Tecltagia paradisi, Linn., the sultana bulbul of the Mahomedans of the Peninsula, its long white feathers in the tail streaming like cotton as it flies.

COTURNIX VULGARIS, the common quail of Europe, Asia, Africa, is chiefly migratory, and is abundant in India.

COULAM, in Southern India, is the name given by the Tamil people to the whole island of Ceylon. It is also the name of the towns which Europeans call Covelong near Sadas, on the east coast, and Quillon on the west coast, of the Peninsula.

COUNTRY: a prefix in use amongst the British to indicate a product of India. It is the translation of several vernacular words, used to express an article local and not foreign. The Tamil word Nat'chhas this signification.

Country Almond Tree, Terminalia catappa.
Country Borage, Coleus Ambicolius.
Country Fig Tree, Ficus racemossa.
Country Galls, myrabloan.
Country Gooseberry, Cicca Distichia.
Country Greens, Amaranthus crenarius.
Country Kreat, Exacum Bicos, Chiretra.
Country Mallow, Abutilon Indicum.
Country Rosin, dammer.
Country Sarsaparilla, Helisemus Indicus.
Country Walnut, Alleirus trifolia.

COURMARINE, an aromatic principle found in Mellilotus officinalis, or common melilot, and in the tonquin bean, Dipertix odorata.

COURSE, a term applied by European residents in India to the places of evening promenade, probably obtained from the Corso of southern Europe.—Eliott.

COURT, a general of Ranjit Singh. He had previously been a lieutenant of the old Imperial French Guard.

COURT, M. H., major of the Madras Artillery, wrote an account of Palambar, 1821.

COURTALLUM, a town near Timnevely in the Arangole pass. It is in lat. 8° 56' 20" N., long. 77° 20' E., and is 700 feet above the sea. It has waterfalls considered sacred by the Hindus.

COURTNE, an ancient village 11 miles from Bellary, in which the Jain religion was formerly prominent, supposed to have been suppressed by the Jangams of Tibet.

COUSIK, a tribe of Sambusi Raijputs; their name would, however, seem to imply Brahmanical descent or connection.—Eliott.

COVADE, a custom amongst several ancient and some existing tribes. According to Apollonius Rhodius, this singular custom prevailed among a people called the Tibareni, at the mouth of the Black Sea.

In the Tibetian land,
When some good woman bears her lord a babe,
'Tis he is washed and groaning put to bed;
Whilst she arises, tends his baths, and serves
Nice posses for her husband in the straw.'
COVELLIA GLOMERATA.

Diodorus Siculus mentions that in Corsica the wife was neglected, and the husband put to bed and treated as the patient.

Marco Polo, in the 13th century, seems to have observed the custom in the Chinese province of West Yunnan amongst the aboriginal tribes of the land, the Miao-tze, who practise it to the present day. The father of the new-born child, so soon as the mother can leave her couch, gets into bed, and there receives the congratulations of acquaintances. And Marco Polo mentions that in the Zar-dandan (gold teeth) tribe on the frontiers of Burma, when a woman bore a child, she rose and went about her business, and the husband took to bed for forty days, and was fed on posset.

About the beginning of the Christian era, Strabo (iii. 4, 17) mentions that among the Iberians of the north of Spain, the women after the birth of a child tend their husbands, putting them to bed instead of going themselves. In the same locality, amongst the modern Basques in Biscay, M. Michel found the same custom prevailing a few years ago. The women, he says, rise immediately after childbirth and attend to the duties of the household, while the husband goes to bed, taking the baby with him, and thus receives his neighbours' compliments. This practice seems to have spread to France, and to have there received the name of faire la coward. It has been found in Navarre and on the French side of the Pyrenees.

Amongst the Caribbees of the West Indies, the father is put to bed and fed on meagre diet, and his body punctured and tortured; and the Abipone husband of S. America is treated like a lying-in woman.

The Yerkala or Yerkal-wanu dwell in the Telugu districts of the Madras Presidency. Those in the neighbourhood of the Dungapurian practise the Covendale. Directly the woman feels the birth-pangs, her husband puts on some of her clothes, places on his forehead the mark which women apply to their foreheads, retires to a room where there is only a very dim lamp, and lies down on the bed, covering himself up with a cloth. When the child is born, it is washed and placed on the cot beside the father. Asafetida, jagari, and other articles are then given, not to the mother, but to the father. During the days of ceremonial uncleanness, the man is treated in the manner that on such occasions other Hindus treat their women. He is not allowed to leave his bed, but has everything needful brought to him.—Mr. John Cain in Ind. Anti., May 1874; Apoll. Rhod. Argon, ii. p. 1012, in Quarterly Review, July 1868; Miller's Chaps., ii. pp. 277-284.

COVELLIA OPPOSITIFOLIA. Gasparr. C. Daemonum, Miq. | Ficus oppositifolia, Wildt. C. Assamica, | F. Daemonum, Vahl. C. Dayacarpus, | SINGH. Kuta-dimboss-gass, | SINGH. Very abundant in the warmer parts of the Ceylon island.—Thu. Pl. Zeyl. p. 266. COVELONG, Coulam, or Kovilam, a scaport village 22 miles south of Madras, in lat. 12° 46' N., and long. 80° 18' E. A fort, now demolished, was erected by Anwar ud Din near the ruins of one that the Imperial E. I. Company of Oost had erected. In 1750 the French obtained possession of it, but in 1752 it surrendered to Captain Clive.

COVIL GRASS, or Penna stipata, during the month of June is in flower, impregnating the atmosphere with an aromatic perfume. On this grass feed innumerable flocks of horses and mares, and its flower communicates to the milk of the mares a certain aromatic quality. Out of the milk is made the Tartar koumiss, and the drinkers of koumiss at this time of the year set at defiance most of the woes that distress mankind.

COVILHAM. Pedro da Covilha and Alfonso de Payva were sent as merchants in 1494, via Genoa, Alexandria, Cairo, and the Red Sea, to Aden, where they negotiated, agreeing to meet again at Cairo, Payva to search for Prester John in Abyssinia, whom he heard of as reigning there over a highly-cultivated people, but he died before reaching Abyssinia. Covilha went on to India, where he made drawings of cities and harbours, especially Goa and Calicut. Thence he returned along the coast of Persia to Cape Guardafui, and continued south to Mozambique and Zofala, where he ascertained that that land joined the Cape of Good Hope. From Zofala he returned to Abyssinia, and sent his diary, charts, and drawings to Genoa by some Portuguese merchants who were trading to Memphis. On receipt of these, King Emanuel, in 1495, sent four ships under Vasco da Gama, who visited Natal and Mozambique. In 1498 he was at Calcutta, and in 1499 back at Lisbon. See Portuguese.

COV. Vacca, | FER. GOW, | LEET. Kuh, | GER. Choo, Chowi, OLD HIGH Bous, Boes, | GR. Ga, HIND, PERS., ZEND. GO (Gons, pl.), | SANS. Ngun, Gao, Gai, | COO, SCOTCH. Vaca, | Sp. A good milk cow should have a good-looking udder, fine skin, and fine tail. The herdsmen of Indian villages take out cows daily to graze, receiving 2 to 8 annas a month. In ancient Egypt the cow was a sacred animal, as also were the bulls Apis and Mueves. At present the cow is worshipped amongst all Hindus; and the Banjara are perhaps the only race in British India who apply the cow to labour. But the Vedas do not enjoin reverence to the cow; and in the Hindu marriage ceremony, where a milk cow, Surabhi, is released on the intercession of a barber, sufficient remains to show that the sacrificial rite of killing a cow was formerly practised at marriages, for the sake of hospitality.

Two Hindu traditions seem to indicate the domestication of the cow. In Hindu mythology, the Cow of Plenty, called Kamadhenu, Surabhi, Savala, granting all desires, is said to have been produced by the Sura and Asura, at the churning of the ocean after the deluge, for the recreation or production of the Chaodas-matna or fourteen sacred things; another fabulous cow, the cow of five colours, or Panch-hara, was given by Indra to the parents of Rama. It is common for Brahmins and others to feed a cow before they take their own breakfast, ejaculating as they present their food, "Daughter of Surabhi, framed of five elements, suspicious, pure, holy, sprung from the sun, accept this food by me; salutation unto thee!" Or if he conduct the kine to grass, "May cows, who are mothers of the three worlds and daughters of Surabhi, and who are beneficent,
With water, cow-dung forms a useful wash for walls and floors, and it enters into the composition of the farmer's fomentations; it hides bad joinery. But its chief use is in forming bratties, or dried cow-dung cakes for fuel. The ground cropped by cattle, and which supplies straw, ought to receive it back before it is reduced to ashes; till this be done, lands must be unduly exhausted. Cow-dung mixed with paddy husk and earth is a fuel much used in Southern India for burning bricks and chunar, also for heating iron tyres for tyre wheels, for which purpose it answers better than any other. It is more economical than coke, as it is neither a disagreeable smoke, but when thoroughly ignited, the heat given out is very intense. The cow-dung ashes balls are Tirunar unde, TAM., and Vibud in Telugu.

A cake of cow-dung is placed on the top of a heap of corn to ward off the evil eye, and to make the grain increase (barhê, HIND.); hence this cow-dung cake is a Barh-awan, also Chauk and Ch'hatur. A Hindi couplet ridicules the practice:

†Jag baurhê śritama bibas bhut puj bhau len;  
Barhô na barhê barhwan jin kisan rakš den;†

†The world is mad, and for the sake of avarice will worship devils, and will still put on the Barhwan, increase or not.—Rohde, MSS.†

COW-FISH, Globicephalus Rissii.
COW-GRASS, Trifolium medium.

Cowage, probably a corruption of the Arabic or Hindustani and Bengali names of one of the plants that produce it. Cowage consists of the hairs found upon pods of different species of Mucuna. They are exceedingly slender, brittle, and easily detached, and the fragments readily stick into the skin, and produce an intolerable itching. Cow-iitch is used medicinally as a vermifuge, by being mixed with syrup till of the consistency of honey, and given in doses of two or three teaspoonfuls. The species are found in hedges, thickets, on the banks of rivers, and about watercourses, in the E. and W. Indics, and in America within the tropics. M. urens and M. pruriens usually furnish the substance; but that from M. monopera, called by the Telings, Enogoa dola Gunda, or elephant's scratchweed, is said to exceed the others in the irritating, burning property of its hairs. Dr. Roxburgh states that M. pruriens was one of the plants formerly used in India to poison wells; but it is less hurtful than was supposed.—Roxb.; Eng. Cyc. p. 177.

COWRIE.

COWRIE.

pure, and holy, accept the food given by me!'

(Colebrooke, As. Res. vii. p. 276). In marriage ceremonies the hospitable rites are conducted by letting loose a cow, at the intercession of the guest, a barber, who attends for that purpose, and explains, 'The cow! the cow!' upon which the guest pronounces this text, 'Release the cow from the fetters of Varuna. May she subdue my foe! may she destroy the enemies of both him (the host) and me! Dismiss the cow, that she may eat the grass and drink water.' When the cow has been released, the guest thus addresses her: 'I have earnestly entreated this prudent person, saying, Kill not the innocent, harmless cow; I call her in my name of the god of the Vais, sister of the Aditya, the source of ambrosia,' etc. (ibid. p. 293). In the Hitopadesa (p. 110), the earth is called Surabhi, and the learned translator (Wilkins) notes the same to be not usually so applied, although the earth may well be called the cow of plenty.

The cow with the female buffalo furnish most of the milk used by the people of India, and there are several breeds of cows famed for the large quantities they yield; one of these, from Aden in Arabia, is much praised.

The custom in India, of using cow-dung for smearing floors and walls, is practised by all sects as well as Hindus, as the most cool and cleanly appliance. Cow-dung is plastered over the cooking-place before the meal of a person of a high class is cooked; or, in camps, or on journeys, a space of 10 or 12 square feet is so purified, but is easily polluted by the approach of impure persons or things, in which vexatious case the food becomes unclean. The ashes of cow-dung, vibud, are also of a very purifying nature; and Hindus of almost all ranks and degrees, men and women, occasionally or frequently use them, mixed sometimes with other ingredients, to mark their foreheads, necks, arms, etc. Sometimes men, especially religious mendicants, or penitents, or those having some claims to sanctity, are rubbed all over with these ashy mixtures, and present a curious sky-blue appearance. Amongst Hindus, the greatest of all purifiers is the urine of a cow. Hindu spirits of impurity abhor this sin-expelling, sanctifying liquid. Images of cows, who is mother of all, and merciful to the poor and to all humanity, is rubbed over the body or into the hair; no man of any pretensions to purity or cleanliness would pass a cow in the act of staling without receiving the holy stream in his palm, sipping a few drops, and with his bedewed fingers marking and crossing his forehead, shoulders, and breasts. —Moore's Pantheon, p. 143; Williams' Nata, p. 136; Kennedy on Languages, p. 43; Wilford; Colebrooke, p. 276; Coleman, p. 293.

COW BEZOAR, and beozors from all ruminating animals, always find a ready market in China, where Chinese doctors lay it up as a rare medicine. They are not unfrequently deceased by an artificial preparation of piperclay and ox-gall, mixed with a little water. — Williams' Middle Kingdom, ii. p. 406. See Bezoar; Calculus.

COWDEE, seeds of Aristida setacea, a wild grass, also of Exacum bicolor, and of the wild grass Kuai.

Cowries are small, white, or yellow, glossy shells, of the genus Cyprea, found in abundance on the shores of the Laccadive and Maldives islands, African coast, Zanzibar, and the Sulu
islands, etc. There are many species, but the Cyprea moneta pass current as coin in payment of fractional parts of a piece, in India and some parts of Africa. They are brought to India in large quantities, and are re-exported to Britain, where they are used in inlaying, in ornamenting toys, work-boxes, etc., and in the manufacture of the superior kinds of porcelain-ware. They were, during the slave trade, exported from Bombay to Africa. The cowrie seems never to have been used for money among the Indian islanders, as it has immemorially been by the Hinduts. Yet the Malay and Javanese name Boya is Sanskrit, and is one of the synonyms which express duty, impost, or tolls. In the currency of India, 4 cowries make a ganda, 20 ganda = a paisa, and 5 paisa = one anna. In A.D. 1740, a rupee exchanged for 2400 cowries, in 1756 for 2560 cowries, and in 1870, in Madras, as many as 5700 cowries were obtainable for one rupee. The Persian name, Khar-mohra, means literally a jackass' or mule's shell, because mules are ornamented in that country with trappings of shells, as a Gossain's bullock is in India. Ibn Batuta says cowries were carried from the Maldiv Islands to Bengal, to be used as coin. The Kamoos adds that a split or broken shell is suspended from the neck to avert the evil eye, and this is still done in India. Among European nations, excepting the British, these shells are known by the name Porcelli, Porcellian, Porcellaneous, and Porcelain, on account of the fancied resemblance of their shape to that of the back of a little pig; and thence arose the term for the Chinese ' porcelain,' of which the glaze or varnish is similar to that of the cowrie. Liverpool imported as under:—

Two commercial varieties are known, the 'live cowrie' and the 'dead cowrie.'—Morrison's Compendious Description; Crawford's Dictionary.

COW-TREE, a tree belonging to the natural order Urticaceae, Borousium utile of Endlicher. When wounded, a milky juice is discharged in such abundance, it is said, as to render it an important object to the poor natives in whose country it grows. It is described by Humboldt as being peculiar to the Cordilleras of the coast of Caracas, particularly from Barbula to the lake of Maracaybo, near the village of San Mateo, and in Caucauga, three days' journey east of Caracas. In these places it bears the name of Palo de Vaca, or Arbol de Leche, and forms a fine tree, resembling the star-apple of the West Indies. The Kirigahuna plant of Ceylon, Gymnema lacteformum, is described as another cow-plant, notwithstanding it belongs to the acrid and dangerous aaspectaaneous order.—Eng. Cyc. New Conn. Pl.

COX, CAPTAIN II., was sent on an embassy to the king of Burma, and wrote his Journal of a Residence in the Burman Empire.

CRAB. Cancer.

See Crustacea.

CRAB-MUNGOOS, Urvia cancrivora, Hod. CRAB'S-EYES, seeds of Abrus precatorius, L., used in India by jewellers and druggists as weights, being nearly each one grain. They are strung together for necklaces, rosaries, etc.

CRACKERS, etc. Chinese fire-crackers are exported to the United States, to India, and S. America. They are made up in strings, and then in papers, and lastly in boxes, five of which are estimated to weigh one pikul. The market of Canton is chiefly supplied with fireworks from Fatshan.—Compendious Description.

CRAMBE CORDIFOLIA, Steven. A plant of Persia, Caucasus, Tibet, and Himalaya, growing up to 14,000 feet. Root and foliage of this kale are eaten. Crambe maritima, Linnae., is seakale.

CRANE.

Crane differ from storks in their appearance, habits, anatomy, modes of breeding, and everything except that both happen to be long-legged birds. The Argila or adjutant, Leptoptilus argala, is erroneously termed the gigantic crane. The words Crane, Geranos, and Grus, and the Hindustani names of the three common Indian species, Saras, Karranch, and Kankara, all have reference to the loud trumpeting of these birds, which have a curious internal conformation resembling that of the trumpeter swans; whereas the storks are voiceless birds, having actually no vocal muscles, and can make no sound but by clattering their mandibles together, which they do pretty loudly. In Australia the term crane is applied to the egrets, or white paddy-birds, as they are called in India, of the family Ardeide; while in the Malay countries the so-called paddy-bird is a finch; and the real crane of Australia, Gr. Australasiana, is known as the Native Companion. Some cranes and storks, four-fifths of the ducks, and the great majority of the scolopacide, breed in the north, and come to India in the cold season.

(a) Grus antigone, Linn., Grus torquata, Vieillot, the Saras, a noble bird, is the largest of the whole tribe. During the breeding season it has a pure white collar below the crimson papillosse naked portion of the neck, whence the name Torquatus. It is mostly seen in pairs, a few of which breed in India in extensive flocks, but the great majority cross the Himalaya for that purpose.

(b) Grus leucogeranos, Dallis, is the beautiful arge white crane of N. Asia, with black wings, primaries, and crimson naked face. A few strai pairs have been observed in the Upper Provinces of Hindustan; and Burns figured it from the vicinity of Kubal.

(c) Grus cinerea, L., the Kulung or European crane, common to Asia and N. Africa, visits India in great flocks, which wholly disappear in the breeding season. If we except the Manchurian species, the European crane is equal to any in the majesty of its gait and the beauty of its plumage.

(d) Anthropoides virgo, L., the Karkara or Demoiselle, common to Asia and N. Africa, is only known in India during the cold weather. It is the smallest, and certainly one of the most elegant, of this particularly graceful group, the only one with the head fully feathered. And it is adorned with beautiful white neck-tufts, and with lengthened and drooping tertaries, and a
bright crimson eye. Highly gregarious, the flocks are sometimes immense. Cranes are easily tamed, and they are very ornamental birds to keep. They have a curious and peculiar habit of skipping about at times, attitudinizing or dancing, and now and then emitting their loud cries. In the wild state they do much damage to the crops from their numbers; and repair during the heat of the day to sandflats in rivers, or to other extensive waters, returning to feed morning and afternoon at regular hours. They fly in V-like flocks, like wild geese. The young, commonly two in number, follow their parents after exclusion, unlike those of the stork and heron tribe, with which the cranes have little in common.—Z.

CRANE-FLY. This gnat is a species of Tipula. Its grub is a pest of the young poppy plant, both on and under the surface of the soil.

CRANGANORE, on the Malabar coast, in lat. 10° 12' N., built on the Aycocka river, seems to have been one of the most ancient capitals of Malabar, and in some of the ancient copper deeds appears to have been called Muyiri-Kodu, the classical Muziris (?).—Horsburgh; Yale, Cathay.

CRANGONIDÉ, a family of Crustaceæ belonging to the division Decapoda Maeroua. The type of the family is the common shrimp, Crangon vulgaris. See Crustaceæ.

CRANI. Anglo-Hind. A Christian copyist or clerk in a public office, generally of mixed European and native descent. The term may be a mispronunciation of Karana, by which the Kayē'kh (Kayastha) or writing caste is designated in Bengal. The word Krani has begun of late years to be considered decidedly dyslogistic. In India, Kayasthas are now never called Khaja. In Mahomedan countries, however, the term Khaja is still applied to writers and teachers. Dr. Shaw says of the Moors in Barbary, 'The Hojas suspend their inkhorns in their girdles' (p. 227); and Lady Montagu says, 'The monastery is now belonging to a Hoja, or schoolmaster.'—Letters, p. 176; Elliot, Supp.

CRANIAL DEFORMITIES. Certain tribes alter the shape of the skulls of their children, making use of, for this purpose, various mechanical contrivances, so as by pressure to bring about that outline which comes up to their peculiar ideas of beauty. Captain Cook noticed it in the island of Ubeta; Marnsen mentions it at pp. 44, 45 of his Hist. of Sumatra. In the Narrative of the Voyage of Her Majesty's Ship Battersnake, Maggillivray mentions (1855) having seen some skulls of children at Cape York, altered into quite a conical shape by a constantly-applied manual compression of their mothers. Dr. Mikluco-Maclay, a countryman, when visiting, in April 1880, the islands of Torres Straits, had an opportunity of seeing, at Mabiak, this strange operation performed on the heads of several lately-born children. During the first weeks of the child's life, the mothers are accustomed to spend many hours of each day in compressing the heads of their infants in a certain direction, with the object of giving them quite a conical shape. Dr. Maclay saw the operation performed daily, and on many children, and fully convinced himself that the deformity which is perceivable in the adults is the result of this manual deformation only. It would appear that among these people we have the only well-authenticated examples of cranial deformities brought about in this way. At Mabiak the deformation is intentional; but Dr. Maclay observed on the east side of New Guinea, numerous cases of distortion of the heads of adult females, in consequence of the practice of their carrying from childhood heavy burdens in large bags, the band of which serves as a handle, and rests across the head a little behind the coronal suture, where a permanent transverse and saddle-shaped depression of the skull occurs. In some cases this depression was not less from three to four millimetres; and he thinks that the acquired cranial deformity has a great chance of becoming more or less transmitted from generation to generation by inheritance, and is therefore most worthy of being recorded.

CRAPE. Crepe,R. ; Fr. Sendal, PORT. Flohr, Kraus flohr, GER. Flor, RUS. Equinilla, Squillo, IT. Crespon, Sp.

A light silk manufacture.—M'Culloch, Dict. CRATÉGUS, a genus of plants belonging to the natural order Rosaceous, and the sub-order Pomeae. C. glabra, Thunb., occurs in Japan. C. crenulata, Roxb., the Indian Pyracantha, or white thorn, is the Gengarn of the Panjab. It is a plant of Nepal, Kamaon, the east of the Panjab, and the Sultej valley between Rampur and Sungnam at an elevation of 3000 to 7000 feet. It is shrubby, with large white flowers; wood used for staves, etc.—Cleghorn, Panj. Rep. p. 64; Stewart, Panj. Plants; Eng. Cey.; Voigt.

CRATÉGUS CRENULATA. Thompson. White thorn, R. ; Eng.; Gengarn., —HIND. Grows in the Garhwal forests, where it attains a height of 20 feet, with a trunk 12 to 15 feet long and 2 to 2½ feet in girth. Timber useful, and yields crushers for sugar and oil mills.—Thompson; Roxb.

CRATÉGUS OXACANTHA. Linn. Pingrat; Ring, Chena, GER. Ring; Ringo, KANGRA. Ramnīa, Patakhen; Phindak, RAVT. Ban-sīnį, Jhēlum, DURANA; Pushtū. Sur-sīnį, Gwanzā; ZR-IND. Not uncommon in various parts of the Himalaya at 5000 to 9000 feet elevation. Fruit not palatable.—Stewart.

CRATÉGUS PINNATIFIDA. Smith. Shan-cha, CHIN.; Mau-cha, CHIN. The large red fruits of this Chinese plant are стрны as beads by Chinese children.—Smith.

CRATÉVA, a genus of plants belonging to the natural order Capparidaceae. The Ægle marnellites (Bilva or Mahura), formerly considered a species of this genus, is now referred to the order Aurantiacae. C. Roxburghii and C. nervula grow in India. The bark of the root of C. gnandyrna, a native of the W. Indies, is said to blister like cantharides.—Eng. Cy.; Voigt; O'Sh.

CRATÉVA NURVALA. Buch. Ham. Cratèva tapia, Born.; C. inermis, L. Tapia, Birni, HIND. Mavalingum, TAMAR. Nirvala, ; MUKAL. Maṭ, TEL.; TR. A small tree, 15 to 20 feet high, which grows in Malabar and Mysore.—Voigt.

A small and very handsome tree of both the Indian Peninsula, of the Cercars, and growing in Bengal, and at Sarannupur; common on the banks of rivers, and is much planted by natives. Wood white and hard; the native dhul is often made of it, and it is used for many common purposes, and for carving models. Dr. Gibson says it is not common on the Bombay side. The fruit is hard, globose, and woody, something like that of the wood-apple; the mucilae of the fruit furnishes a cement. The juice and a decocction of its sargrrent bark are given in intermittent fever and typhus. The bark, macerated in water and mixed with ginger, long pepper, milk, and gingelly oil, is applied as a limiment for drying up sores. An infusion of the bark is also given in flatulency. — Flor. And.; Voigt; Ainslie; Wright; Gibson; Useful Plants; Cat. Ex. 1862; Beddome.

CRATOXYLON NERIFOLIUM, Kurz, and other species, timber trees of British Burma.

CRAW-FISH. See Crustacea; Palinurus.

CRAWFURD, JOHN, F.R.S., a medical officer of the E.I. Company's army. He entered the service in 1808, and died in 1868. In 1811 he accompanied Lord Minto in his expedition to the conquest of Java, and was afterwards appointed to a native court. In 1817 returned to Britain; and in 1820 he published his History of the Indian Archipelago. He returned to India, and was sent on diplomatic missions to Siam and Cochinchina; and in 1823 he was, on the retirement of Sir Stamford Raffles, appointed Governor of Singapore. In 1826, Lord Amherst appointed him Commissioner in Pegu; and, on the restoration of peace, sent him as Envoy to the Burmese court. In 1827 he returned finally to Britain; and in 1828 he published his Embassy to Siam and Cochinchina; and in 1829 an Account of his Mission to Burma. In 1856 he published a Dictionary of the Malay Archipelago; and he took part in all the discussions of the learned at the ethnological and other societies. His publications were:—History of the Indian Archipelago, Edin. 1820, 3 vols.; Researches in India, Lond. 1817, 2 vols.; Embassy to Siam and Cochinchina; Grammar and Dictionary of the Malay Language, 2 vols. 8vo, Lond. 1851; Dictionary of the Indian Archipelago, Lond. 1857; Journal of an Embassy to the Court of Ava in the year 1827, containing a Description of Fossil Remains by Buckland, 4to, Lond. 1829; View of the Present State and Future Prospects of the Free Trade and Colonization of Asia, 8vo, Lond. 1829.

CREAM is made and Tang of the Chinese, and Mallah of Hindustan.

CREAM OF TARTAR or bitartrate of potash, deposited in a crude state upon the bottom and sides of casks containing fermenting wine. 57,898 cwt. were imported in 1870 into Britain.

CREED. Mahomedans distinguish between a creed and a sectarian faith. Din is a creed, and Mazhab a faith. See Kalamah.

CREEK, Kyunggeyc, BURM.; Sherm of the Arabs. CREMATION was common among the old German tribes, and among the ancient Britons in druidical times; but where Christianity established itself, there cremation ceased. Amongst the Hindus it is called Bhoidagélala, Sansan, Samasan. A cremation site is Chilan, Chihan, Chihan, Mar-ghat.

CRESCENT. This is used by the Mahomedan rulers of Turkey and of Hyderabad in the Dekhan as a symbol on their standards. The Adal Shahi also retained it. The crescent is worn by the Hindu god Siva and by his consort Parvati.

CRESS. American or Belleisle cress has a harsh flavour, but, being of a more robust nature than the garden cress, is easier cultivated on the plains of India. It is raised from seed; the young leaves, cut when young, are used for salads; requires plenty of water.

Garden Cress, Lepidium sativum.

Reshad, ... ARAB. Looit patiiah (leaves); HIND. Cresson, ... FR. Cresonne, ... IT. Cresse, ... GER. Tureh-tezak, ... PERS. Chuner, ... GUL. HIND. Berro, ... SP. Halim (the seed), ... HIND.

The leaves are gently stimulant and diuretic; as a salad, they are wholesome and palatable, and serviceable in scrobutic diseases. Cress should be sown thick in very narrow drills, about one inch deep and a few inches apart. It requires to be well watered, and is in season all the year round. It should be cut for use when two inches high.

Water-cress is the Shwii-'k'in- tai of the Chinese.

Cress Seed.

Hurt, ... ARAB., HIND. | Aliveri, ... TAM. Rohitasareshupa, SANSK. Adala Vittilla, ... TEL.

Cress seed is of a reddish colour, and agreeable, warm taste, and is used by native practitioners as a gentle stimulant; also as a warm aperient, when bruised and mixed with lime-juice. — Ainslie; Riddle; Jaffrey.

CRESSA INDICA. Willde. Goon of Sind; an erect, ramous annual. Its seeds are ground, and the flour made into cakes, pure or mixed with flour. — Herb. ii. p. 72.

CREX-RATENSIS, the landrill of Europe, Asia, N. Africa, is common in Afghanistan, rare in the N.W. of India.

CRICKETS in China are pitted against each other, and largely betted on. The cricket species of Acheta and Gryllolatpa are very destructive to garden and field plants. See Insects.

There are about forty species of Crinum in S.E. Asia, many of them with several synonyms. C. asiaticum is common in Indian gardens and groves. The flowers are fragrant and ornamental. The Bengali name means interview of ease. The root of the variety toxiciarium is a good substitute for squill. The succulent leaves are about two inches broad and two or three feet long. The natives bruise and mix them with a little warm castor-oil, and consider them useful for repelling whitlows and other infammations on the ends of the fingers and toes. The juice of the leaves is applied to
CRINUM LATIFOLIUM.

A plant common in Southern India. In Tenasserim are species of crinum, which Europeans usually denominate lilies. A very large-petalled species, of which there are two varieties, is much cultivated in gardens.—Mason.

CRINUM SINICUM, Rech., Wan-shun-lan of the Chinese, is a beautiful plant, cultivated in India, Ceylon, Cochin-China, China, and the Moluccas.—Smith.

CROCODILE.

Crocodile, Crocodylus porosus, of the Malayan Archipelago. C. porosus, Siam, Sam, Jamboja, Sian, Porosus, Crocodile, Borneo, and the Moluccas, is C. porosus; but there is another in the rivers of Borneo, formidable by its size and rapacity, partaking of the character of the hipopatrus and the garial of the Ganges (Crawford, p. 10). Crocodiles are in every creek, in every river, in the Sunderbans, varying in size from a span in length to 18 or 23 feet. They are usually seen lying on the surface of the black mud, basking in the sun; they sleep very soundly, for a steamer may be going at full speed, and making the usual splash and noise, passing within ten paces of a sleeping crocodile, without disturbing their slumbers. To a casual observer they resemble mud-covered logs of wood; and it is not until the large square glittering scales, which are of exceeding strength and beauty, when closely examined, and the elevated and doubly dentilated ridge or crest that runs along either side of the tail, become visible, or are seen to glint in the sun, that the shapeless mass is found to be a fierce, carnivorous, and dangerous animal. The Ganges' garial is not seen in the Sunderbans; it appears to love the sweet and, comparatively speaking, quieter waters of the upper rivers of India and their clean sandbanks, where they may be seen lying with their mouths wide open, but for what purpose it is difficult to divine, unless it is to get rid of numerous small red filamentous worms that cluster about their fauces. The lower jaw being prolonged backward beyond the skull, causes the upper jaw to appear movable, which it only is when accompanied by the whole of the skull. A small brown bird has been seen to alight upon the tongue of an open-mouthed crocodile, and pick the worms from the throat as it lay upon a sandbank in the Ganges. It is generally believed that the snubbed nose crocodile always remains in fresh water; but such is not the case, as they are found all along the Chittagong and Arakan coasts,—never far from the shore, it is true, but still in bona fide salt water, where they are as dangerous as sharks. In the rivers of the delta of the Ganges, where they flow through the cultivated portions of the country, stakes are driven into the bed of the river at the watering places or ghats opposite to the villages, where the inhabitants may bathe in security, and draw water for domestic purposes; but even this precaution is not always sufficient to ward off the attacks of the fiercer crocodiles. The crocodile finds no difficulty, when pinched by hunger, in turning the flank of the stakes, and taking up his rest within the enclosure, where he silently awaits his prey. A surveyor on the banks of the Ganges was witness to a shocking occurrence in connection with these enclosures. A young Hindu girl about 14 years old came to fill a pitcher with water, and had hardly put her feet into the water, when a crocodile, which had been lying in wait inside the enclosure, rushed at the poor girl, seized her in its formidable jaws, scrambled up the banks of the river, holding the shrieking, struggling girl well up in the air by the middle of her body, and plunged heavily into the river outside of the stakes. A smothered scream, a ripple upon the water, a few bubbles, and the frightful scene was closed. A more daring attack by a Sunderbun crocodile than even the above, occurred at Hooa. A gang of ironed convicts were being inspected by the magistrate prior to their being sent off to another and a more distant jail. The men, numbering with their guards about fifty, were drawn up in line on the raised embankment or levee of the river; the examination was proceeding, when a crocodile rushed up the bank, seized a manacled prisoner by the legs, dragged him from the ranks, and in a moment, and before any assistance could possibly be rendered, plunged into the river and disappeared. The Peer-puker at Punna, in Sind, is a large tank, forty feet deep and 500 years old. The most remarkable tenant of this tank was a tame crocodile, called Fatteh Khan, which answered the call of a fakir living upon the embankments. On summons, the monster would show itself upon the surface, and keep floating for several minutes. Captain von Orlich saw thirty crocodiles in a tank near Kurchee, which at the call of the fakir instantly crept out of the water, and, like so many dogs, lay in a semicircle at the feet of their master. In Colonel Tod's time there were two crocodiles familiar to the inhabitants of Udaipur, who came for food when called. He often exasperated them by throwing an inflated bladder, which the mon-
Crocodile.

Herodotus (ii. p. 69), after describing the
honours paid to the sacred crocodile by the Egyp-
tians, adds: 'But the people who live round about
Elephantine even eat them; they don't think them
sacred.' In Siam the flesh of the crocodile is sold
for food in the markets and bazaars. The Singhalese
believe that the crocodile can only move swiftly
on sand or smooth clay, its feet being too tender
to tread firmly on hard or stony ground. In the
dry season there, when the watercourses begin
to fail and the tanks become exhausted, the marsh-
crocodiles have occasionally been encountered in the
jungle, wandering in search of water. During
a severe drought in 1844, they deserted a tank
near Korngalle, and traversed the town during
the night, on their way to another reservoir in the
suburb; two or three fell into the wells,
others, in their trepidation, laid eggs in the
jungle, and some were found entangled in garden
fences and killed. Generally, however, during
extreme drought, they bury themselves in the
mud, and remain in a state of torpor till released
by the recurrence of rains. At Arme-tweo, in the
eastern province of Ceylon, while riding across
the parched bed of the tank, Sir J. E. Tennant
was shown a recess, still bearing the form and
impress of a crocodile, out of which a crocodile
had been seen to emerge the day before. They
are said to eat only living creatures, but the dead
bodies in the Ganges are also said to be eaten by
them. A curious incident occurred in Ceylon
some years ago on the Magurganga stream,
which flows through the Pamun Corle to join the
Bentotte river. A man was fishing seated
on the branch of a tree that overhung the water,
and, to shelter himself from the drizzling rain, he
covered his head and shoulders with a bag, folded
into a shape common with the natives. While in
this attitude, a leopard sprang upon him from the
jungle, but, missing its aim, seized the bag and
not the man, and fell with it into the river. Here
a crocodile, which had been eyeing the angler in
despair, seized the leopard as it fell, and sunk
with it to the bottom.

The gharial of the Ganges is supposed to be the
largest of the living saurians. The measurement
of the largest mentioned by Messrs. Dumeril and
Bibron is given at 17 feet 8 inches. The gharial
abounds in all the great rivers of Northern India.
It is found in the Indus, from its delta north-
wards to near Attock, and up the Punjab rivers
for a considerable distance, where it is most
abundant.

Major Court mentions that as canoes were
paddled along the Mosee river in Palenbong, he
saw, on two occasions, crocodiles raise their
heads out of the water near the boat's side,
and attempt to seize one of the paddlers. The
boatmen escaped their grasp by moving away.
During the time he was at Palenbong, seventeen
paddlers were carried away by crocodiles. Two
gentlemen coming in a small boat up the river to
pay him a visit, had provided themselves with
a basket of provisions for their journey. On
their way, a crocodile raised its head from the
water; the paddlers shrieked, and fortunately
escaped, but the basket of provisions became the
prey to its voracity.—Letter from Gomerat
Monodellor, Interpreter of the Supreme Court, 19th
January 1861; Cal. Rec.; Jo. B. A. S.; Low's
Sarawak; Sir Tennant's Ceylon, p. 288; Court's
Palembang; Adams.

CROCODILE ROCK, a dangerous rock 16
miles due east of Cape Comorin.

CROCODILE, the crocodile tribe, a family
of Saurians, of the order Emydosauroi, which
includes also the family Gharialidae, which
includes the largest living forms of that order of reptiles.

Dumeril and other naturalists distinguished the
family by the appellation of Aspidoc (shielded)
saurians, while many modern zoologists have con-
sidered them as forming a particular order. See
Crocodiles.

CROCUS, in the arts, a peroxide of iron, used
as a polishing material.

CROCUS SATIVUS. Linn. Saffron, Crow
Saffron.

Zaffran, Kangan muthi, . . . TAMB.
Kusun, Kangan muthi, . . . Kusun Kungo, . . . TAS.
Kong, Kusun Kungo. . . TAL.
Kashmiri, Kash., KASHM.

A native of Asia Minor, naturalized in England,
France, and many other parts of Europe, and
cultivated in Persia and in Kashmir, in one small
tract at Pampur, not far from the capital. The
saffron is exported both to south and north from
Kashmir. Vigne says it goes mostly to Yarkand;
and Cayley mentions that, in 1867, 51 mounds
reached Leh, which would be worth at Yarkand.
1840. The saffron of commerce consists of the
dried stig mata of the flower. These are picked
out, dried on paper, either in a kiln or by the sun.
If compressed into cakes, it is called cake saffron.
Hay saffron is what is usually met with, and it
consists of the stig mata, each about an inch and
a half long, brown-red, the upper part flattened,
widened, and cleft; the lower hair-like and
yellowish. The odor is fragrant and very fragrant;
the color is saffron yellow, Mr. Perea informs us that one grain of good saffron
contains the stig mata and styles of nine flowers,
so that one ounce of saffron is equal to 4320
flowers. Cake saffron, as now met with, contains
none of the real article, being prepared from the
florets of the safflower (see Carthamus), made
into a paste with gum-water. Dr. Hohnberger
mentions that Crocus sativus is monopolized by
the Kashmirian government, and that the hakims
of the Panjab use saffron in melancholy, typhus
fever, enlargement of the liver, and retention of
urine.—O'Sh, p. 654; Howig; Royge; Stewart;
Birdwood; Waring. See Saffron.

CROCUS THIBETANUS. Smith. Tsang-hung-
lwa, Chinese. A saffron of Tibet.—Smith.

CROMLECH is a word applied by the British
to widely different structures. It is derived from
the Keltic word Krom, crooked or curved, and
Lech, a stone. In Brittany they are known as
the Grottes aux fes, also the Roches aux fees. Its
correct application is a circle of upright stones,
The cromlech of the British anticiparian is the same as the Welsh and English 'quoit,' such as Arthur's quoit or cocon (Coetme Arthur) near Cricceth, Lanyon quoit and Chum quoit and others in Cornwall, Stanton Drew quoit in Somersetshire, the Kitts koty or quoit near Maidstone, and the Coit-y-enroch in Guernsey, all of them circles of upright stones. Professor Svon Nilsson, however (on the Stone Age, p. 150), defines the English cromlech as synonymous to the French dolmen, the Scandinavian dis, and the dys of Denmark, consisting of one large block of stone supported by some three to five stones arranged in a ring, and intended to contain one corpse only, several of these dorras being sometimes enclosed in circles of raised stones. Following, however, the nomenclature given by the late Dr. Lukis, we cannot be far wrong in assigning the word cromlech to all elaborate megalithic structures of one or more chambers, in which category the passage graves may be included.

The dolmen (Dola, table, Moen, a stone) is, as its name implies, of different structure. The cromleches of Jersey and the adjacent islands partake of the character of the French grottes aux fees, the fairy's grotto, as well as the Gangriter, the gallery tombs of the Swedes, the Jettestuer or chambered tumuli of the Danes, and the German Hunenbetten.

In China the chambered tumuli associated with megalithic avenues have attained their greatest development. The great tomb (the Ling or resting-place of Yung Lo of the Ming dynasty), thirty miles from Pekin, consists of an enormous mound or earth barrow covered with trees, and surrounded by a wall a mile in circumference. In the centre of the mound is a stone chamber containing the sarcophagus, in which is the corpse. This chamber or vault is approached by an arched tunnel, the entrance to which is bricked up. This entrance is approached by a paved causeway, passing through numerous arches, galleries, courts, and halls of sacrifice, and through a long avenue of colossal marble figures, sixteen pairs of wolves, kelines, lions, horses, camels, elephants, and twelve pairs of warriors, priests, and civil officers.

The tombs of the Hova race of Madagascar consist of stone vaults, made of immense slabs of stone, flat inside, forming a subterranean grotto. They also erect stone pillars similar to the menhir. The supposed aborigines of Madagascar were the Vazimba, whose tombs are small tumuli or cairns, surmounted by an upright stone pillar. The cromlech or trilithic altar, in the centre of all Druidic monuments, is supposed by Iod to be a toon or triumphal arch, sacred to the sun-god Belenus.

In 1881, Lieut. Conder saw 400 cromleches in E. Palestine, in seven central localities. In addition to the cromleches, several menhirs or standing stones were found, and ancient stone circles in connection with both classes of monuments. Among the sites explored were Hesibon, Elealeh, Mediobna, Baal-Baal, Nebi, and Pisgah, the hot springs of Callirrhoë, Rabbath Ammon; he found the place of the worship of Baal-Peor and the site of Bamoth-Baal; he discovered the method by which the enormous stones used at Arak el Emir were brought up from the quarries.—Lt. Oliver, R. A. F. R. G. S. Quarterly Journal of Science, April 1870. See Cairn.

CROMLECH.

CROOM. Beng. A dip, a ravine, a valley, a hollow.

CROPS. On fertile lands susceptible of irrigation, British India enjoys two crops during the year, one called the Kharif, or rain crop, sown in June and reaped in October; the other sown in October, and reaped in March and April, called the Rabi, or cold - weather crop. The latter, embracing the months which approximate in temperature to that of the season of cultivation in colder countries, corresponds with them also in the nature of the plants cultivated, as, for instance, wheat, barley, oats, and millet; peas, beans, veteh, tares, chick-pea, pigeon-pea, and lentils; tobacco, safflower, and succory; flax, and plants allied to mustard and rape, as oil-seeds; carrot, coriander, and cumin, and other seeds of a similar kind, as ajwain, sonf, soya, anesun. In the rainy season, a totally different set of plants engages the agriculturalist's attention, as rice, cotton, indigo, and maize, with sorghum, pulse, joar, koda, most of the tropical legumes, as well as several of the cucumber and gourd tribes, together with the sesamum for oil, and varieties of the egg-plant as a vegetable. The sumn and sumne, two corage plants, are also cultivated at this season.

Dr. Royle gives the following arrangement of the countries of which the plants will grow in the different parts of India:

- Tropical and East Island crops. Brazil, Guiana, W. Indies, and Florida.
- East and west coast of Africa.
- S. of Africa, extra tropical N. Holland, S. America beyond lat. 23° S. Mediterranean region.

- Chino - Japanese region.
- Middle Andes, Peru, and mountains of Brazil.
- North of Europe, north of Asia, and North America.
- Himalayan mountains, regions of oats and pines.
- Arctic regions, mountains of Europe, elevated Andes.

- Tropics of the southern hemisphere, in the Cuddapah district, is usually sown mixed with nine other seeds. Delichos uniflorus, D. Sinensis, Phaseolus mungo, Cicer arietinum, Cajanus Indicus, Lablab vulgaris, Sesamum orientale, and Hibiscus subdariffa.

- The rai crop (Eleusina, species) is usually sown mixed with Lablab vulgaris, this pulse being put in lines, without reference to the rai crop, being dropped in a furrow made with the native plough. Mixing crops is of the utmost importance, for the purpose of the growth of one crop, as the plants differ in demands on the soil; the variety increases the chances of success; and, as they ripen at different stages, they give continuous work to the ryt and his family.

56°2 per cent. of the adult male population of British India are engaged in agriculture, the total
being 34,844,000. The number of persons returned as engaged in agriculture and in tending or dealing in animals, is 371 millions; but besides these, the boys and girls and wives of a household, and many tradesmen and artisans, own land which they cultivate by the aid of the younger members of the family. The farms of India are all small, and the machinery and capital proportionate. The farmer works the soil himself, assisted by relatives, laborers, and hired. The plough is light and rude, and the draught cattle are in general small; but the fields are ploughed and re-ploughed a dozen times, and freely exposed to the weather. The crops raised are excellent; and no Mahomedan, European, or East Indian has ever been able to compete with the Hindus.

In Mysore, where the ragi and other dry grains occupy about 80 per cent. of the cultivable area,—rice 10 per cent,—little has been done to provide water for artificial irrigation.

Very good land in Bengal will yield 48 maunds per acre, and in exceptionally good lands 53 maunds. In an ordinary year, in that good land, the range may be 36 to 40 maunds. Ordinarily fair low land in a really good year, from 30 to 35 maunds; and, on an average of ten years, 18 to 24 maunds. Poor or high sandy lands, 18 maunds, or, on an average, 12 to 13 maunds. The average of all classes of land, 15 maunds per acre. (J. C. Otteley in Mor. and Mat. Pro., 1874-75, pp. 56-37.)

In the Upper Provinces of N. India, the following is the detail of seed sown per acre, and the yield, of the more ordinary crops:

One of the most important points for the Indian statesman is to discover other industries than that of the production of food, in order to give profitable employment to the varied capacities of the people. A large addition to the production and manufacture of tobacco, sugar, wool, silk, jute, paper, etc., would have this effect, and this could be obtained without curtailing the supply of food, by the addition of one-tenth to the yield of food crops,—a result that might easily be brought about if greater attention was paid to the cultivation. This would set free an area covering 20 million acres, which would add 200 millions sterling to the general wealth, at the moderate value of £10 per acre, when the crops were converted into a manufactured product by the well-employed industry of the people. To aid in this, further attention to artificial irrigation is needed. The inferior pulses are greatly dependent on rain; but for garden cultivation, as for the vegetables, the poppy, tobacco, and sugar-cane, artificial irrigation is indispensable everywhere, except in low-lying lands near rivers. Every tank should be kept in repair, wells sunk wherever water is to be met with, and manure largely used. Mr. Schrattly says that in the middle of the 17th century the average quantity of rice produced in India from each acre of land was 1358 lbs.; of wheat, 1155 lbs.; cotton, 670 lbs., unpicked, which is equal to 223 lbs. of picked. But the statistics of the 19th century show that the land yields rice now at an average of 800 to 900 lbs. per acre; wheat, 600 lbs.; and picked cotton, 52 lbs. In 1828, certain lands in Central India yielded 128 lbs. of cotton per acre. In Broach, in 1844, the yield was 83 lbs. and at the present time the quantity produced does not come to above 85 lbs. And the conclusion arrived at is that the lands are becoming poor, and unless it gets a portion at least of what is taken from it, its producing qualities will still further deteriorate.—Carmegy.

CROREJ or Kror, ten millions. A crore of rupees is equal to one million sterling. The names of the higher numbers, Elliot says, are thus given in the Zabdat-ul-Quanin:—

100 crore = 1 urub. 100 pudum = 1 sunkh.
100 k'urub = 1 sunkh. 100 old = 1 urub.
100 neel = 1 pudum. 100 neel = 1 puna.

When Akbar introduced his revenue reforms, he appointed a collector for every crore of dams (i.e. Rs. 25,000,000), whom he designated by the title of Amil or Amliguzar; and to that functional the instructions are directed in the Ayin-i-Akkbar; the designation of Crori being of subsequent introduction.—Elliot.

CROSS.

The symbol of the circle and the cross, under every variety of circumstance, in Egypt, Africa, Britain, China, Scandfnavia, and America, in every age, by every people, from the dawn of secular history to the present hour, has been held by all in the same superstitious veneration, has been honoured with the same distinguishing rites, and has always expressed the same doctrine or mystery. Divine potentiality was sometimes indicated by two or more sceptres arranged at right angles or quadrangularly, with the nave of a wheel, or a simple circle, or six or eight round stars, at the point of intersection, with other orbs or ornaments. Osiris by the cross gave eternal life to the spirits of the just. With the cross the dove smote eternal life to the spirits of the just. With the cross Therman the head of the great serpent. The Muscaemmother shed the children beneath a cross, trusting by that sign to secure them from evil spirits. The cross-cake, says Sir Gardner Wilkinson, was the hieroglyph for civilized land, obviously a land superior to their own, as it was indeed to all other mundane territories; for it was that distant traditional country of sempiternal contentment and repose, of exquisitely delightful and serene, where nature unassisted by man produces all that is necessary for his sustentation, and whose midst was crowned with a sacred and glorious eminence,—the umbilicus orbis terrarum,—towards which the heathen in all parts of the world and in all ages turned a wistful gaze in every act of devotion, and hoped to be admitted, or rather to be restored, at the close of this transtitory scene. The Crux ansata is the earliest known form of the cross. It is commonly called the key of the Nile, because often seen on Coptic and Egyptian monuments. It was very similar to the Roman letter T, with a roundlet or oval placed immediately above it, and signified hidden wisdom or the life to come. It was used by the Chaldæans, Phoenicians, Mexicans, and Peruvians; doubtless it was intended to denote the solar and terrestrial
CROTALARIA

spheres. And, subsequently, sovereigns each adopted the circle, associated with it the cross, and this symbol of royalty is in use with every king of Europe. The Chakra in the hands of Brahma, Vishnu, and Siva, is a modification of it. In Egypt and China it was used to indicate a land of corn and plenty; and, when divided into four equal segments, it was the symbol of the primeval abode of man, the traditional paradise of Eden. The cross, says Colonel Wilford (As. Res. x. p. 124), though not an object of worship amongst the Buddhists, is a favourite emblem and device amongst them. It is exactly the cross of the Manichees, with leaves and flowers springing from it, and fruit also, it is said. It is called the divine tree, the tree of the gods, the tree of life and knowledge, and productive of whatever is good and desirable, and is placed in the terrestrial paradise.

The pre-Christian cross is not unfrequently associated with a tree or trees. The sign of the cross began to be used by Christians in the fourth century, and is described by Lactantius as an impregnable fortress to defend those impressed with it, for such the devil cannot approach. The use of the pre-Christian cross, either in the form of the handle cross of the Mediterranean districts, or the swastika of the Buddhists, was widely spread amongst ancient peoples, and it is in use at the present day over all Buddhist and Hindu countries. Mr. W. King has described many cruciform monoliths at Mungapet, in the Tuluncha taluk, on the right bank of the Godavery on the road to Hanumconda, in the Nizam's dominions.—Journal Bengal Asiatic Society.

CROSS, ROBERT, a skilled gardener who aided Mr. Clements Markham, C.B., in introducing cinchona trees (1860-1879) and coca trees (1875) into India from S. America, species of castilla. He made five journeys to procure cinchona plants.—Markham, Peruv. Bark.

CROSSBILL, Loxia pyrha, Hodgson, inhabits the pine forests.

CROTALARIA, a genus of plants of the order Fabaceae, sect. B. lotus, of which 40 species are known in India. The fibres of the banks of C. Burha, C. juncea, and C. retusa are largely used as cordage material. C. juncea yields the sum of commerce; the C. tenuifolia furnishes the Jubbulpur hemp.—W. Jc.

CROTALARIA BURHA. Ham. Bach.

Khp, Bhat, Bui, Beas. Bada, Khip, S. STELE.
Latha, Kharsan, Hind. Sia, Sissi, TR-IND.
Dranrote, Sind. Meini, Pul, E.

A naked-looking, bushy plant, common in Sind and in all the more arid parts of the Punjab, from Dehli to Trans-Indus up to Peshawur. It is browsed by cattle. It has a very tough bark, and with exactly the smell of broom when bruised, which probably gets it the name Bui, fragrant. Twine and small ropes are in many parts made from it by the dry process (and apparently sometimes after two or three days' steeping), but notably not so in places near Dehli, where the khip used for this is from Orthanatha, a very different plant.—Stewart.

CROTALARIA JUNCEA. Linn.

C. Bengalensis, Linn.
C. tenuifolia, Rosch, ill. 263.
C. fenestra, Sintz.
C. porrecta, Wall.
C. serticea, Willd.

CROTONALDE.

Grows in Malabar and Bengal. It has bright blue and greenish-white flowers. The juice of its leaves is used in medicine.—Voigt.

CROTONALDE, a family of reptiles of the order Ophidia, and sub-order Serpentes vipersi.

CROTON, a genus of plants of the natural order Euphorbiaceae. The species of India and the Archipelago are.—C. aromaticum, bicolor, drupaceae, fieicodana, jovra, levigata, laicferum, microdenia, Monnii, muricata, nigro-viride, oblongifolia, pavanum, polyandrum, tigillum, urophylla, unbellatum. The seeds and oil of C. polyantrum and C. tigillum are purgative. A species of croton, whose roots are used by the Burmese for a cathartic, abounds in some parts of Burma, especially on the Monmel hills.—Mason.

A native of the East Indies, very common in Ceylon up to 3000 feet; trunk arborescent, with rude and angular branches, and is said to furnish the finest of all the sorts of lac, of a bright red, and also to furnish a brilliant varnish in Ceylon.—Thew. p. 275; Eng. Cyc. p. 212; O'Sh. p. 553.

CROTON OLBONGIFOLIUM. Roxb. | C. levigatum, Wall., Bhatam kusaam, | SANSK. | Bhutala bhai, | Tel.

A small tree not uncommon in S. India and Ceylon. The Telugu name means demon-driver or devil-goad, sticks made of it being carried as a protection against evil spirits. — Voigt; Elliot; Thew. Zeyl. p. 276.

Grows in the Circars, Bengal, and Hindustan, near hills and streams in moist places. Perennial; seeds exactly like those of the castor-oil plant, but much smaller. Esteemed by the natives of India to be a good purgative, one seed bruised with water being given for each evacuation desired. The Burmese cultivate this species of croton, which grows into a thick bush. It is very common also on the banks of the Jumna, where it is called Jamalgota.—Royce; O'Sh.; Roxb.

CROTON SANGUISFLUA, the blood-wood of Norfolk Island; is said to be of little value except for firewood. On an incision being made in the bark, a fluid exudes which is used for marking the convicts' slopes, staining furniture, etc.; and it is a good tonic and astrigent, strongly resembling dragon's blood (Dam-ulkwain).—O'Sh.; Keppel's Ind. Arch. ii. p. 282.

CROTON SCABIOSUM. Bedd. A small tree on the Nullaymalay mountains, Kurnool district, where it is most abundant about the Yerrachalma (2000 to 3000 feet elevation); its very silvery appearance renders it highly ornamental.—Beddome, Pl. Sylte. p. 283.

CROTON TIGLIUM, Croton-oil plant. Crotton Jamalgota, Buxh. | Tiglium klotchianum, Rh.

This small tree grows to 15 or 20 feet high in most parts of India, Assam, and the Mouluccas. Every part of the plant is purgative, but the fruit or seeds are dangerously so, and in the medicinal practice of Europe they are never given, though in India native practitioners separate the embryo, and give it internally. The seeds yield a powerfully cathartic oil, by grinding the seeds, placing the powder in bags, and pressing between plates of iron. The oil is then allowed to stand 15 days, and afterwards filtered. The residue of the expression is saturated with twice its weight of alcohol, heated on a sand-bath from 120° to 140° Fahr., and the mixture pressed again; the alcohol is distilled off, the oil allowed to settle, and filtered after a fortnight. One seer (2 lbs.) of seed furnishes 11 fluid ounces of oil,—6 by the first process, 5 by the second.

Crotton Oil. Nagala oil; Tiglii olem.

This oil is prepared by grinding the seeds of C. tigillum, placing the powder in bags, and pressing between plates of iron. The oil thus expressed is allowed to stand about a fortnight, and then filtered. It is of an orange-yellow colour, is soluble in alcohol, and reddens litmus paper powerfully. It is an exceedingly powerful cathartic. It has a heavy oily smell, and is very irritating to the skin. It is procurable in most Indian bazaars, often adulterated with castor-oil and other fixed oils. The seeds are administered by native doctors; and when the operation is excessive, they give the patient the juice of the sour lime, which is said to counteract the effect of the croton seeds.

Crotton Seed.

Hab-ul-malak, | ARAB. | Cherakan, | JAV.
Pa-tan, | CHIN.

The seeds of C. tigillum are about the size of a small marble, of a convex shape on one side, and bluntly angular on the other, enveloped in a thin shell.—Paulukner; Ausile; Royce; Roxb.; Voigt; O'Sh.; Lindley; Jnr. Rep.

CROTON VARIEGATUM, an ornamental shrub, commonly called the laurel; the leaves are variegated. There is a variety of it with specially variegated leaves, and handsome; the plants thrive best in large pots or tubs, shaded from the moonlight sun.—Jeffrey; Graham; Thomson's Records.

CROWS.

Cornelle, | FR. | Cantare, | IT.

Kowa, | HIND. | Griy, Darra, | ST.

Conostoma cemodium, one of the Rassorial Crows, of the sub-family Glaucopinae, inhabits the northern region of Nepal, and in Celebes; and on the Malabar coast black and white crows occur, also occasional albinos. The crow is reckoned a bird of ill-omen in India; still Malabar women are sometimes named Kaka, the name in that dialect, as well as in Sanskrit, for the crow. The females
of Malabar are, more than others, called after animals. Mani, the crocodile, is a name among them. In Christian countries, Barbara, Ursula, — Barbarian and Little Bear, — are not unusual. The crows incubate chiefly in March and April. The common crow of India is of unwonted familiarity, impudence, and matchless audacity. Mr. Sitr mentions a crow seizing a bread from a toast-rack, and another taking food from a dog while eating. Sir James E. Tennant mentions that one of these ingenious marauders, after vainly attitudinizing in front of a chained watch-dog, that was lazily gnawing a bone, and after fruitlessly endeavouring to divert his attention by dancing before him, with head awry and eye askance, at length flew away for a moment, and returned bringing a companion, which perched itself on a branch a few yards in the rear. The crow's grismaces were now actively renewed, but with no better success, till its confederate, poising itself on its wings, descended with the utmost velocity, striking the dog upon the spine with all the force of its strong beak. The dog started with fear and pain, and the bone he had been gnawing was snatched away by the first crow the instant his head was turned. The Corvus culminatus, or large black crow of India, may be constantly observed wherever there are buffaloes, perched on their backs, and engaged, in company with the small minah (Acridotheres tristis), in freeing them from ticks.

—Tennant's Ceylon; Sivr's Ceylon. See Corvica.

Common in all the south of India, in rice-fields, flowering in the cold weather. Its value in leprosy is asserted. The juice of its green leaves dyes blue.—Voigt.

CRUCIBLE. Musa, Tel. In India, these are made by coppersmiths, etc., for their own use, of pipeclay or other suitable clay, beaten up for a considerable time on the anvil with burnt paddy husk; being formed, they are left to dry and are then ready for use. Mr. Rohde had seen a crucible formed for melting silver, simply by spreading wet clay on a bit of rag, which was immediately placed on the fire, which again was urged by the breath through a bamboo tube.—Rohde, MSS.

CRUCIFERE. This order of plants is so called from the four flower-leaves (petals) being disposed, more or less distinctly, in the form of a cross, as in the the wallflower, cabbage, and cress. Nearly all are herbaceous; none are poisonous, though they are generally a little acid; they are especially antiscorbutic.

CRUDE, a commercial term applied to raw and unrefined products, as crude camphor, crude tar, crude porcelain rouge.

CRUDIA ZEYLANICA. The. A large tree, of Galpata, near Calturua.—The.

CRUSADES. Military expeditions made from Christian countries in the 11th to 13th centuries, to recover the sacred buildings famished from the first origin of Christianity. At the time of the first crusade, the Mahomedan power was shared between those of Arab and those of Mongol origin. The Arab movement had been stayed by their defeat by Charles Martel, on the banks of the river Loire, and they had settled down in the countries which they had conquered, advancing in civilization and cultivating science. But later, the fresh converts to Mahomedanism, the Seljukian Turks and Tartars, issued from Central Asia, carrying ruin in their path. Asia Minor was lost to the Greek empire, and Constantinople itself imperilled, when Peter the Hermit roused Christian Europe to recover the Holy Sepulchre at Jerusalem. It was subsequently, in 1187, lost again by the conquest of Salah-ud-din; and at the time that St. Louis of France took the cross, Chengiz Khan with his followers had so ruined the whole tract from the Caspian to the Indus, that the succeeding centuries have not sufficed to restore it. The right wing of this enormous host was bringing ruin on the Slav nations of eastern Europe, while its left wing was menacing Bagdad and Syria. Poland and Hungary were invaded in 1258, and they had entered Bohemia and Moravia. Frederick II., in 1229, after Salah-ud-Din's death, recovered the Holy City, but it was again finally lost to the Kilwaite by the Black Sea to every Christian whom they found. Not long after, the Christians were again defeated at the battle of Gaza, which was fought in company with Malik Mansur, the ruler of Damascus, against the king of Egypt. St. Louis made two crusades, in the first of which he was completely defeated. The Ayubi are descendants of Salah-ud-Din. The family are known as the Hasan Keif, and occupy the district of Shrivan. In Mr. Rich's time, the Boy was powerful and independent. See Acre; Eyubi; Kafra.

CRUSTACEA. The Crustacea of the French, and the Krustenthiefe of the Germans. The common crab, the lobster, and crayfish, the common shrimp and the water-flea, may be taken as types of different sections of this family.

Cancer is a genus of short-tailed crustaceans, and is the type of the family Canceride of Linneaus; it includes a very numerous species of the genus Cancer; and the term Crab, which is a translation of it, is in common parlance applied to the great bulk of the brachyurous crustaceans. Dr. Leach restricted the genus Cancer to the form of Cancer pagurus, Linn., the large edible crab of British coasts, which was, when he defined the genus, the only species known. For the Blood-spotted Crab of the Asiatic seas (Cancer maculatus, Linn., etc.), and the Coralline Crab (Cancer corallinus, Pabur.), Dr. Leach instituted the genus Carpi/us, characterized by the existence of a single tooth on the border of the carapace, and by the tridentated front; and for the "Eleven-toothed Crab" (Cancer undecimdentatus, Pabur.) Egeria is a genus of brachyurous decapod crustaceans established by Dr. Leach. E. Indica, in size, general form of the body, and length of the feet, bears a great resemblance to Inachus scorpio; but, besides general differences, the arms are rather the short and slender. It inhabits the Indian seas. The Hermit Crabs are very common; and the nimble little Calling Crabs, Gelasimus tetragonon, Edw., G. annulipes, Edw., G. dussumierii, Edw., scanner over the moist sands, carrying aloft their enormous hand, sometimes larger than the rest of the body. They are of the E. and W. Indies. They bore holes for themselves in the black soil of the coasts. On some coasts of the East Indies the sands at ebb-tide swarm with them. They are
CRUSTACEA.

the food of the inshore sea fishes, and some of them are the best bait that can be used; and one species of Gelasimus is common in the casava fields of Brazil. Several small crabs are parasites, or take shelter within other animals. Cymothoe, a genus of the Indian Ocean, is too imperfectly organized to catch its own food, and the species take up their home in the mouth cavity of fishes of the genus Stromatea, where they snap up all that comes within their reach; Cymothoe stromatea is found inside the mouth of Stromatea nigra on the Coromandel coasts; another species has been found in the mouth of a chetodon, and inside that of a cyprinus of the Amur, and the Ceratootho exoceti has been found within the mouth of the flying fish.

Ostraocotheres tridacnae, Ruppell, is a little crab which lives within the great tridacna molluse, whose immense shell serves in European churches as a vessel for holy water. The crab takes shelter in the gap beneath it. Ostraocotheres tridacnae inhabits the Tridacna squamosa; the Conodytes melaegrineus lives in the shell of the pearl mussel; the Epiphrys giganteus lives on a fish of the Indian Archipelago; the Icthyoxenus Jellinghausi lodges in a fresh-water fish of the island of Java. Pinnotheres is a genus of small crabs which live within mussels, amongst others the Avicula margaritifera or pearl mussel, and in the holothurians of the Philippine Islands, and Pin. Fiscieri is of New Caledonia; one species lives within the Chama.

Again, species of Pagurus, about 30 in number, all lodge in deserted shells, and change their dwelling-places as they grow older. They are known as the Hermit Crabs. Darwin thinks (p. 544) that certain species always use certain kinds of shells. Their abdomen is too soft to be exposed. In the Keeling islands, the large claws of some of the hermit crabs are beautifully adapted, when drawn back, to form an operculum to the shell.

Crabs and crabs occupying deep waters in places to which light is seldom visible, are found without eyes. Three species of Amphipoda and one Isopoda, from Kailapai, New Canterbury, New Zealand, were found in this state.

The Birgus latro of the Keeling islands is famed for the skilful manner in which it tears off the husk and opens the coconut, in order to extract the medullary matter of the interior. It is a kind of intermediate link between the short and long tailed crabs, and bears a great resemblance to the Paguri. Darwin observed that they live on the coconuts that fall from the trees. The story of their climbing these palms and detaching the heavy nuts is mere fable. Its front pair of legs are terminated by very strong, heavy pincers, the last pair by others narrow and weak. To extract the nourishment, it tears off the husk, fibre by fibre, from that end in which the three eyes are situated, and then hardening upon one of them with its heavy claws until an opening is effected. It then, by its posterior pincers, extracts the white albuminous substance. It inhabits deep burrows, where it accumulates surprising quantities of picked fibre of coconut husks, on which it rests as on a bed. Its habits are diurnal, but every night it is said to pay a visit to the sea, perhaps to moisten its branchie. It is very good to eat, and the great mass of fat accumulated under the tail of the larger ones. sometimes yields, when melted, as much as a quart of limpet oil. They are esteemed great delicacies, and are fattened for the table.

Several small crabs are destructive to the growing grain crops of the tropics. The rice plant grown on the bhulls at the mouth of the Indus, is much cut down by a small black sea crab, called by the people Kookee. Without any apparent object, it cuts down the growing grain in large quantities, and often occasions much loss.

The Land Crabs are migratory, and often take long journeys. They live in the interstices of rocks, in the clefts of trees, and bore holes in the ground.

The Eriocheir Japonicus of Manchuria is remarkable for its hairy hand. A curious little crab of the Malacca Straits has been called by Mr. Bate, Sphaeropodia Collingwoodi, because of its taking in sand to eliminate its food, and ejecting the sand in the form of a pill. The species is unparalleled. The Phylluromas are styled Glass Crabs. The large Spider Crab of the Japanese islands, Inachus Kampferi, has been measured 1½ feet from tip to tip. It is of a bright yellow, with crimson patches.

The Ocypode ceratopthalmus of Ceylon burrows in the dry soil, jerking out the sand to a distance of seven feet. Of the Painted Crabs, the Crabes peintes and Crabes violets of the French, Grapsus stigmosus, Herbst, is distinguished by dark red marks on a yellow ground. They are found on the reef to the south of Colombo harbour. The Paddling Crabs, Neptunus pelagicus, Linna., and N. sanguiinolentus, Herbst, have their hind pair of legs terminated by flattened plates, to assist them in swimming.

The larve of the crab are termed Zoce. The crab has periodic moultings, during which it escapes from its shell a soft, harmless creature, incapable of exertion or resistance, and would become an easy prey to any of the devourers so numerous in the sea, were it not that so soon as the denudation is complete, a stout crab of the same species takes care of it to the best of its ability, until a new shelly case grows, and is enabled again to protect itself, and present a strong back to its foe. If the sentinel be removed, another will be found to have taken its place after the next tide, and this will be repeated many times in succession. While the crabs are young, the change of shell is supposed to take place frequently, and there is probably a time when the changes cease. Crabs and other crustacea are said to cast away their limbs when alarmed or frightened, as on the occasion of a thunderstorm, or on the firing of a cannon, and this is believed to be true. When a claw has sustained any injury, it is cast off by the animal, and a new one in due time takes its place. Most land crabs are carrion feeders; a few are vegetarians. Swimming crabs, Polybuns species, are very plentiful.

The place of the crabs among the crustacea is well defined.

Latreille, Desmarest, Leach, the two Milne-Edwards, De Haan, Dana, Heller, and Stimpson, have been among the most prominent systematic writers on the Crustacea; and of the naturalists of the present day, M. A. Milne-Edwards of Paris, Mr. Miens of the British Museum, M. de Man of Leyden, and Prof. Wood-Mason of Calcutta, have paid
CRUSTACEA.

especial attention to the Crustacea of the Indian and Malayan regions.

CRUTTENDEN, G. S. J., an officer of the Indian Navy, author of a Report on the Micijartheza Tribe of Somali, inhabiting the district forming the N.E. point of Africa; also of a Memoir on the Western and Eastern Tribes inhabiting the Somali Coast of N.E. Africa; also of a Journal of an Excursion to Sansa, the capital of Yemen; Memoir on the Edo, or Tribes of the N.E. Coast, Somali Coast of Africa, Bombay, 1848. He was largely employed in surveying parts of the coasts of the south of Asia. He wrote a journal of his excursion into Dahar.—Bomb. Geo. Trans. 1844-46, 1847-49; E. I. Marine Surveys.

CRUZCOOL, an opening or strait separating Mascall Island from the Chittagong coast, north of the White Sandcliffs, which are in lat. 21° 37' to 21° 24' N.—Horzb.

CRYPSIRHINA VARIANS, a curious bronze-coloured mapgle, common to Siam and Java. C. varians is the Phrenotria temia, Horsfield, and seems to be of common occurrence in the Tenneria Provinces, where its presence was first remarked by the late Dr. Heer.—Wallace; Bryth.

CRYPTOCARYA, a genus of plants, all of them trees, of the natural order Lauraceae. C. amygdalida, Nees, of Patongg; C. floribunda, Nees, of Sylhet; C. Griffithiana; C. membraneus, Thw., of Saffragam, Ceylon, up to 2000 feet; C. Wightiana, Thw., of Ceylon; C. Stockski, D. C., Peninsula of India; C. Neighberriensia, D. C., Peninsula of India, are known species.—Voigt.

This very large, fine tree is not uncommon in the moist forests of the Western Ghats and in Ceylon, at elevations from 2000 up to 5000 feet; also in the Timneelly and Travancore ghats, Malabar and S. Canara. In Ceylon its timber is considered valuable for building purposes.—Thw.; R. Br.; Wall.; Beddome.

CRYPTOGAMIC PLANTS of the S. and E. of Asia have been little studied. They include acroges, byroges, thallogens, and protophytes; ferns, rushes, mosses, fungi, lichens, seaweeds, etc.; and from the lichen tribes and from the algae, fungi, mosses, and ferns, man derives nutriment and valuable products. Some form articles of commerce, particularly as food-plants, affording gelatinous and amlyaceous matter, and being useful in medicine and the arts. The flowerless cryptogamic plants include the
CRYPOPHELIUM.

seaweeds, Porphyra, sp., layer; Ulva, sp., green layer; Laminaria, sp., tongue; Alaria, sp., baffledlock; Iridea, sp., and Rhodymenia, sp., dulse.

Ceylon moss is Plocaria candida, and P. tenax is Chinese moss; Garcillaria hemichthecum is Coriscian moss, also the Laurencia obtusa. Australian moss is the Eucheuma speciosum; the edible seaweed of Valparaiso is Durvillaea utilis; Sphacelochoccus lichenoides is found on the British coasts. Irish moss is Chondrus crispus and Gigartina marina, and Cetraria Islandica is the Iceland moss. Several of the lichens furnish valuable dyestuffs, particularly species of Lecanora, Roccella, and Borreria anem. —Food, 105; Simonds.

CRYPOTHELIUM, a genus of plants belonging to the natural order Asclepiaceae. C. elegans, C. grandiflora, C. pauciflora, C. reticulata, and C. Buchananii occur in India.—W. Ic.; Voigt.

CRYPTOMERIA JAPONICA. D. Don.

Cupressus japonica, Thunb.

The suji, or Japan cedar, a beautiful and greatly admired tree of Japan and N. China, is a species of pine not unlike the araucaria of Norfolk Islands and Brazil. When growing luxuriantly, it is highly ornamental, rising from the ground as straight as a larch, and sending out numerous side branches almost horizontally from the main stem, which again drop towards the ground in a graceful and weeping manner. It is the finest of all the trees of Japan, rising to 60 and 100 feet high, and five feet in circumference at three feet from the ground. It is seen in the valleys, and to up 7000 feet on the mountains. The wood of the tree has a kind of twisted grain, and possesses great strength and durability. It is highly valued by the Chinese; and, from its beauty and straightness, is often used by the mandarins and priests for the long poles which are generally seen in front of their houses and temples. It is also well known and highly prized by the natives of Japan as an ornamental tree. It is a most conspicuous tree, evidently in high favour with the priests of Buddha, and well deserves to be so. It succeeds admirably in China, and has been introduced into England, where it is admired.—Fortune’s Wanderings, p. 128; Tea Districts, pp. 16, 212, 304; F. von Mueller.

CRYPTOSTEGIA GRANDIFLORA. R. B. Norium grandiflorum, Rox. | Palay, | Maleal, | Tam.

A climbing plant belonging to the family Asclepiadaceae. It is common in the south of India, and yields a fine silky fibre, capable of being spun into fine yarn, and of employment for many of the purposes to which flax is applicable, suited to the weaving of different qualities of cloths. It seems to be a good substitute for flax, as it is soft, plant, and susceptible of being split into the finest threads. The stalk contains a large percentage of fibre, besides yielding a milky juice, which solidifies into a gum-elastic of the nature of India rubber; but it has not as yet been collected for the purposes of commerce, and it is doubtful if a sufficient quantity could be obtained to render it an article of trade. The small samples obtained answer well for rubbing out pencil marks from paper. Mr. Underwood made a fair attempt at producing waterproof cloth by simply running the juice over the cloth.—M. E. F. R.

CRYPOTHELEA CONSORTIA, the wood moth.

CRYSTAL.

Cristal, | Fr., Sp. | Balur, | HIND., PERS.
Krystal, | Ger. | Cristello, | IT.
Koreh, | HEB.

The word for crystal alluded to in Genesis xxxvi. 40 as ice, and in Job vi. 16 as frost, and the Hind-Persic word Balur, seem to have been applied differently to ice and rock-crystal. Rock-crystal occurs abundantly in many parts of India, and that of the south of the Peninsula is known as yellow stone, from the place of its occurrence. It is said that rock-crystal, if made red-hot, and plunged red-hot into the tincture of cochineal, takes a ruby hue; if into a tincture of red sandal, it takes a deep red tint; into tincture of saffron, a yellow like the topaz; into a tincture of turkoses, a yellow like the topaz; into juice of nerpum, it takes a deep violet like the amethyst; and into a mixture of tincture of turkoses and saffron, it becomes an imitation of the emerald. Also by steeping the crystal in oil of turpentine, saturated with verdigris or spirits of wine, holding dragon’s blood or other coloured resins in solution, depth of tints are produced proportioned to the time of steeping. Crystals can be coloured if heated in a crucible with orpiment and arsenic. Crystals coloured red are false rubies, known in France as rubaces. Cups of rock-crystal were largely prized in ancient Rome; but even in Phiny’s time the price of agates, as he calls them, had begun to fail, and now-a-days the Cambay stones formation is so extensive, that the principal use of Cambay stones is as studs, paper-cutters, knife-handles, and nursery cups. —King, p. 178. See Cambay.

CSHITIA, Caesia. SANSK. The horizon; also the name of an arc referred to the horizon, used for finding the ascensional difference.—Warren, Kala Sangatoli.

CSOMA DE KOROS. Alexander Csonka de Koros was a highly learned Hungarian philologist, who died in 1842 on the Himalaya. A memoir of him appeared in the Bl. As. Trans. 1841. He bequeathed Rs. 5000 to the Asiatic Society of Bengal. He resided in Kunawar, and at Ladakh and Kanum, from 1828, for the sake of studying the language of the country. An account of Gerard’s interview with him appeared in the Gleanings in Science, 1829, i. p. 110. He wrote a Geographical Notice of Tibet in Bl. As. Trans. 1835, i. 121. The Buddhist religious works of Tibet, brought to notice by him, are the Tanjur, which consists in its different editions of 100, 102, and 105 folio volumes, and comprises 1053 distinct works. The Tanjur consists of 225 volumes folio, each weighing from 4 to 5 lbs. in the edition of Pekin; but an edition has also been published at Lhasa and other places; of these De Koros gave an analysis in the 20th volume of the Asiatic Researches. See Pali.

CETESIAS, b.c. 440-570, a Greek of Cnidus, of the Asclepiad tribe, a contemporary of Xenophon and Herodotus. He took service with the Greek mercenaries who joined Cyrus, son of Darius II., in his expedition against his brother Artaxerxes Mene mon, by whom he was taken prisoner at the battle of Cynaxa, b.c. 401, 41 miles from Babylon. He became physician to Artaxerxes Mene mon, king of Persia, at whose court he resided for 17 years. During his residence he was able to consult the public archives, and he compiled from them a history of the Persians and of their predecessors in the empire.
of Asia. He also wrote an account of India and its productions, but the absurd exaggerations and fables which this contains have caused all his other works to be viewed with suspicion. He is likewise accused of being led, by extreme jealousy of Herodotus, into direct mis-statements, that he might contradict that historian. Aristotle more than once declares him to be unworthy of credit; and modern critics have generally agreed to reject altogether, or to receive with great reserve, all his assertions. Yet Diodorus Siculus and several ancient authors appear to have followed and trusted him, and may be observed that whilst more travelled than Aesop and Togus, the works of Ctesiphon probably the only sources of his Indian marvels, written records and monuments may have furnished him with well-authenticated historical facts, to assist him in compiling the history of the country in which he resided, and of which he had a personal knowledge. Unfortunately, of his history very little remains, except the names of kings. Much relating to Assyria, contained in the works of others, was, however, undoubtedly copied from him. Ctesias and Isidore both mention a statue pillar of Semiramis at Baptae, but these and the Syriac inscriptions have disappeared. Ctesias mentions the use of swords as lightning conductors.—*Smith's Dictionary of Gr. and Rom.*

CUBERO. The Babylonian empire was succeeded by Cyrus, who is said to have taken the capital by turning the course of the Euphrates, and marching his troops along the bed of the river into the centre of the city. The walls and temple of Belus are said to have been demolished by Xerxes on his return from the Grecian expedition; but if so, they must have been rebuilt, as they were standing in the time of Alexander. After the building of Seleucia and Ctesiphon, Babylon became gradually deserted; and we learn from St. Jerome that the space within the walls was converted by the Parthian kings into a royal hunting park. From this period we cease to hear of Babylon as a city; but, notwithstanding that so many ages of barbarism and ignorance have passed away, tradition still continues to identify both its name and situation. The town of Hilla is said by the people of the country to be built on the site of Babel; and some gigantic ruins, still to be seen in its vicinity, are believed to be remains of that ancient metropolis. From her fallen towers have arisen not only all the present cities in her vicinity, but others which, like herself, are long ago gone down into the dust. Since the days of Alexander, we find four capitals at least built out of her remains,—Seleucia by the Greeks, Ctesiphon by the Parthians, Al Modain by the Persians, and Kufa by the Khalifs,—with towns, villages, and caravanseris without number. The ruins of Ctesiphon are to be seen on the eastern shore of the Tigris, 15 miles south of Baghdad; and immediately opposite to it are the ramparts and fosse of the Grecian city of Seleucia, which afterwards becoming identified with the former under the name of Coche, they assumed, when thus united, the epithet of Al Modain, or the cities. Ctesiphon was most admirably situated, on a sort of peninsula formed by a sudden flexure of the Tigris, which must have embraced the greatest part of the town. Its foundation, however, can hardly be ascribed to any particular person; as it would seem to have increased gradually, during a succession of many years, from a camp to a city. Pacoras, supposed to be Orodas, king of the Parthians, and contemporary with Anthony, is thought to be the first who surrounded it with walls, and made it the capital of the Parthian empire. It was sacked, together with Seleucia, by the generals of Marcus Aurelius, A.D. 165, and afterwards by the emperor Severus. It became the favourite winter residence of the powerful successors of Artaxerxes, from whom it was taken by Said, the general of the khaliif Omar, A.D. 657. The capital was taken by assault, and the multitude that resisted the attack is said to have leaped into the river to escape to the sabres of the Mahomedans, who shouted with religious transport, 'This is the white palace of Chosroes! this is the promise of the Apostle of God!' The sack of Ctesiphon was followed by its desertion and gradual decay. The Arabs disliked the air and situation of the place, and Omar was advised by his general to remove the seat of government to the western side of the Euphrates; and little now remains but part of the palace of Chosroes, called Tak-i-Kesra, the Arch of Chosroes. It is seen from afar on the plain, and presents a front of 300 feet in length by 160 in depth, having in its centre a vaulted hall 100 feet in height to the top of the arch, the span of which is 85 feet. The Ali Capi at Isfahan, and gates of the palace of Dehil, sink into insignificance beside the Tak-i-Kesra. The city walls, which appear to have been of very great thickness, may also be traced to a considerable distance on both banks of the river. The names of Seleucia and Ctesiphon are very frequently confounded by the early Christian writers; but the cities stood on opposite sides of the river Tigris, and were built at different periods. Mr. Jackson, when proceeding up the Tigris in 1797, passed by the ruins of Ctesiphon, which that river had considerably undermined. There were visible a great many earthen jars, some half-exposed, others ready to fall into the river. Captain Mignon dug into the sides and bases of many of the mounds at the Tak-i-Kesra, and found their foundations invariably composed of the fire-burnt brick.—*Layard, Nineveh, i. p. 242; Kinney's Geographical Memoir, pp. 255-254, 273, 274; Porter's Travels; J. B. Fraser's Travels.*

The cubeb pepper of commerce is stated to be the fruits of Piper cubeba and P. carica, both of them natives of Java, to which island their cultivation appears to be confined. Dumki mirchi and lada bacakor, meaning 'tailed pepper,' are derived from the appearance of the dried fruit, which has always the footstalk adhering to it. — *Irvine; Cranfield's Dict.* p. 117.

CUBERO. Don Pedro Sebastian Cubero, author of the Peregrinacion de la Mayor Parte del Mundo, published at Saragossa 1688. He set out about 1650 from Moscow, with the Russian ambassador, to the court of Persia. From Ormuz he sailed to Damany (Daman?), Surat, and Goa, where he found the capital of Portuguese Asia in a state of miserable decay, and its trade almost in the hands of the Dutch.

CUCUBALUS DRABA. Gartner. A plant of the alpine vegetation of Kodarnath.—Hofmeister.

CUCULIDE, the cucumber family of birds, is of the tribe Scansores. Their outer toe is versatile, usually turned back. They mostly live on insects, a few on fruit. Some hatch their own eggs in nests constructed by themselves, others deposit their eggs in the nests of other birds. This family is divided as under:

Himalaya regions. It is cultivated in Persia and Afghanistan, the Panjab, and all over India. From time immemorial Kashmir has been famous for the excellence and abundance of its melons, which form a staple article of the food of the inhabitants; and the melon of Multan and Jang are excellent. Dr. J. L. Stewart says that this fruit rapidly degenerates if sown in the plains. In Kabul it thrives, and is in perfection in October and November, when the first frost touches the plant. It is largely taken for sale to Peshawur.

CUCUMIS MOMORDICA. 

Phunti, | Beng. Karkari; Karkatai, Tam.
Phunt; Tut; | Hind. Pedda dosa kaia, Tel.
Kukra, | Panj. Mullu dosa kaia,

Cultivated throughout India; when young, is a good substitute for the common cucumber. Seeds occasionally ground into a meal. When the fruit is ripe, if eaten with a little sugar, it is little inferior to the melon, and reckoned very wholesome; natives use it in curries.—Roxb.

CUCUMIS PUBESCENS. Wild.

C. maderaspatanus, Roxb.

Kakri, Bun-gunuk, Hind. Single, China.
Rasu, Pers. Keiti, Nella kidins, Tel.

Grows wild in South India, in the Panjab, Hindoostan, Bengal, and the Peninsula. Its small fruit is eaten by the natives, though they do not cultivate the plant; on ripening it becomes aromatic.—Roxb.; Voigt; Stewart; Irvine.

Cucumis dudain, Queen Anne's Pocket Melon, is a native of Persia, and produces a fruit variegated with green and orange, and oblong unequal green spots; when full ripe it becomes yellow, and then whitish. It has a very fragrant vinous musky smell, and a whitish, floury, insipid pulp.

CUCUMIS SATIVUS. Linn. Cucumber.

Kusad, | Arab. Khyiar.
Fakari, | Dakh. Mutrula, Sookasa, Sansk.
Fakari, | Eg. Rata kacari, Singh.
Kadarko, | Hind. Pilu, Amba.
Antinam, Timman, Mal. Malu veleri, Tam.
Mullen velleri, | Maleal. Vellerakai,
Khiro, | Panj. Dosa kaia, Tel.

This is commonly grown and largely used over all India, but most Europeans find it difficult to digest. Cucumbers of the C. sativus and C. utilissimus are consumed in immense quantities by the Kares and Burmans, who seem to prefer them large and yellow, rather than pluck them when green and tender. The seeds of this and of C. utilissimus are considered cooling.

CUCUMIS TUBEROSUS. Heyne.

Adulay kai, | Tam. | Casara kaia, Tel.
Nellay piku, | |

This is a pot vegetable, eaten by the people in cry. It grows wild in cotton soils of North Tennesse. It is very prolific, and on waste lands, headlands, etc., in great abundance. A coolie load of tubers gives six large measures of fine flour, considered by the natives a most excellent breadstuff. One measure of the flour is considered equal to two measures of the Panium glossarium, which latter is the staple food of North Tennesse. The tubers are washed and peeled, then bruised on a rough stone, after which it is washed precisely like arrowroot, the washing extending over seven or eight days, when the starch is dried in the sun. The flour is almost as white as arrowroot; it is reduced to conje quite as easily, by pouring boiling water upon a spoonful or two which has been first moistened with cold water. The fruit, a small capsule used in sweetmeats, is known as the Adulay.—Roxb.; Rev. J. F. Keccott, in Agri. Hort. Soc. Proc. 1862.

CUCUMIS UTILISSIMUS. Roxb.

Kiza-ut-tani, | Arab. Rakari, Karkari, Hind.
Kanka, also Karkari, Beng. Khyarih-badang, Pers.
Tha-khwa, | Bum. Dosa, Nakka dosa, Tel.
Gurkel lange, | Ger.

Cultivated throughout India; and Dr. Stewart has seen it at 6000 feet, on the Ravi, in the hills. This gourd attains 2 or 2½ feet, and is stated to reach the extraordinary length of 5 feet. When ripe, if carefully gathered and suspended, it will keep good for several months, from which circumstance they are valuable for long voyages. It is pickled when half grown. The seeds, like those of the other cucurbitaceous fruits, contain much farinaceous matter, blended with a large portion of mild oil. The natives dry and grind them into a meal, which they employ as an article of diet; they also use them a mild oil from them, which is prepared from the seeds and to burn in their lamps. The seeds are highly nourishing, and well deserving of a more extensive culture than is bestowed on them at present. The powder of the roasted seeds mixed with sugar is said to be a powerful diuretic, and serviceable in promoting the passage of sand or gravel. In Roxburgh's time, in the Guntur, during the Cireen, these seeds formed a considerable branch of commerce.—Roxb.; Cat. Exs. 1862; Hong.

CUCURBITA, a genus of the Cucurbitaceous, which includes all pumpkins, gourds, squashes, and vegetable marrow, and of these there are innumerable varieties.

C. moschata, Duchesne, is the musk gourd.
C. melopepo, Linnaeus, the squash gourd, can be stored for months. It is supposed to be a variety of C. pepo.
C. pepo, Linnaeus, the pumpkin, is largely grown in particular localities. Its naturalization in desert tracts would be a boon.
C. aurantia. — ? Yin-kwa, Chin. A deep golden-coloured gourd of Cheh-kiang. It is rather more tender than the other species.
C. lobata. Tinda, Panj. In the Panjab this is a small round gourd when young, at which time it makes a most delicious vegetable for the table; the fruit is not bigger than a small turnip.—Powell; Eng. Cyc.; Smith.

CUCURBITACEAE. A natural order of climbing or creeping plants, the gourd tribe, chiefly natives of hot countries, ranged by Meisner under 35, and by Endlicher under 28 genera. Of these, there occur in Egypt, Abyssinia, and Arabia 8, in Astracan and Persia and the Levant 3, in China and Japan 6, and in the East Indies 100 species, of which 40 are natives of India,—arumcula, benincasa, bryonia, bryopis, citrullus, cocinea, cucumis, cucurbita, erythropical, heteropercum, gymnopetalum, karuia, lagarica, luffa, melothria, morridnea, mukia, pioigne, siccyos, trichosaenthes, Zehneria. Some of these species afford cathartics of remarkable power, others have useful edible fruits. The fruit varies much in size, form, and external characters, but is generally fleshy within, and its pulp is often so saturated with water that it cannot be dried. The roots of most of the order contain starch.
often associated with an acrid poisonous matter, which can be separated by washing the powdered root with water, in which the acrid matter dissolves, while the starch is left. The seeds of most of the order are of a mild sweet taste, give good emulsions with water, and yield a fixed oil by expression. Few of the plants of this order are indigenous in Europe. In tropical countries this fruit is a large or abundant portion of their food, which it often affords of the finest quality in the most arid deserts, or on barren swamps and islands. In Persia, China, and Kashmir, they are cultivated on the flats, on the floating collections of weeds common in these localities; in India they are very abundant, either in the wild or cultivated state. According to Dr. A. Hunter, the Cucurbitaceae abound in fibres of great length. The following are the chief dietetic species:—

**Cucurbita maxima.** The seeds yield oil by expression, and are considered cooling.

C. ovifera, L. Vegetable marrow.

**Beniness cerifera, Peth.**

C. Madarapatapessis, Roxb. Fl. Ind. iii. p. 723.

C. puteseens, wild, common near Saharanpur; becomes aromatic on ripening.

C. momordica, Phoot.

C. sativus, cucumber, Kheera. Fruit contains sugar; seeds yield a mild oil.

C. utilissimus, Kurkee.

C. pentandra, China.

L. momordica, Kalee-tori.

Moromdia chantamia, Kureala. Fruit slightly bitter.

Trichosanthes anguina, Chuchingh. T. dioka, Pulwal.

T. cucumina, Janglee-chuchinga.

**CUCURBITA MAXIMA.** Duch.

Cucurbita melopepo, Roxb. | Pampkin; Gourd.

C. coccata, China.

Shah, pha yung, BURM.

Pha yang kha, ...

Nam-kwa, Kuang-kwa, CHIN.

Red or squash gourd, Eng.

Mitha kaal, HIND.

Halwa kudda?

Cultivated throughout India, in Kashmir, up to 6000 or 9000 feet, and in Ladakh up to 10,500 feet. It is made to trail over houses and trees. It needs much water and good soil. The fruit is very large; when boiled, it tastes like a young carrot, and is used in various ways; its leaves are boiled as greens. This gourd is presented with great ceremony in China to married children who, on the evening of the festival of mid autumn, which happens on the 15th of the 8th month of the Chinese year. In India the tallow gourd is presented to a wedded pair.—Voigt; Stewart; Gen. Med. Top.

**CUCURBITA OUVIFERA.** Linn.

Vegetable marrow, Eng. | Simai-pusini kai, TAM.

This is the most wholesome of the Cucurbitaceae, and is largely grown by the market gardeners of India. It is said to be indigenous at Astracan; it is an excellent vegetable, of easy culture in good rich soil.—Jeffrey; Voigt.

**CUBBEAR.** is the Tsze-fen and Shih-ju of the Chinese. It is a powder procured from the Lichen Tartaricus, a plant found in Iceland, used in dyeing violet, purple, or crimson. Its colours are not durable when it is employed alone, and it is therefore used as a body to other expensive dyes, as indigo, cochineal, etc., making them more lively. It is used but little by the Chinese, and the demand in that market is not great.—Compendious Description. See Dyes.

**CUDDARLOR.** a town on the Coromandel coast, in lat. 11° 42' 45" N., long. 79° 48' 45" E.; population, 40,464. It is in the South Arcot district, and has the three parts of old Cuddalore, Munja Coopum or New Town, and Fort St. David, the last of which, in 1864, Nunbaji gave permission to build. In 1767 the fortifications were rebuilt; and after the capitulation of Madras to the Bourdonnais in 1766, Fort St. David became the seat of government. The French advanced against this fort in 1766, but were defeated by Mahfuz Khan. Duplex besieged it, but retreated; and he subsequently, in 1749, failed in a night attack on the town. Major Lawrence made it his headquarters. In 1758 Lally took Cuddalore town without opposition; and on the 24 June 1758 Fort St. David surrendered, and the fortifications were razed. In 1760 it was retaken by Colonel Coote, but in 1782 was again taken by the French under M. Bussy.—Findlay.

**CUDDAPALL.** a town in lat. 14° 28' 49" N., and long. 78° 51' 47" E., which gives its name to a revenue district of the Madras Presidency, lying between lat. 13° 25' and 16° 20' N., and long. 77° 55' and 79° 40' E.; area, 8567 square miles; population, 1,351,194. It has the districts of Kurnool and Guntur on the north, and Mysore and North Arcot on the south. The river Pennar enters the district at Tallapadattoor, and, after many windings, passes by Sidwhut within nine miles from Cuddapah town, and flows in an easterly course to the Bay of Bengal.

There are diamond mines about 7 miles northeast of the town of Cuddapah, on both banks of the Pennar. Iron ore is abundant in the hills. Cotton, wheat, and indigo are the chief crops. This district formed part of the territories of the Bijanagar dynasty. In A.D. 1589 it fell to the armies of the Kutub Shai dynasty of Golconda, who sacked the city, and broke the idol of the great temple. It was afterwards under the Adal Shahi rulers of Bijapur, later on taken by Hyder Ali about A.D. 1779, and its ruler, Halim Khan, carried captive. In 1800 it was ceded by the Nizam to the British. The chief towns are Sidwhut, Jummal Madagoo, Badwail, Palgoor, Adullu, Gildalore, and Jungam-rapug. In the district are 108,676 Mahommedans and 4973 Christians.

The non-Aryan migratory tribes are the Yanadi, a hill tribe of small stature, determined plunderers of the shepherd flocks, but are valuable as foresters.

The Yerkalas are wholly migratory and predatory; steal into houses at night, and wrench the jewels from the ears of the women and children.

The Chenchuwar, a physically fine race of men, but incorrigibly predatory and regardless of human life.

The Sugoli, a wandering, pilfering race, who have a picturesque costume.—Imp. Gaz.

**CUDDING** of Coorg, a breastwork.

**CULCUNI,** a Tamil accountant.

**CULITLAWAN BAIRK** is obtained from several species of cinnamonum trees.

**CULLEN, General,** of the Madras Artillery, long a resident at the court of the Jaffreys of Travancore; for half a century a contributor to physical science in India. He wrote on the Geological

CUMELLA EXCELSA. W. Ic.

Kattoo-bolde, SINGH. Malai konji maram, TAM. Kattoo heritya, Durio zeylanicus, Gard. A tall tree of the southern part of the Peninsula of India, and common in the central province of Ceylon, at an elevation of from 3000 to 5000 feet; trunk straight, from 60 to 80 feet high. Wood white, rather open-grained, apparently not very good, but the outside wood only was examined. Under the microscope, its longitudinal section is very peculiar.—Wight; Gibson; Thw.

CULLEN'S LIQUID, for preserving wood and iron, is a mixture of two measures (by bulk) of coal-tar to one measure of quicklime and one of powdered charcoal. Lime is freely dissolved in coal-tar, with which it forms a cement which takes readily to wood, brick, iron, or other building materials, however wet, and which sets with nearly the cohesion of mortar or hydraulic lime. With the addition of the charcoal, mixed in an exceedingly fine state, it is found that white ants, which attack and destroy creosoted wood, were effectually excluded, carbon, it appears, being especially poisonous to them. Six pieces of decodar, or Himalaya pine, were buried in a place particularly infested with white ants, three of the pieces being protected by Cullen's preparation, and the three others being left in their natural state. At the end of five months the blocks were dug up, when those which had been coated were found to be as sound as when put down, while those which had been left unprotected were found riddled with the perforations of the ants.

In the case of iron, creosote is believed to be a complete protection in ordinary soils, but in salt-petre soils is said to be of no use whatever. Six pieces of thin iron were buried, three being coated with Cullen's preparation, while the others were left as they were cut from the original plate; the coated iron was completely protected for the time tried, whereas the pieces put down in their ordinary state were found to have been much rusted.

CULLUKA, an ancient Hindu commentator on the book of Menu, the Hindu lawgiver.

CULTIVATORS of the soil in British India are known as the ryot and the zamindar, the former being an Arabic word, the latter from the Persian. The Tibetans style them Glupa. In India, the chief cultivating races are the Jat, Kapa, Khassa, Kunbi, Kurni, Mala, Wakkala, Vallalar, and the bulk of them are co-proprietors with the rulers. Menut says cultivated land is the property of him who cut away the wood, or who cleared and tilled it,—an ordinance binding on the whole Hindu race, and which no international wars or conquest could overturn. In Bengal, a man with a helping boy, with a plough and a pair of bullocks, will cultivate as much as three acres, or even more. Throughout India their crops are designated by the seasons at which they occur, as Bhaduwari, Kharif, Rabli, or Rajastan, i. p. 496. See Agriculture; Crops; Soil.

CUMBAH, in Hindu astronomy, the solar sign Aquarius. In explanation of the analogy between the vessels emblematic of the Isæ of the Nile and the Ganges, there is a festival sacred to the sage Agastya, who presides over the star Canopus, when the sun enters Virgo (Kanyas). The Camacumpa is then personified under the epithet Cumbha-yoni; and the votary is instructed to pour water into a sea-shell, in which, having placed white flowers and unground rice, turning his face to the south, he offers it with this invocation, 'Hail, Cumbha-yoni, born in the sight of Mitra and Varuna (the sun and sun divinities), bright as the blossom of the cusa (grass), who sprang from Agni (fire) and Maruta.'

CUMBLI, TAM., Tel., Gardena lucida, yields the Ruda-cumblis, a strong diuretic herb, for cleansing foul ulcers. It is used by some European practitioners in case of worms in children.

CUMBLI, HIND., also written Kamli, Cumul, and Camul, and also called Cameline, is from the Sanskrit Kamal, a blanket, and is a coarse woolen blanket worn by the peasantry of all India, and sold at Rs. 1½ to 100. Cumblis are woven in almost every district of India of the wool of the country, which is spun by hand. The yarn is sized with the juice of the common squill; the woof is beaten with a hand batten (in the way that sailors adopt in forming mats for protecting the rigging), no reed being used; a finer description of cumblis, of which the sepoys clacks were formerly made, is manufactured at Ellora in its neighbourhood. Mysore cumblis of superior quality, in black and white colours, are sold at from Rs. 25 to 100 each; ordinary sizes, Rs. 4 to 20 each. Bullary cumblis are well made, but are not of so high value as those of the Mysore district; they are 6 cubits long by 3. The cumblis is usually made in pieces of two or three feet broad, and five or six or more long, and generally very coarse, of a dark or black colour. Sometimes, however, they are manufactured larger and finer, and striped or spotted black and white. There may be some connection between the Sanskrit word Kamal and the Grecian Chlamys and the Latin Chlamys. It is barely possible, also, it may not be unconnected with the Arabic Kamis, from which we have the Italian Camicia, the Portuguese Camisa, and the French Chemise. The Chlamys was generally, like the Cumbl, made of wool, and in shape it was much the same, being half the breadth of its length. A similar connection may perhaps exist between the Persian and Hindi Suya, the Latin Sagum, and the modern Spanish Saya. Good cumblis are made in Ulwar, and in the neighbourhood of Meerapur in Meerut. The Sansala cumblis of Meerut sometimes sells as high as 25 rupees. It is made of the wool of lambskins, shorn about three days after their birth.—Elliot, Supp. Gloss.; Hindu Infanticide, p. 195.

CUMBUM, a town in lat. 15° 34' 18" N., and long. 79° 91' E., in the eastern part of the Kurnool district; has a tank of 15 miles circumference, formed by damming up the Gundla Kama river.

CUMIN. The black cumin of Scripture is the Nigella sativa, the aleuæ of Hippocrates and Dioscorides. The Helleborus niger, however, has also been named cumin.
CUMIN SEED.

CUMIN SEED, Cuminum cyminum.

Kanum; Khamn, ARAB. Cuminum; Comino, L., Sp. Zey. 2; Zeey. BURM. Comininho; Porr. Jirga, CAN. Durru, SINGH. Komanne, DAK. Siragum, TAM. Shah, Zira, DURK. Nut-siragum, TEL. Koomyn, DUR. Jilakara, TEL. Kumin, GER. Kemnun, TURK. Kuminon, GR.

Cumin seeds, the fruits of Cuminum cyminum, are of an ash-grey or light brown colour. Taste warm, but not so agreeable as anise. It is extensively cultivated in the East, but has long been introduced into the south of Europe, Sicily, and Malta. It is found in the Sutlej valley between Rampur and Sunnmam, at an elevation of 7000 to 9000 feet, and its seeds are exported to the plains. 16 cwt. of the fruit yield about 44 lbs. of the oil, which has a pale yellow colour, and is limpied, of a disagreeable smell and acid taste; sp. gr. 0:345. The seeds are used as a condiment in India, and the oil is used in medicine; it is a stimulant carminative. The seeds were formerly much employed as an external application in emphysema and cataplasma cumini, and still by Jews in the process of circumcission. The seed is particularly prized by the Mahomedans, who season their cakes with it.—Annie R. Roche; Roy Rover, Stewart Mason; O'SK.

CUMMUM, a town in the Hyderabad dominions, where seams of coal have been struck. CUMPAS. — A light, brown-coloured wood of Penang, a large tree, used only for planks. CUMRBAND, HIND. Waist-belt. Kannarbandha means literally, to gird up the loins. CUNALAH PALLAH. — A bamboo-coloured wood of Travancore, used for saddles.

CUNEIFORM CHARACTER, also called the arrow-headed, also the wedge-shaped character, was used for the Bactro-Med-Persian language of the dynasty of the Achemenides. It was first observed at Be-situm, a little village at the foot of rocky mountains, which are covered with bas-reliefs. Cuneiform or wedge-like writings have been discovered on the solitary monument of Cyrus, on the Marshab, on the ruins of Persepolis, on the rocks of Be-situm, near the frontiers of Media, and on the precinct of Van in Armenia. It is generally supposed that the cuneiform character was invented about 1000 B.C. according to the time of Darius; General Ferrier supposes that it was invented by the Iranians of ancient Persia, who are the authors of their characters. The first cuneiform character was Median or west Iranian, and is to be distinguished from the alluvial plain of Babylonia furnished with clay, and the use of such a writing material will easily account for the vertical direction in which the characters were made to run.

The inscriptions in the Nashi-i-Rustum is a list of the Persian nations subject to Darius; the Persians attribute them to the chisel of their famous sculptor Farahad. A description of them is to be found in Sir John Malcolm's Persia. Enormous marble capitals of columns are to be seen at Be-situm. There are two tablets, the one containing a mutilated Greek inscription, declaring it to be the work of Gotarzes; the other a Persian politian sculpture, adorned with nearly 1000 lines of cuneiform writing, exhibiting the religious vows of Darius Hystaspes after his return from the destruction of Babylon, on the revolt of its usurper, Nebuchadrezzar, the pretended son of Nebuch. Both Ctesias and Isidore mention a statue and pillar of Semiramis at Bactane, but the sculptures of Semiramis and the inscription in Syriac characters have wholly disappeared. Baghidstan is traditionally described as the pleasure-grounds of Semiramis. According to Sir H. Rawlinson, D'Anville first suggested the identity of Be-situm with the Baghistan of the Greeks, and there are good grounds, from the ancient notices of this place, for supposing him to be correct. Eymond, really confused the evidence is even more striking. To solve all difficulties may perhaps, he adds, be admitted that the sculpture did really exist in the lower part of the rock, scarped by the Assyrian queen; and that Khusrv Farvez, when he was preparing to make the scarped surface the back wall of his palace, and for that purpose began to excavate deeper in the mountain, destroyed the sculptures, and removed all further trace of them. With regard to the pillar of Semiramis, it is very curious that an oriental writer of the 15th century should describe the rock of Be-situm from his own observation, as though it were sculptured in the form of a minarch or minaret. Certainly nothing of the kind now remains. Their language is ancient Persian, before that of the Zend, which represents the Persian language previous to the time of Darius. General Ferrier says the existence of bricks with cuneiform characters among the rivers of Balkhi, had been remarked by profuseous travellers, and, he adds, is of much interest, as no other similar relics are known so far to the east. Sir Henry Rawlinson suggests that they may belong to the Kushan (a famous Scythian race), who held Balkh in remote antiquity, and whose bricks, stamped with cuneiform Scythic legends, are also found at Susa, and on the shores of the Persian Gulf. M. Ferrier found great numbers of baked bricks, nearly three feet long and four inches thick, scattered about the citadel of Furrah, an ancient town which was plundered by Chengiz Khan. That their origin was certainly anterior to that of the town, was plainly indicated by the inscriptions upon them, in the cuneiform character. The existence of bricks with cuneiform characters at Furrah is very important, and is not mentioned by any other traveller. The size of the bricks is also remarkable. The only place where bricks of so large a size have been found, is in the kitchen of Sardanapalus, at Calah or Nimrud. Bunsen says the first cuneiform character was Median or west Iranian, and is to be distinguished from the
language of the Zend books, which is east Iranian, or Old Iranian worn down.

Cuneiform inscriptions of Armenia, Azerbaijan, and Elymais, are in Scythic or Turanian dialects. The third column of the trilingual inscriptions of the Zagrus range is also Scythic.

A clay tablet has been found at Cappadocia, relating to the gift of certain silver articles to the sun-god. The character is a peculiar kind of the cuneiform; and tablets with the same character have been found by Mr. Rassam in 1880 at Kounjuk. From this it is supposed that Cappadocia also had a clay library. A collection of 5,000 cuneiform tablets were discovered by Mr. Rassam at Sippara, near Babylon. It is supposed that these tablets are the library mentioned by Berossus, which contained antediluvian records copied from earlier documents by King Sargon I, who lived 1800 years B.C.—Bunsen, iii. pp. 457, 570; Ed. Ferrier, Journa, pp. 207, 393; G. Rawlinson, ii. p. 345.

CUNG-QUA, a resting-place for travellers, or rather for officers of Government, in Lin-Choo. The Cung-qua corresponds very nearly to the Turkish khan and the Indian sarai, except that, being used only by persons of some consideration, it is in every respect far more neat and elegant. The house resembles a private dwelling of the better class.—American Expedition to Japan, p. 189.

CUNNINGHAM. Four brothers of this name, sons of Allan Cunningham, sought a career in India, two of whom rose to distinction.

Cunningham, J. D., an officer of the Bengal Engineers, an extensive contributor, chiefly on archaeological subjects, to the Journal of the Bengal Asiatic Society. A distinguished antiquary, statistic, and geographer. Resident at Bhopal; ob. 1851. Author of Description of Kunwar, in the Bl. As. Trans., xiii. part 1, 1844; On the Ruins of Putharee, ibid., 1848, xviii. part 1, 305; On the Lingam of Bhojpur, ibid., 154; Notes on the Antiquities within the Districts of the Bhopal Agency, etc., ibid., 1847, p. 783; History of the Scikhs, Lond. 1829; Cal. Rev. No. xxvii.

Cunningham, General A., of the Bengal Engineers, author of Discovery of Buddhist City of Sankassa, Lond. As. Trans. vii. p. 242; Journal of a Trip through Kulu and Lahul to the Chemuneri Lake, in Ladakh, Bl. As. Trans. 1848, xvii. 201; Memorandum detailing the Boundary between the Territories of Maharaja Gulab Singh and British India, etc., ibid. 295; Verification of the Itinerary of Hiwen Thang through Ariana and India, ibid. 476; Proposed Archaeological Investigation, ibid. 555; Description of Ancient Gems and Seals from Bactria, the Punjab, and India, ibid., 1841, 147; Essay on the Aryan Order of Architecture, as exhibited in the Temples of Kashmir, ibid., 1818, 241; Descriptions of, and Deductions from the Consideration of, some new Barbarian Coins, ibid., 1840, ix. pp. 867, 1217; Bhisham, ibid. 158, 1571; he was appointed Superintendent of the Archaeological Survey of India, and has printed annual reports; subsequently the Rev. James Burgess was appointed to the Survey of the Bombay Presidency.

Colonel Francis Cunningham, the youngest son, joined the Madras army, and almost immediately took part in the Afghan war, and was in Sale's brigade. He was one of the besieged garrison of Jalalabad.—Dr. Büst's Catalogue.

CUNNINGHAMIA LANCEOLATA. The lance-leafed pine. In parts of China is in great abundance; indeed, this species, and the more common Pinus Sinensis, are almost the only trees of any size which grow in some mountainous districts.—Fortune's Wanderings, p. 38.

CUNNINGHAMIA SINENSIS. R. Br. San-mah, Sha-mah, Chins. | China pine, . . . . Eng. Grows in China and Japan, at a distance from the sea-coast. Timber valued for making coffins, flooring, furniture, house-frames. It is less liable to the attacks of insects than the Pinus Sinensis, but in damp ground is less suited for piles, particularly if exposed alternately to air and damp. Its charcoal is used for gunpowder.—Smith.

CUON RUTHIANS. Jerdon. Wild dog.

Canis Dukhunensis, Sikes. C. familiaris, var., Elliot. | Cuon primus, Hodgson.

Sonak, Bankutta, . . . . Sidda-ki, Tel.

Rahmna, . . . . Reza kuta, Tel.

Sakki sarai, HYDERABAD. | Advai kuta, Tel.

The Cuon rutilans is common in Ceylon, and is found over all the Peninsular, jungles of the Dekhan, and S. Mahatra country, Malabar, Neilgherries, and Assam, Burma, and the Malay Peninsula. See Dog.

CUP. | Coup.

Coupe; Tasse; Gobelet, Fr. | Cappa; Tazza, It.

Becher; Schluck, Ger. | Bicke, Sc.

Piala, | Copa; Tazza, Sp.

Several of the drinking races of India and Asia use the cup or piala to welcome the coming guest. Colonel Tod tells us (p. 377) regarding the love of strong drink and indulgence in it to excess, so deeply rooted in the Scandinavian, Asi, and German races, in which they show their Greek origin, that the Rajput is not behind his brethren either of Scythia or Europe. Though prohibited by ordinances which govern the ordinary Hindu, the Rajput welcomes his guest with the nunwar piala, or cup of request, in which they draw ancient eunuchs. The heroes of Odin never relished a cup of mead more than the Rajput his madhava; and the bards of Scandinavia and Rajwara are alike eloquent in the praise of the bowl, on which the Bardhus every metaphor, and calls it ambrosial, immortal. The Bard, as he sips the ambrosia, in which sparks the ruby seed of the pomegranate, rehearses the glory of the Rajput race. Even in the heaven of Indra, the Hindus warrior’s paradise, akin to Valhalla, the Rajput has his cup, which is served by the Apsaras the twin sister of the celestial Hebe of Scania. ‘I shall quaff full goblets amongst the gods,’ says the dyaus, Geier warior, ‘Ide laurel of the sentiments which would be appreciated by a Rajput. Cups in use with the Tibetans are made of mule knots, produced on the maple by the Balanaphora. Those in use by the ultra-Gangetic races in Burma, and the Shan States, are lacquered bamboo; those of China and Japan are of porcelain.—Rajasthan.

Cupania is a genus of plants belonging to the natural order Sapindaceae. C. pentaphylla is figured in Wight's Icones; C. lavis grows in Bourbon and Mauritius; C. Madagascarensis grows in Madagascar. C. canescens is a tree of the Circars and Kandula, and common in the Upper Ghat jungles of the Bombay side. Wood of average quality, white; not equal to Sapindus rubiginosus, and does not bear exposure.—Dr. R. Devo., Giffon, Voigt, p. 44.

CUPPAS SAPIDA. Conbusis, Bilghia sapida, Kos.; a native of Guinea, cultivated in India for its wood. It is the Akke of Africa, and was introduced into the W. Indies by Brigham.—Voigt.

CUPID. An article of female jewellery worn on the head.

CUPID, the Cupidon of the French; Cupido, Liebesgott der Germans; Kama of the Hindus. Amongst the Hindu deities Kama takes the place of Cupid. Ananga is a poetical epithet of the Hindu Cupid,—literally, incorporeal, from a, private, and Anga, a body.—Rajasthan, i. 255.

CUPPAY MAYNIE. Singh. A plant, according to the natives, with which cats are so enchanted that they play with it as they would with a captured mouse, throwing it into the air, watching it till it fall, and crouching to see if it will move. This seems the billi-boa, the Acalypha indica, one of the cat-rolling plants, species of valerian, melissa, or nepeta.—Teenan, Ceylon.

CUPPUM. A fishing hamlet.

CUPRA, a human skull, the calvarium, in Hindi dialects pronounced cupar. The cup of the Scandinavian warrior was a human skull, that of Thor, the god of battle, in which they showed their thirst of blood, borrowed from the chief of the Hindu triad, Har, the god of battle, who leads his heroes in the red field of slaughter with the cupra in his hand, with which he gorges on the blood of the slain.—Tod.

CUPRESSUS, a genus of plants of the natural order Pinaceae, of which there are several species. C. Australis, Pers., is a tree of New Holland; C. fastigata, Wall., C. funebris, Fortune, of China and the Himalaya; C. glauca, Lam., the Goa cedar tree of the gardens of Bombay and the Dekhan, a name also applied to the C. Lustianica, C. sempervirens, Linn., C. horizontalis, the spreading cypress, a handsome species. The common cypress grows in the Himalaya, in Italy and the S.E. of E.M. Wood in Mexico and the southern parts of N. America. C. thuyoides is the white cedar of N. America, where its chips are used medicinally as a stomachic; and C. torulosa, Lamb., is the twisted cypress of the Himalaya, Bhutan, and Niti.—Voigt; Stewart; Fortune; Ridgell.

CUPRESSUS FUNEaris. Fortune. The funeral cypress; grows in the Himalaya and in China. It is a most beautiful tree, a weeping cypress. Fortune says that it rises about sixty feet in height, having a stem as straight as the Norfolk Island pine, and weeping branches like the willow of St. Helena. Its branches grow at first at right angles to the main stem, then describe a graceful curve upwards, and bend again at their points. From these main branches others long and slender hang down perpendicular, and give the whole tree a weeping and graceful form. Its stem is perfectly straight, like the Cryptomeria, and its leaves are formed like those of the arbor-vitae, only more slender and graceful.—Fortune's Tex. Dist.

CUPRESSUS GLAUCA. Lam. C. Lustianica? C. pendula?

The Sarav, or Goa cedar, is a tall, elegant, and graceful tree, well adapted for border walks in a garden, being always green, and a favourite with the natives of India. It grows easily, and is generally planted alternately with the arceas or betel-nut tree. Slips, if taken off before the commencement of the rains, and planted in a bed of soil from the sun, take root; each slip should be six inches apart, and if common care is used, one-fourth of the plants will strike and grow. After that they may be put out in nursery beds, at the distance of one foot from each other, until required for transplanting to where they are to remain. Its leaves have a singularly glorious colour.—Ridgell.

CUPRESSUS ORBUSA. Von Mueller. Retinospora obtusa, S. and Z., the Hinoki of Japan, forms a great part of the forests of Nipon; attains a height of 80 feet, with a stem 5 feet in circumference. The wood is white-veined and compact, and assumes when planed a silky lustre, used for temples.

Cupressus pisifera, Von Mueller, Chamaecyparis pisifera, S. and Z., is a very hardy tree of Japan, rising 30 feet high, stem 3 feet in diameter, of beautiful aspect and quick growth.—Von Mueller.

The cypress tree is a native of the warmer parts of Europe, though it has long been transferred to gardens for the sake of its deep-coloured evergreen branches and leaves. The gates of Constantinople, famous for having stood from the time of Constantine to that of Pope Eugene iv., a period of 1100 years, were of cypress wood. It is hard, elastic, and strong, resists worms, and its odour repels insects. The tree grows in the outer Himalaya up to 5000 feet, and attains a girth 6 to 8 feet, and a height of 40 to 45 feet; it also grows at Kabul, but Dr. Stewart says its wood is of no especial value there. Its fruits were formerly used in medicine, but are now obsolete. Oriental physicians used to send their patients labouring under lung diseases to breathe the air of Candia, where the cypress was abundant, in the persuasion that the emanations were particularly wholesome. The precise period or the age to which the tree lives has not been clearly ascertained. In some countries this tree is planted over the graves of the dead as an emblem of immortality.—O'Sh.; Irvine; Eng. Cyc.; Book of Trees; Stewart; Hoag; Voigt.

CUPRESSUS TURULOSA. D. Don.

Nawir, Nurt, Lwarr, Panj.

This tree grows on the Ravi and Beas, on the outer hills near the Sutlej, in Kulu, in Naini Tal up to 8000 feet; and Dr. Stewart had seen a tree 120 feet high, and 15 feet in girth. It grows also in Bhutan and Niti. In Naini Tal it is used for roofs. In its eastern localities, the tree is deemed sacred, and is not felled; and in Kulu images are made of its wood. It occurs in the N.W. Himla-
CURAEO.

CURUMA ANGUSTIFOLIA.

CURU. ARA. A sacrifice. See Kurub.

CURULIGO, a genus of plants of the nat. order Zingiberaceae, growing in the south and east of Asia. It is a tribe of many species furnish a febrifuge, which is called the East Indian arrowroot. C. angustifolia, Zed., grows in Travancore, the N. and S. of Konkans, Nagpur, and Benares, and is that commonly used for the East Indian arrowroot. C. caulina, Graham, of the Mahabaleshwar hills, furnishes the Mahabaleshwar arrowroot. C. pseudo-montana, Graham, yields Ratnagorher arrowroot, and is probably Roxburgh's C. montana, and Rayle's C. kushoor of Sirmore and Bissechar. C. decipiens, Dalzell, C. zedaria, Zed., and C. amada, Zed., grow on the western side of peninsular India, and all yield febrifuge. C. rubescens, of Bengal and Travancore, and C. leucorrhiza, are similarly used. The species known in the south of Asia are about forty in number,—eruginea, amada, angustifolia, aromatic, attenuata, caulis, caulina, cozom, cordata, elata, ferruginea, grandiflora, latifolia, leucorrhiza, longa, montana, Neligherrensis, ornatella, puriculta, petiolar, pseudo-montana, reclinata, Roscoea, rubescens, strabilla, viridiflora, xanthorrhiza, zedaria. The particles of East India arrowroot are very unequal in size, but on the average are larger than those of West India arrowroot.—Zed.; O'Sk.; Voigt; Birdwood; Drury.

CURUMA AMADA. Zedb. Mango ginger. Amada, ... BENG. Ara kanla kacharom, Tel. Tommon munga, MALAY. Shagrandika, ... A plant of Gujerat, Konkan, Bengal, and Java. The root is called mango ginger, from its peculiar smell while fresh. It is a gentle stimulant, but now only used as an article for seasoning food. Ara kanla, meaning 'six eyes,' and Shagrandika, 'six-jointed,' are also syns. of C. caesia, and probably refer more correctly to C. zedaria, or 'long zedoaria.'—Zed.; Voigt; O'Sk.

CURUMA ANGUSTIFOLIA. Zedb. i. p. 31. Tikkur, Tikor, ... HIND. Kuns, Kogha, MALAY. Kughail, ... MALAY. Kus-kus, TAN. Kus-kang, ...
Narrow-leaved turmeric, grows wild in all the hilly parts of the centre of the Peninsula, in Central India, in the forests, extending from the basin of the river Kistna on the south, and on the Malabar coast, and is very generally cultivated. Its tubers are found at the end of fleshy fibres, which meet together, forming a crown, and they yield part of the East Indian arrowroot of commerce. The method of preparing arrowroot is substantially the same, from whichever plant it is extracted. The commercial value of the East Indian farina is very much below that of the Manhantu arrowroot. It is less used as an article of diet, but is largely bought by the starch makers of London. The tubers should be planted in a good rich soil, about one foot apart, just before the rainy season, and taken up as soon as the leaves are dry. Rats, porcupines, and wild hogs are very destructive to it, both when first planted, and also when ripe. Such tubers as are required for seed should be kept in a dry place in sand.—Roxb.; O'Sh.; Simmonds; Eng. Cyc.; M. E. J. Reports; Ainslie; Rohde, MSS.

CURCUMA AROMATICA. Salisb.

Curcuma zedoria, Roxb. [Wild turmeric.]
Bun haldi,, BENG. [Jungli haldi, ] HIND.

Grows in China, the islands of the Eastern Archipelago, Malabar, and Bengal, and its root is used as a perfume, and also medicinally. It possesses tonic and aromatic properties.——Roxb.

CURCUMA LEUCORHIZA. Roxb. Tikur, HIND., BENG. Grows wild in the forest of Behar and at Bhagulpur. Arrowroot is made from its long straight roots, often a foot in length, and of a pale yellow inside, by rubbing them on a stone or beating them in a mortar, after which they are rubbed in water by the hand, and strained through a cloth; the fecula having subsided, the water is poured off, and the arrowroot dried for use.—Roxb.; Voigt; O'Sh.; Eng. Cyc.

CURCUMA LONGA. Roxb. Turmeric.

Koonkhet,, MALAY. [Pasupu; Pampi, ] TEL.

Turmeric is grown all over India and the Archipelago, frequently along the edge of fields of ginger, in the Punjab, Siwalik tract, and outer hills, from 2000 to 5000 feet, up to the Ravi at least, and occasionally beyond that. It has large whitish flowers, with a faint tinge of yellow, the tuft greenish white. In cultivating it, the ground must be rich, friable, and so high as not to be drowned in the rainy season, such as the Bengali ryots about Calcutta call danga. It is often planted on land where sugar-cane grew the preceding year, and is deemed a meliorating crop. The soil must be well ploughed and cleared of weeds, etc., and in April and May, according as the rains begin to fail, the soil is raised into ridges 9 or 10 inches high, and 18 or 20 broad, with intervening trenches 9 or 10 inches broad. The cuttings or sets, consisting of small portions of the fresh root, are planted on the top of the ridges, at about 9 to 12 inches apart. One acre requires about from 900 such sets, and yields in December and January about 2000 lbs. weight of the fresh root. The tubers are a deep orange inside, bitter, and aromatic. The colouring matter of the dried root is bright yellow, soluble in alcohol and water, and changed to a deep red by alkalies. It is employed by the woods-dyers for compound colours of yellow, as for cheap browns and olives; as a yellow dye it is employed only in silk. In 1880-82 only 70,783 cwt. were exported from India. White paper dyed by an alcoholic tincture of turmeric is a very sensitive test for alkalies. The root enters into many of the religious ceremonies of the Hindus. The entire, or the corners, of every new article of dress, whether of man or woman, are stained before wearing it with a paste made of the root and water. Mixed with lime, it forms the liquid used in the Arati ceremony for warding off the evil eye. Women use it largely as a cosmetic, and some smear all the body with it as a detergent. It is a mild aromatic and carminative, and is largely used as a condiment in curries; the paste is applied to foul ulcer. Clothes dyed with it are deemed a protection against fever; and the Javanese make an ointment of the pounded roots, and rub it all over their bodies as a preservative against fever. With it, in conjunction with lime-juice, the Hindus in the month of Vishnu prepare their yellow tiroochorun, with which they make the perpendicular mark on their foreheads.—Ainslie; Roxb.; O'Sh.; Boyle; Dr. Shortt.

CURCUMA RUBESCENS. Roxb. A native of Bengal, Chittagong, Burma, and Pegu. All the parts of the plant have a pleasant aromatic smell when bruised. The root is highly aromatic. Its chief use is for the preparation of tiker, a very fine fecula, like arrowroot, which in Travancore constitutes an important article of food.—O'Sh.

Tomon,, MALAY. []

A native of Bengal, Chittagong, Java, and China. This is the true zedoary, all kinds of which resemble ginger in their medicinal qualities, but are inferior to it in strength and agreeableness of flavour. Its flowers are largish, of a deep yellow, and at the top a bright crimson tuft. This plant is supposed also to yield the long zedoary of the shops; the powdered root is mixed with the powder of Casaulpinia sepan to make the ‘abir’ or ‘shagoo,’ the red powder thrown about by Hindus in the holi festival; the root is also used medicinally.—Roxb.; Voigt; O'Sh.

CURDUCHA or Kurdistan, the ancient Carduchia of Xenophon, a country which, from its strength and position, commanded all the western part of Persia. It is inhabited by nomade tribes, who, though tributary to Turkey, and professing Mahomedanism, are virtually independent. Sir John Malcolm travelled through their country in 1810, and formed the opinion that they had remained unchanged in their appearance and character for more than thirty centuries.—Malcolm’s Persia, i. p. 105; Chatfield’s Hindustan.

CUREA. HIND. A village, from the Arabic Karyah, assembling together, a concourse. The word is preserved in Cureat Mitto, Cureat
CURIA MURIA ISLANDS.

Seekhur, Curcat Dost, and Curcat Mendloko, the names of parganas in the province of Benares.

CURIA MURIA ISLANDS, on the Malra coast of Arabia, were ceded to the British in 1854 by the Imam of Muscat. They are only valuable for deposits of guano.

CURIOSITIES, or Curios.

Under the general term Curios are included a great variety of articles. In China they consist chiefly of such things as please the fancy, and are for the most part procured for ornamental purposes.—vases, pots, jars, cups, images, statuettes, ornamental screens, plates, boxes of copper, iron, bronze, clay, silver, porcelain, stone, lacquer-ware, or wood of every shape, size, and variety of workmanship, rings, stands, and pedestals, lanterns, scrolls, etc.—Morrison's Compend. Descrip.; Williams' Middle Kingdom, ii. p. 400.

CURLW LE ISLAND, a name of Kalagouk, in the Gulf of Mactan, 30 miles south of Amherst. It is 8 miles long, Cavendish Island, at its extreme south end, is half a mile in length. The greatest breadth is 1 ¼ mile. On its highest point, about 500 feet above the sea, are remarkable trees, a point for navigators making the coast. Agulnaa lighthouse was built of stones from this island. The editor visited it in 1863, and reported it as wholly unsuitable for a sanatorium.

CURMA, in Hindoo mythology, the second incarnation of Vishnu in the shape of a tortoise.

CURMOLE. MALAY. A tree of the Canara forests, which grows to about 12 or 18 inches in diameter, and from 15 to 30 feet high. It is used by the natives for house-work, and is considered a useful and durable wood.—Edge, M. and C.

CURNUM. TAM. A village accountant.

CURRANTS.

The currants of commerce consist of the small dried grape, or berry, of species of vine, cultivated in the Morea, Ionian Islands, and some parts of Persia, etc. A currant, like the European red currant, called rasta, is largely eaten by the people of the Upper Panjab. Currants (zirishk), both acid and sweet, the former being the fruit of the berberry dried, and which resembles European currants, are brought from Kahirul and other hill places. The zirishk currants are of two kinds, somewhat alike in appearance,—one is sweet, and grows in Kahirul, etc., being a species of small-fruited vine (vitis); the other is acid, being the dried berberry. Sweet currants, basho, (Tibetan), from species of vitis, are imported from Balti. Bengal currants are the fruit of Carissa carandas.—Poulkner; M'C. Com. Diet.; Powell, Handbook. See Vitis.

CURRENCY NOTES in circulation throughout India have increased as under:—

1862-63, Rs. 4,41,94,255 1872-73, Rs. 12,86,49,367
1863-64, 5,23,25,000 1876-77, 11,64,16,538
1864-65, 6,88,20,116 1879-80, 12,79,76,300
1865-66, 7,75,57,963 1880-81, 13,65,46,020

CURRIE, SIR FREDERICK, Bart., twice Governor of Bombay, Chairman of the Board of East India Directors, Vice-President of the India Council. He was born the 3d of February 1799.

He entered the Bengal Civil Service in 1817. He became Secretary to the Government of India in 1842, and accompanied Lord Hardinge in his campaign across the Sutlej in 1845, and the following spring. He was created a baronet December 17, 1846, immediately after the battles of the Sutlej. In April 1854 he was nominated one of the Court of East India Directors, was chosen Chairman of the Company in 1858, and held that appointment until the cessation of the functions of that body, on the 1st of September 1858.

CURLY. 200 years before the Portuguese had appeared in the Indian seas, Ibn Battuta describes the natives of Ceylon as eating curry, which he calls in Arabic Conchon; in modern Arabic, Isan is the name. In the Rajavali, also, this article of diet is mentioned as in use in Ceylon in the 2d century of this era. Nevertheless, several writers have suggested that the word has been introduced from the Portuguese. The name is probably from the Tamil word Kadai or Karai, a bazaar; and Tamil children in the Peninsula sing a nursery song:

'Kai vies ammah kai viss,
Kadli ki palam kai viss.'

'Swing your hand, mother, swing your hand;
Let us go to the market, swing your hand.'

Curry in Urdu is called Saal, in Tamil Karri, in Telugu Koora, in Persian Nan-kliuris. Curry is daily used in every family on the Indian coast, wherever the Bengali, the Tamil, Telugu, and Malabar people have spread, and in greater or less quantity according to the means of the family, always with vegetables and with mutton or fowl, as they can afford. The ingredients are usually brought fresh from the market daily, but Europeans in India often grind and keep the dry materials in powder. There are very numerous receipts, but almost every household has one of its own, and up to the middle of the 19th century many houses prided themselves on their curries. The curry powders of India are articles of considerable commercial traffic; 32,500 cwt. of curry stuff was imported into Ceylon, chiefly from India, in 1851. The usual ingredients for curry stuffs are: aniseed, allspice, cardamon, cloves, mace, nutmeg, cinnamon, coriander, cumin seed, black pepper, mustard seed, chillies, turmeric, fenugreek, garlic, onions, ginger dry and green, poppy seed, long pepper, saffron, chironje nut, turmeric, almonds, coconut, nut, ghee, butter, salt, tamarind, lime-juice, mango. Coconut milk is much used on the coast in forming the gravy to many curries, especially fish and prawns, as well as the oil fresh expressed from the nut when grated. If the curry is to be dry, the onions must be fried brown in ghi or butter, and the ingredients ground to a paste with water mixed in the same, the meat and fowl added, stirring the whole until the gravy and butter are absorbed. For a gravy curry, cut the meat or fowl into slices, put the ghi into a stewpan over the fire with the sliced onions, and dress them; then add the meat with the ground ingredients, and some water or broth; mix well together, and let the whole simmer gently until the meat is properly done. Chundu is made with meat only of that has been previously dressed. It is to be minced up and added to chopped onions fried in ghi, with whole red chillies, and the other curry ingredients well mixed together; the
Cuscuta planiflora.

Cuscuta, also written Cashbura, the designation of the artisans who work in bell-metal; from Kausi, bell-metal, and Bharna, to fill. They are also employed in fusing precious metals and making ornaments which require to be formed in moulds. They comprise one of the subdivisions of the Sonar or goldsmiths, of which, in Hindustan, the others are, Mathcorea Myr, Khuttre, Kume-thika Lahoreea, Poores, Canojuja, Mauhare, Mahanun, Agurea, Birpoorea, Chhynewan, Mungarea. Of these, Mathcorea ranks the highest. The Cashbura is below them all. Amongst these tribes there is a secret language, which is adopted for the purpose of concealing their fraudulent acquisition of property.—Elliott, Supp.

Cuscuta. Hind. Poppy seed; properly, Khush-keush.

Cuscuta root.

Usir, | Guj. | Vetti vayru, . . . . Tam.
Khas, | Pers. | Cura varu, . . . . Tel.

Another herbarium, Retz, roots are used for making screens, tatties, punkahs, large fans, or covers for palanquins; and, when wetted, a very fragrant smell issues.

Cuscutaacea, an order of twinning, parasitical, leafless herbs; many species occur in the south and east of Asia,—aggregata, Arabicus, australis, capitata, carinata, Chinensis, corymbosa, grandiflora, hyalena, longiflora, macrantha, pedicellata, planiflora, reflexa. They twine on various trees, and are found up to 9000 feet in the Himalaya and Afghanistan. C. longiflora is the Nethari of Kaghani.

Cuscuta Europaea and C. Chinensis are the Tu sz-tze of the Chinese, dodder of the English. The seeds are small and round, of the size of black mustard-seed, and are given in bilorheas and leucorrhoea. The young shoots are used externally as washes.—Smith, Chin. Med. Med.

Cuscuta macrantha. Don.

Nila-thara, | of Jhule, | Aml, . . . . Chenab.

Grows up to 9000 feet, up to the Indus. It is found on Populus, Salix, Sphacia, Loniceru, Desmodium, Urtica, and Polygonum; and, like some of the other species, it exhalés at times a very strong scent. It is eaten by cattle and goats. Edgeworth mentions that the mountaineers believe that cows pluck sprigs of this and of C. anguina, Ela., to drop into water, where they become snakes, and so furnish food for themselves. Madden states that the natives promise boundless wealth to him who finds the root of it; while others, again, believe that the possession of its root will confer the gift of invisibility.—Dr. Roxburgh, J. L. Stewart, Joqnt. Cuscuta pedicellata. Led.

Kwi klapoj, . . . . Kangra.

This is found on the genera Morus, Leptopus, Elecanthus, Polygonum, Artemisia, etc., in Kashmir, etc., from 4000 to 5000 feet, and was got in Afghanistan by Bellew on tamarisk, Allahi, and Peganum.—Stewart.

Cuscuta planiflora. Ten. Found in fields of Kashmir iureme, at Googara, in Montgomery, and it is common in Lahoul and Ladakh up to 11,000 feet, growing on Carum, Artemisia, Cineria, and A. parviflora, Solanatha, and Perowskia.—Stewart.

861
CUSHITA, a race of Arabs who first gave their name to a part of Arabia; they afterwards crossed the Red Sea, and settled in Ethiopia. In ancient times, the Cushite and Jottanite occupied Arabia Felix, when the Ammonite and Ishmaelite dwelt in A. deserta, and the Moabite, Edomite, Nabathean, Midianite, and Amalekite in A. petrea.

CUSTARD APPLE is the fruit of the Anona squamosa. Sour-sop is the Anona muricata. The custard apple is a favourite fruit, and its shrub grows in the Dekkan with little care. Its seed, called sherifah, disperses vermin. Flies are reported never to settle on the tree or its fruit, though ants will attack both. Bugs have a great antipathy to the leaves of the custard apple, and are said to quit a bed in which they are placed. — Tennant's Ceylon; O'Sha; Hooker, Hist. Journ. Customs.

A plant of British India, Panjab, Sub-Himalayas, Sylhet, Gujarat, and the Peninsula, growing on the tops of trees. It is used by alchemists, also in dyeing and in medicine. The whole leafless herb is gathered and dried; it is employed either in mixture or infusion as a laxative in fever, as an anthelmintic, and also as an alternative in cancer.

CUSH and Laya were the two elder sons of Rama, and from Cush descended the Cushwah princes of Nirwar and Amber. — Tod; Elliot.

CUSH, a descendant of Hasti of the Lunar race, had four sons; one of whom, Cusshahna, whose descendants are styled the Kuska or Kuska, founded Muhadya on the Ganges, afterwards changed to Caneyabjba or Canouj, which maintained its celebrity until the Mahomedan invasion of Shuhab-ul-Din (A.D. 1193), when this overgrown city was laid prostrate for ever. Feriha states it in the early ages to have been twenty-five coss (35 miles) in circumference, and that there were 30,000 shops for the sale of betel-nut only, and this in the 6th century, at which period the Raitor dynasty, which terminated with Jye-chand in the 12th, had been in possession from the end of the 5th century. Cusshamba founded a city, which he called after his own name, Cusambli, and its name was in existence in the 11th century. The other sons of Cush built two capitals, Dharmarunya and Vasumuttee, but of neither have we any correct knowledge. — Tod; Elliot.

CUSHITE, a tribe of Arabians peculiarly connected with the Yemen, wandering through Southern Arabia and Eritrea. They have been the subjects of many voyages, and are mentioned as being a people of the plains, living principally by the produce of their gardens and flocks. Their language is a dialect of Arabic.

CUSTARD APPLE, a tree of the genus Anona, found in the Deccan. The fruit is of a yellow color, and is said to be very delicious. The tree is also cultivated in other parts of India. — Hooker, Hist. Journ.

CUTCH, including the Rann, extends between lat. 22° 47' and 24° 40' N., and long. 68° 26' and 71° 45' E., and in 1871 had a population of 487,365. It is bounded to the north by the Great Rann, beyond which is the Thar or Little Desert; to the S.W. and S. by the Gulf of Cutch and the Indian Ocean; to the E. and S.E. by the district of Gujarat; and to the N.W. by the eastern branch of the Indus and Sind. Its extreme length is 180 miles, and breadth 50 miles. Its area is 6500 square miles, while that of the Rann and its islands is 9000 square miles. All between the Aravalli mountains and the Indus, from the Sutlej or Hysudras on the north to near the sea on the south, is a waste of sand, in which are cases of different size and fertility, the greatest of which is around Jeysalmir. Cutch intervenes as a narrow strip of land between the desert and the sea, and makes a sort of bridge from Gujarat to Sind.

South of the Indus, the land becomes sandy, gradually sloping to the sea, first as a plain covered with a series of billows of sand, then as the level Rann up to the mountains of Cutch, the extent being from 500 to 600 miles in length, and varying from 70 to 150 miles in breadth, on which a considerable population dwells. The Rann itself is 150 miles from east to west, and about 40 miles broad; but there is a prolongation of the Rann towards Ahmadabad, and a very narrow line to the Gulf of Cambay. It is almost level, and a little water, from the banking up of the sea by the Sirmur, converts it into a very shallow lake of a foot or two deep, and 40 to 60 miles broad; but in the dry season its saline sand and clay soil are hard like a slate billiard-table, and the mirage is so incessant as to deceive ordinary travellers. None but experienced guides can travel there.

The Put district, immediately north of the Rann, is less saline, and is cultivated. The district north of the Rann, extending from 500 miles up to the rivers Indus and Sutlej, is called the Tur or Thrur, on which are billows or hills of sand 400 to 500 feet high above the sea-level, and 200 to 300 feet above the plain. Sir B. Frere alludes to these as of volcanic origin. The other part of Cutch is an irregularly hilly tract, completely isolated by the Rann and the sea. On the southern coast the country is a dead flat, covered with rich soil, but the northern part has three distinct ranges of hills running from east to west. The central of these ranges consists of sandstone, limestone, and slate-clay, with beds of coal; the hills north of it have numerous fossils; and those on the south, and all the face of the country near them, are covered with volcanic matter.

In 1819 Cutch was devastated by an earthquake. A dyke was thrown up, 50 miles long, 10 broad, and 18 feet high, which has been named Allah Baud, the dyke of the Lord. Denodur, the largest and highest hill in Cutch, is situated near the shores of the Rann. It is an extinct volcano; its crater is still apparent, and in the north side is a large gap. It is said to have been active during the earthquake of 1819. On a level spot near the village of Wage ka Pudda are several small craters, circular spaces surrounded by basalt. And several other small basins have been blown out in the surrounding table-land, forming inverted cones about 15 or 20 feet in depth. Numerous fossils occur in the sedimentary rocks. The land at Mundavee, Moondrah, Dudraser, and other seaports, up to the Gulf of Cutch, has been gaining on the sea. Some of the creeks and inlets penetrate 6 or 7 miles from the coast, through a tract covered for miles in extent with shrimps. At low water these plants are exposed to the roots, but at high tides merely their upper branches are visible, so that the boats sail through a marine
forest, the sails and yards frequently brushing against the boughs of the trees, and the sailors have often to force their boats through the upper branches. The stems and branches are covered with crustae and mollusca, whilst numerous waterfowl occupy the higher branches.

The Cutche dialect of Hindi is used, but Gujaratti, Hindustani, and Persian are also known, though little used. On the death of Rao Lakhpat, his sixteen wives burnt themselves on his funeral pile, and their tombs, built in a beautiful group, stand close to the British Residency. The title of the ruler is Mirza Maha Rao, Sri Khengarji. The inhabitants of Wagal or Eastern Cutche have been notorious pirates. Satie and female infanticide were frequent. In 1868 the proportion of males to females was 1:04 to 1.

Its people are chiefly followers of the Hindu religion; and the ruling race are Jhariraj Rajputs, derived at a comparatively recent date from Tatta in Sind, from a common ancestor, Humrej, whose son, Rao Khengar, acquired Cutche before the middle of the 16th century.

A. Rajput Grasia, viz.:—

1. Jhoroja.
   a. Deda.
   b. Anur.
   c. Halla.
   d. Hothe.
2. Wagela.
3. Mahomedan Grasia, viz.:—
   a. Vene.
2. Nohar.
3. Abra.
4. Mygimmia, 3 tribes.
5. Nora.
6. Raoma.
7. Nangorchia.
8. Sunejcha.
10. Mohdi.

C. Hindus:—
1. Bhattiatham.
2. Banya.
3. Lomowa.
5. Charan.
7. Lang.
8. Megwal.

Cutchee and Labourers.
1. Ahir.
2. Rehari.
4. Lowanna.

Cutchees:—
1. Khojah.
2. Mehmun.

The Jhulla are Rajputs of Sindian origin; and there are tribes of Lowanna, Ahir, and Rehari. The Bhattiatham, of Sindian origin, are a fair, handsome race, skilful and industrious mechanics, and found in all the ports of Eastern Africa, Arabia, and Western India. The Ahir are a pastoral tribe in the Gulf of Cutche. The Khosa are a marauding tribe on the Thul desert between Hindustan and Sind. The ancient Cutch people were the Odemboor of Pliny.

There are also Brahman tribes, Sodash Rajputs, Mahrattas, Bhiis, Kols. The language of the hunters and tanners, the Dhed, is a dialect, but the language of Larak is purest. Iron ore occurs in various parts, but has been mined chiefly at Doodye, opposite the S.W. end of the Bunne, where it occurs in small lumps, spongiform and friable. Coal has been found in various places, and has been used. Alum is manufactured from shale near Muhur.—Tr. Bo. Lit. Soc. ii. p. 222; M'durdo's Cutch in 1815; Barnes' Bokhara; Grant, Geology; Sir Birtle Frere on the Run of Cutch.

CUTCHE, Catechu.

Catechu, cumin, gambier, and terra japonica, are commercial terms for the insipissated aqueous extracts from the wood of the Acaia catechu and from the leaves of the Uncaria gambir. A few years ago the terms were employed synonymously; but they are now, for the most part, used in trade somewhat distinctively, though not uniformly in the same sense. The catechu and gambir imported into Great Britain in 1881 was 33,011 tons.

CUTCHERRY. Anglo-Hind. An office of a revenue magistrate, a bureau, a court of justice.

CUTCH GANDAVA is the plains of Baluchistan. See Tor.

CUTCHWAHA. Prithi-raj was rao of Amber, a name now set aside by Jeypore. The twelve branches of this prince formed the existing subdivisions or classes of the modern Cutchwa, whose political consequence dates from Hunyund.—Todd's Rajathan, i. p. 299.

CUTLEY. Salem and Trichinopody afford evidence of the skill with which this description of manufacture can be carried on. At the Madras Exhibition of 1855, the daggers exhibited from the northern division exhibited in a high degree the proficiency of the operatives in that part of the Madras Presidency. Salem cutlery may compete with that of Europe.—M. E. J. R.

CUTTACK (Kataka, the fort), a British district in Orissai, lying between lat. 20° 1' 50" and 21° 10' 10" N., and long. 85° 35' 45" and 87° 3' 30" E., with an area of 3585 square miles, and a population in 1872 of 1,491,784. The Mahanadi river, aided by some of the large streams from the north, has formed a rich delta. From the town of Puri, containing the great temple of Jaganath, to the Dhamrah mouth, there is a deltaic tract fully 30 miles broad, and which comprises nearly the whole of the Cuttack district, great part of that of Puri, and a portion of that of Balasore. In addition to the low districts, Orissa has an enormous tract of hilly country of the interior, the population of which is partly Oorya and partly aboriginal. The people of Orissa have a language with a character peculiar to themselves. There are 18 estates known as the Cuttack Tributary Mahals, with an area of 15,000 square miles, viz. Angool, Autgar, Autmalik, Banki, Barumba, Boad, Dhenkanal, Duspella, Hindole, Keonjheur, Kundia-parra, Mohurbhunj, Nilghur, Nyagarh, Narsinpur, Ranpur, Talchir, Tigeria. Angool and Banki were annexed for the misconduct of the rajahs. The other sixteen tributary rajas administer civil and criminal justice, controlled by the Superintendent. The most powerful are the rajahs of Mohurbhunj and Keonjheur, both of whom rendered good service during the mutinies. Cuttack has been subjected to great vicissitudes. Frightful inundations occurred in 1823 and 1831; on one occasion causing a destruction of lives estimated at 10,000, and the entire population of 300 villages is said to have been destroyed. In 1867-68, in Cuttack, Puri, and Balasore, famine raged with great intensity, and continued longest. Manbhum, Singbhum, Midnapur, Bankura, Raniganj, Bardwan, Hoogly, Howrah, Nudde, also suffered. Mr. Ravenshaw estimated the loss in Orissa at not less than one-fourth of the population. The aboriginal tribes are Kaudh, Bhumij, Kol, and Savara, the last numbering 16,589, all of them very poor. Of the Hindus, the Khasa cultivators are 156,308, the Khandz militia 254,762, the Mastane 15,520, the Goala 11,728, and Rajputs 10,728.

CUTTEKARE. Giant's Tank in Ceylon.

CUTTEAMUNDOO is the juice of the plant
CUTTLE-FISH.

Akoor chewoodoo, or Enphorhia cattamundoor, Elliot; it is common in the Northern Cirears, and is also called Brama Chemooodoo. At the Madras Exhibition of 1855, Mr. Elliot exhibited seven articles, bassia, orr, tumbler, etc., made of cuttæmundoor gum, moulded with the hand, without any preparation. The fresh juice is used as a vesicant, and also as a cement for fastening knife handles, etc.—M. Ez. Jur. Rep.

CUTTLE-FISH or Squid, the Wu-tshih-yu and Meh-yu of the Chinese. The cuttle-fish inhabit all the great oceans, and abound in the warmer latitudes. They feed on crabs, squids, and mollusces, breaking down the carapace or shells of these animals with their beak-like jaws, and their strong muscular stomach completes the comminution. In 1882 one was stranded at Cook's Strait 75 feet long, 9 feet 2 inches circumference, its head 4 feet in diameter; its longest arms measured 25 feet, the smaller ones 12 feet long. The economal products are a deep pigment, known as Roman sepia, which in the cuttle-fish is contained in a bladder at the bottom of the abdominal sac; also the cuttle-fish sepium, or shell, or bone, called by the French Biscuit de mer. The cuttle-fish is particularly abundant on the coasts of China, and are there much used as food, as also are species of Octopus, Haliotis, Turbo, Hiphopnus, Tridacna. Adams says some monodonta taste quite peppery.

Cuttle-Fish Bone.

In Sepia officinalis, the soft parts are supported by a firm calcareous bone, the cuttle-fish bone of the shops; and in all the naked cephalopods (not including Ocythoe) now existing, some rudiment at least of a bone, horny or cartilaginous, support is to be found. Cuttle-fish bone is found on all the coasts, and is used for rubbing down paint, etc., by the painters; also for the purpose of cleaning and polishing the surface of silver and other metals. The Chinese formerly engraved these bones, or inlaid them as ornaments.—Smith; Eng. Cyc.; Rohde's MSS.; Ains.

CUTIONORA, the Cuttiara of Ptolomey, supposed to be either Calicut or Cochini, whence pepper was exported to Baracca.—Ind. in 15th Cent.

CUTTY. Tam. The term applied in Southern India to the iron bloom of native manufacture.

CUTWA, a town on the Bhagirathi river, Arrian's Katalupha. Indeed, Katwadeep and Agrawdweep and Nabadweep all refer to a period when they must have been regular dweep or islets, to have received such names. To the vaishnav sect, Cuttwa is a sacred place of pilgrimage; there, Chaitanya, flying from the roof of his parents, and leaving behind his wife, embraced the Dandi sectarianism, to shake off the obligations of society and the cares of a secular life. He was initiated into its rites by a Gosain, named Kesab Bharuty; and the hairs shaven from his head on the occasion are yet preserved in a little white temple.—Tr. of Hind. i. p. 49.

CUTWAL, a military police officer; the police officer of a military bazar. The word is properly Kot-wal, a fortress holder.

CUVERIE, the Hindu god of riches.

CUVIER, Baron Cuvier and M. Valenciennes' Histoire Naturelle des Poissons, published in Paris in 1828 and following years, contained much information as to Indian fishes.

CYAMOPSIS PSORALOIDES. D. C.

An erect annual; cultivated during the cold months in gardens for the little flat pods, which are used in curries as a substitute for French beans; grows from 2 to 3 feet high; the pods are seldom very tender, but are esteemed a good vegetable.—Mason; Jaffrey: R. Br.

CYATHIA, a genus of the tree-ferns, tropical plants. Many tree-ferns rise to a height of 20, 40, or even 60 feet in their native forests, supporting magnificent crowds of gigantic fronds, in some species 15 to 20 feet in length, C. spinulosa, Wall., occurs in Nepal, Khasaya, S. India, and Tenasserim, and in Ceylon C. sinuata, Hook., and several others. C. Siamesis, of Prone, yields a whitish gum. C. Rumphii, Miq., of S. India, Andamans, Burma, and Tenasserim; its wood yields a starch. The seeds of C. sphærica are ground into flour. The better known tree ferns are Cyathia aculeata, arborea, debulata, maricata, hemitelia, horrida, and Karsteniana, Alsophila armata of the W. Indies, A. Cooperi of Queensland, and A. excelsa of Norfolk Island; also Angiopteris prinosa and Blechnum Brasiliense. C. debulata grows abundantly in New Zealand on the declivities of the hills, under the shade afforded by the forests. The natives use the trunk of this fern as posts in the erection of their dwellings, and they are very durable—the medullary portion soon decaying, but the exterior lasting for several years. C. medullaris, the tree-fern of Norfolk Island, is about twenty feet in length, and presents a beautiful appearance.—Dr. Bennett, Australasia.

CYATHEA ARBOREA.

This fern rises in Ceylon 25 to 30 feet. Its stem makes beautiful walking-sticks. The section of this tree-fern displays well the structure of an acrogenous stem, hollow in the centre, marked on the outside by the scars of the fallen leaves, and showing the elongation of the axis by junction of the petioles.—Madras Hort. Garden; M. E. J. R.

CYTHOCALYX ZEYLANICUS. Champion.

Kakasal, . . . Singh; Espetta, . . . Singh.

The light lacquered Kandyan walking-sticks are said to be made from this Ceylon tree.—Percyson.

CYTHULA ORBICULATA, C. capitata, and C. tomentosa, sand-binding plants of the Peninsula.

CYAXARES was the name by which the Greeks designated Vakistar, king of the Medes. In alliance with the king of Armenia, and Neho, king of Egypt, b.c. 609, took and destroyed Nineveh, and its sovereign, Assur-ibl-li, set fire to his palace, and, with all his wives, burned himself.

CYBELE. See Osiris; Saraswati.

CYBIMUM GUTTATUM. Tom-Maln, Singh.

One of the scemboerd fishes, known to Europeans as the seer fish, is the finest table fish of Ceylon. Its flesh is white, but resembles that of the salmon.
in firmness and flavour. C. Commersonii, Looep., is another of the scir fish

CYCADACEAE. a natural order of plants, of which Lindley makes four genera and includes about fifty species. They have a simple cylindrical trunk, which increases by the development of a single terminal bud, and is covered by the scaly bases of the leaves. There are several known species of Zamia and Cycas, some of which grow in India, and in the islands of the Eastern Archipelago. They all abound in a mucilaginous naceous juice, and the soft centres of Cycas circinalis and C. revoluta are convertible into a kind of sago. The species of Euphorbiaceae are called Kaffir bread. The seeds of Dion edule yield starch in Mexico. A similar substance, under the name of sago, is obtained from species of Zamia in the Bahamas and other West India islands; in Japan, from Cycas revoluta; and in the Moluccas and Southern India, the Cycas circinalis yields a coarse kind of flour, and also yields a transparent gum. The plants are propagated by suckers. A trunk of the order has been found in the lower greensand, Kent, and at Portland. None are now native in Great Britain. C. Normani, Iow Mueller, is a Queensland species; and C. sphereica, Roxb., is a tree of the Moluccas. The fruit of Cycas angulata, R. Br., forms a food of the Australian aborigines during a portion of the year. They cut it into thin slices, which are first dried, afterwards soaked in water, and finally packed up in sheets of tea-tree bark. In this condition it undergoes a species of fermentation, the deleterious properties of the fruit are destroyed, and a mealy substance with a musty flavour remains, which the natives of Australia probably bake into cakes. They appear also to like the fruit of the Pandanus, of which large quantities were found by Dr. Leichhardt in their camps, soaking in water, contained in vessels formed of stringy bark. The tree grows 70 feet high.

This very handsome tree in appearance resembles the palm tribe. It grows in Ceylon up to 1500 feet, is common on the Malabar coast from Callicheerry to the foot of the Ghat, and occurs northwards towards Bombay; it is also common in the Karen forests of Tenasserim, in Cochin-China, China, Sumatra, Java, and the Moluccas. It resembles a dwarf coconut tree; its blossoms are yellow. In Sumatra the cabbage and the young shoots are eaten. It yields a gum resembling tragacanth, also a kind of sago; and a flour called inadopidi is obtained by the Singhaleses, by pounding the fresh kernels. These are cut in slices, and well dried in the sun before they are fit for use, otherwise in Europe. When eaten they are intoxicating, and occasion vomiting and purging. — Mason's Tenasserim; O'Sh; Thw. Zeilan.; Marsden's Sumatra, p. 89; Rumphius, i. p. 22.

CYCAS PECTINATA, W., is a sago palm which grows in Sikkim, on the flats by the Ranjit streams. Its stem is ten feet high, with a beautiful crown of foliage.—Hooker, i. p. 151.

CYCAS REVOLUTA. Thunb. A native of China and Japan; a kind of starch, the Japanese sago, is obtained from the cellular substance. The whole plant yields a copious mucilage, which hardens into a transparent gum. It is the most northern member of the order of plants. — O'Sh.

CYCLAMEN, sp., sow broad. The poisonous, acrid Hai-yu of the Chinese is dedicated to their goddess Kwan-yin. — Smith.

CYCLAS STURCIPENNI, a weevil of Ceylon, very destructive to agricultural produce.

CYCLE. Cycle, Course, ... Pr. Rivoluzione, Corso, ... IR. Zirkel, Cyclyus, ... Gene. Circle, Circlo, ... Sp. Punto.

Eastern races have chronological cycles. The Chinese astronomical cycle of 60 years, in use since the 61st year of Hoang-ti, is the most ancient form of a primitive and very simple equation of lunar and solar years. Its 76th recurrence fell in 1864. The Tai-kok-tai cycle of the Egyptians, of 30 years, led to the cycle of 60 years. There were Indian cycles of 5 years; the result of a rule equation; the Chaitree cycle of 600 years was of later date. The 12-yearly zodiacal cycle is in use amongst the Mongol, Manchu, and Igurian Tartars, and amongst the inhabitants of Tibet, the Japanese, and the Siamese. Amongst the Tatar populations, however, this is a cycle of 60 years. The cycle of the Chaitree was of 60 years, but they had one of 60 × 10 = 600, which grew out of the great patriarchal year. The oldest cycle known to the Greeks was one of 9 years, which gave way to the Metonic cycle of 19 years; but one of 60 years was in use amongst the Semitic and Iranian races of primeval Asia, as well as amongst the Chinese. Plutarch considers the 60 years' cycle as the original one known to all astronomers. The Apis cycle was of 25 years, and of these made up the patriarchal year of 1400 years, with 15 years, and the Phoenix cycle was 500 years. — Bunsen. See Chronology.

CYCLEA BURMANNII. Arnott.
Cocculus Burmannii, D.C. Menispermum peltatum, C. peltataus, D.C. Gurt., Lam.
Cissampelos discolor. Wald.

Pada valli, MAMEL. Wal tjedde, SINGH.

This trailing shrub grows in Ceylon, Malabar, the Konkan, and Coromandel; by native practitioners the bitter root is mixed with buttermilk and cumin seeds, and given in dysentery, hemorrhoids, and flatulency, and the juice of its leaves is applied to inflamed eyes. — Useful Plants.

CYCLOADRIPUS. The following species of this genus occur in S.E. Asia and Australasia:

C. punctatus, Edw., Indian Ocean.
C. Andonii, Edw., New Guinea.
C. quadratus, ... Ceylon.
C. edwardsi, Edw., New Zealand.
C. Gaimardii, Edw., New Holland.

Cyclone.

Cyclone is the term now applied to the furious tempests formerly called taffin, typhoon, or hurricane, because of their being uniformly found to be whirlwinds, and from the Arabic Tour, circumambulation. Cyclones are of frequent occurrence from 100 miles N. or S. of the equator, and between 1746 and 1881, 17 disastrous cyclones have been recorded. The first written notice is from the pen of Colonel Capper, a Madras officer, who describes them as whirlwinds of immense size, not less in diameter than 120 miles, and having their vortex near Madras or Pulicat. Other authors have followed since that date, 1801, offering theories and explanations of the phenomena.—Redfield and Espy in America; Dr. Thom, 86th Regiment; in Mauritius, Messrs. Bousquet, Hare, and Dove, Colonel Reid, Mr. Piddington of Calcutta, and many others. But, from the data furnished by their writings, it was left for Colonel Reid to form the law by which practical action has been given, and his position has been greatly extended and made easy by the intelligent labours of Mr. Piddington. The usual names, taffin, typhoon, hurricanes, typeets, being catalogued to lead to confusion, a new term was sought for storms coming under the new law, and the word cyclone was selected, derived from the Greek Kuklos, as neither affirming the circle to be a true one, though a circuit be complete, yet expressing sufficiently the tendency to circular motion in these tempests. Colonel Capper put forward the view that the storms of the Indian Ocean were rotatory. Mr. Redfield and Professor Dove further developed that theory; and Colonel Reid discovered the fact that the rotation of these storms in the N. hemisphere was N.W. to S.E., or opposite to the direction of motion of the hands of a watch with its face upwards, and that the reverse is the case in the S. hemisphere. Mr. Espy of Philadelphia ascertained that in cyclones there is an inward centrifugal force; and Professor Dove explained the opposite direction of rotation in the northern and southern hemispheres, by what he called the law of gyration.

The subsequent writers on cyclones and their laws, have been Professor Taylor, Sir John Herschel, Mr. Blanford of Calcutta, Mr. Meldrum of Mauritius, and Mr. Willson. Professor Taylor's theory was that cyclones originate from an upward expansion of the air, produced by local heat; that this is followed by an inward movement of air, and that the rotary motion of the earth produces spiral movement round a centre, over which a continuous upward movement of the air takes place. This theory was adopted by Sir John Herschel in his work on meteorology. Messrs. Meldrum and Willson are of opinion that they are primarily due to lateral and opposite currents of air. Mr. Blanford ascribes their cause to a local atmospheric depression arising from condensation of vapour, and so causing an inward movement of air to the place of origin. Mr. Elliot favours a modified form of Mr. Blanford's theory (Geog. Mag., June 1877). Mr. Blanford's theory is in accordance with the present views of the London Meteorological Office, viz., that the winds blow from all quarters into every central area of lowest barometrical pressure. The workers and their contributions to this subject have been numerous.

From 1839 to 1851, Henry Piddington of Calcutta contributed largely to the history of hurricanes; and it was he who discovered that in India to the north of the equator they are circular, moving from right to left, and are progressive, and he made out the tracks on which they move, and their rates. Captain Carseless and Dr. Thom, 86th Foot, gave an account of the great hurricane of April 1847, in which the Cleopatra, Captain Young, was lost.

Dr. George Buist collected accounts of hurricanes on the west coasts of India from 1647 to 1859, and wrote careful memoirs on the subject of cyclones. Lieutenant Ferguson published an account of the cyclone of 1862. Mr. Franklin, at Madras, published an account of the storms of 20th October and 25th November 1846, with diagrams. Lieutenants Mullins and Hemery described the cyclone at Nellore and Cuddapah of 2nd November 1847. An account of the Calcutta cyclone of 1864 was drawn up by Colonel Gastro and Mr. H. F. Blanford, with a list of recorded storms in the Bay of Bengal, from 1737 to 1864.

Of 73 cyclones in the Bay of Bengal, notices of which occur in old records, Mr. Piddington's works, or which Mr. H. F. Blanford himself recorded in recent years, he says the distribution in the several months were as follows:—January, 2; February, 0; March, 1; April, 5; May, 17; June, 4; July, 2; August, 2; September, 3; October, 20; November, 14; December, 3. All that occurred between November and the end of April had been restricted to the south of the bay; and the same is to be said of the greater part of the November storms. May and the first half of June, and October with the first week of November, are the only periods in which cyclones can be said to be prevalent in the north of the bay, though they occur occasionally in the intervening months, that is, during the south-west monsoon (p. 623).

Captain Taylor, R.N.B., Master Attendant at Madras, writing on the Bay of Bengal, says ships exposed to the cyclone experience, after fearful weather from one quarter, a short rest, during which the sun or stars are visible overhead, after which the storm comes on again from the opposite quarter. The wind observes in all cases the same relative bearing,—on the north side of the cyclone the wind is always east, on the east side the wind is always south, on the south side the wind is west, and on the west side the wind is north. And these storms always come up more or less from the south-east, and pass away to the north-west.

Madras city and its adjoining coast have suffered repeatedly from cyclones. They seem to travel up from the E.S.E., and progress rapidly in a W.N.W. direction, until they touch the land, and there they assume a westerly or W.S.W. course. Their diameters are about 150 miles, and they revolve in a direction contrary to the hands of a watch, for 20 to 80 days. On the 17th October, 1846, 23 days after the surrender of Madras to M. de la Bourdonnais, a cyclone burst on this town. The ships Duc d'Orleans, Phœnix, and Lys put to sea, but foundered, and in them upwards of 1200 men were lost; the Mermaid and Advice, prizes, shared the same fate; the Achille and two other vessels of war were dismantled; and of twenty other vessels of different nations in the Madras roads, all were either wrecked or lost at sea.

A cyclone occurred off Cuddalore on the night
of the 12th—13th April 1849. It blew from the N.N.W., and continued all the next day. H.B.M. ship Pembroke was wrecked on the Colerun shoal, a little off Porto Novo, and only 12 men were saved. The Namur flooded in shoal water not far from Devicottah, when 527 officers and men were drowned. Off Fort St. David, the E.I. Company's ships Lincoln and Winchelsea, and almost all the small vessels, were lost.

On the 31st October 1752, a violent hurricane was experienced.

On the 1st January 1761, a violent hurricane occurred at Pondicherry. At that time the British were besieged by sea and land. Of eight sail of the line, two frigates, a fire-ship, and a ship with stores, the Norfolk escaped. The Panther, America, Medway, and Falmouth were dismasted, but rode out the gale; the Newcastle, Queenborough, and Protector ran ashore; and the Duc d'Aquitaine, the Sunderland, and the Duke founder, and of the crew of 1100, all but 7 Europeans and 7 natives perished.

On the 21st October 1773, a violent hurricane visited Madras, when the ships that remained at anchor all perished.

On the 20th October 1782, a gale began from the N.W., and the following morning 100 small country vessels were stranded on the beach. H.M. ships Superb and Easter were dismasted, and got to Bombay with jury masts. At that time the ravages of Haider Ali had driven the people into Madras, and sickness followed the cyclone, during which Lord Macartney, the Governor, nobly exerted himself to mitigate their sufferings.

On the 27th October 1787, a heavy gale occurred, in which the barometer did not fall below 29-465, in which the barometer did not fall below 29-465, in which the barometer did not fall below 29-465, in which the barometer did not fall below 29-465, in which the barometer did not fall below 29-465, in which the barometer did not fall below 29-465.

On the 5th December 1803, H.B.M. ship Centurion, on her passage from Trincomalee to Madras, and the Albatross, were dismasted in a cyclone, which raged from midnight till 5 P.M.

On the 10th December 1807, a hurricane burst over Madras, and was accompanied by a storm-wave, which inundated the whole of Black Town.

On the 2d May 1811, in a violent hurricane at Madras, the Dover frigate and Chichester store-ships were lost, and 90 vessels went down at their anchors; only two vessels which put to sea were saved. During this cyclone the surf broke in 9 fathoms water, 4 miles from shore.

On the 24th October 1818, a cyclone commenced with the wind from N., and, after increasing in violence, suddenly lulled, but as suddenly blew from the S. Its vortex passed over the town. It travelled west. The barometer fell to 28-78.

On the 9th October 1820, a cyclone commenced at N.W., and veered to W. and S.W. The barometer fell to 28-50. It passed north of Madras, and travelled west.

On the 30th October 1836, a gale set in from the north. At 4 P.M. it blew violently from the N.N.W. and N. After a half-hour's lull, it blew at 7-30 P.M. with redoubled violence from the south, and at this time the barometer was 28-285. The vortex passed over the town.

In May 1843, another hurricane occurred, the brunt of which was felt out at sea, and several vessels were lost. Those that remained at anchor rode it out.

On the 25th November 1846, a hurricane occurred during which the pressure of the Observatory anemometer broke at a pressure of 40 pounds registered; and the force of one heavy gust was computed at 57 pounds per square foot. The large iron wind-vane of the Observatory was bent to a right angle, and one of the flat pipes on the Elphinstone Bridge was blown over.

Of these fifteen cyclones, one each occurred in January and in April, two each in May and December, and nine in October.

On the 1st November 1864, a cyclone, accompanied by a storm-wave, swept over Masulipatam, rising 12 and 13 feet above the ordinary high-water mark, and rushing inland for nine miles (in one instance for 17 miles) from the shore, submerged an area of 7200 square miles, and about 39,000 of the population were drowned.

A cyclone occurred at Madras on the 2d May 1872, when nine British and 20 native ships were driven on shore, and 19 lives were lost.

A cyclone occurred at Vizagapatam on the 7th October 1876, and another at Bakarganj.

1822, 6th June, in Bombay a great tidal wave; 100,000 people perished.

A cyclone occurred at Bombay in 1837. Another on the 1st and 2d November 1854. At midnight the wind rapidly increased in force from 15 pounds pressure on a square foot of surface till 3 A.M. of the 2d November, when it inclined a little more to the south, and increased in pressure to 35 pounds.

Amongst the calamities that have overtaken the Sunderbans, have been great inundations caused by cyclones. About the year 1854, the tract lying between the Horinghatta and the Ganges, known as the Bakarganj or Burrisal district, was swept by an inundation, succeeded immediately afterwards by an incursion of Pundag and Mugh pirates. In June 1622, this same tract was again inundated, 10,000 inhabitants perishing, and many houses and much property destroyed.

In the Gentleman's Magazine for 1737, mention is made of a storm and inundation at Calcutta, from which 300,000 lives were lost. In A.D. 1736 the Megna rose six feet above its usual level at Luckippur. A cyclone of 1831, over Calcutta, swept away 300 villages and 11,000 people. Occurrences of cyclones have been recorded at the mouth of the Megna on the 6th and 9th June 1822, on the 1st November 1867? on the 16th May 1869, and 1st November 1876.

In A.D. 1833, Sagar Island was submerged 10 feet; the whole of the population, between 3000 and 4000 souls, together with some of the European superintendents, perished; at Kedgeree, a building 18 feet high was completely submerged, and the Duke of York East India Man was thrown high and dry in the rice-fields near Fultah in the Hooghly. In A.D. 1818, the island of Sundee was submerged. A cyclone is mentioned as occurring in Calcutta in 1859, attended with a great loss of life. A cyclone of the night of the 5th October 1864 came from the sea, passed over Calcutta, and founderd and stranded steamers and ships of 2000 tons burden, and swept away every tree and building in a tract 300 miles long. This one, originating near the Andamans, travelled in a north-west direction, and struck the coast of Bengal at the Balasore roads and Hidgel. Thence it passed over Calcutta on the 5th October, over Kishnaghur and the Bogra district, and finally expended its strength in the Garo Hills. The wind destroyed muck, but it brought with it
CYCLOPES

a storm-wave 30 feet high, which flooded the country for a distance of 8 miles on both sides of the Hooghly river. In Calcutta, and in Howrah, on the right bank of the Hooghly, the partial or complete destruction of 196,481 houses and huts told a sadder tale than even the violent death of human beings. But widespread ruin swept over the fertile tracts of Midnapur, and over the Sunderbuns, which had been recovered from total inundation by the efforts of a quarter of a century, and the expenditure of millions of rupees. In many districts there, no less than three-fourths of the whole population, their cattle and other property, were engulfed in sudden destruction. Had the Hooghly been the Thames, and London—not so densely populated—Calcutta, a cry would have gone up which would have thrown the earthquake of Lisbon and similar catastrophes, famous in history, into the shade. In all, about 200 ships were lost, and 70,000 persons perished.

The inhabitants of the large fertile islands in the estuary of the Megna, Shabazpur, Hattiah, and SundEEP, full of rice grounds and cocaanut grooves, are not unfamiliar with the dangers of their marshy home, for since 1822 there have been at least seven cyclones; but the islands stand fairly high above the water, and it has been the storm which has caused most damage, though it generally gives notice of its approach long beforehand, by the unnatural hush in the air, and the livid colour of the sky, but on the night of the 31st October 1876 there was no warning. A violent north wind prevailed from 10 P.M. of the 31st October to 3 A.M. of the 1st November, and brought down the river water more rapidly than usual. The tidal wave was unusually high, and the north wind was followed by S.W. and west winds, which propelled the storm-wave into the converging water area of the estuary. It was full moon on the 31st October, and the usual tidal bore occurred at 11 P.M.; and before the water flowed off, one or two storm-waves followed from the S.W. about 3 A.M., and between 4 and 5 A.M., causing a second and third inundation, covering the islands with from 10 to 45 feet of water. The waters continued to rise till 4 A.M., when they began to subside. The inundation caused bad food and bad water. It was shown that 165,000 people were drowned, and subsequently 75,000 died of cholera. South of the equator, they occur in the months of November to May, and travel to the W.S.W.; and afterwards, but not always, to the southward and S.E., the wind invariably moving round a central space (which is usually characterized by a calm) from left to right, or with the hands of a watch; while the storm, which has a diameter of 1 to 1500 miles, moves onwards at the rate of 1 to 20 miles, but more frequently 4 to 7 miles an hour, for a period varying from a few hours to ten days, attended with torrents of rain, and its northern half often with lightning. Dr. Thom showed that, south of the equator, the storm-waves generated between the N.W. monsoon and S.E. trade winds. They occur only during the S.W. monsoon months, and their rise and progress are intimately connected with the S.E. trade wind and N.W. monsoon, two opposing winds. With the ships, the safest course is to lie to and watch the barometer and wind till the bearing of the centre be known with some certainty.—Geog. Mag., June 1877; Linton's

CYCLOSTEMON MACROPHYLLUS.

CYCLOPES are supposed by Poecke to be the Guela-pes from the Jumna or Guickla-des. This derivation would designate them as a pastoral race, from Go, SANSK., a cow; but their great irrigation works denote them an agricultural population. Such a race at some remote time occupied Baluchistan, and raised great irrigation structures similar to those in Greece, and in the Peninsula of India. At Bogdegi is a mound with Cyclopean substructures. Lieutenant Aytoun, in his Geological Report on a portion of the Belgaum Collectorate, given in Carter's Geological Papers on Western India, p. 392, mentions that certain gorges in the hills had been artificially bended, and present one or two points of slight resemblance between the Pelasi, the builders of the Cyclopean walls of Greece, Italy, etc., and the Ghorbasta builders of Baluchistan, suggesting that they might have been a kindred people, with kindred habits. The Pelasi came from Asia, not from Asia Minor, not from Syria, nor from Assyrin, not from Persia, but probably from that birthplace of emigration, the tract north and north-east of Persia.

The Ghorbasta builders probably came from the same tract, and were not Mekranese, nor Persians, nor Assyrian. The Pelasi existed only a few generations in Greece (about 250 years), before they were turned out by the Helotenes; they must therefore have brought with them, when they entered the country, their propensity for building massive walls, and commenced their work almost immediately on arrival. It was probably the same with the wall builders of Baluchistan; they only remained in the country long enough to allow them to extend northward as far as Kelat, when, meeting with the Mulla pass, they debouched into the plains. Their art was a fully developed one before they arrived there to carry it out. The Pelasi arrived in Greece about 1800 B.C. This date seems to accord roughly with the advent of the unknown Ghorbasta into Jhalawan. The Ghorbasta structures, however, when compared with the Cyclopean remains of Greece, are slight, most roughly executed and insignificant; yet they evince a like instinct and habit in two races which probably came originally from the same region.

The tank at Cumbum, the Husain-Saugar tank at Secunderabad, the Oossor lake or tank near Bangalore, are each about 7 miles in circumference. Their date is not known. The Mir Alam lake at Hyderabad, constructed during a famine to provide food, cost £1,600,000, and a steamer on it; and a great lake, formed in a famine by the damming up of the Goomti river, cost £1,500,000.—Dr. Cook in No. 6, Bombay Nat. Transactions.

This large tree is very common in the dense moist forests of the Animaliyas, 2000 to 4000 feet
CYNODON JAPONICA.

CYNODON DACTYLON.

elevation; and in Coorg at the waterfalls near Mercara, 4000 feet; and in other parts of the Western Ghats, Travancore, etc. It is found also in Ceylon at 5000 feet, and Java. Indian specimens (Var. B. ascalifolia) have the flowers sessile; the timber is very hard.—Thevetius; Beddome.

CYNODON JAPONICA. Pers.

Hai-hung, Hai-t'ang-li, Hai-t'ang pu, Chin.

The Cydonia genus of plants belongs to the natural order Pomeae. C. Japonica is a beautiful flowering tree, originally from Sin-lo on the Yellow Sea, now largely cultivated in China; and Szechuen produces fine sorts, one variety being called Ts'ai-hai-tang.

CYNODON VULGARIS. Pers. Quince.

This small, crooked, and much branched tree grows in the south of Europe, in Persia, Afghanistan, Kashmir, in the N.W. Himalaya, in Hindustan, and is cultivated from Kabul to Kashmir. Flowers few, of a white or rose colour. The fruit is of a yellow colour, downy, and remarkable for its fine odour. The seeds, called Bibi-dana, are in great use medicinally, being brought into India from Persia, Kabul, Kandahar, and Kashmir, and are highly valued as a demulcent tonic. The fruit contains some astringent matter. It is now made into a preserve, or used for flavouring the preserves of other fruits. There is a 'tursi' or bitter, and a 'shirin' or sweet quince.—Dr. Rygle; O'Sh.; Roxb.; Voigt; Stewart; Clegorn.

CYGNIAE, the swan family of birds. Cygnus olor is the mute swan, of which C. immutabilis is the wild race. Cygnus musica is the Cygnus ferus, or Hooper swan, and is found in N. Europe, Asia, and N. Africa. It is migratory, and one specimen was obtained in the valley of Nepal.

CYMBIDIUM, a genus of plants belonging to the Orchidaceae, all of them with beautiful flowers.

C. alatum, Roxb., of Sunderbuns and Chittagong, has pale sulphur flowers.

C. aloifolium, Setz., the Paras, the Epidendrum aloifolium, L., Ariosdes Borassei, etc. Flowers large and white, egged, on most of the hills of India; a beautiful plant when in flower, and blossoms in April.

C. aphylleum, Setz., the Limodorum aphylleum, Roxb., with yellow flowers; Coromandel coast.

C. giganteum, Wall., the Limodorum longifolium, Buch., grows on the Khasaya and Nepal hills.

C. pendulum, Setz., the C. crasifolium, Wall., and the Epidendrum pendulum, Roxb., grows in the Khasaya hills, and in the Peninsula of India.

C. triste, Willde, grows from Nepal and Ceylon to Japan and N. Caledonia, has small pale green flowers. It is the Epidendrum teres of Thunb., E. triste, Forst., and Linsia tertifolius, Gard. and Franch. and C. giganteum, Wall., and C. gigas, have the leaves in Nepal; and C. Gib. sonii, Wall., C. inconspicuum, Wall., C. Masteri, Wall., and C. striatum, Wall., grow on the Khasaya hills. Wight also gives C. erectum, C. tenuifolium, and C. tesseloides.

CYMBIRHNCHUS MACRORHYNCHUS, called by the Malays the rain bird, is the most beautiful of the Malacca birds, and is known to naturalists as the blue-billed gaper.—Wallace.

CYMOBOPONG LANGIER. Def.

Khawi; Panii, .. Panj.; Injani, .. Panj., Solars, .. Buir, .. of HABRIANA.

Root Sheaths.

Azkar; Mirchisangad, H.; LAMJAK kataran, .. Hind.

Dr. Stewart says (p. 253) this and C. iwaran-
cusa are not uncommon in many parts of the plains.

CYNANCHUM (from xwlo, a dog, and drvex, to strangle), a genus of plants belonging to the natural order Asclepiadaceae. The species are herbs or undershrubs, with opposite leaves and mostly twining stems. Dr. Wight gives C. alatum, callialata, pauciflorum. The Populus Euphratica, a species of Cynanchum, Choris bartata, and Cyperus aristatus, all ascend to 11,000 feet in Indiath. Peganum harmala attains 9000 feet. The leaves of C. argal of Upper Egypt in small doses are purgative, and they are much used in Egypt for adulterating sema. C. ovalifolium of Fenzag yields abundance of very fine caschatone.—O'Sh. p. 51; Eng. Cyc. p. 275.

CYNARA CARDUNCULUS. Linn. The cardoon; is similar to the garden artichoke, but grows much higher, though cultivated similarly to the artichoke.

CYNARA SCOLYMUS. Linn. Artichoke.

Kirshuf, Kharisuf, .. Arab; Kanjur, .. Hind., Pers.

The artichoke has very large flowers, of a violet blue colour, and is grown in many gardens of the Deccan.

CYNIPS, gall-producing insects, puncture and lay their eggs in large numbers in the fruits, seeds, and leaves of plants, and the excrecences are known as galls. A species on the Himalaya affects the oak.

CYNCEPHALUS. Cuc. A genus of quadrumanous mammals, known as baboons, meaning in the Greek dog-headed. Its most marked characters consist in the great prolongation of the face and jaws, and in the truncated form of the muzzle, which give the whole head a close resemblance to that of a large dog. In their native mountains, the ordinary food of the baboons is berries and bulbous roots; but in the vicinity of human habitations they make incursions into the cultivated fields and gardens, and destroy a still greater quantity of grain and fruits than they carry away with them. C. hamadryas, Linn., the derrias, is found in Africa and Arabia. It measures upwards of 4 feet when standing erect.

CYNOCNOTUM PAUCIFLORUM. Dec.

Cynanchum pauciflorum, R. Br.

Very common in the central province of Ceylon and India. The Singhalese eat the young leaves of this and of many other plants of this natural family, in their curries.—The. Zeyl. p. 195.

CYNODON DACTYLON. Pers.

Panicum dactylon, Linn., Agrostis linearis, Retz.

Durhka, .. Beng., Hind., Hurrum pilu, .. Tam.

Dobh, Dobha, .. Arugam pilu.

Harial, Durua, .. Durka, Garka kurnou, .. Tel.

Khalan, Khabar, .. Hind., Tella garki.

Barawa, .. Tr.-Ind.

The Harryllee grass of India and Europe is considered, in India, the best for cattle. The root creeps through the loose soil to a considerable extent, and has strong fibres at the nodes. The stem rarely exceeds six inches in height. Florets are all on one side of the spike-stalk, avenless, purplish, and ranged in two close alternate rows. All the stems which lie near the ground take root, and by this means, though an annual plant, it increases and spreads very wide. It yields abundance of seed, of which small birds are very fond.
OYPERACE.IE.

It is grown for hay; and it is good to allow the seed to ripen before the hay is cut, as it then propagates itself by seed, in addition to the runners. This grass is found in Great Britain, but its produce and nutritive properties are there comparatively insignificant, while in India it constitutes three-fourths of the pasture. Sir W. Jones observes (As. Res. iv. p. 242) that it is the sweetest and most nutritious pasture for cattle, and its usefulness, added to its beauty, induced the Hindus, in their earliest ages, to personify it as the mansion of a benevolent nymph. The A’charvana Veda thus celebrates it: ‘My Durva, which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth a hundred years.’

It is the principal one of the Indian grasses, and is perhaps the most generally diffused, possessing much nourishing property in its long stems, no less than in its leaves. It endures the greatest elevation of temperature, as its roots penetrate far below the surface; and although, during the dry hot season, giving no sign of life, it puts forth its tender leaves on the first approach of the rains. It grows throughout the year, and lawns and pastures of moderate extent are made by planting pieces of the creeping stems. It is also much used for forming a covering for the banks of rivers, ramparts, and esplanades. The young and tender leaves are used in chatnis, and are considered very pleasant; the roots make a cooling drink. It is also one of the most abundant grasses on the Tamasserin coast, but it is much less conspicuous than many others.—Mason; Cleghorn; Jaffrey; Von Muelen.

CYNOGALE BENNETTI, a rare otter-like animal of Borneo. It has a very broad muzzle, clothed with long hairs.—Wall. I. 590.

CYNOGLOSSUM, a genus of the borage tribe of plants, growing in Bengal and Northern India. C. diffusum, canescens, Falconerianum, furcatum, marifolium, and racemosum, pretty little annuals, flowers mostly blue, purple, white and purplc; grow in any common soil.—Riddell; Roxb.

CYNOGLOSSUS LINGUA. B. Ham. The sole.

CYNOMETRA BIJUGA. Spanoggles. A timber tree of the Sunderbuns.

CYNOMETRA RAMIFLORA. Linn.

A tree which attains a height of 60 feet in Ceylon, Malabar, Java, the Moluccas, and Sumatra. A cubic foot when seasoned weighs 56 lbs., and it is said to last from 15 to 60 years; sp. gr. 0.86. It is used for bridges and buildings, and is the best suited of the Ceylon woods for under-ground purposes. Its roots, leaves, and an oil from the seeds are used medicinally. Chips of the wood infused in water give a dark purple dye.—Mr. Mendis, Useful Plants; Thewitts; Beddome.

CYNOMETRA TRAVANCORIA. Bezd. This is a straight tree of great height and very beautiful foliage, particularly when in young leaf. It grows on the Tinnevelly and Travancore mountains at 2000 to 3000 feet elevation.—Beddome.

CYNOMORIACE.E, Lindl., an order of leafless parasitic plants. Wallich says a species of the Cynornorium, a fungus-like genus, is parasitical on the roots of trees in the Tamasserin Provinces, and valuable as a styptic.—Mason.

CYPEREAE.

CYPONITHECUS NIGRESCENS, the black baboon monkey of Celebes.

CYPEREAE, the sedge tribe, a natural order of plants, found from the arctic to the antarctic circle, in marshes, ditches, and running streams, in meadows, on heaths, in groves and forests, on the sea-shore, and on mountain summits, wherever phenogamous plants can exist. In Griffiths’ Herbarium are 244 species of Indian Cypereae, collected from the Himalaya to Mergui. The most useful of the tribe are species of Cyperus, Euphorium, and Papyrus, q.v.

C. Jemeniacus, Roxb. | C. capitatus, Retz.
C. gernaniaca, Anisile.
Shilandi arisi, | TAM. Puridampa, | Tel.
Furigaddi, | Tel.

This plant grows on the Coromandel coast near the sea; its roots are used as flour in times of scarcity, and they are also eaten roasted or boiled. Dr. James Anderson, in an excursion to the southern part of the Peninsula of India, discovered that the Shilandi arisi, growing in sandy situations by the seaside, and requiring but little water, was the common food of the natives during a famine, and when other grains are scarce. It is nutritious, pleasant to the taste, and makes a pudding somewhat resembling that made of sago.

—Anisile, Useful Plants; Roxb.; O'Sh.

CYPERUS CORYMBOSA. Roxb. Rot ball, in India used for mats.

CYPERUS ESCULENTUS. Linn.
Sha-tsa'u, | CHIN. | Hsiang-tu teze, | CHIN.

In China the shoots are used to make bats and matting; its tubers are in much request for food. The roasted leaves have been used as a substitute for coffee, and yield a preparation resembling chocolate. The cultivation of the plant deserves attention for its considerable alimentary value. Yen Muelle; Smith.

Bhada tunga gaddi, | Fumiu, | YUNNAN.

Var. a. C. rotundus, Linn., Roxb., grows in all Southern Asia, from Arabia to China, Java, and N. Holland. Its tuberous roots are sold in the bazaars at 2 annas the pound, and used by perfumers, under the name of nagor moothi, on account of their fragrance. Hogs are very fond of them. Cattle eat the grass. In the Ho-nan, Shen-si, Hu-peh, and Szee-chun provinces of China its fibres are woven into cloth. In India and China its fresh tubers are deemed medicinal. —Smith; Roxb.; Voigt; Fl. Am.; C. M. Top.; O'Sh.

CYPERUS INUNDATUS. Roxb.
C. precocis, Roxb. | C. baeca, Buch. Ham.
Pat., | BENG. Potupullu, | MAL.

Found in great abundance on the low banks of the Hoogly near Calcutta, and of rivers in the south of India, where the tide rises over it. It thrives most luxuriantly, and helps to protect the banks from the rapidity of running water. —Roxb.

CYPERUS PAPYRUS, of the Egyptians, is still called babier in Syria. It is about 15 feet high. The pithy-like tissue of the larger flowering-stems, cut into thin strips, united together by narrowly overlapping margins, and then crossed, under pressure, by a similar arrangement of strips at right angles, constituted the papyrus of antiquity. This paper is but little liable to decay. Pliny, for instance, relates that the books of laws of Numa Pomplius was found in Rome in a high state of preservation, after having been buried nearly six centuries in the earth. —O'Sh. p. 628.

CYPERUS PERTENNIS. Roxb.
Nagar moothi, Naga, BENG. | Kola tanga mutu, | Tel.

Roots aromatic; employed as a hair perfume. —Roxb.; Voigt.

CYPRÆIDEÆ, the Cowry family of shells, the Porcellaneum of the Germans, and Porcelain or porcelain shells of the French. Cyprea argus occurs at Ceylon, and a pair was once sold for four guineas. C. moneta is used in many parts of the East as a circulating medium, and for ornamenting the dress of several races, and the trappings of animals. 4 cowries = 1 ganda; 60 cowries = 1 pan.

CYPRESS.
Pien-pee, | CHIN. SAVY, | HIND. PERS.
Cypres, | FR. | Cypresso, | IT.
Cyprææ, | GER. | Cipres, | SP.
Tirzah, | HEB.

The Chinese cypress Tien-pee is the Cupressus thyoides. The cypress-wood of Cupressus sempervirens, L., is aromatic, compact, and almost imperishable. It is an overgreen forest tree, a native of the south-eastern parts of Europe, particularly of Italy, Mexico, and the southern parts of N. America. —Cleghorn, Panj. Rep. p. 63.

CYPRINIDÆ, a family of fishes of the order Physiostomi, the species of which are distinguished by their having the mouth small. The family is classed into fourteen groups, viz. Catasetomina, Cyprinaea, Rhodocentra, Lepitobarbia, Raarborina, Semiplatina, Xenocypridina, Leuciscina, Rhodeina, Danionina, Hypothalyma, Michthyina, Abramidina, Homolopterina, Cobitina, in which are 110 genera, and about 600 species. —Engl. Cyc. p. 219. See Fishes.

871
CYPRUS.

CYPRUS, an island in the Mediterranean, near the coast of Syria; taken by the Turks from the Venetians in 1570. Its length is 140 miles, and its greatest breadth 60, pervaded by a chain of mountains, the highest of which is called Olympus. The soil is an excellent fertile clay. It was transferred to Great Britain in 1879.

CYRTOPHYLLUM FRAGRANTS. The Anan of the Burmese, grows in Moulmein. Is one of the Nux vomica tribe, and one of the hardest, most compact, and heaviest woods known.—Col. Cat. Ex. 1851.

CYRTUS INDICUS. Bloch. A fish of the Indian seas, of which large quantities are dried, and carried to the natives of India.—Contar.

CYRUS RIVER. The principal streams of the province of Fars are the Bendamir or Araxes, which receives the Kur-ab or Cyrus, as it falls into lake Bakhtegan; and the Nabon, whose course is from Firozabad southward to the Persian Gulf. In this country are also the higher parts of the two branches of the Tab.

CYRUS THE GREAT. A cylinder of this monarch, which was sent to Britain after Mr. Hormazd Rassam's return, was the most interesting historical record in the cuneiform character till then brought to light. It is in the Babylonian script, and was discovered among the ruins of the Birs Nimrud, the ancient Borsip. The cylinder is 9 inches long by 3½ inches in diameter, and must originally have been covered with 4½ long lines of text. The writing is very minute, and it is computed that the inscription would run to about 130 lines of the average length. Unfortunately the beginning was wholly lost, with the exception of a few scattered signs. It is found to relate to the very moment of that great historical event, the capture of Babylon by the founder of the Persian universal monarchy. Nabonidus has abanoned his capital, which has fallen into the hands of Cyrus, though he is still struggling against his fate in Babylonia. The Guti, and a people whose name is taken to be equivalent to Blackheads, are described as his subjects, and the god Merodach has delivered king Nabonidus into his hands. In a proclamation issued by Cyrus upon the taking of the city, the king repeats in the first person the principal allegations of the proclamation. It is partly mutilated, but the beginning, 'I am Cyrus,' with his genealogy in full, and his description of himself as 'king of Gyinds,' etc., can be pretty clearly made out. Cyrus is made to speak of his reparation of the temples of Babylon, and of the favours conferred upon him by Merodach, Bel, and Nebo, in answer to his prayers to them; of the homage paid him by distant nations, and of the gatherings of the people in the city to acclaim him king. Sir Henry Rawlinson said this new text settled for ever in favour of Herodotus, as against Ctesias (in Dio-
dorus), the genealogy of Cyrus. He was fifth in descent from Achemenex, next to whom came Teiseps, then Cyrus the grandfather, and Cambryes, the father of Cyrus the Great. The suc-
cession was direct, not indirect, as Professor Oppert has maintained. The inscription styles the native country of the Persians 'Assyria,' which Sir Henry Rawlinson seems to think was in the plains between the modern Shusser and the Persia of the classical writers. An important religious centre, named Calana in the inscription, he re-

ferred to the Calneh of Genesis and the Calno of Isaiah. Cyrus evinced sympathy with the Jews, as is shown by Isaiah xli. 2, xlv. 28, xlv. 1, and Ezra i. 2 to 4.

CYSTICERCUS or Soolex, from Kustis, a bladder, and Kerkos, a tail, is a hydatid or larval form of a cestid worm, called in its sexually matured state, Strobila, the C. tennia medico-cancella. When the flesh of an animal in which it is contained has been received into the human alimentary canal, the Cysticercus can be developed into a tape-worm.

D.

D, as sounded in the English language, has letters with corresponding powers in Arabic, Persian, Hindustani, Sanskrit, Hindi, Mahrati, Gujarati, Bengali, Urdu, Telugu, Karnataka, Tamil, and Male-

alam. In all these tongues, however, there is also a softer-sounding d. The English compound dh also, the Tamil tongue excepted, has corres-
ponding letters, simple, modified, or compounded, with both soft and hard sounds; d and r, in several of the Indian tongues, are, moreover, so pronounced as to be difficult for a European ear to catch their niceties; and d and r are therefore frequently confounded. D and r are not used by the Chinese, who use the liquid l for r.

Some nations of Europe, with a soft pronunciation of the letter j, require to prefix d to that letter for the correct pronunciation of such words as Jamal, a camel; thus Djamal. Vambery used dj for the Arabic chm. Dhs is changed by the Siamese to th.—Wilson; W. W. Hunter.

DAB. HIND. Poa cymoiroideus, the sacred grass of the Hindus; is generally applied only to the first shoots of the Koosh grass; it is called Dabasa in Rohilkand, and is used by Hindus in their religious services.

DAB. HIND. of Kohat. A moist soil.

DAB or Dabha. HIND., TAM., TEL. A small copper coin; money in general.

DABBATU-1-ARZ. ARAB. The second beast mentioned in the Revelation. Mahomedans believe it will issue from a mountain in Mecca, with the staff of Moses and the seal of Solomon. With the first it will strike the believer, and with the latter it will stamp the face of the infidel with the words, 'This is an infidel.'

DABGAR, a low caste of non-Aryans, who manufacture large leathern vessels for holding ghi or clarified butter (dabbar), and of vessels in which atta and ghi are deposited.—Sherrimg.

DABHA, a town in the Chanda district of the Central Provinces, lat. 19° 38' N., long. 49° 42' E. The people manufacture tasar silk handkerchiefs, coloured cloths, and silver snuff-boxes. The population is almost wholly Teling.—Im. Gaz.

DABHA, petty state of Mahikanta; estimated population in 1875, 1612. The ruler is a Mukwana Koli, a convert to Islamism. The religion of the Miah race of Dabha is a mixture of that faith and Hindusim; they give their daughters in marriage to Mahomedans of rank, and marry the daughters of Koli chiefs. They burn their dead.

DABHOI, the ancient Dharbhavati. A town in the territory of the Gaekwar of Baroda, 15 miles S.E. of Baroda; lat. 22° 10' N., long. 73° 28' E.;

872
DAB-i-AKBAR.

DAB-I-AKBAR, AKBAR. In astronomy, the constellation of the Great Bear. Dab-i-Sghir, the Lesser Bear.

DAHSHILAM, an ancient Hindu raja, by whose orders the fables of Pilpay were composed.

DAHISTAN, the School of Literature, a learned work on the various religions of Asia. It is in the Persian language. It contains a dialogue between a Brahman, a Mahomedan, a Zoroastrian, a Jew, a Christian, and a Philosopher. The representative of each religion brings forth his arguments, which are successively condemned,—some on account of the vicious character of their founders, and all for the absurdity of their doctrines, and the want of proof of their alleged miracles. The Philosopher winds up the discourse by recommending a system which shall have no ground but reason and virtue. It was translated by Colonel Kennedy in Tr. Bombay Lit. Soc. ii. p. 247; also, though not very accurately, by Shea and Troyer, for the Oriental Translation Fund (Paris, 1843). The author, Mohsin Fani, belonged to the sect of Sipai among the Parsees, and wrote in India during the latter half of the 11th century of the Mahomedan era. His account of the Zoroastrian religion is exceedingly full and accurate; and he also gives a good description of the Hindu and Muslim systems, as well as of the Sufi and other philosophical sects.

DABKAI, a goldsmith who flattens gold wire into tinsel and spangles.

DABLING—Dubling, two villages in Bushahr State, Panjab; in lat. 31° 45' N., and long. 78° 30' E., and 9400 feet above the sea, on a belt of arable land near the left bank of the Sutlej. The cliffs on the opposite side of the river rise to a sheer elevation of 6000 or 7000 feet. The population have the Chinese Tartar type of physiognomy, and profess Buddhism. The path between the two places, a mile apart, is rendered practicable by means of wooden scaffolds fastened against the face of the precipice.—Imp. Gaz.

DABOU; a small weight of Musaliputam, equal to 11½ grains.

DABRAY JOGI, also called Dabray Bajawanla, and Bal Santa ka Jogi, a class of Hindu mendicants who sound the damb.

DABUL or Debul, a seaport town on the Malabar coast, eight miles south of Severndrug. This port was burned about 1508 by the Portuguese viceroy, Almeida. He came to India in 1505, the successor of Dias, Vasco da Gama, and Cabral. On his arrival, he concluded a defensive treaty with the king of Vijayanagar; but the Venetians, who up to that time had monopolized the trade with India, jealous of the growing power of the Portuguese, instigated the king of Egypt to oppose their progress. He accordingly sent a fleet under Mir Hukum, who, in conjunction with the fleet of Gujerat, bore down upon Lorenzo, son of Almeida, and defeated him in 1508, Lorenzo falling in the fight. Almeida, to avenge his son's death, burnt the port of Dabul, and defeated the enemy in the harbour of Din, and then concluded a treaty.

DACCA. There are two towns of this name, one Dacca Jalalpur and the other Dacca proper, between Dacca Jalalpur and the Megna river. The latter gives its name to the whole district, which is one uniform level of rich alluvial soil, annually inundated by the overflow of the great rivers. The villages are built upon mounds of earth artificially raised above the flood. During the rainy season, this tract presents the appearance of a continuous sheet of green paddly cultivation, through which boats sail to and fro. The chief means of communication at all times of the year is by water. The bordering rivers are the Ganges or Padma, the Jamuna or Brahmaputra, and the Megna. The city of Dacca is situated on the north bank of the Buriganga river, in lat. 23° 43' N., and long. 90° 25' 25" E. The town extends along the bank of the river for a distance of nearly 4 miles, and inland, towards the north, for about 1½ mile. The ruins of the capitals and palaces of the Bhuyia rajas lie scattered throughout Eastern Bengal, along the line of the Brahmaputra valley; and their memory is still cherished in the household tales of the Hindu peasantry. The Mahomedans first entered Bengal in 1205 a.d.; and two most celebrated of their viceroys are Mir Jumla, the general of Aurangzeb, who failed disastrously in his expedition to Assam, and the nephew of the Nur Jahan Begum, Shaista Khan, who broke the power of the Portuguese, and captured Chittagong to the Mogul empire. Dacca has numerous Hindu temples and many Mahomedan mosques for the large Musulman population, with churches and schools of the various Christian sects. The Roman Catholics are under the spiritual guidance of priests from Goa and elsewhere, with churches of their own and old Portuguese names. Formerly they used to intermarry with the natives, but of late years they seek alliances amongst their own people. Their complexions are very dark, and their custom semi-oriental; but they supply Calcutta with excellent domestics. The English, the French, and the Dutch had established factories about the middle of the 16th century, when the city was visited by the French traveller Tavernier. Cotton, jute, and saiflower may be considered staples of Dacca. The indigenous cotton has long been cultivated along the banks of the Megna from Dacca to its forks along the rivers, to the distance of about forty miles; on the banks of the Brahmaputra creek (the ancient channel of the river of the same name), and along the Luckia and Banar. It presents different shades of quality, the finest of which is named photi, and is the material of which the delicate Dacca muslins are woven. It is described by Roxburgh as differing from the common herbaceous cotton plant of Bengal in several particulars, but chiefly in having a longer, finer, and softer fibre than it. Three pieces of muslin, made to be presented to the Prince of Wales, measured each 20 yards by 1 yard, and weighed 3½ ounces. Next to fine muslins and embroidered fabrics, silver filagree work is that for which Dacca is most celebrated. This art is also practised in great perfection at Cuttack, and in Sunatara and China. The articles usually made at Dacca are ladies' ornaments, such as bracelets, earrings, brooches, chains, necklaces, etc., and the attar-dans and small boxes for natives. The design best adapted for displaying the delicate work of filagree is that of a leaf. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece
of bamboo for a blow-pipe, small hammers for flattening the wire, and sets of forceps for intertwisting it. The drawing of silver and gold (i.e. silver wire covered with gold), used as thread in embroidery, is extensively carried on here. Bonures is also celebrated for this art. There are several varieties of silver and gold thread (bdla) made at Dacca, as kalabatoon for the embroidery of muslins and silks, goshoo for caps, and covering the handles of chauris; sulmah for turbans, alippers, and hookah-snakes; and bowel for gold lace and brocades. Some of it is drawn almost as fine as a hair. In the time of Aurungzeb a quantity of this article was made yearly for the court at Dehli. A hundred sticks covered with it, and plain gold and silver bdla to the amount of £2000 in value, appear among the items composing the mulboos khas muzr, which was annually sent to the emperor. Shawls, violets, shell ornaments, and boleos are largely manufactured. Amongst Mahomodians, the name of Dacca was Jahangirnagar.—Dr. Taylor.

DACELLO PULCHELLE, a kingfisher. Their feathers are much prized by the Chinese, who make them into fans.

DACOITY, a legal term of British India for a system of robbery by gangs of people of the country. It is derived from Daka, the verb being Daka parna, to plunder. In India, thugs and dacoits who had been tried and convicted as having belonged to a band of thugs murderers or dacoits, but who, having made a full confession of their crimes (in some individual cases amounting to the murders of as many as eighty persons), and having denounced their associates, received a conditional pardon. Originally, in the criminal code of India, Dacoity was applied to the armed bands who plundered, but it and the term Thuggees are now applied to several well-defined classes, and in times of scarcity many of the unemployed may join. Amongst the predatory races were the Budak of the Nepal Terai, also the Dasaah of Behar, who used to make frequent predatory excursions into Lower Bengal, the Bind of Ghazipur, the Nath, the Ahir, Boria, Kurmi, Gujar, and a host of low castes. In the Panjab, dacoity generally assumed the form of cattle-lifting. The Meena were active and energetic, and were concerned in most of the dacoities of Northern India. And in the S.W., the Santal with his club, long bamboo spear, and terrible battle-axe, often swept down on the plains of Birbhum, Hazaribagh, and adjacent districts, and the flare of their torches or light of the burning huts gave the first warning. The leaders of a dacoity band in Central India carried with them an axe with a highly polished edge, sacred to Bhawani.—People of India, vii.

DACRYDIUM, a genus of coniferous plants, growing in New Zealand, Tasmania, and New Caledonia. They are valuable timber trees, growing to a great height.

D. Colenso, Hooker, of N. Zealand, attains to 50 feet, yielding hard and incorruptible timber.

D. cupressinum, Solander, also of N. Zealand, the rima or red pine of the colonists, attains to 200 feet, with pendulous branches, yields a hard, valuable wood.

D. Frankii, Hooker, fls, the huon pine of Tasmania, has a height of 100 feet, circumference 20 feet; its wood highly esteemed for shipbuilding and artisans’ work.—J. Backhouse.

D. Kirkki, P. v. Mueller, the manao of N. Zealand, a pyramidal tree, attaining 80 feet in height, has a reddish-coloured timber.

D. Taxifolium, Solander, the kaka tree of New Zealand, grows in low marshy ground. Its foliage resembles the yew, and it grows to 140 or 180 feet in height.—Jum. Ed. Jour. 1825, xiii. p. 378; Ferdinand von Mueller.

DACTYLOPTERUS. Lacépède. A genus of fishes belonging to the order Acanthoptyrgii and family Loricati; Triglia volitans, Linnaeus, commonly called the flying gurnard and flying fish. Another species inhabits the Indian seas, and is the Dactylopterus orientalis of Cuvier.—Eng. Cyc.

DAD. Pers., Hind. Literally, a gift; a postfix and prefix much in use, as Khudadad, given by God, the Theodotus of the Greeks, and Dev-dutt of the Hindus.

DAD. Pers. Justice; petition; representation. Dad-khah, a plaintiff for justice. Dast-sitadun, taking vengeance. Dad-khah means one seeking justice. It was the title of the earlier viceroys of Central Asia, and is still used in Khokand and Eastern Turkestan. Dad-Mahal, lit. palace of justice.—Vambery, Bokhara, p. 317.

DADAP. Malay. A tree of the Archipelago, planted in the coffee grounds of Java to shelter the young coffee trees.—M’Nair.

DADAR, a town and valley in Cutch Gandava, lat. 29° 28' N., and long. 67° 34' E., 55 miles N.W. from Bagh, and 5 miles from the eastern entrance of the Bolan pass, on the river Bolan, surrounded by hills. In the first week of May, the thermometer ranges from 64° to 120°. It is separated from the great plain of Cutch Gandava by a line of jibal or low hills. Dadar is excessively hot, and a Persian couplet runs, ‘Ali Allah, dozakh ki sakhti, chon Dadar hasti?’ ‘O Lord, why do you make hell when you have Dadar?’

DADH or Dat. Malay. Ground prepared by burning for being planted; the weeds and grass are stove over it to be burned.

DADHALYA, a petty state in Mahikanta. The family are Scosdia Rajputs, who originally came from Udaijar (Oodeypore) in Rajputana.

DADUNGAWU, a tutelary spirit of the Java hillmen.

DADU PANDURANG, RAO BAHADUR, a learned native of Bombay, and religious reformer, who died 17th October 1882, aged 68. He mastered Mahrati, Gujarati, Urdu, Sanskrit, English, Persian, Telugi, Tamil, etc., and at an early age composed a complete Mahrati grammar, published a school atlas, a work entitled The Wiping of the Tears of the Widows, Grammar of the Persian, and another of the Sanskrit; the Kavakuti, The Cosmopolitan Arya, and the Hindu Gentleman’s Reflection. He was the founder of the Parmahams Sabha, which led to the formation of the Prarthana Samaj.

DADU PANTHI, a Vaishnava sect of Hindus, whose tenets are derived from Ramananda, after whom, Dadu, its founder, is said to be the fifth spiritual guide. Their worship is restricted to the Japa, or repetition of the name of Rama, as the deity negatively described in the Vedanta theology. They have no temples or images. Dadu was born at Ahmadabad about A.D. 1600, and is said to have been a cotton-cleaner there and at Ajmir. They carry a rosary, have no frontal mark nor mala, but wear a round or four-cornered hat. They are said to be numerous in Marwar.
and Ajmir. Their chief place is Naini, 40 miles from Jeypore. They are classed as (a) Virahta, who go bare-headed, and have but one garment and one water-pot; the (b) Naga, who carry arms and serve Hindu princes, making good soldiers; the (c) Bhilatsu Dhari, who follow the avocations of ordinary life. They burn their dead at dawn.—Wilson. See Dae; Vairagi.

DAEDEALUS SHOAL Callled by the Arabs Abdul-kheesan, in lat. 24° 45' 30" N., and long. 35° 50' 30" E. A submerged coral reef in the Red Sea. 1200 yards long and 450 yards broad, with six inches of water, on which, in 1862-3, a lighthouse was erected.—Findlay.

DAEE, a sect met with at Gajer, Makran, Kej, and Turbot. They resemble the Brahui in appearance, and wear the same dress. Portions of certain of the Brahui tribes are Daeed, such as the Sageta, Takee, Shudu, Laec, Marbrow, etc. They have a mullah or priest, and a book. They say that they originally came from the westward near Kej, where there is a town called Turbot. The sect abounds in Makran, and has extended east. At Turbot is a little hill of circular form, called by them Koh-i-murad, on the summit of which is their principal masjid, where they meet at stated times to perform their rites. Professor Wilson, in his Ariana Antiqua, p. 141, mentions the Daeed, amongst other Scythian tribes, as associated with the Massagetae; and in a map attached to Digby's translation of Chardin's Curtaia, their position is fixed a little south of the Jaxartes. This coincidence of association with the Sageta and Sakai, both then and now, is worth remarking.

DAEMIA EXTENSA. B. Brown. Cynanchum extensum, Jac. [C. bicolor, And. C. cordifolium, Retz. Asclepias echinata, Roeb. Chagal-banti; Ubrun, Ben. Vela parti; Utamani, T. M. Sagoani, ... HIND. Jutugas, ... TEL. This plant is used medicinally. Its fibre, known commercially as cotton fibre, is a promising substitute for flax. It is soft, white, silky, and strong, and can be procured in considerable quantities in Southern India.—M. E. Jur. Rep.

DAEN or Dawan. HIND. Tying a number of bullocks together for the purpose of treading out the grain from the car.—H. Elliot.

DAENDELS, HERMAN WILLIAM, born at Hattem in Gelderland, 21st October 1762; died at New Guinea, 1818. He was Governor-General of Dutch India, and formed the great military road of Java.—Max Havelar.

DAERD, a class of agricultural slaves in Kanara.

DAF. HIND. A hand-drum, a tambourine, the only lawful musical instrument for Musalmans.

Dafli, a small tambourine.

DAFFADAR. PERS. An officer in the native irregular cavalry; the title of a native military or police officer; a native non-commissioned officer of cavalry of the Indian army.

DAFILA. HIND. A tambourine. Daira, a large tambourine.

DAFTAR. HIND. A record, a register, an account; an office in which public records are kept. A volume, a book of gold or silver leaf. Daftar- dar or Daftari, a record keeper, a registrar, an accountant, a gold-beater.

DAG. HIND of Kohat. Land cultivated only once in three years.

DAGA, a boat used on the Indus.

DAGGER. The daggers in use in S.E. Asia are of many shapes, and all with individual names. One of a particular shape is the official weapon in modern Indian courts. A drawing of the dagger of ministry is given in the last volume of Duff's History of the Mahrattas. Those usual in British India being the jambiya, bichwa, pesh-kabz, kum-bjar, katar, etc.—Hind. Theatre. See Arms.

DAGH, a hill, a mountain. Alajah Dagh, or varanu, is a mountain, is near Ararat.

DAGHA. HIND. Deceit, fraud. Daghia-baz, a thief, a swindler.

DAGHDA, mother of Zoroaster, founder of the Parsee religion.

DAGHESTAN, a province in the Caucasus subjected by Russia after a war of 20 years. The men of Daghestan are intelligent, and were at one time, with the exception perhaps of the Circassians, the most warlike of the races of the Caucasus. Unlike the other inhabitants of the range, they are extremely industrious, and have even shown themselves capable of organized labour requiring considerable skill. During the war, Schamy was able to erect a cannon foundry in their country. Elburz is 18,526 feet; Great Ararat, 16,916; Little Ararat, 12,840 feet.

DAGOBA or Dhatagarbha. SANS. A Buddhist bone or relic receptacle. The term is from Da, Datu, or Dhatu, a relic; Garbhan, a shrine; and was in use by Indian Buddhists. At Ana-radhapura, in Ceylon, are several dagobas. They were built at from B.C. 307 to A.D. 276, and end in a terminal Tec, in the form of a cone supporting a pointed spine. They are the Tibetan Dungan, a relic monument which is still erected in Tibet over the body or the ashes of the lamas. The ancient edifices of Chichen, in Central America, bear a striking resemblance to the topes or dagobas of India. The dagoba is the descendant of the sepulchral tumulus of the Turanian races, whether found in Etruria, Lydia, or among the Scythians of the northern steppes. See Chatiya.

DAGON. BURM. A corruption of the Talain words Ta-kong. The Shocay Dagon is a Buddhist temple of Rangoon, which rises from the summit of a scarped hill to a great height.

DAGON, the fish-god of the Assyrians, possibly the source of the fish avatar of the Vaishnavas.

DAGOOKAN, a shrub of Jullundur. The wood is used as fuel, and the leaves are given to buffaloes as fodder.—Conr. Flêr. Dur.

DAGOOTHRA. BUR. A crooked timber in Tavoy and Mergui, floats in water, and used for building boats, for planks of houses, ladders, etc., but is liable to attacks of worms and dry-rot.—Captain Dance.

DAGSHAI, lat. 30° 53' 5" N., and long. 77° 5' 38" E., a military station 16 miles S.S.W. of Simla. The cantonment is 6025 feet above the sea, on a bare and treeless height.—G. T. S.

DAH. PERS. Ten. Dah'm, the tenth. In the Punjab, Dah-mah-di, farm servants hired for ten months. Daha, also Askra and Ashora, the first ten days of the Mahrarr, which Shah Mahomedan pass in sorrow. Sunni Mahomedans erect tabuts in reverence of Hasan and Husain, sons of Ali.

DAH. HIND. In the N.W. Himalaya, a clod-crusher, a flat beam of wood dragged over the fields to smooth clods. It is the Sogha of the plains.—Powell.
DAHR, a heavy weapon made use of by the Bhot and Burmese races, as a sword in war, and intended for felling trees or cutting up firewood; the friction on the handle is very great.

DAHIL. Hind. Coagulated milk; sour milk.

DAHIA. Hind. A Jat tribe in Delhi district.

DAHINA or Dakshana. Hind. The left.

DAHIR, the takhallus or literary name of Mirza Salamat Ali, who lived in Lucknow in the 19th century. He was at one time a papermaker. He was famed for his marxis or elegies, and was known as the Tuti-i-Hind, the parakeet of India. He died about a.d. 1875.

DAHIR, Desput, or lord of Dobeil, from Des, a country, and Fur, the head. He was a ruler over the country of the Indus (about a.d. 711, a.h. 92), whose capital was at Alor, near Bakkar; but he possessed Multan and all Sind, with perhaps the adjoining plain of the Indus, as far as Kalabagh. Hejaj, governor of Basra, sent a force against him under his nephew, Muhammad Kasim, who took Dewal, defeated and took prisoner a son of Dahir, advanced on Nerun, now Hyderabad, and took Schwam. He subsequently advanced on Alor, where he encountered Dahir, who was defeated and slain. His widow defended the city; but ultimately the women devoted themselves to the flames, which they lighted themselves. The Rajput garrison bathed for the sacrifice of themselves, and perished fighting. The city was taken by assault; all the men in arms were slaughtered in the storm, and the women and children reduced to bondage.—Elphinstone, p. 262. See Muhammad Kasim.

DAHLAN, a tribe of the Taga in the Upper Doab. Their numbers are estimated at 9,000. They are a kind of Kashmiri paper, lit. of ten handbreadths.

DAHNAJ. Arab. A stone described by Abu Zakd as resembling an emerald.

DAHYA. Hind. The Shum or Kumari or Daho system of cultivation carried on by hill tribes. The land is prepared by burning the grass and brushwood on it. The seed is then sown in the ashes.

DAIJA, literally lamp - holders; the term applied to the handmaids who invariably form a part of the Rajput Daija (Rajasthan, i. p. 628), dowry or portion, which the Hindu wife brings a husband in marriage. It is the Maritague of the civil law. Wilson, in a note to Mill's India (i. p. 447), says that 'amongst the Hindus the practice of purchasing a bride by a dowry is apparently of modern growth, and a violation of the law.' There are, however, passages in Menu on the subject which would imply the observance of both practices; and the same may perhaps have continued till the time of the Greek invasion, for Arrian (Indica, cxvii.) says the Indians neither took nor gave money in marriage; where Megasthenes (Strabo, lib. xv.) says their wives were purchased for a yoke of oxen. Amongst the agricultural tribes in the N.W. Provinces, the present practice is most usual for the bride's father to purchase the bride - woman, so that the man receives the dowry or Dai, which consists for the most part of money and household utensils. Thus, even when the daughter of Jye-chand was forcibly abducted by Priti - raj, her father sent to him the richest gems, the fruits of the victory of Beoji Pal, inestimable wealth, pearls, elephants, and dyes. This custom, the fruitful source of female infanticide, arises from the almost universal desire to obtain for the daughter the privilege of marrying into a higher family, which is only to be acquired by purchase. Sometimes, indeed, an imaginary purchase is made, similar to that which took place at certain Roman marriages, under the name of Coemptio, though of course not with a view of securing the peculiar kind of privileges which the Coemptio gave, but merely as a type of a custom of which the breach is thought preferable to the observance. This subject is noticed in Steele's Summary of the Law and Customs of Hindu Castes.—Elliott.

DAIMACHAS, an ambassador sent by Seleucus, or by his son Antiochus Soter, to Bimbasara, son of Chandragupta. He was regarded by Strabo as the most lying of all the Greek historians of India. See Vindusara.

DAIMIO or Daimiy, a hereditary prince of Japan territorial nobility, who, until the revolution in 1869, had extensive jurisdiction, with revenues estimated at 10,000 koku of rice. The words mean Great Name. The nobility are now designated Ku- wa- zo- ku. Each Daimio had a particular crest, which was marked upon all his effects, from his gateway to the lacquer made for his own use, like the European dinner or breakfast sets. Besides a private crest, each Daimio had a public one, to be put upon all china or lacquer made on his estate. When buying lacquer with both crests upon it, you know that it had been in use in the Daimio's family, and that either he had been in immediate want of money, and has therefore sold some of his household furniture, or that he has had as much use as was required out of the article. The Gorogio was the council of five Daimios, who were in fact the executive government, and with whom all the foreign ministers had their transactions.—Frere, Antipodes, pp. 419, 417.

DAINGNET, of whom there are 1955 in the Akyab district, are in feature somewhat like the Gurkhas of Nepal, and differ from the hill tribes of Akyab. They dress in white, wear their hair at the back of the head, and do not tattoo their bodies. They do not intermarry with other races, and dwell among the hills of the Yethaydong township, near Chittagong frontier, across which they are said to have come into Arakan. Their language is said to be connected with Nepali. A few speak that tongue; some can talk Bengali, and some have acquired Arakanese. The returns of 1872 show 3542 Daingnets resident at that time in the district of Akyab.

DAIR, a town north-west of Bussora, remarkable for a colossal tower of beautiful structure. Ibn-ul-Wardi in the Kassihia-ul-Ajaib says that strange sounds are occasionally heard to proceed from its interior. Great antiquity is attributed to this minaret by all the natives of the country.—Migman's Travels, p. 239.

DAIRA. Hind. The largest variety of tambourine, being from a foot and a half to two feet in diameter, played upon with a stick.

DAIRI, until 1869, amongst the Japanese, the
eclesiastical head of the government, who resided at Misko. See Kio; Kobo.

DAKSY, the little perennial plant called Bellis perennis by botanists. In India cultivated by the British as a souvenir of home.—Jaffrey.

DAITYA, a Hindu term used in various ways, but generally to designate a different and hostile race of ancient days. In the Mahabharta they are spoken of as aborigines, and others of them as having power on the sea coasts. In other places the term is made applicable to the Buddhists; and the mythological wars of the Daitya against the Devata are supposed to be the hostile operations against the Aryan race carried on by some of the races anciently in the Peninsula of India who opposed the advancing Aryans. In Hindu mythology the Daitya bear the same character as the Danava. When the Deva obtained the cup of Amritasar in churning, the Daitya rose in arms to seize it, but were defeated and driven back, according to the myth, to Patala or hell, but they subsequently acknowledged the supremacy to the holders of the discus and mace. The wars between the immigrant Aryan and the Daitya were thus changed in the course of years into miraculous battles between gods and demons.—Wheeler, Hist. of Ind.

DAITYA, in Hindu Mythology, the giant sons of Diti. Daityaevi, from Ari, an enemy. Daityaguru, from Guru, a teacher.

DAIVAKA or Daivajna, astrologer caste of Brahmans.

DAJIL, one of the three eastern sections of Baluchistan. It borders on the river Indus. The town of Dajil is in Cutch Gandava.

DAJJAL. ARAB.; HIND.; PEES. Antichrist. The Mahomedans believe in Antichrist, whom they term the false or lying Christ, al-Mashih-ul-Dajjal. He is to be one-eyed, and marked on the forehead with the letters K.F.R, signifying infidelity. They say that the Jews give him the name of Messiah bin Daood, and pretend he is to come in the last days, and to be lord both of land and sea, and that he will restore dominion to them. According to the traditions of Mahomed, he is to appear just between Al-Irak and Siyr, or, according to others, in the province of Khorasan. They add that he is to ride on an ass, and that he will be followed by 70,000 Jews of Isfahan, and continue on earth forty days, of which one will be equal in length to a year, another to a month, another to a week, and the rest will be common days; that he is to lay waste all places, but will not enter Mecca or Medina, which are to be guarded by angels, and that at length he will be slain by Jesus, who is to encounter him at the gate of Lud. It is said that Mahomed foretold Antichrists to the number of about thirty, but no one of greater note than the rest.—Lane.

DAJLA, the river Tigris.

DAK. HIND.; Ta'wil, Tam. The post, mail; to travel by dak, meaning as fast as the post, was performed in palanquins, or in carriages, or on horseback. Also the mail or postal arrangements of India, where railroads, carts, horses, and menrriers are employed to carry the mails.

DAKA. SIND. A water-wheel for irrigation.

DAKAR. HIND. Of CIS-Sutlej. Low-lying, stiff clay land.

DAKAUT, also Dakhautiya. HIND. Hindus born of or descended from a Brahman father and Goddess mother. They subsist on alms collected on a Saturday, and are astrologers, fortune-tellers, and the like.

DAKII. HIND. Vitia vinifera; grapes, especially the wild vine, also raisins. Kagh-dak'k designate the currants of Ribes rubrum, and Gidar dak'k, the fruits of Cissus carnosa, Sageretia oppositifolia, and Prunus padus. Dakha-kamalth, wine.

DAKHILAH. PEES. In accounts, an entry; also a receipt for money.

DAKHMII, ARAB. A coffin, a vault, a place for the dead; the tower of silence, the place of lodging the bodies of the Parsed dead, vernacularly Dokhma, or tower of silence.

DAKINI. HIND. A witch, a female goblin. In Hindu mythology also called Asra-pas, or blood-drinkers; a kind of female imp, attendant on Kali, and feeding on human flesh.

Dakin-rayi, a forest deity in Sangor island. After a battle in which Bugtea, a Rahoar chief, charged through Abiye Singh's army, the Rajput poets sang of his deed,—Is it the battle-cry of Kali, the hissing of Sehesag, the denunciation of Kalispur, or the war-shout of Hanowants? Is it the incantation of Nur-sing, or the darting beam of Surya? or the death-glance of the Dakini? or that from the central orb of Trineeta?—Raijathan, ii. p. 111: Dowson.

DAKOTA, also Dakocha, also Dakant, in the Mah ratified country, a tribe who follow fortune-telling; alphabet-makers. They claim descent from a Brahman father by a cowherd mother.

DAK-PA, also called Bruk-pa, a Bhot race.

DAKRA, a poisonous root of Nepal, made up with grain into balls, and so employed to poison elephants.

DAKSHA, author of a law treatise; is mentioned in the Mahabharata. He lived as a hermit on Mount Vrindana.—Ward, iv. p. 27.

DAKSHA, in Hindu mythology, was an avatar of Brahma upon earth in a human shape. There are several accounts, but the myth relating to him indicates a contest between the followers of Siva and Vishnu. Wilson says Daksha was the son of Brahma and mother of the moon; or the death-gaze of Daksha? or that from the central orb of Trineeta?—Raijathan, ii. p. 111; Dowson.

There are several accounts, but the myth relating to him indicates a contest between the followers of Siva and Vishnu. Wilson says Daksha was the son of Brahma and mother of the moon; or the death-gaze of Daksha? or that from the central orb of Trineeta?—Raijathan, ii. p. 111; Dowson.

Having undertaken to celebrate a solemn sacrifice, he invited all the gods except Siva, which so offended Sati, that she threw herself into the sacrificial fire. To avenge her fate, Siva created Virabhadra and other formidable beings, and sent them to the scene of action, where they disturbed the rites, beat and mutilated the assistants, and even maltreated the gods, till Siva was appeased, and arrested their excesses. Daksha, who had been decapitated in the scuffle, was restored to life, but the head of a ram was substituted for his own. Sati was born again as the daughter of the mountain Himalaya, and was again married to Siva. From this second birth she called Parvati, the mountain dweller, or Brinn, the mountain-brindled. The disturbance of Daksha's sacrifice is a favourite legend with the Hindus.—Coleman, Hind. Myth. p. 6; Hind. Theat. ii. p. 263.

DAKSHA SAVARNI, in Hinduism, one of the 14 patriarchs who preside successively over the 14 Manvantaras of the Calpa.

DAKSHINA, SANSK. A present to a Brahman on the conclusion of any ritualistic ceremony.
DALBERGIA.

DALBERGIA OOIJAINENSIS.

DALBERGIA. SANSK. The right hand; vernacularly Dakhin or Deccan, as the right hand; hence the country to the south, when a Hindu looks towards the rising sun, the south point of the compass, Southern India. Dalberga-Patha, the Sanskrit name for the Dakhan. The Periplus names it Dachinabades. Dalberga—Yana, the sun's southern declination.—Prin. Ind. Ant. See Dakhan.

DALBERGIA CHAIYIN. SANSK. One who follows the observances (achara) of the right-hand tribe or caste; practisers of the purer forms of the Hindu ritual, as opposed to the Varnachari or left-hand caste.—Wilson, Gloss.

DAL. HIND. Any split pulse, hence Tur-ka-dal, Cajanus indicus; Mung-ka-dal, Phaseolus radiatus, Ph. mungo; Channa-dal, Cicer arietinum. The various dal are mostly used as food by all the richer classes of natives, and many Europeans also like it, generally mixed with rice. Europeans often pronounce the name as if written Dol. The dal of Cajanus indicus is considered the best.

DAL. The lake or Dal of Kashmir, lies to the north of the chief town, stretching from the base of two hills to the more lofty mountain range which bounds the valley on the north. It is 5 miles long and 2 miles broad, but is only open in its northern half, the end nearest the town being occupied by large islands, with narrow channels between them, in some of which there is a good deal of current. Its waters are discharged into the Jhelum by a considerable stream, which, flowing from its south-east corner, runs to the westward in a course nearly parallel to the southern margin of the lake for nearly a mile, where it bounds a rocky south to enter the Jhelum in the middle of the capital of Kashmir.

DAL. BENG., HIND. A coterie, a club, an association. A bow, a basket of leather or twigs. Dali, a present.

DALCA or Dahal, the largest island in the Red Sea, near the coast of Abyssinia, well known for a pearl fishery, in long. 40° 10' E., and lat. 15° 44' N.

DALADA. SINGH. The sacred tooth of Buddha kept at Kandy in Ceylon. The original was destroyed by the Portuguese in a.D. 1560. That was probably the tooth of a man; but the object now shown is a piece of discoloured yellow almost two inches long, less than one inch in diameter, and resembles the tooth of a crocodile rather than that of a man. The name is from Dhata-Dhata. It is greatly revered by the Singhalese Buddhists. Its history is given in the Dalada-Mawaana.—Temnant.

DALAI LAMA. See Delai Lama; Tibet.

DALAL. A tribe of Jats in the Rohitak Zillah.

DALAN. PEES. A hall with an open front, used by Mahomedans of rank as a reception room. It is the verandah, or roofed but otherwise open space in front of a room.—Ouseley's Travels, ii. p. 11.

DHAL BALU GEERA. CAN. A tree of Canara and Sunda, on the elevated plateau between Gungwally and Black River; does not reach a great size. Wood very strong and tough, and sought after for agricultural implements.—Dr. Gibson.

DHAL BEHERA. URIYA. The chief or head of the Goala and other castes.

DALBERGIA, a genus of plants belonging to the natural order Fabaceae. Dr. Wight describes D. frondosa, latifolia, reniformis, scadens, marginata, rimos, stipulata, Ujijainsis, robusta, and tamarindifolia. Dr. McClelland mentions that in Tenasserim there are four kinds of Dalberga, all blackwoods, Yindike, Bum., all yielding a heavy timber which will not float, similar to sissoo. These trees are very plentiful in the Tharawaddy and Hlane districts, also in the lower parts of the Toungoo district. The timber seldom attains a very large size, and is generally found of a girth of three or four feet. D. cultrate, Graham, a tree of British Burma, furnishes a useful oil. D. alata, —? Tsouk-yoa, Bum., a tree of Moulmein, used for tool handles. D. osata, —? Tsouk yo, Bum., a tree of Moulmein. A tough wood, much used for tool handles.—Cat. Cat. Ex. 1862.

DALBERGIA FRONDOSA. Roxb. D. arbores, Heene. Erna pachchari; Pedda sopara, Tel. In Ceylon, not uncommon in the central provinces, and elsewhere up to an elevation of 3000 feet. Grows in Godawari, and in the Circars; also in Pegu, where it attains a girth of four feet and upwards; is taller and straighter than the sissoo, and furnishes a strong, useful timber.—Fl. Andh.; Beddome; M. C. Chapple; Tbr.

This tree occurs throughout India. It grows to an immense size, the trunk sometimes measuring 20 feet in circumference. It has a very dark, heavy, and strong wood, sustaining a weight of 516 lbs. Everywhere in Southern India this valuable wood has risen much in price, and in 1858 an experimental sowing was made at Nellumbor. The wood is extensively used for cabinet work, knees of vessels, agricultural implements, combs, etc. The wood of the centre of the trunk and large branches is greenish or greenish black, often mottled, or with light-coloured veins running in various directions. It is close-grained, admiring of the finest polish, and is employed in the Madras Gun-carriage Manufactory, for light field beams, cheeks, axles, cases, braces, perches, poles, splinter-bars, waggons, perches and framing, light field spades and felloses. For gun-carriages it is so valuable, that large plantations have been formed in waste places of the North-Western Provinces of Hindustan. In Malabar it is the magnificent tree from which the well-known Malabar blackwood is obtained, and planks 4 feet broad are often procurable, after all the external white wood has been removed. It is one of the most valuable woods of the Madras Presidency.—Dr. Roseburgh, Wight, Gibson, and Clegghorn; Voigt; Beddome.

DALBERGIA OOIJAINENSIS. Roxb. | Tunnus; Tewus, Mahr. | Nemmi chettu, Tel. | Ah mukanna, ... Tel. | Tella motuku, ... Manda motuku, ... Mubi, Tel.

A tree 30 feet high, 7 or 8 feet in girth, grows in the warm valleys of the Himalayas, the Kheri
jungle, Dehra Doon, Kamaon, Panjab, Simnore, in Oudh and the Godavery forests. Found both in the Konkan and inland Bombay forests; especially common in some parts of Kolwan, Kandesh, and the Satpura Hills. Its wood is of great strength and toughness, of a clear dark brown colour; heavy, tough, and durable; is used for waves of wheels, legs of bedsteads, handles of axes; especially applicable for cart-building, ploughs, etc.; seldom reaches a size sufficient to give a plank of 9 inches. The wood of that which grows on the Godavery is valuable, but the tree is rather rare there.—Voigt; Fl. Audh.; Thompson; Useful Plants; Dr. Gibson; Captain Beddome.

DALBERGIA PANICULATA. Roxb.

This tree grows in Montcen, Assam, Oudh, in the Northern Circars, in the Godavery forests, Coimbatore, at Courtallum, in the Mawul districts, and above the Ghats. In Coimbatore it attains a considerable size, and the timber is said to be strong, and fit for many purposes. It is rather common in most of the Bombay forests, both of the coast and inland. The wood there is light yellow, strong, compact, and fit for many purposes in house-building, agriculture, etc. But Captain Beddome tells us of Porilla sopara (Godavery), Tella patara (Circars), Tel., Dalbergia paniculata, that the wood is perfectly useless; it is arranged in rings with softer substance in between the layers. Voigt tells us that it is white and firm, but less useful than some of the other species. The character of the wood would thus seem to vary according to locality.—Drs. Wight, Gibson, Voigt, Beddome.

DALBERGIA ROBUSTA. Roxb.
D. Krowe, Roxb. | D. latifolia, Gibson.

This tree grows in Nepal, Assam, and Pegu, where it is very abundant, attains a girth of 4 feet and upwards, and is taller and straighter than sissoo.—Voigt; McClelland, p. 10.

DALBERGIA SISSOODES. Grah.

It is a smaller tree than D. latifolia. Both yield a black wood, and in Madras are indiscriminately called rosewood. The wood contains much oil, which unites it for receiving paint. Mr. Rohde says that this is one of our best woods for plain furniture, though at Madras it is said to cast about a good deal. Logs are almost invariably fauly in the centre. As a tough, strong wood, it will be found useful, whether curved or straight. Dr. Gibson does not recognise this as a species distinct from D. latifolia.—Drs. Gibson, Wight, Cleghorn; Mr. Rohde.

DALBERGIA SISSOO. Roxb.
Pterecarpus sissoo, Roxb.
Tali, . Panj.

This tree grows in Bengal, Nagpur, Gujerat, in the hills about Nagotnah, and Kunheri jungles. It is the most valuable hard wood in the Panjab, and grows at 2000 to 4500 feet in the Himalayas. In Nagpur, logs of it are procurable from 10 to 15 feet long, and 2½ to 3 feet in girth, at 6 annas the cubic foot. It is said to attain a great size in Chaula, and is employed in ornamental work, domes of gharries, etc. It was introduced into the Madras Presidency from Bengal, at the recommendation of Dr. Wallich. Its rapid growth recommends it for avenues, for the tree attains perfection in 20 years; it is propagated and reared with facility, and early attains a good working condition of timber. The wood is greyish brown, with darker coloured veins, very strong, but said to be not very durable. It is used in Bengal for gun-carriages, and furnishes shipbuilders with their crooked timbers and knees, being remarkably strong, but not so durable as could be wished. In the Dekhan the wood is used principally, from its strength and natural bend, for native hackeries; when it can be procured long and straight, it makes good shafts for buggies. The wood of the Ajmir tree is very dark and beautifully veined, like rosewood. Flowering time, the beginning of the hot season; the wood rips up about the close of the year.—Voigt; Captain Macdonald; Mr. Rohde's MSS.; Irvine; Riddell; Roxburgh; Thompson; Cleghorn; Captain Sankey.

DALCHINI. Ptns. Cinnamon; the Cassia lignea of the species of Cinnamonum trees.
DAL-DAL, the name of Mahomed's mule; also of the horse of Ali, son-in-law of Mahomed.
DAL-DAL or Dahi. HIND. Bog, quagmire, quicksand.

DALECHAMPIA. Of this genus of plants Wight gives Capenais, Indica, and velutina. D. arborea is Galedupe Indica. D. bidentata, Blume (D. Indica, Wight; D. velutina, Wight), grows at Gonagama, on the lower Badulla road from Kandy, but is not common.—Thc. Zeyl. p. 270.

DALECHAMPIA POMIFERA. Douk-ya-mad, Burm. Met with on the banks of streams in the Pegu valley, particularly in the Ponnah Choung. The trees are from 3 to 4 feet in girth. Wood red or dark brown, and adapted for cabinet-making.—Dr. McClelland.

DALI. HIND. Arable land.

DALHOUISIE. James Andrew Brown Ramsay, tenth Earl and first Marquis of Dalhousie, was born on the 22d April 1812. He was a third son by the heiress of the Brouns of Colstown in Haddingtonshire. He was educated at Harrow, and subsequently at Christchurch, Oxford, where he was fourth class in classics (1833), and graduated M.A. in 1838. By the deaths of his two elder brothers he became Lord Ramsay in 1832. He was employed in the Ministry of Great Britain, and was Governor-General of India from the 12th January 1848 to the 29th February 1856. The period of his administration was marked by great changes, and posterity has styled him the Great Proconsul. He was naturally prompt and impertious; he was prompt to vindicate his authority, and he had quite a special faculty for making his displeasure dreaded. He never failed to reward good service, though even his friends regarded him with a certain awe; and it used to be said of him, that 'although his height was not imposing, he looked every inch a king.'

On reaching Calcutta, Lord Dalhousie proclaimed his policy: 'We are lords paramount of India, and our policy is to acquire as direct a dominion over the territories in possession of the native princes, as we already hold over the other half of India,'
Soon after his arrival, British officers were murdered at Multan, and Mulraj its governor was in revolt; the Sikhs were defeated, and the Punjab annexed to the British dominions. In 1852, the Government was involved in hostilities with Burma, where British traders had been insulted by the officers of the king of Ava, and in a few weeks the entire coast of Burma was occupied, and before the close of the year the province of Pegu was annexed. From that time to the end of his administration, the Indian Empire enjoyed comparative peace.

During his time a Legislative Council was organized, prison discipline was improved, a system of uniform and cheap postage was introduced, a portion of the Peninsula intersected by railway, and all the large towns brought into immediate connection by means of the electric telegraph, laid down by Dr. (Sir William) O'Shaunnessy, 4000 miles having been constructed and placed in working order between November 1853 and February 1856. The introduction of cotton, tea, and flax, the breeding of sheep, and the improvement of agricultural implements, all received his attention. The development of the resources of the country in iron, coal, and other minerals was a matter on which he bestowed peculiar care; and measures were also taken for the preservation of the forests, and for making their produce available. A new and uniform survey of the districts was commenced, and the limits of feudatory states accurately defined. Irrigation on a large scale was attended to in Sind, Madras, and Bombay; the navigation of the Ganges, Indus, Nerbudda, and Brahmaputra was improved; grand trunk roads were carried to Delhi, through the Punjab, and to Patna, and others made in Pegu and Sind. A road was also constructed to the frontiers of Tibet, commencing from the plains of the Sutlej, and another put in progress from Arakan over the Yoma ridge to Pegu. The most stupendous work, however, was the Ganges canal, carried out by the skill of Sir Proby T. Cautley. The department of public works was reformed throughout, and colleges founded to train young men specially in civil engineering. Schools and colleges were established and placed under Government inspection. Strenuous efforts were made for the eradication of sati, thuggee, and infanticide. The condition of the British soldier was greatly improved. Provision was also made for both Protestant and Roman Catholic worship on more equal terms, and extensive changes were made in matters of criminal and civil justice. The government of each Presidency, each lieutenant-governor, and the chief officer of every province, were required to send in to the Governor-General an annual address on the state of affairs in their respective territories. This was the event of the chief interest that occurred within their several jurisdictions, in order to test the progress made by the nation at large. In his last minute, he said: 'No prudent man, who has any knowledge of Eastern affairs, would ever venture to predict the maintenance of continued peace within our Eastern possessions. Experience—frequent, hard, and recent experience—has taught us that wars from without, a rebellion from within, may at any time be raised against us, in quarters where they were the least to be expected, and by the most feeble and unlikely instruments. No man, therefore, can ever prudently hold forth assurance of continued peace in India.' For his success in the Punjab, Lord Dalhousie was raised to a marquessate in 1849; and on his return to Britain in May 1856, the East India Company settled on him a pension of £5000 a year. He had previously been appointed to the wardenship of the Cinque Ports on the death of the Duke of Wellington. He died on the 19th December 1860.

DALHOUSSIE, municipal town, cantonment, and hill sanatorium in the Gurdaspur district of the Punjab, in lat. 32° 31' 45" N., long. 76° 0' 15" E. It occupies the summits and upper slopes of three mountain peaks of the main Himalayan range, east of the Ravi river. The hills consist of rugged granite, and the houses are perched in a few gentler slopes among the declivities.—Imp. Gaz.

DAL. HIND. From Dalial, a branch, a tray, on which complimentary presents of food, fruits, or vegetables are placed.

DALIMA. HIND. A class of Tuga in Muradabad.

DALIMBA, a hard, granular, coarse stone of Cuttack, worked into utensils of various kinds.

DAL-KOHLU, a sugar-cane press, in Ambala and Cis-Sutlej.

DAL-LA, or Giant's Peak, in Bhutan, N. of Tanong, in lat. 27° 50' N., and long. 92° 34' E. The top of the peak is 22,495 feet above the sea, as trigonometrically measured from Gohatti. This peak is the prominent feature in the Himalaya panorama of Central Assam.—Schlag.

DALLAL. HIND. A procurer, a horse-courier, an agent, a broker, a go-between. Dallalah, a courtisan. The Delilah of the Bible, a female go-between.

DALMA, a range of hills in Mahrumh, occupied by the Kharris and Paharias. Dalma, its highest hill, is 3107 feet above the sea.

DALMAN, a town on the right bank of the Ganges, 16 miles south of Rai Bareli. It is said to have been founded about the 4th century A.D., by a brother of the raja of Kanouj. It was long in the possession of the Bhar, and the surrounding country was the scene of a protracted struggle maintained by that tribe against the Mahomedans. About 1400 A.D. the Bhar were almost annihilated by Sultan Ibrahim Shaki.—Imp. Gaz.

DALME-KATTEA. SINGH. Wood-moth, Eumeta Cramerii.

DALOSINGHA, a tree of Ganjam and Gumsur. Ploughshares are sometimes made of it.—Captain Macaulay.

DALRYMPLE, ALEXANDER, Hydrographer to the East India Company. He died 1807. He was an active writer.

DALULUAN or Dalulam, the bark of the Broussonetia serrifera, prepared for writing on.

DALYELL, N.A., and A. Gibson, joint authors of Dalyell's Bombay Flora. Mr. Dalyell contributed several memoirs on botanical subjects, and on the influence of trees on climate.

DAM. ARAB. Also Dama, a prayer. 'May it be perpetual.' Dam danatihii, dam zillihii, 'May his prosperity continue.'

DAM, a copper coin of India, now obsolete. In Akbar's time 40 dam of copper were equivalent in account to one rupee, and the dam of copper is itself defined at 5 tank, or 1 tola 8 mashes and 7 rati in weight, which at 186 grains per tola is equal to 325-3625 grains. There seems to have been
DAMASCUS.

been 9'29 chitals in each dam, and in the Sheer Shahi rupee 371'8 chitals, instead of the old 320 divisional coins of that name and value, which went to the lighter silver piece of former days. In the Ayin-i-Akbari, and in most revenue accounts, the dam is considered the 40th part of a rupee, but to the common people it is known as the 50th of a taka; 25 therefore go to a pya, and 12' to an adhela. In the time of Alangir, 4'6' dam, and later, 80 and 90 dam, went to a rupee.

DA-MA, spelled Mra-ma or Myamna, is that portion of the Burmese race who occupied the country above Province.—Maxon, p. 62.

DAMALCHERRY, a pass about 30 miles N. of Ambur, leading from Mysore to the Karnatic. On the 20th May 1740, Nawab Ali Dost fell here in action against the Mahattas. —Orme.

DAMAN is a Portuguese settlement just 100 miles north of Bombay. It has a population of about 50,000, and an area of 82 square miles. The Portuguese, soon after its capture in the 16th century, converted a mosque into a church, and have since built eight other places of worship, besides docks and yards for shipbuilding. The settlement has two forts, and is ruled by a governor with civil and military functions, under the viceroy at Goa. There are some fine teak trees and other timber in the neighbourhood; and in former days Daman was noted for dyed piece-goods, and a flourishing trade in opium with China. The town on the right bank of the river Daman was sacked by the Portuguese in 1581, rebuilt by the natives, and retaken in 1588 by the Portuguese.

DAMAN-i-KOH is the name given to the low hills that form the basis of the higher ranges of the Himalaya, and in which such hill states as Kotahah and others are situated. It means the skirt of the hills, and is applied also to the skirt of the Santal Pargana, and also to the tract between the Suliman mountains and the west bank of the Indus, comprising portions of Dehra Ghazi Khan, Dehra Ismail Khan, and Kohat districts, between lat. 28° 40' and 35° 20' N., and long. 69° 30' and 71° 20' E.

DAMARA. Wilson's History of Kashmir describes this as an ancient people, as a fierce, intractable race, murderers of King Chakram Varna, and who opposed Lalata Ditya in his advance to the borders of Uttaram-kuru.

DAMARA canes supposed to be a small hand-drum or rattle, usually seen in the hands of Siva or his avatars. This definition of the emblem is, however, doubtful; it has the appearance of an hour-glass, and rattlets of this form are sold in all the bazaars of India, and used by religious devotees and others to attract attention. —Cole, Myth. Hind. p. 377.

DAMASCUS city is about 2 miles in length, is surrounded by a fortified enclosure, dating back to the time of Selim I., and which was built on the site of the old walls raised by the Arabs in 650. Damascus was the usual residence of the Khalifs of the Ommiah dynasty. During the convulsions which at last overthrew the Khalifs, it had many changes of rulers, and was destroyed by Timur, A.D. 1400. It has eighteen gates, one of them being called Bab-i-Paulous, or the Gate of St. Paul. Damascus contains many places of worship; the largest and finest being that dedicated to St. John the Baptist. It was thoroughly repaired by the Khalif Walid in the year 86 of the Hijira; its doors are of bronze, and beautifully wrought. A Mahomedan tradition says that at the end of the world St. John the Baptist will descend into this building, while Jesus Christ will come to the temple of Omar at Jerusalem, and Mahomed, the prophet of God, to the temple at Mecca. In the great bazar to receive the caravans, from 1200 to 1500 camels may assemble. Damascus was the general rendezvous of from 40,000 to 50,000 pilgrims, who assembled there from all points of Ottoman Europe and Asia. Many came from Persia and Turkستان, in order to go with the caravan to Mecca; but most of the pilgrims now go by the Suez canal. Damascus was formerly celebrated for its manufacture of sword-blades, brass work, and peculiar heavy silks of shot colours. The population of Damascus amounts to 180,000 — 130,000 Mahomedans, 30,000 Christians, Greeks or Latins, and 20,000 Jews. The schismatic Greeks have a church of their own, but the Catholic Greeks have not, and perform their religious duties in the three Latin monasteries, viz. the Holy Monastery, that of the Lazzarists, the successors of the Jesuit missionaries, and that of the Capuchins. The Armenians and the Syrians have each a particular sanctuary, and the Jews have three synagogues. Damascus is the residence of a first-class mullah, and of the Greek Patriarch of Antioch, who has forty-two archbishops and bishops under him. The Pasha of Damascus bears the title of Prince of the Pilgrimage, because he was formerly charged to accompany the caravan to Mecca. The plain of Damascus is covered with magnificent gardens, planted with orange and lemon trees, cedars, fig and apricot trees, and shrubs of all kinds. The Baradi, the ancient Chrysorrhoea, a pure and limpid river, divides itself into seven branches, and waters the town and its fine gardens. The nearest seaports are Beyrount and Saïda.

DAMASCUS, a commercial and art term, applied to a variegated structure and appearance on iron and steel gun-barrels, daggers, sword-blades, where, as in the Kotel twisted gun-barrel trade, the barrel is made of twisted bars, and nothing can be imagined more elegant. Damascus swords press on their surface a variegated and antique of watered steel. The blade was formed by mixture in nearly equal proportions of the celebrated wootz and soft iron, which, being welded together and repeatedly doubled, gives the desired appearance. Daggers and sword-blades thus formed are common among the retainers of the hill zamindars in the Northern Circars of the Peninsula of India, the handles of which, formed of iron, are frequently damascened in silver. Atkinson (Oriental Western Siberia, p. 120) says that Colonel Andsoff at Zlatavnst had succeeded in manufacturing valuable Damascus blades, weapons combining edge and elasticity. The water was a succession seemingly of small bundles of almost parallel lines, occupying the whole breadth of the blade, the ends of the bundles crossing and mingling at the point of
DAMASK.

DAMASK.

DAMASKERK, DUT. Kamtschatkana, RUS. Venise, F. Safitiki, DAMASTEN TAFELZENG, GER. Tela adamasca, Sr. Teladamascana, IT.

This is a fabric woven in a loom, with figures of flowers or other objects. The art is said to have been brought from Damascus, hence the name.

DAMASONIUM INDICUM. Wilde, Parmi kulla, BEN. Nír venekil, Tel. Ottel-ambel, CAN.

A pretty flowering annual, a native of sweet waters in India and Archipelago; flowers in the rainy season. The petals are of delicate white, and the long calyx has its corners ornamented with fringes, gathered into a kind of flounce or flint lace.

DAMATHE, B. M. The book containing the Burmese code of laws.

DAMAYANTI, daughter of Bhima, raja of Vidarbha, was famed for her radiant charms and exceeding grace. She chose Nala, raja of Nishad, at her Swayamvara, by throwing a wreath of flowers around his neck, and two children were born to them. Their story has been told by the poet. Nala took to gambling, and lost all but his wife, and was driven with her to the forest, where he urged her to return to her father's house, and, on her refusing this, he deserted her while asleep. She subsequently went to her father, and, falling to discover her husband's retreat, she declared she would hold another Swayamvara. To this the king of Oudh came, in a chariot driven by Nala, on which Damayante recognised her husband, and they were happily reunited.

DAMBULA or Dambulla, a celebrated rock Buddhist temple near Matelle, in Ceylon. The temple has been hollowed out of a hill of stone, and, from its antiquity, its decorations, and its magnificence, is by far the richest in that island. It is supposed to have been founded B.C. 246 by Dewanampiya Tissa, the ally of Asoka, and friend and patron of Mahendra, who introduced Buddhism into Ceylon. The roof of the vault is covered with fresco paintings. Some of the statues of Buddha are upwards of 40 feet in length; but there is an admixture of Buddhist and Brahmanical emblems, as the Makara, a monstrous idol, with the trunk of an elephant, the feet of a lion, the teeth of a crocodile, and the ears of a pig, is a prominent figure. It was first endowed 86 b.c.

DAMBUT TAGH, mountains of the province of Iran, yielding the topaz, beryl, schorl, and gold.

DAM-DUM, a venomous fly in the Phangan pass, the bite of which causes severe irritation.

DAMIETTA, a town in Egypt supposed to have given its name to the damity fabric. It was long ago suggested that the word dimity is the Greek Dimitos, so called because woven— with a double thread in the woof. Professor Skeat has lent his authority to this etymology.

DAM-I-MADAR, called also Dhummul, is a popular ceremony with the agricultural and lower classes in India. It consists in jumping into a fire, and tearing out with the exclamation of 'Dam-i-Madar, Dam-i-Madar!' that is, 'By the breath of Madar, by the breath of Madar.' It is devoutly believed that not a hair of these devotees gets singed, and that those who have practiced the ceremony are secure against the venom of snakes and scorpions. Badi-ud-Din Shah Madar, in honour of whom this ceremony annually takes place, was, according to the Mirat-i-Madaria, a converted Jew. He is said to have been born at Aleppo in 1050 A.D. and to have come to India in the reign of Sultan Ibrahim Sharki, and, having taken up his abode between Cawnpur and Farrukhabad, and expelled therefrom an evil genius called Mukun Deo, who infested the place, he gave the name of Mukunpur to his residence, and was buried there in 1483 A.D., at the good old age of nearly four hundred years. The tomb, which is a handsome structure, was raised over him by Sultan Ibrahim. He is believed still to be alive, and hence is frequently styled Zinda Shah Madar. The prophet Mahomed gave him the power of being born again, or retention of breath, and hence arose his longevity, as the number of his respirations was diminished at pleasure. There is a class of fakirs called Madaria, after his name. They generally wear black cloth, and are much addicted to the use of intoxicating drugs. A fair is held at the tomb during the first 17 days of Jamadiul-Awal. — Elliot, Supp. Gloss. See Madaria.

DAMIT, a tutelary spirit of the Javanese.

DAMMAJI GAUKWAR, styled Shamscher Bahadur, the first of the Gaekwar family, who founded the dynasty in A.D. 1720. He was an officer under Khandi Rao Holkar. The Gaekwar made a treaty with the British in 1802. See Mahatta Governments in India.

DAMMAPADAN, a work in Pali, containing moral precepts. — Hardy, Eastern Monachism.

DAMMARA, a genus of trees found in Australasia, New Hebrides, New Caledonia, New Zealand, the Fiji islands, Java, Borneo, and Amboyna. Their names are,—Dammara obtusa, Lindley, of the New Hebrides and Queen Charlotte's group; D. australis, Lambert; D. orientalis, Lamb.; D. Niticensis, Fiji; D. macrophylla, Lindley, of New Hebrides; D. Moorii, Lindley, of New Caledonia; D. robusta, Moore, of the Burnett and Mary rivers of N. Australia; D. ovata, Moore, of the Isle of Pines. — Roxb.; F. v. Mueller; Bennett.

DAMMARA AUSTRALIS, Lambert, is the Agathis australis, the kaawi tree of New Zealand, first noticed by Captain Cook. Its wood contains a considerable quantity of resin, and appears to shrink little. The mean girth of the tree is from 3 to 6 feet, and it is from 90 to 200 feet high. It is a close, even, and fine-grained wood of a very uniform texture; its colour is a light-yellowish brown, the lustrous silky, the annual rings marked by a line of deeper tints of the same colour. It is used for masts and yards of ships, and seems admirably adapted for internal joiners' work. The bark thick, yielding tears of resin in great profusion. Enormous masses of a similar resin, many pounds in weight, are found in the soil in many places far from where these trees now grow, and are presumed to have the same origin. It is used in varnish-making. The perfectly straight trunk is clear of branches up to 80 or
DAMMARA LAMBERTI.  
Planta dammara, Lam.  
A tree of Ambonya; it yields dammer.—*Roxb.*  
DAMME or Damma, in the Arfakura Sea, is a high large island, 70 miles N.N.W. from Sermatam; the island is 15 miles long north and south, and at its N.E. extremity has a volcano, with hot springs.—*Horsburgh.*  
DAMMER.

Damar, | MALAY. Googilium, | TEL.  
Yakshalupha, | SANSK. Taia-gotsa, | URITA.  
Dammer is a general name for the resins of several different trees, being applied to the Indian copal or gum anime of the Vateria indica; to the New Zealand copal from the Dammara australis; to the hard brittle resin of the Dammara Ambonya; the brown resin of the Vatica robusta; to the black resin or pitch of the Vatica tumbugia; and to the resins of species of Canarium, as Canarium pinnate (Lan-t’ang, Chix.), which yields the resin for the Chinese dammer. Agathis loranthishola, Salish, grows on the lofty mountains of Ambonya, and, according to Dr. Wallis, in Tavoy. It is a very large tree, used in building. White dammer, a product of this tree, occurs in fragments of variable size, marked with reddish streaks, transparent, amber-like, brittle, with brilliant fracture, very inflammable, inodorous, and tasteless. It hangs from the branches, and resembles stalactites, the pieces being sometimes as large as the hand, and 4 to 8 inches long; some pieces are like anime resin. Dammer is found adhering to the branches, or in masses at the foot of the trees which yield it, or floating in rivers, drifted to them by the floods of the rainy season. It is produced in such abundance, and gathered with so little labour, that its market price seldom exceeds four or five shillings a hundredweight. The natives of the country apply it to most of the uses to which we put tar, pitch, and resin.  
Damar kuching, MULAY, Damar jang, and Damar batu, are gum products of the Malay Peninsula and of the Archipelago. Damar mata kuching, when mixed with the mimisk kayu, or wood-oil, makes a durable varnish. Damar puteh is white dammer, and Damar selo is another dammer.  
The dammers of the Madras Presidency are obtained from trees of the genera Vateria, Canarium, and Vatica. The two former, viz. Vateria and Canarium, yield by far the largest part, if not the whole, of the dammers produced on the western coast of the Peninsula of India, whilst the Vatica genus yields the greater part of that collected in the northern and eastern districts.  
The Black Dammer of the Western Coast is from Canarium strictum, the Carpo coonglimum of Ainslee, the Dammara nigra legitima of Rumphius, and the Canari of the Malacca. This occurs in large stalactitic-shaped masses, of a bright shining black colour when viewed from a distance, but translucent and of a deep reddish-brown when held in thin lamina between the eye and the light. It is perfectly homogeneous, and has a vitreous fracture. Its shape appears to be due to the fact of the balsam having exuded in a very fluid state, and trickled down the trunk of the tree, where it gradually hardens by exposure to the sun, the fresh resin continuing to flow over that already hardened, giving rise to the stalactitic appearance of the large lumps of resin, the outside of which much resembles the guttering of wax caused by placing a lighted candle over a drain. It is insoluble in cold, but partially soluble in boiling alcohol on the addition of camphor; when powdered, it is readily soluble in oil of turpentine. Powdered and burnt on the fire, it emits a more resinous smell, and burns with more smoke, than white dammer. The size of the lumps of this resin, together with its colour and the peculiarity of shape already mentioned, suffice to distinguish it from other Indian resins.  
The White Dammer of the Western Coast is the Piney resin of the Vateria indica and allied species of Limneus and Wight, Choloroxylon dauphina of Buchanam and Ainslee, the Doopada resin of Mysore, and the Piney of the Malabar people. It has two varieties:—  
Var. 1. Compact Piney resin, or first sort white dammer, or Indian copal, occurs in large lumps of all shapes, and varying in colour on the outside from a bright orange to a dull yellow, characterised by evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard, and bears a great resemblance to amber. Its colour internally is of all shades, from a light green to a light yellow, the green tint predominating in the generality of specimens. It is more soluble in alcohol than black dammer, and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its colour, and amber-like appearance.  
Var. 2. Cellular Piney resin, or second sort white dammer, occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell. Has a very cellular structure, which is attributable partly to the mode of collection, and partly to the age of the tree. Notehes being cut in the trunk of the trees sloping inwards and downwards, the resin collects in the cavity, some, it is evident, being collected and dried in the bark of the tree, it is of all shades, from light green to light yellow or white, and is usually translucent. Specimens are sometimes seen in which, from the desiccation having been improperly conducted, the resin is more opaque, of a dull green colour, and full of air-bubbles, presenting the appearance of having undergone a partial fermentation. This resin may be recognised by its cellular appearance and balsamic smell; but the balsamic smell, which is due to the volatile oil it contains, is gradually lost by long keeping or constant exposure to the air. On splitting open old and decayed trees, portions of a dark-coloured resin are often found, having the solid consistency of the first variety, but the inferior quality of the second.  
The finest specimens of Piney resin are obtained by making incisions in the tree, and are in pale green transluscent pieces of considerable size. The resin that exudes naturally usually contains much impurity. In most of its properties it resembles copal, but it possesses qualities which give it some advantages over the latter. Like copal, it is but slightly soluble in alcohol; but, as

883
Borax is pointed out in the case of copal, it can be brought into solution by the addition of camphor to the spirit. It is easily soluble in chloroform, and thus might find a small application as a substitute for amber in photographers' varnish. It differs most advantageously from copal, by being at once soluble in turpentine, and drying also without the necessity of the preliminary destructive fusion required by that resin, a process which tends greatly to impair the colour of the varnish. The solution of the Piney resin in turpentine is clearer and milky, but by the addition of powdered charcoal, and subsequently filtering, it yields a solution transparent and colourless as water, and yields a varnish which dries with a purity and whiteness not to be surpassed. The solution in turpentine readily mixes with the drying oils. It is on these properties of the resin that its chance of becoming an article of trade will depend. In price it cannot compete with copal, when supply to the European market is regular and abundant. The ordinary price of the best copal in the English market is but 2s. 10s. per cwt. Piney resin yields, on destructive distillation, 82 per cent. of an oil of agreeable odour, but not differing essentially from that obtained from much cheaper resins.

East Indian dammer, which is well known among varnish-makers, though frequently confounded with this, is the product of a very different tree, and is not produced in the Madras Presidency.

Dammars of the Northern and Eastern Districts.
Sal tree dammer, Vatica robusta and other species, occurs in sticks much resembling in shape the black dammer, but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown, the two colours being very frequently blended in the same lump, and giving it the appearance of having a regular grain. It is friable, and differs from the white dammer of the western coast in its inferior hardness, its opacity, and its peculiar form, and from the black dammer in its colour. There are extensive tracts of Vatica jungles in the Ganges and Umba districts. The Khand and Uriya races, living in and near these jungles, wound trees in several places; the resin issues, and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark charcoal. The tree is called Guggilam in Telugu, and Tala gosto in Uriya. The Khand and Uriya races make the leaves into the plates from which they eat their food, and also roll up tobacco in them to smoke like a cheroot. In time of famine, the above tribes live on a soup made from the fruit of this tree.

Vatica tumbugga is also a limited extent on the west coast, but yields little if any of the dammer collected there. It exudes an amber-coloured resin.

The White Dammer of Singapore is the product of Dammara orientalis. The Australian dammer, or kauri or cowry gum, or Australian copal, is obtained from the Dammara alismat.

In Borneo, also, dammer is produced by many kinds of trees quite different from Marsden's Dammara orientalis. The white dammer is used for the same purposes as gum-copal. Dammar mata kuching, or the cat's eye dammer, is the least common and most valuable, being beautifully transparent. The Dammar daging, or flesh-like dammer, takes its name from its veined appearance, which causes it to resemble some kinds of agate. In Sumatra some of the trees producing dammer, yield valuable timber. The Dammar lait tree, not mentioned by Rumphius, is employed at Penang for the frame timbers of ships, beams, and knees. Dammer is also the name of a gummy substance found floating on the sea off the E. African coast, which the people believe to be excreta of whales. Captain Burton supposes it to be unripe gum washed seaward during the rains.—Powell; Beddome, Pl. Sylis, p. 84; Burton; Hawkes; Mad. Ez. J. Rep.; Dr. Wallich.

DAMNI, also Daoni, Hind. An article of dress of Mahomedan women.

DAMODAR, a river of Bengal, which rises in the Chutia Nagpur watershed, and, after a S.E. course of about 350 miles, falls into the Hoogly just above the James and Mary Sands' shoal, which it has helped to deposit at the junction. Together with its tributaries, it forms the great system of drainage of the country stretching northwest from Calcutta to the fringe of the plateau of Central India. The Damodar river, tributary to the Hoogly, rises in lat. 23° 55' N., and long. 84° 53' E., and runs S.E. to Bardwan, S. to Diamond harbour. Its length is 350 miles. It runs through a rich country, which suffered in the middle of the 19th century with a terrible fever epidemic, that spread in 1868 into Birbhum. The Damoodah valley is rich in coal, which is very largely extracted. Damoodah is subject to sudden rises during the periodic rains, and has often burst its banks and devastated all around. One of the most severe inundations was in 1823, when this river overflowed the country for many miles, and many people perished. In that inundation a good-sized pinnae sailed through the Sookasagar and Chinsura, and Chandernagur were laid waste by water. The Santal race venerate the Damoodah.

DAMOH, a district lying between lat. 22° 10' and 23° 30' N., and long. 79° 5' and 80° E. It is on the table-land of the Vindhyian mountains, and in its extreme length measures about 90 miles north to south, breadth 50 miles. The population is about 269,642,—aboriginal tribes, 32,528; Hindus, 237,204; Mahomedans, 8064; Buddhists and Jains, 5418; Gonds, 30,209 in 1872, the remainder consisting chiefly of Kurku; Brahmins, 21,378; the mass of the Hindu population consisting of Lodhi (33,342), Kurmi (20,664), and other inferior castes. The first known government was that of the Chandal Rajputs, whose seat of government was at Mahobar, in the Bantulkhand. After the depredations of the Chandals the country seems to have fallen into various hands at different times; but the most definite of the local traditions point to a period of Gond supremacy exercised from Kathola in Bundelkhand, the seat of a long since extinct Gond principality, and subsequently, as regards the southern portions of the district, from Chauragarh in Nerbadda valley, one of the capitals of the Mandla dynasty.
DANCING

DAMOLA. Hind. A tola (180 grs.) of gold dust, a kauch. 

DAMON and PYTHIAS, the two followers of Anaxagoras, are supposed by Major Cunningham to be the Sanskrit Dhamma, virtue or practical morality, and Buddha, wisdom. Even the word Pythagoras seems derived from πυθαγος; or, Buddha, and ἰασω, to exprop or announce. He is said to have married Theano (Sanskrit Dhyanas, devout contemplation), and by her had a daughter, whom he named Dano (Sanskrit Dhamma, virtue or practical morality), and who became a most learned Pythagorean.

DAMONU. Uriya. Grewia tiliaefolia, used for fishing-rods; abundant at Palmochad.

DAMPIER STRAIT, called Gamen or Geny by the Dutch, is formed by Battanta island on the south and that of Waygiiou on the north side, and is about 72 miles long from Cape Mabo to Point Pigot. It affords a good channel for vessels passing from the Moluccas to the Pacific, and is very generally selected. —Horsburgh; Journal of the Ind. Arch. June 1862, p. 308.

DAMI, a small copper coin, formerly current in the Karnatic; all copper coin; any small money. In N. India, a nominal coin equal to 3/4 or 3-1-4, or between 2 and 3 3/4, and so that a dami varies between 8 to 12 kauns.

DAMI MASJID, a pretty little mosque, near the fort of Ahmadnagar.

DAMUL-AKHWAIN. 

1) DAMOLA. 

2) DAMONU. 

3) DAMRI, DAMWAST. 

DAMRI, DAMUl-AKHWAIN.

DAN, DANAI, DANAIS, DAMAUL-AKHWAIN.

DAN, a tribe in the Rajputana district. —Wilson.

DAN. Hind. An-Dan-Khan comprehends the sum of sovereign rights in Rajastan, being allegiance, commercial duties, mines, etc.

DAN, two Persian words, one from Dastian, to hold or have, the other from Dastan, to know. These two derivatives form several compound words, as Attar-dan, a scent-bottle, a perfume-holder; Kalm-dan, pen-holder; and, from Dastan, Na-dan, ignorant. Dan, SANSK., a gift; Dan-pan, charity, from Da, to give.

DANA. Hind. Wise. Dana, wisdom. Dowlat-i-Hind, o danai Faring, is a Persian phrase, meaning, Give me Indi for wealth, but Europe for knowledge.

DANA. Hind. Any grain or seed; a grain weight. Bibi-dana, Cydonia vulgaris; Hadadana, Euphorbias hypericifolia. E. thymifolia; Kala-dana, Pharbitis til; Ram-dana, Amaranthus mangostanus; Shahkar-dana, Colebrookia oppositifolia.

DANAGA. KAHN. A cowherd, a shepherd.

DANAISS TYTIA, a butterfly with semi-transparent bluish wings, and a border of rich reddish-brown. This is exactly reproduced in Papilio agestor and in Diadema nana; and all three insects not unfrequently come together in collections made at Darjiling.

DANAKIL tribes occupy the low-lying waterless region between Abyssinia and the sea, trackless and unencultivated.

DANAVA, an inhabitant of the Hindu mythological Mount Meru, described by the Aryan immigrants as enemies of the gods; probably the early inhabitants of the countries with whom the advancing Aryans came in contact. See Avatar; Meru. Danava is also described as a tribe on the CAli, or children of Danu-Bel; their leader was named Danavendra; their origin unknown.

DANCALI, a country in the north-east part of Abyssinia, extending 300 miles along the coast of the Red Sea. The soil is unproductive; and its chief riches consist in fossil, salt, and honey.

DANCING has been practised from the most ancient times by many races. David, king of Jerusalem, danced naked in a religious rite. Later than the Sorecs, regarded the dancing as a part of religion. Most of the uncivilised non-Aryan races of British India have dances, as the Bihil, the Juanga, the Khadd, the Kol. In Southern India, also, the Jakkulwar and Jattivilalaraw are dancers. Of the races in S.W. Bengal, the Jadur, Jumbir, Terriaha, Kharlia, Karna Basa, Dawa, and Bani have war dances. The Kol of Nagpur have several dances, which are all more or less connected with some religious ceremony. Among the Santal, also, the dance is known, and the whole of their religious observances are generally performed and attended to by the votaries whilst in a state of intoxication,—a custom which reminds us of the worship of Bacchus among the Greeks and Romans.

Dancing is not practised in India by any Aryan race of Hindus nor by Mahomedans; but Persians, Afghans, Mahomedans of India, and Hindus of all sects, gladly witness the performances of professional dancing. Many of the non-Aryan or aboriginal races of India, however, particularly those who have not greatly advanced in civilisation, have their national dances; and the Uraon and Ho of Central India are passionately fond of it. The Kodiga race of Coorg have a national dance. The Mahomedan dancers are all women, in bands called taifa, and are public. The Hindu dancers are also all women, but do not associate with others than Hindus, most of them being attached to the temples. Many of the dances of wilder races are solemn attitudinizing, moving in a ring, and locking up close to each other, often holding sticks.

The natives of Australia in their corroboree run in Indian file or sideways, and as they stamp the ground they grunt.

DANCING DARVESTH, a name given to the Mewleviye, also to the Rafa order of the darvish of Turkey and Egypt. See Darvesh; Ecsawiya.

DANCING GIRLS.

DANCING GIRLS.

DANCING GIRLS.
their toes, the movements and position combine something of the Waltz and Spanish cuchucha,— they advance, retire, whirl around, drop down and rise again with ease and rapidity, whilst the several movements are kept in order with the twirling and twisting of their hands, features, body, etc. Some portions of the step resemble the hoppipe and jig; whilst they hop and skip from one leg to another, keeping time, now turning, now whirling, now capering, and now dropping, performing a coquetish pantomime with their antics, then affecting coyness, and dancing away from the assembly, by suddenly turning away as if careless of their allurements, but returning to the attack with greater vigour and increased blazonishments. It is indeed surprising to witness their feats of strength and bodily powers of endurance, for, notwithstanding their frail make and delicate appearance, the amount of fatigue they endure, dancing as they do from childhood to early hours of the morning, is astonishing. Their dancing is perfection; and the bodily fatigue they must undergo, from the attitudes and positions they combine in their dances, must be great. In what is called the sterria cuchoo, athletic feats are performed,—resting their hands on the ground, and flinging their feet in the air with great rapidity, and thus twirling round and round, successively, performing various somersaults; lying full length on the ground with their hands and feet resting, contorting, twisting, and twisting their bodies in various ways; or, whilst resting on the hands and legs, with their backs to the ground and their chest and abdomen turned upwards, drawing the hands and feet as close together as possible; whilst their bodies are thus arched they, with their mouths, will pick up rupees from the ground. In this arched position, beating time with their hands and feet, they work round and round in a circle. During their performance they join their attendants in the songs that are sung, and regulate the various movements of their bodies to the expression given vent to in the song.

Modiye diciratha.—In this dance the word 'modi' is a term used to designate a craft or encumbrance practised by a conjurer, who places or hides money or other valuables in a certain place, and often in the presence of his opponent, with the view of testing his ability, and challenges him to remove it, which the opponent endeavours to do by playing on a pipe termed 'maked;' and if he be not equally skilled, he is struck to the ground in a mysterious manner, sick and ill, frequently bleeding from the nose and mouth profusely. The dance is in imitation of this, by the girl playing on a 'maked,' dancing at the same time, and throwing herself on the ground; the right leg is stretched out at full length, forming a perfect angle with her body out on one side; on the other, the left leg, doubled under the knee, is stretched out in like manner on the opposite side, producing a singular appearance, and as if there were no joint in the hips.

Colu antena, or the stick dance, is formed by a number of girls of the same age, size, and dress, numbering from twelve to twenty-four or more, each having two sticks, one in each hand, about eighteen inches long, well turned, and painted with circular stripes of yellow, green, and red. Either to the roof, or across a piece of wood raised in support for the purpose, a stout skein of thread in different colours is suspended, and having as many strands as there are girls; the free ends of the strands are tied to the ends of the painted sticks each holds; the dance begins with the usual song and accompaniment of music, when each girl, striking her stick, dances a kind of jig and hops from place to place, exchanging places with each other. This is done with such order and regularity, that the several strands are plaited with the utmost evenness into a stout cord or tape of many colours, according to the design. At a sign from the conductor, the same is undone with equal order and regularity, the girls dancing and exchanging places with each other without a single mistake or false step, either in the plaiting or unplaiting of the strands of thread. The readiness, grace, and ease with which the several movements are effected, are worthy of admiration. At some places, on festive occasions, during the peregrinations of the Hindu idol around the town in procession, these girls perform the stick dance on a platform, which is carried and precedes the idol. More frequently these and other dances are performed on foot in front, and at some distance from the procession, which stands still at a certain distance to allow of its being properly carried out.

Mahomedan dancing women attitudinize with their feet and hands, and move their eyes and change the expression of their face to indicate various emotions.

DANDAKARANYA.

DANDAKARANYA, or the forest of Dandaka, is celebrated in Indian story. Varaha Mihira, the great astronomer, mentions Dandaka along with other places in the south of India as follows:—Kerala, Karnataka, Kanchipura, Konkana, Chittapattana (now Madras), etc. In this list Dandaka is distinct from Konkana, or the Upper Kistna, and may, General Cunningham suggests, therefore perhaps be identified with the lower valley of the Kistna, of which Dandakakata was the capital.

Gen. Cunningham (Anc. Geog. of India, p. 544) seems to have been led to this surmise from M. Vivian Graham-Martin having stated his suspicion that the name of Dandaka is connected with Dandakakata. But there were in ancient times great forest tracts stretching across the Peninsula of India from east to west, portions of which still remain, and several parts of them seem to have been so designated. That described in the Ramayana was a forest near the Godavery river, in which Rama was residing when Ravan carried off Sita.
It has also with much probability been supposed to have been a forest anciently covering the south of the Peninsula, now the territory of the Marava and Koliari, whose features are often like those of the baboon, hence the origin of Valmiki's monkey army. The forest tract in the Syhadri mountains, in the Deklan, and the plateau of Chutia Nagpur, have also been pointed to as parts of Dandakanya.—Cunningham's Anc. Geog.

DANDA KASANWAL. Hindi. Sticks used for wringing out skeins of silk from the dye vat.

DANDASA. Hindi. Astringent banks of Juglas regia and other trees.

DANDASULU. Tel. Village watchers.

DANDAWAT, Dandam. SANSK. From Danda, a walking-stick. A Hindu form of salutation, bow, obeisance, prostration, performed amongst Hindus to each other, and is daily seen from a Hindu of inferior caste to a Brahman or higher caste. It consists in joining the hands with the tips of the fingers pointed upwards, and raising the hands so joined to the forehead. It seems the same as the Anjali (SANSK), Hindu form of respectful obeisance. The head is slightly bowed, the palms of the hands are brought together, and raised laterally to the middle of the forehead, so that the tips of the thumbs only are in contact with it.—Hind. Theat. ii. p. 108. See Ashtanga danda.

DANDA-ZANI, Hindi, literally stick-beating, a mode of torture said to have been practised by the subordinate officers in the private domains of the raja of Benares.

DANDELION. Pu-kung-ying. Chin. The Chinese plant is said to be Leontodon taraxacum, also L. Chinense. It grows to the north of the Meikong hills.

DANDH, or 'Kolab,' in Sind, a tract of low land flooded by the inundation, partially or totally dry during the cold season, and at all times a hotbed of miseries.—Burton, Scinde, p. 377.

DANDHU PUNT. In the north of India, Baji Rao, the ex-Peshwa, who had been dehroned in 1918, lived on till 1853 in the enjoyment of his annual pension. His adopted son, Dandhu Punt, styled the Nana Sahib, inherited his accumulated savings, but could obtain no further recognition. When the Bengal native soldiery mutinied and the people rebelled, his cruelties at Cawnpur to helpless women and children has made him execrated. He fled, and is supposed to have died in the Tenri.—Imp. Gaz. iv. See Nana Rao.

DANDI. Hindi. A Hindu sect who worship Siva, and represent the fourth, Asrama or mendicant, life, into which the Hindu is to enter, after passing through the previous stages of student, householder, and hermit. He shaves his hair and beard, wears only a cloth round his loins, and subsists on food obtained ready dressed from the houses of Brahmanas, once a day only. Any Hindu of the first three classes, of student, householder, and hermit, may become a Sanyasi or Dandi. Indeed, in these days, a Hindu of any caste may adopt the life and emblems of this order. These constitute the Dandi, simply so termed, and are regarded as distinct from the primitive members of the order, to whom the appellation of Das-nami is also applied, and who admit none but Brahmanas into their fraternity. But the Brahman can pass from any one of the first orders to the last at once. He becomes a Sanyasi, abandoning all sensual affection. The Dandi is distinguished by carrying a small dand or wand with several knots on it, and piece of cloth dyed with red ochre, in which the Brahmanical cord is supposed to be enclosed and attached to it. The Dandi are followers of Sankaracharya, and are a numerous order of religious mendicants, many of whom have been eminent as writers on various subjects, especially on the Vedanta philosophy. They are divided into ten classes, hence their other name Das-nami, each of which is distinguished by a peculiar name, as Tirtha, Asrama, Vana, Aranya, Sarwati, Puri, Bharati, Gir or Giri, Purvata, and Sagara, which is added to the proper name of the individual, as Purushottama Gir, or Bodhendra Sarwati, etc. They are hence known collectively as the Das-nami, or ten-name Gossains. Of these, only three and a half tribes, the Tirtha, Asrama, Sarwati, and part of Bharati are now considered pure Dandi of Sankaracharya; the other six and a half members of the Das-nami are called Atit. They have abandoned the yajamans, and the Gharai, seek money, and ornaments, prepare their own food, and admit members from any order of Hindus. They are often collected in maths as well as the Dandi; but they mix freely in the business of the world, carry on trade, and often accumulate property, and they frequently officiate as priests at the shrines of some of the deities. Some of them ever marry, and are thus styled Sam-yogi. The Dandi are to the Saiva sect what the followers of Ramanuja are to those of the Vaishnava faith. Sankara's Dandi are sufficiently numerous in and about Benares.—Wilson. See Danda; Hindu.

DANDI, author of the Dasa-Kamara-Charita, or the Adventures of the Ten Princes, is supposed to have lived about the end of the 11th century. The scene is laid in Pashapuri, a city of Magadh, then ruled by Raja Hansa, whose queen's name was Vasumati. It is a pleasing story in harmonious verse, arranged into two parts. The first, containing five chapters, ends with the marriage of the prince with the princess, and the second comprises the adventures of the same prince and his companions. Unscrupulous deception, ready invention, extreme credulity and superstition, and disregard of human life, are strongly illustrated.

DANDI. Hindi. In the Simla Himalaya, a hammock-shaped conveyance for travellers, slung on a pole, with straps for the feet and back, and carried by two bearers. It is a light litter suited for hill travelling.

DA-NEE. BURM. Nipa fruiticans.

DANG, a hill or precipice, the summit of a mountain, as Lal-dang. In Delhi, and generally in Upper India, the word is used to signify the high bank of a river. It is provincially corrupted into Dhang and Diayung; the forest or jungle tracts in the Syhadri range are so called. A wild, a thicket, a place overrun with bushes, a tract of timber, along, near to, or below the Ganges, or other mountains, but interspersed with hills so as to leave no extent of level ground. Dangi, Hindi., a forester. Danga is the designation of the tract of country situated within the limits of the Political Agency of Kandish, bounded N.W. by the petty state of Warsaw in the Rewa Kanta Agency.—Elliott; Imp. Gaz.
DANGA-GURGUR. Beng. Coix gigantea.

DANGA-GURGUR. In Persia, a custom exists of dividing fields, villages, whole districts, and even the water for irrigating the fields, into six parts, which are further subdivided into two unequal parts, the one containing four parts, Char-dangheh, and the other two parts, Do-dangheh.

DANGAI. Hind. Rebellion, riot, uprising.

DANGAR, in the Bombay Presidency, rice grown in the kharif or monsoon months. It is sown in small beds, and transplanted in July and August into beds which have been highly manured, flooded, and repeatedly ploughed. The crop ripens in October, yielding 20 to 40 seers the bigha.—Gloss.

DANGAREE, a coarse cotton cloth in use in India for common towels.

DANGAST. Hind. A class of Rajputs in Ghizipur.

DANGI. Mahr. A forester; an inhabitant of a low, hilly, and jungle tract. Also a tribe of Rajputs inhabiting the woody districts of Eastern Malwa, who are generally given to the Bandelas.

DANIEL. Mr. Layard says his tomb was preserved amongst the ruins of Susa, or in a valley of the Bakhtiyari mountains. Daniel-i-Akbar, a name of Susan or Sushan on the Kavan river. See Kuristan. The Arabs made no opposition to Baron de Bode entering the chapel in which the coffin of Daniel is said to be deposited, on learning that Christians as well as Mahomedans acknowledge him to have been a prophet.—De Bode's Travels, ii. p. 190; Layard, Nineveh, i. p. 252. See Susa.

DANK. Hind. Jewellers' foli.

DANT. Hind. A tooth. Dant-tinka, an ancient form of depressing anger, alluded to in the inscription on the lat of Firoz Shah at Delhi. The supplicant takes a straw or bit of grass in the mouth and stands on one leg. It is meant to imply that the supplicant is as the offended person's cow.—H. Elliot.

DANTA PURA, the modern Puri. A tooth (dant) of Buddha was sent there after his death and cremation. After lying there 800 years, it was, A.D. 311, sent to Ceylon, where, as is said, it still remains.

DANTI. Hind. A sickle, perhaps a corruption of Durante.—Elliot.

DANTIWARA, a village in the Bastar state. It derives its importance from a celebrated temple to Dauteswari or Kali, the household goddess of the rajah of Bastar for many generations. It is said that Meriah sacrifice used to be practised here in former years; and in front of the shrine is the stone pillar or block to which the animals now substituted are tied up before being killed.

DANJ or Dhanu or Dhnao, a rude Burmese tribe near Myamurr.

DANUK, a low tribe in Behar and the Upper Provinces of India, fowlers, hunters, also pastoral slaves.—Wils.

DANUSHIA, the unerring bow, the 11th article produced by churning the ocean. See Karma.

DANYA. Maleal. Coriander seed.

DAOUDI, believers in the divinity of king David among the Bakhtiyari in Persia. The Georgians in Bokhara, though for centuries resident there, inwardly are Christians, outwardly Mahomedans.—Wolff's Bokhara, i. p. 54.

DAOUDPUTRA, a Mahomedan tribe who claim descent from the khilaf Abbas, but supposed to be from Daoud, the first of the family who acquired a name. They are said to be Bahch changed by a long residence in Sind. They moved from Bahawulpur and seized land on the Sutlej, reducing the remains of the ancient Lune and Jhelum, and introducing the Sind system of canals of irrigation; and both banks of the river below Pakpatan bear witness to their original industry and love of agriculture. Daoudputra is applied both to the country and to its possessors, the children of David. Daoud Khan is said to have been a native of Shikarpur, west of the Indus, who drew upon himself the arms of Kandahar. Unable to cope with his opponent, he abandoned his native place, passed his family and effects across the Indus, and followed them into the desert. The royal forces pursued, and, coming up with him at Sootialoh, Daoud destroyed his families, who impeded his flight, and faced his foes. They, appalled at this desperate act, deemed it unwise to attack him, and retreated. Daoud Khan, with his adherents, then settled in the Kutch, or flats of Sind, and gradually extended his authority into the thul. He was succeeded by Mubarak Khan, who deprived the Bhatti of the district called Khadal, and settled in their chief town, Derrawal, founded by Rawul Deoraj in the eighth century. Derrawal was at that time inhabited by a branch of the Bhatti, broken off at a very early period, its chief holding the title of Rawul, and whose family since their expulsion have resided at Gurialah, belonging to Bikanir. The Daoudputra are to be met with in various parts of Sind.—Tod's Rajasthan, ii. p. 321. See Bahawulpur; Jut.

DAPHILA, Dophila, or Dufilla, a tribe in a tract of country on the N.E. frontier of India. It lies north of Durang and Lakhipur districts, in the province of Assam. They call themselves Bangni, a word signifying 'man' in their own language.

In the cold season of 1874-75, an armed expedition was marched into the hills to recover captives.

DAPHNE, a genus of plants of which several species grow in India. They are of the natural order Thymalaceae. A daphne grows in the Kashmirian mountains allied to D. gnidium and D. oleoides. It is essentially different from D. cannabina, which, in Nepal, a paper is manufactured according to the Chinese manner. Acid and dangerous properties appear to be common to them all; some species are remarkable for the toughness of their fibre, and for the economical purposes to which they are applied. From D. cannabina is prepared the best kind of writing paper in China, according to Loureiro; but in Nepalese daphne paper is very brittle and bad.

At the Great Exhibition of 1851, a huge sheet of Nepalese paper was exhibited by Colonel Sykes. The lance-leafed tree D. lagetta, now Lagetta lindenii, of the West Indies, is remarkable for the beautiful net-like appearance of its several easily separable layers of bark, whence it has received its English name. A plant common in English gardens, and used in medicine on account of its acridity, is the D. mezereum of botanists.—Bengal Disp. p. 531; Homberger, p. 268; Eng. Cyc.

Niggi, Jeku, Hind. Mahadeo ka phuli, Hind. A small evergreen perennial shrub, somewhat like a laurel, which bears poisonous berries. It
grows in Nepal, Sikkim, in Kamaon at 5000 to 9000 feet, the N.W. Himalaya generally at from 3500 to 8000 feet. It is with this shrub that the Nepali paper is made; and in Kamaon, etc., large quantities are manufactured from the purple-flowered variety. The bark is boiled in a metallic pot with oak ashes, which are highly alkaline. The softened bark is then pounded with a mallet in a stone mortar, till reduced to a pulp like dough. This pulp is churned with water into a very thin paste, so that it lose all trace of fibre, and will diffuse and settle smoothly. In this state it is poured into a coarse sieve placed over a frame, with a cloth bottom floating on water. The sieve stops the coarse pieces, allows the fine emulsion to pass through, and then by agitation this is smoothly deposited over the cloth. Removing the frame, the water filters away, and the pulp dries rapidly by placing the frame before a fire.

The paper is subsequently polished by friction with a shell or piece of hard wood. Sheets have been made many yards square. It may be purchased at Kathmandu at 17 annas each for 3 seers. Bricks of the pulp are sold from 8 to 10 annas for 3 seers. The greater part of the paper is made by the Himalayan Bhotia, east of the Kali river. The manufacture seems to have been introduced from China about the 14th century. This unsize paper is much overrated. But it is tough when kept dry; can be used like cloth for wrapping up dry substances; and it can be used after having been saturated with water, provided it be carefully dried within a reasonable time after it has been wetted. The dried bark may be substituted for D. mezereum. The bark of mezereum is almost always inert from age. In Chamba, the flowers appear to be hung up as offerings in temples. — J. L. Stewart; O'Sh. p. 531; Beng. Phar. p. 279; Cleghorn, P. R.

The berries are brisk but unsafe cathartics. Fresh bark is counter-irritant and external stimulant; the dried bark is a stimulant alternative in syphilitic, rheumatic, and scrofulous maladies. It is frequently combined with sarasarillas, as in the Lisbon diet drink. — O'Sh. p. 530.

DAPHNE OLEOIDES. Schreb. D. mezonata, Royle. — Kutti lal, Kanthan, Jhail Katal of — Hazara. — Gandlena, Gundalun, Rav. — This paper shrub grows in Kunawar and in the Panjab, and is used medicinally, and said to be used in papermaking. It is in great abundance from a little above Kawai to Kathgan. The pretty red berries are not unfrequently eaten, but are said to be apt to cause sickness. — J. L. Stewart; Cleghorn.

DAPHNIDIIUM CUBEBA. Smith. Laurus cubeba. — Pib-ching-kia, Chin. — A plant of Cochin-China and the S. of China. The bark and berries are said to be used to cure fish. D. elongatum, Nees, and D. pulcherrimum, Nees, are trees of Darjiling hills. — Kurz; Smith.

A good-sized glabrous tree, very common on the mountains on the west side of the Madras Presidency, and in Ceylon at elevations from 4000 feet upwards; also indigenous in Hong-Kong, Lo-p-Choo, Corea, and in Japan. The wood makes excellent fuel. Its foliage makes it highly ornamental for shrubberies, etc. — Bitholome, Fl. India.

DARABGIRD. — Darab, Dar-ul-baka, hence can Cleghorn.

DARAB, Dar-us-sultanat, in to. The syphilitic, after Phar. the it

Dar-ul-baka, the permanent abode, i.e. the world; Dar-ul-ubla, the permanent abode, i.e. eternity; Amil-dar, a hospital; Dar-ul-khilafa, the khalif's residence; Dar-us-sultanat, the residence of a king, a capital; Dar-ul-barb, a country under a non-Mahomedan government, the seat of constant hostility or war, non-Mahomedans at all times being legitimate objects of attack.

Dar-ul-karar, a rhetorical addition to Kandahar. The words mean the abode of quiet, or city of stability. Throughout the East, Mahomedans often employ this kind of alliteration. After Choki, a chair, they will add choki-oki; to Bachah, a child, is added bach-kach; Hyderabul is farhmdlah baniald, of happy foundation.

Dar-ul-karar, or city of permanence, is allegorically applied to towns of the future world, as opposed to this, the Dunyai-i-ram, the transitory world.

Dar-ul-khilafat, at Bagdad, the city built by Al Mansur, the second khalif of the Abbas dynasty, and which his successors enlarged and furnished in the most costly manner. A piece of the Hajjar-us-siah, or black stone of Mecca, was let into the threshold of the principal gateway, and a large curtain, made of the hangings of the temple, was suspended from a window of the gateway, to about the height of a man from the ground. Every person entering had to rub his eyes with the curtain, and to crawl over the black stone to avoid touching it with his feet.

DAR. Pers. A door, a gate; hence Dar-wain, a door-keeper, Dar-waza, a door, a gateway. Most cities in India have their gates named from the chief town to which they lead. Thus the Delhi gate, the Mecca gate.

DAR. Hind. A weight used in the tinsel-maker's apparatus.

DAR, a town near the valley of Kabil, with many sepulchral tops.

DARAH. Punkt. A glein, a defile.

DARA or Durrah. Mahi. A body of the Pindari.

DARA, a king of Persia, son of king Darah, overcome by Alexander the Great.

DARAB, king of Persia, son of Kai Balman or Ardeshir Dara, Artaxerxes Longimanus.

DARABGIRD, one of the five ancient divisions, circles, or departments of ancient Pars. Darabgird was built by Darius 1. It is 150 miles S.E. of Shiraz; is finely situated, and surrounded with orange and lemon and date groves; tobacco and other products are largely cultivated. The people have numerous flocks and herds. — MacGregor, p. 116.

DARANA. HIND. A scarecrow; from Darna. Darari-DANDA. HIND. A rolling-pin and convee receptacle used by native needle-makers for flattening wire.

DARBAND, a town of Daghistan, since 1813 in Russian territory. It has the citadel Naraini Kala, supposed to have been built by Alexander. The Caucasian wall extended from Darband. It was 21 feet high and 7 feet wide, and was intended as a defence against the Scythians from the north. It was first captured in 1722 by Peter the Great. Near it is the Kogre-Kafe mountain; at its foot, the village of Dashkossine and the cave of the Dives, the dwelling-place of the giants of the Scripture.

Dashkossine. DARENGRI. DARD, Pers. A general reception by a ruler in British India, or by any officer of rank; a court, a royal court, a levee. Also the Sikh temple at Amritsar.

DARD, an Urdu poet of Delhi, whose name was Khaja Mir. He lived in the 18th century; his poems were of a plaintive and pathetic character, as the Nala-i-Dard, Ab-i-Sard, Soz-i-Dil, Shama-i-Mahfil.

DARD, a race lying along the Indus, to the westward of Ladakh, and to the N. and N.E. of the Snowy Range, who speak three distinct dialects. They use the Persian character in writing Dardu, the three dialects of which are called Shina, Khajuna, and Arniya. The Shina dialect is spoken by the people of Astor, Gilgit, and lower down in Chelas, Darel, Rohi, and Elah, on both banks of the Indus. The Khajuna, by the people of Hunza and Nangy; and the Arniya in Yasan and Chitral. The Dard group of languages includes the Arniya, Astor, Gilgit, Kalashmender, and Khajuna. The Kashmir people have their own peculiar language. In Gilgit, Astor, and Baltistan, the castes are Rani, Shin, Yaskun, Kremin, and Dum or Dom. The Kremin is a mixed race. The Shin or Shina and Yaskun were the dominant race. In the N.W. Himalaya, the lowest castes are the Dogra and Dom. Astor has an area of 1600 square miles, on the left bank of the Indus. Gilgit, in Tibetan Gilygyid, has an area of 2560 square miles, on the right bank of the Indus. The Dard or Duri, the people who now occupy the country called Dardu, are supposed by Vigne to be the Daficce (Δαρίδες) of Herodotus. Darada, a country in the Hindu Kush, bordering on Kashmir, is mentioned by Piny. The people are the Dard, and are mentioned in the Vishnu Purana. The Kashmiri has decided affinity with the Dard tongue. The Balai people of Little Tibet say that Nulik, Iskardo, Khopelu, Purik, Nagy, Gilggit, and Astor are distinct Tibet. Pappo is a drug from Ladakh, seemingly composed of dough, which the Dards add to an infusion of corn to make the bread called mo. Wine is largely made by the Dards. Men and women amongst the Dards eat together. When men drink plain milk together, it is as an oath of eternal friendship. At the conclusion of the mullah's reading the marriage service, the bride and bridegroom partake of a spoonful of boiled milk. Dards are fond of changhan bazi, or hockey on horseback, also called polo. The game is called tope in Astor; at Gilgit it is called bulls. The Dard legends and beast tales have been described by Dr. Lethes, — Jodjoon; Latham; Vigne.

DARBANELLIES, two castes of Turkey. One, called Sestos, is in Roumania; the other, Abydos, in Natalia. Long. 26° 26' E., lat. 40° 10' N.

DARGA, a round shield used by the fair red-haired Touroreng race in Northern Africa.

DARENHI. HIND. An astringent leaf used in Kashmir in dyeing.

DARFUR or Darfoo, a kingdom of Africa, on the borders of Nubia and Nigritia. The people are barbarous, and consist of native tribes, of a deep black complexion, with wooly hair.

DARGAH. HIND. Pers. A tomb or shrine, of which there are in India several of fame. Near Mangalore, at the village of Cuddry (two miles off), is Shaikh Furreed ka Dargah. It consists of a hole in the centre of the side of a perpendicular laterite rock, which is fabulously said to lead all the way to Hyderabad, 450 miles. The opening is square, about six feet above the mosque, and is composed of a light of sandstone rudely constructed, and just large enough to allow of a person to crawl in. The cavern is very dark, and no one knows the exact size of it. Adjoining is a chasm with an opening left for people to creep in by. Tradition states that about A.D. 1788, there was a pir named Shaikh Furreed, who made chilla (i.e. neither speaking, eating, or drinking for forty days, but worshipping God and living retired from the world). He resided at Cuddry for twelve years, during which time he used to observe chillas, remaining for forty days together in the cavern, seeing and speaking to nobody, eating and drinking nothing; after the forty days were over, he was wont to come out for four or five days, but partake of no other food but the leaves of a plant (since named after him), Furreed-boothee, which grows wild in the surrounding jungles, and has a sweetish taste; he drank water, spoke to those who assembled in an adjoining stone building, and then retired again to this cavern to perform another forty days' chilla, and so on. At the end of twelve years he disappeared, and this being the road to Mecca, it is said that he set out for that town by the subterraneous route, and has never been heard of since. Mahomedans resort hither occasionally, and on Fridays cook victuals, and, having offered fathia over them while burning incense, in his name distribute them among the fakirs resident there, as well as those who have accompanied them. If a dargah be situated in a place where no food can be dressed (from want of materials or otherwise), they take sweetmeats with them, which they substitute in its stead. This dargah is in the charge of a fakir, who receives the offerings that are made by visitors, and which are placed at the entrance of the cave; when he dies, the four principal makkhanwans (pirs), residing at the four principal makkha (or houses of pirs), spiritual guides (so called) at Mangalore, and six or ten of their murid (or disciples), select a successor; on such occasions numerous fakirs are likewise present. In Tipu Sultan's time, the individual in charge of this dargah received rupees
DARJILING. Darius Hystaspes, whose name has been said to be derived from Hyysa, to neigh, and Aspa, a horse. His Persian name was Guishasp. His admiral, Seylax, reported so favourably of the wealth of India, that Darius invaded India, and annexed the provinces bordering on the Indus. His Indian possessions were the most valuable of his twenty satrapies, and are supposed to have included the Punjab; but there is no testimony to this beyond the authority of Herodotus (lib. iii. p. 100), and the doubtful voyage of Seylax down the Indus. Bunsen gives the following dates of the reigns of the kings Darius:—Darius, son of Hystaspes, B.C. 521 to 486; Darius Nothus, B.C. 423 to 405; Darius II., surnamed Codomannus, B.C. 335 to 332. The edicts of Darius Hystaspes are preserved in the Achaemenian inscriptions at Behistan, first translated by Sir Henry Rawlinson. Bactria is enumerated as one of his provinces in the inscription which he caused to be carved on the rock of Behistun.—Ed. of The Hist. of Pers., p. 45.

DARJILING, in lat. 27° 2’ 48” N., and long. 88° 18’ 36” E., in Sikkim, is a large station and sanatorium, 412 miles from Calcutta. The top of the Observatory hill is 7168 feet above the sea. Darjiling ridge, however, varies in height from 6500 to 7500 feet above the level of the sea. The mean rainfall is 130 inches, and mean temperature, 50°. To the N.W. towards Nepal, the snowy peaks of Kumba and Junnoo (respectively 24,005 feet and 23,312 feet) rise over the shoulder of Singalelah; whilst eastward the snowy mountains appear to form an unbroken range, trending north-east to the great mass of Donka (28,176 feet), and Thence south-east by the fingered peaks of Tunkola and the silver cone of Chola (17,320 feet), gradually sinking into the Bhutan mountains at Gipmoochi, 14,605 feet above sea-level. Darjiling was acquired by the British in 1855 as a sanatorium, a tract of country 138 square miles in extent being ceded by the raja of Sikkim, in return for an allowance of £300 per annum, afterwards raised to £600. Its population has increased from a few scattered tribes to upwards of 100,000, chiefly Murmi and Nepalese (32,338), Rajbansi Koch (23,121), the original Lepcha (3952), Dhimal and Mech (1766), along with Sharpa Bhattia, Limbu, Sanwar, and Chepang, and Brahman, Rajputs, and Oraon. The Bhutia, Lepcha, and Murmi are Buddhists, and speak the Tibetan language. They are strong and active, and inlinestrongly to the Mongolian race. The Limbu, Sanwar, and Chepang are of a small Mongolian type, strongest in the Limbu, and their language is referable to either the Tibetan or Indian standard. The Mechi, Dhimal, and Garo are lowland tribes, with a Mongolian physiognomy, but are neither Hindus, Buddhists, nor Mahomedans. The Tharao and Dhunwar are Buddhists or Mahomedans, with fair and barely Mongolian features. The Bahir, Kelant, Amatti, Malaria, Dhanook, and Dom are not Mongolian, but a dark race speaking Hindi or Bengali. The Koch or Rajbansi inhabit the Terai of Nepal and Sikkim, and have spread into British territory.

The mountainous country, at from 1500 to 4000 feet above the sea, is inhabited by the Limbu, a martial, beardless Mongolian race. From 4000 to
6000 feet, the hills are occupied by the Lepcha, the Bhutia, and Murmi. During the summer months, the summit of the great Singalodha spur separating Darjiling from Nepal is occupied by the Garong, a pastoral race from Nepal, who graze their flocks at heights from 9000 to 14,500 feet, their great flocks being guarded by huge savage black dogs. The Lepcha Buddhists are aborigines; they are a fair, bearded, Mongolian race, omnivorous, amiable, and cheerful. They have a written language in a character of their own.

The Limbu are Hindu, Buddhist, and polytheist by turns, as circumstances or convenience require.

The Bhutia are from Bhutan, east of the Tista river. Many of them have beards and moustaches. They have a written language in the Tibetan character. They are Buddhist Mongolians. They are agricultural and pastoral.

The mountain slopes are so steep, that the spurs or little shelves are the only sites for habitation between the very rare flats on the river banks and the mountain ridges, above 6000 feet, beyond which elevation cultivation is rarely if ever carried by the natives of Sikkim. The varieties of grain are different, but as many as eight or ten kinds are grown without irrigation by the Lepcha, and the produce is described as very good, 80-fold. Much of this success is due to the great dampness of the climate; were it not for this, the culture of the grain would probably be abandoned by the Lepcha, who never remain for more than three seasons in one spot. The geological structure of the mountains of Sikkim is very uniform, the rocks being principally varieties of micaceous shale and gneiss. The soil is generally formed by the disintegration of these rocks, and is covered in some places with vegetable mould. At Darjiling the Minchu spring water is a carbonated and sulphuretted chalybeate, containing its iron in the peculiar state in which it is found in the Bath waters.—B. H. Hodgson, Esq., C.S.; Indi. Ann. Med. Science, p. 264; Hooker, Hin. Journ.; Dr. Thomson in Eth. Soc. Journ.

DARMA, a pass leading into Garbwal. Its occupants are said to be the descendants of a body of Mongols, whom Timur left behind him in Kamaon. They practise divination, taking their omens from the warm liver of a sacrificed sheep. They eat the yak and the cow. They inter their dead for a time, and then, in the month Kartik, they exhume and burn them.—Cunningham's Ladakh; Latham's Ethnology.

DARMA. Beng. Amphidnax karka, Lind. The darma grass matting is much used in Bengal to make walls of native huts and fences.

DARNING, or Rafu-gari, is a branch of the sewing art, which, though in Europe applied to the most homely purposes, requires the greatest skill in the East, where a defect in a costly shawl is to be made good, or a coarse thread to be picked out of a muslin of a rent, of which a twelfth has been accidentally introduced. So skilful are some of the rafu-gari, that they can extract a thread twenty yards long from a piece of the finest muslin, and replace it with one of the finest quality. They are principally employed in repairing the muslins and calicoes that are injured during bleaching; in removing knots, and joining broken threads; also in forming the gold and silver headings on cloths. — Taylor; Royle, Arts of India.

DAROGHA. Hind. A superintendent.

DAROO or Darn. Hind. A general term for ardent spirits, and equivalent to the Araq of the Arab and Persian. Daroo distilled from the mahwa flower is produced in great quantities in all the jungles of the Upper Godavery, and in several parts of the Bombay Presidency; but in the S.E. of Asia, rice, gur, or unclarified sugar, the fermented palm wines, are the substances commonly utilized. Daroo also means gunpowder; likewise also medicines.

DAROOD. Hind. Properly Darud. Pers. Blessing or benediction. Darudi, a person who reads prayers or the Koran at tombs.

DARORAH. Hind. Gang robbery with violence.

DARRAH. Hind. A valley, a glen, a defile.

DARRANG, a district in Upper Assam, in a narrow strip of land, 126 miles long, between the lower ranges of the Himalaya and the Brahmaputra, which is navigable for steamers all the year round. The Aham are a wild tribe of Shan origin from the Burmese hills, who first entered the valley about the 16th century. They organized their conquered territory with minute precision, and held their own until the advent of the British. In Darrang they number only 3490. The Towang Bhutia are entirely independent of the state of Bhutan. They trade with Tibet, and are quiet and friendly. The Aka or Hrusso are a small tribe who used formerly to commit frequent raids on British territory. They now receive passa or black-mail to the amount of £67 a year. Farther east are the Daphla, whose native mountains extend along the neighbouring district of Lakhimpur. In the year 1872, the village of Amlola, occupied by Daphla settlers, was attacked by a strong party of hill Daphla, and 44 persons were carried off to the mountains.

In Darrang, as in the rest of the upper valley of the Brahmaputra, the great majority of the population are of aboriginal descent. The aborigines of the census report are mainly composed of Lachari, who number 62,214 out of the total 76,094; Bahna, 10,302; Daphla within the district boundaries are 134 in number; Koel, 46,788; Dom, 8023; and the Aham, 3490. Of Hindu proper, by far the most numerous caste is the Kolita (16,998), the ancient priesthood of Assam, who are now admitted to Hinduism as pure Sudras. The weaving castes are also strongly represented, with an aggregate of 18,550 members.—Imp. Gaz.

DARSAKA. Sansk. Demonstration; a system of doctrine or philosophy, of which six schools are recognised by the Hindus:—

1. The Sankhya philosophy of Kapila was dualistic, teaching the distinction of soul and matter.

2. The Yoga or Patañjali system taught the practice of abstraction, or Yoga.

3. The Nyaya, as taught by Gautama or Aksha-pada; and

4. The Vaiśeṣika, founded by Kanada or Kanabakhsha.

5. The Purva Mīmāṃsā philosophy, by Jaimini, treating of the purport of the ceremonies of the Vedas. It is commonly called the Mīmāṃsā.

6. The Uttera Mīmāṃsā or Vedanta, by Veda
DARUD.

Vyas or Badarayana, inculcating the unity of spirit and matter.

The principal doctrines of the Uttara Minansa are that God is the omniscient and omnipotent cause of the existence, continuance, and dissolution of the universe. It is supposed to have been founded three or four centuries before Christ. The Nyaya and Vaiseshika recognise a supreme being. The Yoga is theistic, and Sankhya atheistical. All have the same final object, the emancipation of the soul from future birth and existence, and its absorption into the supreme soul of the universe.

The Sankhya system was taught by Kapila. Its principal doctrine is that rest from transmigration is to be obtained by true knowledge, and that true knowledge consists in regarding man and the world as altogether worthless and perishable. Kapila added little, or nothing, about the eternal reality behind these transitory things, and this important portion of the scheme was completed by Patanjali, forming the second or Yoga system of philosophy. Patanjali's four chapters are appended in the best manuscripts to the Sutras (or leaves) of Kapila, and form together the work called Sankhyapravachana.

The third philosophic system is the Nyaya of Gautama, which again was supplemented by the Vaiseshika, or fourth system of Kanada. These two darsanas both occupy themselves with elaborative investigations into the mental constitution of man and the laws of logic, as means for the attainment of true knowledge. Lastly, the fifth and sixth systems are called the Purva Minansa and the Uttara Minansa. The first originated by Jaimini, and the second by the eminent sage Vyas. It is this last system, the Uttara Minansa of Vyas, to which the title of Vedanta is applied; the word meaning, 'the ultimate aim of the Vedas.' All the other systems of philosophy recognise the Vedas as sacred; but the two Minanas treat them as absolute revelation, and are in fact commentaries and interpretations of their earlier and later portions.

The Vedanta simply teaches that the universe emanates in successive developments from Brahma or Paramatma, the supreme soul; that man's soul is identical in origin with the supreme soul; and that liberation from transmigration will be obtained so soon as man knows his soul to be one with the supreme soul. The Vedanta system represents the religion of Hindu philosophy, or rather the religion of philosophers. To suppose that men who accepted the Sankhya or Nyaya systems would therefore take no interest in the Vedanta, would be somewhat like supposing that if a man studied Aristotle he would necessarily despise the Psalms. The great Hindu theologian, Sankaracharya, author of the poem Atma-Bodha, was an enthusiastic Vedantist.

v. Darsana with lay Hindus generally means performance of religious duties, visiting temples, seeing or reverencing idols.

DARUDI, from Darud, a door, and Vihan, to beg, is the Persian term synonymous with the Arabic and Indian fakir, a Mahomedan religious mendicant. Originally there were twelve orders, viz. Rafi, Sadi, Saharvardi, Shihani, Mulavi, Kadiri, Nakshi, Chishti, Jalwati, Khaltwati, Bedawi, and Dassuki. There have been many branches added, amongst whom may be mentioned the Bawa, Chishti, Kalandar, Madaria, Rasul-Shahi. The system of religious devotees originated amongst Mahomedans,—according to one tradition, with Oways bin Aamir. He had never seen Mahomed, but he so loved and revered him, that he caused two of his front teeth to be extracted, because Mahomed had lost two of his front teeth in the disastrous battle of Ohod, and the example given by Oways was followed by the khilafah Abubakr and Ali, and the associations of recluses created by them. But most of the existing orders of darwesh which are scattered over Mahomedan countries, trace back their origin to Jalal-ul-Din, Rumi, the author of the Mahnavi-i-Sharif, who founded the Mulavi order. In European Turkey, the darwesh have formed somewhat prominent communities, and about sixty different orders, each named after its founder, are supposed to exist there. The Bataashi or Bektashi of Constantinople are said to be quite atheistic, not attached to the principles of the Koran, nor firm believers in Mahomed as a prophet. They are generally of the sect of Ali, therefore Sufi or Mahomedan spiritualists. They have a takiah on the bank of the Tigria at Baghdad, on the west side of the town. The Rafai darwesh, so common in Turkey, inflict on themselves great self-torture. They are also known as the Ecsawiya, q.v. Some of the wandering Indian fakirs travel so far west as Hungary, to visit the shrine of a santon, Gul-baba, and travel east to Tenasserim and Burma. One whom the editor met near Hingolé, in the Dekhan, was a native of the Panjab, but had been to Ceylon, Mergui, Tavoy, Rangoon, and Moulmein. In British India many fakirs are low profligate men, held in great disesteem by all classes of the community, and some of them are utterly degraded in habits and mode of life. The bulk of them are Be-Sharra, literally without law, i.e. do not act up to the precepts of Mahomed, but are latitudinarians; a few are Be-Sharra, or with law, following Mahomedanism. The latter are styled Salik; the Be-Sharra are the Majuba. Azad, Rasul-Shahi, Imam Shaki, Kalandar, are of both sects.

No character in the Moslem world is so proper for disguise as that of the darvahes. It is assumed by all ranks, ages, and creeds,—by the nobleman who has been disgraced at court, and by the peasant who is too idle to till the ground; by

DARVESH.

The consequence applied to Siva, on whose solicitation Parvati produced from herself the form of Kali, having in her hands a trident and a skull. On beholding her, the affrighted gods ran away. Kali alone attacked Darnika and her hosts, and destroyed them.—Cole. Myth. Hind. p. 378.

DARUN - AJ - AKARII. ARAB. Doroniceum scorpoides, a kind of fern, the root and leaves of which reached Ajnir from Arabia via Bombay. Considered as a tonic. Four to six massas are a dose. One tola costs two rupees. — Gen. Med. Top.

DARVESH, from Dar, a door, and Vihan, to beg, is the Persian term synonymous with the Arabic and Indian fakir, a Mahomedan religious mendicant. Originally there were twelve orders, viz. Rafi, Sadi, Saharvardi, Shihani, Mulavi, Kadiri, Nakshi, Chishti, Jalwati, Khaltwati, Bedawi, and Dassuki. There have been many branches added, amongst whom may be mentioned the Bawa, Chishti, Kalandar, Madaria, Rasul-Shahi. The system of religious devotees originated amongst Mahomedans,—according to one tradition, with Oways bin Aamir. He had never seen Mahomed, but he so loved and revered him, that he caused two of his front teeth to be extracted, because Mahomed had lost two of his front teeth in the disastrous battle of Ohod, and the example given by Oways was followed by the khilafah Abubakr and Ali, and the associations of recluses created by them. But most of the existing orders of darwesh which are scattered over Mahomedan countries, trace back their origin to Jalal-ul-Din, Rumi, the author of the Mahnavi-i-Sharif, who founded the Mulavi order. In European Turkey, the darwesh have formed somewhat prominent communities, and about sixty different orders, each named after its founder, are supposed to exist there. The Bataashi or Bektashi of Constantinople are said to be quite atheistic, not attached to the principles of the Koran, nor firm believers in Mahomed as a prophet. They are generally of the sect of Ali, therefore Sufi or Mahomedan spiritualists. They have a takiah on the bank of the Tigria at Baghdad, on the west side of the town. The Rafai darwesh, so common in Turkey, inflict on themselves great self-torture. They are also known as the Ecsawiya, q.v. Some of the wandering Indian fakirs travel so far west as Hungary, to visit the shrine of a santon, Gul-baba, and travel east to Tenasserim and Burma. One whom the editor met near Hingolé, in the Dekhan, was a native of the Panjab, but had been to Ceylon, Mergui, Tavoy, Rangoon, and Moulmein. In British India many fakirs are low profligate men, held in great disesteem by all classes of the community, and some of them are utterly degraded in habits and mode of life. The latter are styled Salik; the Be-Sharra are the Majuba. Azad, Rasul-Shahi, Imam Shaki, Kalandar, are of both sects.

No character in the Moslem world is so proper for disguise as that of the darvahes. It is assumed by all ranks, ages, and creeds,—by the nobleman who has been disgraced at court, and by the peasant who is too idle to till the ground; by
DARWAZ.

Dives who is weary of life, and by Lazarus who begs bread from door to door.

The Madaria order are named after Badi-ud-Din, Shah Madar, called also Zandah Shah Madar, who is buried at Makanpur (ob. 1433 a.d.).

The Nakhshbandi darvesh illustrate their theology with pictures.

Meleviyeh, dancing darvesh, are a solemn and, for the most part, learned body of men, revolve like teetotums till they have added their brain.

Guishaniyeh, the Howlers of the guide-books, toss their heads backwards and forwards, and howl the name of Allah till they fall back foaming at the mouth in an epileptic fit.

The Rafaiyeh cut themselves with knives, eat live coals, chew glass, and perform other mad freaks for the same purpose, namely, to lose the idea of self and attain a fancied reabsorption in the Deity. How far the same motives may have actuated the prophets of Samuel’s time, when Saul (as casual spectators at a darvesh celebration often do now) stripped himself naked and joined the wild prophetic dance (1 Samuel xix. 24), must be left to biblical scholars to decide.—*Burton’s Meccca*, i. p. 21; *Osborn’s Islam*, p. 92; *Herklot*, *Qawoon-i-Islam*; *H. Elliot*.

DARWAZ, a chieftaincy in the valley of the Oxus. It is north of Badakhshan, and is ruled by an independent Tajik chief. He claims a Grecian descent, like the Mir of Badakhshan, and the chiefs of Chitrail, Gilgit, Iskardzo, and others. The Oxus sands here are washed for gold.—*MacGregor*, p. 224.

DARWAZAI. HIND. Door; the gate of a town or fortress. All great Mahomedan cities name their gateways generally as leading to other cities, such as Mecca—darwazah, Dehlidarwaza. Darwazah-i-Irak, the western gateway of the town of Herat. See Dar.

DARWAZYE, one of the Hazara states, the chief of which is of the Tournouze.

DARYAN or Dryon, a strait about 120 miles long, from Pulo-Varela to the Carimons, and is bounded on the west side by the coast of Sumatra, False Durian, Sabon, and the contiguous islands; on the east side by the islands off the south and west sides of Lingin, Great and Little Durian, and the adjacent islands. Throughout these straits the tides are very irregular.—*Horsburgh*.

DAS. HIND. Ten. Dasaha, Mahil, the period of the ten days’ impurity on the death of a relative. Dasoond, the tenth part. Dasaa-Marma, the ten commandments of Valabhairacharya. Dasagiriva, or the ‘Ten-necked,’ a name of Ravana. Dasahara, or ‘Ten-removing,’ a name of Ganga.

DAS, Dissa, Doss, forms part of the names of many Hindus of N. India and Bengal, and is of frequent occurrence amongst the Kayasth tribes. Dasa means servant, slave, the servant or slave of a deity, and corresponds to the Abdi and Ghulam of the Mahomedans. The Arab Abdullah and the Hindu Iswana Das alike mean the servant of the Lord. Narayan Doss, Bhagavan Das, Krishen Doss, for instance, signify the slave of Narayan, Bhagavan, or Krishna. Randas is, in like manner, the slave of Rama. Deva Dasa are Hindu temple women, slaves of the temple deity. In the days of Akbar it was borne by Rajputs, as Raja Bhagwan Das, of the Kachwaha tribe. It is now seldom used by Rajputs except for illegitimate offspring.

DASA, an order of Vaishnava devotees. DASAHARA or Dashara. SANSK. The tenth of Jeth Shukhl Paksha, which is the birthday of Ganga. Also is the tenth of Asin Shukhl Paksha, Asoj or Ashwin shud, on which, after the worship and religious ceremonies performed during nine nights, the Hindus throw the images of Devi into the river. The day is celebrated with great pomp by the Mahattas and Hindus of Mysore and on all Maharashtras. The festival occurs about the first days of October. It is supposed to relate to the antumnal equinox or the breaking up of the S.W. monsoon, when the weather becomes suitable for military operations. In Bengal it is a popular festival in honour of Durga, celebrated in the month Aswin (September—October), for nine days. The tenth day of Asoj is commemoratory of the date on which the deified Rama commenced his expedition to Lanka for the recovery of Sita from Ravana. The nine days preceding the Dashara are the Naorati, or ‘nine-nights,’ during which a Brahman is engaged to read the praises of Durga, and on the tenth perform the homa or firesacrifice, in which rice and ghee are poured into the fire. Bania women keep up a dance called garbar. As Arjuna and his brothers worshipped the shunne tree, the AacIan suna, and hung up their arms upon it, so the Hindus go forth to worship that tree on the festival of the Dashara. They address the tree under the name of Aparajita, the invincible goddess, sprinkle it with five ambrosial liquids, the pancharmit, a mixture of milk, curds, sugar, clarified butter, and honey, wash it with water, and hang garments upon it. They light lamps and burn incense before the symbol of Aparajita, make chandlos upon the tree, sprinkle it with rose-coloured water, and set offerings of food before it.

In this festival Hindu soldiers have converted the animals and instruments of modern warfare into emblems of their Bellona. Thus the horse is invoked to carry his master, first to victory, and then to repose. The flagstaff is the ensign of Indra; the sword is celebrated under several names; the bow and arrows are also praised; and even fire-arms have their proper pre-eminenre by adaptation. The Hindu artilleryman at all times regards the gun to which he is attached as an object of superstitious reverence, and usually bestows on it the name of some deity. During the Durga festival, the cannon belonging to the army were planted, praised, invoked, and pro- pitiated by several species of offerings. On the morning of the tenth day, the Peshwa, with all his chiefs and soldiers, used to move out to the camp in the vicinity of the city, each being ranged under his particular banner, mounted on his best horse, dressed in his finest clothes, and with his arms highly polished. Horses, elephants, and camels were all arranged in their gayest trappings, and every corps spread its gaudiest flags and banners. The whole population of the capital, either as actors or spectators, joined in this grand procession, which moved towards the sacred tree, the object of adoration. After the offerings and prayers, the Peshwa plucked some leaves of the tree, on which all the cannon and musketry commenced firing. The Peshwa then plucked from a field, purchased for the occasion, a stalk of jawari or bairi, on which the whole
DAFJAR.

A descendant of Hottough.

JANAKA. soverign of Ikshvaku.

Rama, chief of the Saurastra, was given to Lakshmana, and the two other brothers were married to Mandavi and Srutakriti, the daughters of Kausalya, who was given to Dushyanta.

Janaka, whose chief queen, Kausalya, bore Rama; Kuiksey gave birth to Bharata, and Su-matra bore Lakshmana and Saruguna. The time that Sita was married to Rama, Urmila, the other daughter of Janaka, was given to Lakshmana, and the two other brothers were married to Mandavi and Srutakriti, the daughters of Kausalya, who was given to Dushyanta.

DASAKJACHIL. HIND. An ancient missile weapon of India.

DASARATHA, king of Ayodhya, of the Solar race, a potent sovereign in ancient India, and father of Rama. His kingdom consisted of the eastern countries, Sindh, Saurashtra, Savira; southern countries, Anga, Banga, Magadha, Kosala, and Kasi. He was a descendant of Ikshwaku. Buchanan supposes him to have lived in the 15th century before the Christian era. According to Wilson, the sons of Dasaratha were Rama, Lakshmana, Bharata, and Saruguna. His chief queen, Kausalya, bore Rama; Kuiksey gave birth to Bharata, and Su-mitra bore Lakshmana and Saruguna.

At the time that Sita was married to Rama, Urmila, the other daughter of Janaka, was given to Lakshmana, and the two other brothers were married to Mandavi and Srutakriti, the daughters of Kausalya, who was given to Dushyanta.

The southern countries, Anga, Banga, Magadha, Kosala, and Kasi. Was he a descendant of Ikshwaku? Buchanan supposes him to have lived in the 15th century before the Christian era. According to Wilson, the sons of Dasaratha were Rama, Lakshmana, Bharata, and Saruguna. His chief queen, Kausalya, bore Rama; Kuiksey gave birth to Bharata, and Su-mitra bore Lakshmana and Saruguna.

Dasht-i-Tik, part of Dasht Goran.

Dasht-Khor, in Key, is fertilized by the river Khor, which disembogues near Juni, W. of Ras Pishkan. The occupants are Kurdish (Khadu?), Kir, Hot, Birdi, Bar, and Shahzada.

DASHTISTAN means a level country, from Dasht, a plain; but it is particularly applied to the low country extending along part of the shores of the Persian Gulf.

DASHYANTA was eldest son of Aullia, and father of the emperor Bharata by Sakuntala.

DASI. HIND. A female servant.

DAS-NAMA, a Hindu sect, worshipers of Siva, also called Dandi. Sankaaracharya was their founder. They take this name from the words Das, ten, and Namah, a class, because there were ten orders amongst them. See Dandi.

DASOOND, or tenth, in Mewar, as in Europe, was the stated sum to be levied in periods of emergency or danger.

DAS PADSHAH-KI GRANTH. This and the Al-i-Granthi form the religious writings of the Sikh sect. See Sikh.

DASARATAMA, a name of Rama Chandra.

DAS PERS. The band, Dastawez, a signature or a voucher. Dast Boste, lit. hand-kissing. Dasta, a kailifron, or small hand hookah. Dastana, a glove, also a flat brush for spreading newly-made paper. Dast Panna, a pair of tongs carried by fakirs.

DASTAGIR-WALAY, an appellation given by the Gyr-Mahdi Mahomedans to all other sects.

DASTAR or Pagri, the name given in India to the turband, worn on the head by Mahomedans of Turkey and India, and by Hindus. The word turband is unknown to Mahomedans of India. It is from Sarband, head-dress.
DASTAR-KHAN.

DASTAR-KHAN, a table-cloth, or rather a floor-cloth, being spread on the ground; but it is also used to denote the custom, whenever a guest enters a house, of laying a table, from which, under all circumstances, he must eat something. The man who attends to the duty is called Dastarkhan-ji. In Central Asia leather tableCloths have, in modern times, been replaced by bright-coloured Russian calico, or, amongst the richer classes, by silk with long fringes. — *Vambery, Bokhara*, pp. 201, 382.

DASTUR, a high priest of the Zoroastrians.

DASTUR. Hind. Custom, hence Dasturi, a customary fee, perquisites formerly paid by a dealer to servants when their master makes purchases.

DASTUR-ul-AMAL, a revenue work prepared in the time of Akbar. A body of instructions and tables for the use of revenue officers under the native Government of India.—*Wde.*

DASYA, in the Sanskrit writings, a race or races who, along with the M'helea, opposed the advancing Aryan race. It is probable that they were the prior occupants of the new countries, and were all reduced to subjection or slavery, the word being either from Dao, a country, or from Dasa, a slave. The Altareya Brahmana says most of the Dasya are sprung from Visvanitra, and Sanskrit writers applied the term Dasya to all the aborigines from the Naga of North-Eastern Bengal, throughout all India, to the indigenous races of Ceylon. They are usually supposed to have comprised the Bhil, Kol, Santal, Naga, and other races, who, when the Aryans entered India, were occupying the entire country between the Himalaya and Vindhyas. They seem to have been worshippers of trees and serpents, and to have been the first to have adopted Buddhism. Ferguson (p. 13) supposes them to have been of Tibetan origin. They were overcome and ruled over by the Aryans. They built square tower-like temples, with a perpendicular base, but a curvilinear outline above.

DASYAULUS. *Thwaites.* Several species of this genus of middle-sized trees occur in Ceylon, viz. *D. fulvus*, at Hewssee in the Pasoon Corle; *D. microphyllus*, in the south, but rare; *D. Moonii*, at Calutta near Ratnapura; and *D. nervifolia*, Gang-mee, Sinoen., common on the banks of rivers and streams in the warmer parts of the island. The last is the Russia nervifolia of Moon's Cat. It is grown for shade in the cinnamon gardens, and its timber is used for common purposes.—*Wde.*

DATA, a mode of address among fakirs.

DATE PALMS are met with in almost every part of the south of Asia. In the Peninsula of India the wild date, Phoenix sylvestris, shoots up in every dip of ground, and it is common in portions of the Dacca, Mymensing, and Sunderbun districts. When not stunted in its growth by the extraction of its sap, it is a very handsome tree, rising to 30 or 40 feet in height, with a dense crown of leaves spreading in a hemispherical form on its summit. The leaves are from 10 to 15 feet long, and composed of numerous leaflets or pinnules about 18 inches long; the fruit is only about one-fourth the size of the Arabian variety. The cultivators of the true date palm, Phoenix dactylifera, in Arabia, fertilize the clusters of blossoms in the female trees, by taking the stamens of the flowers of the male plant and placing them in the centre of each cluster of blossoms. In some parts of Arabia, however, the male trees are planted to windward, and the pollen, wafted by the wind, fertilizes the blossoms in all the trees in the gardens. The culture of the date is of great antiquity. It was emblematic of the Jewish nation. Jericho was the city of palm trees. The date palm was familiar to the Egyptians B.C. 2378. It is first seen in Babylonian monuments B.C. 1500, and first appears on the Assyrian monuments B.C. 858. A recent writer has supposed the date to be the conical figure on the top of the thyrus of Bacchus. This fruit, according to Pliny, was consecrated to the worship of almost every heathen divinity; and the date palm is the sculptural emblem of all that is dignified, beautiful, and good. It is entered largely into the ornamentation of temples. In India, the Phoenix sylvestris is used solely for the palm juice extracted from it. The process of tapping and extracting the juice goes on all the year round, but in Bengal it is continuous from the 1st November to the 15th of February. Some days previously, the lower leaves of the crown are stripped off all round, and a few extra leaves from the side of the tree intended to be tapped. On the part thus denuded a triangular incision is made with a knife, about an inch deep, so as to penetrate through the cortex and divide the sap vesicles, one point of the triangle downwards, into which is inserted a piece of grooved bamboo, in order to direct the sap into an earthen pot suspended underneath it by a string. The pots are suspended in the evening, and, when sugar has to be made, are removed very early the following morning, ere the sun has sufficient heat to warm the juice, which would cause it immediately to ferment, and destroy its quality of crystallizing into sugar. The cutting being made in the afternoon in Bengal, next morning the pot is found to contain, from a full-grown tree, 10 seers of juice, the second morning 4 seers, and the third morning 2 seers of juice; the quantity exuding afterwards is so small, that no pot is suspended for the next four days. The boiling apparatus consists of a hole of about 3 feet in diameter, sunk about 2 feet in the ground, over which are supported by mud arches four thin earthen pans of a semi-globalur shape, and 4 inches in diameter; the hole itself is the furnace, and has two apertures on opposite sides for feeding in the fuel and for the escape of the smoke. The fire is lit so soon as the juice is collected and poured into the four pans, which are kept constantly supplied with fresh juice as the water evaporates, until the whole produce of the morning is boiled down to the required density. As the contents of each pan become sufficiently boiled, they are ladled out into other earthen pots or jars of various sizes, from 5 to 20 seers of contents, according to the local custom, and in these the boiled extract cools, crystallizes into a hard compound of granulated sugar and molasses, and is brought to market for sale as goor. By subsequent processes the goor is deprived more or less of its molasses and impurities. A Persian poem celebrates the Arabian date palm, Phoenix dactylifera, and its 900 uses.

DATE PLUM, Yuen-tsu-nu, Chin. Fruit of Diospyros kaki.

DATES of Phoenix dactylifera.

DATIA.

The best dates are the fruit of the Phoenix dactylifera, dried in the sun. They have a shrivelled appearance, and a pleasant subacid taste. The date trees on the coast of Oman form a continuous grove to Khorfakan, a distance of 150 miles, and the Arabs have a saying that a traveller may proceed the whole distance without ever losing their shade. Dates form the principal product from Oman, large quantities being taken to India. The Mahomedan and Hindu population are very partial to them. The best are brought from Basrah and Bahrein, those from Oman being classed next in excellence. Some are simply dried, and then strung on lines; others, which is the usual plan, are packed in baskets. The Phoenix dactylifera is invaluable to the desert tribes of Northern Africa and the Sahara, whose most important wants it supplies. The fruit is the common food of themselves and their cattle, while their huts and houses are chiefly constructed of date-wood. Makran dates are famed, and are largely exported. Multan, Dehgra Ghazi Khan, and Muzaffargarh produce large quantities in dates from the Phoenix sylvestris, but of an inferior kind to those of Arabia; they are, however, preserved, either by being dried, or else by being boiled in oil and water, and then dried; when about to ripen, a piece of matting is put over the cluster to prevent the ravages of birds, etc.—Wellsted's Travels, i. 188. Fraser's Journey, 74; Burton's Mecca; Powell's Punjab.

DATIA, chief town of Datia state, Bundelkhand, lying on the road from Agra to Sagal (Saugar), 125 miles south-east of the former, and 148 miles north-east of the latter, lat. 25° 40' N., long. 78° 30' E.; estimated population, 40,000, almost exclusively Hindus.

DATISCA CANNABINA. Linn. Ilk'bir, Hind. Grows in Kashmir, Kanawar, Nepal, and the Himalaya; its bark and the woody portions of the root are much esteemed in the Punjab for dyeing silk of a yellow colour. It is also an ingredient in producing a pleasing pale 'pista' green. It is exclusively a bill product. It is used as an expeptorant in catarra. The bark also contains a bitter principle like quassia. Root exported to Amritsar as a dyestuff.—Stewart; Cleghorn; Cat. Cat. Ex. 1862. See Dyce.

DATTA. SANS. From Da, to give; abbreviated into Dat or Dut, a gift, a donation, a son given in adoption, a girl betrothed. Datta or Dutt is a subdivision of the writer caste of Bengal, and borne as a name, as Jai Krishn Dutt. The Datta came to Bengal along with the Kulin race.

DATTA JAYANTI, a Hindu festival held in honour of a deity named Datta.

DATU. MALAY. A governor under a sultan.

DATUNI, the root of the Croton tiglium; it is a very powerful purge, much used in prescriptions.

DATURA ALBA. Rumph.
D. metel, Roxb., Rheede.

Jouz-maz, ARAB; Safed dhatura, HIND.
Pa-daing-phoe, BURN; Humata, Humata, MALE.
Nau-yang-lwa, CHIN; Velle umati, TAM.
Man-to-lo-lwa, TEL; Tella umati, TEL.

Sala dhatura, HIND.

The Datura genus of plants is common in India, both wild and cultivated; the colours of the flowers are white, yellow, purple, and blue. D. pontica is reputed to have contributed to the poisonous quality of the honey that was eaten by Xenophon's soldiers. Bishop Heber notices Datura alba in his Walk in Bengal:

'While to the cooler air confest
The broad datura bares her breast.
Of fragrant scent and virgin white,
A pearl around the locks of night.'

Its beautiful long white flowers in Rohtak are used as an offering to the shrines of certain deities. Its value as a curative in asthma is known both to Europeans and natives, who smoke the seed in their hookahs when so afflicted. The white and purple species are alike used by thieves to stupefy victims, but the white is considered the most efficient. The victims are usually discovered in a state of insensibility, and breathing hard and heavily; if removed, care should be taken not to expose them to the heat of the sun, which is fatal. The action of the poison is quicker in the hot weather than in the cold; much, of course, depends on the individual constitution of the victim. But usually in hot weather it begins to act in five minutes, and coma supervenes within the hour; in cold weather it begins to act in a quarter of an hour or twenty minutes. The seeds are given with sweetmeats, and the effects have been known to continue for two days, and still recovery take place; cold effusion and strong stimulant emetics constitute the most effective treatment. The vision often continues obscured long after the general recovery takes place. This state is best remedied by blisters to the temples or nape of the neck, and by cold effusion. If given while the stomach is empty, a much smaller dose may induce all the preceding symptoms and prove fatal. This is well known to the Indian poisoners, who suit the time of administration according to the purpose they mean to serve.—Powell; Stewart.

DATURA FASTUOSA. Roxb.
Kala dhatura, ENG. Kachu-bong, MALAY.
Purple thorn apple, ENG. Nella umata, MALEH.
Methel seed, ENG. Gaaz-giah, PERS.
Downy thorn apple, ENG. Anolanta, SINGH.
Dhatura, ENG. Vayu umata, TAM.
Rotikubung, MALAY. Nalla ummeta, TEL.

This is very common over both of the Peninsulas of India. It is used in asthma. Both the single and double flowered varieties of this species may be often seen near Burman houses, and children not knowing its poisonous character sometimes eat the fruit, with very serious effects. Its large tulip-shaped white flower is sacred to Mahadeva.—O'Sh.; Roxb.; Gen. Med. Top. p. 133; Cat. Exh. 1862; Mason; J. L. Stewart.

DATURA STRAMONIUM. Linn.
Fuh-kia-rh, Fung-kia-rh, CHIN.; Thorn apple, ENG.
A native of waste places all over Europe. Its narcotic properties have been proved by Lindberger and others to correspond exactly with those of the belladonna and hyoscyamus. The alcholic extract of the seeds is a perfect substitute for belladonna for many of the purposes described under that head.—O'Sh. p. 469.

DATYA, in Hindu mythology, were Brahmans slain by the gods, but were resuscitated by Sukra, their guru, and attacked the gods in Swarga, from which the gods fled in various disguises—Indra as a peacock, Yamuna as a cow, Kuvera a lizard, Agni a pigeon, Nairat a parrot, Varuna a partridge, Vayu a dove, etc. Indra thus lost his heaven; but he afterwards slew Vitr, the
DAVARAJPATNAM.

Datya, and committed the crime of Brahmanicide, for which he had again to leave heaven and depart. This myth seems to be an account of one of the ancient wars between the Aryan Brahmans and a race with whom they came in contact, or a relation of the suppression of the Vedic naturalism.—Cale. Myth. Hind. p. 376.

DAUSUS CAROTA. Linn. Carrot.

Ottoman imperial from Jadhao announced young Mahomedan long. They reckoned as their gods.‘

DAULAT, Arab. Fortune, empire, any monarchy. Daulat-ul-Aliyah-ul-Usmainyiah, the Ottoman Government.

DAULATABAD, a town and fortress in the Hyderabad dominions, in lat. 19° 57' N., and long. 75° 18' E., 10 miles N.W. from Aurangabad. The fortress, also known by the name of Deogiri, has from remote antiquity been a stronghold of the rulers of the Dekhan. At the time of the Mahomedan invasion of the Dekhan in 1294, Deogiri had been in the hands of the Jadhao dynasty since the beginning of the 12th century, and was then the capital of Maharanath. Ahmad-Din suddenly galloped into the town, and announced himself as the advanced guard of the imperial army; the city surrendered, but the Jadhao dynasty was not finally extinguished till A.D. 1812. It received the name of Daulatabad from the emperor Muhammad, son of Tughalaq Shah, who tried to make it the capital of the empire in place of Dehi. See Deogiri.

DAULI, in Cuttack, has two separate local edicts, the remaining edicts corresponding with those at Girnar, in Gujarat. They are in the old Lat character, in Old Pall of the 3d or 4th century b.c., probably b.c. 306? Devanampiya, the young prince of Ujjain, is named ‘the beloved of the gods.’ The king is probably the father of Asoka, who was regent at Ujjain. Both edicts appoint two tupeh or colleges for meditation and the propitiation of Heaven. These edicts repeatedly speak of this world and the world hereafter; and the people are expressly commanded to propitiate Heaven, and to confess and believe in God, who is the worthy object of obedience, or more literally, Him, the Eternal, ye shall propitiate by prayer.

DAUP-YAT, in Amberst, a timber employed for rafters. It is a beautiful, yellowish-white, compact wood, but has a tendency to split. The leaves are used as a dye.—Captain Dance.

DAUR, Hind. A large earthen vessel used by grain-parchers.

DAURAN, amongst the Balute or village officers of the Dekhan, one of the inferior alutes.

DAURANI, a tribe, or nation, inhabiting the tract of country, about 400 miles long, through which runs the road between Herat and Kandahar. Its breadth in the N.W. is about 80 miles, and in the S.E. 150 miles. Their country is bounded on the north by the Paropamisan range, inhabited by Airmaks and Hazaras; on the west and S.W. is Seistan and desert of sand, the desert separating it from Baluchistan; on the south are Shorawak and the hills of Kajhah Amran, which separate it from the Tarin and the Kakars, and on the east they join the Ghilzai. The chain of Kajhah Amran, though not a mountain of the first rank, is high enough to bear snow for three months, and to be cold all the year. It is chiefly inhabited by shepherds, who belong to the Achakzai clan of the Daurnu. They were formerly called the Abdali, till Ahmad Shah, in consequence of a dream of the famous saint at Chumkani, changed it to Daurnu, and took himself the title of Shah Dur-i-Daurnu. Some accounts describe the mountains of Toba as their most ancient abode. More numerous traditions represent them as having descended into the plains of Khurasan from the mountains of Ghor, which belong to the Paropamisan group, but leave it uncertain whether that tract was their original seat, and by what causes their emigration was occasioned. This tribe is divided into two great branches, Zoruc and Panjja; but these divisions are now only of use to distinguish the descent of the different clans. That of Zoruc is reckoned by far the most honourable. From those branches spring nine clans, of which four belong to Zoruc, and five to Panjja:—Zoruc—Popalzai, Alkuzai, Barakzai, Aitkhazai. Panjja—Nurzai, Aidai, Ishakzai, Khugiani.

The whole population of the country number about 600,000, of whom the Daurnu are about one-third. They are largely pastoral. The better sort have their lands cultivated by hired labourers, Buzgar, or slaves, but often put their hand to necessary work. The poorer Daurnu are often Buzar, but seldom labourers, these being chiefly Tajak and Afghun Hamsaya. The pastoral tribes dwell in kisli and black tents, 20 to 25 feet long, and 10 or 12 broad, price about 4£.

DAURI-GOSAVI, Mahir. A Gosain sect who beat the daaru, a small drum.

DAVALLIA, an elegant fern of Moulmein; fructifications in roundish separate spots near the margin. D. parallelis and D. pilosa are of Bengal.

DAVARAJPATNAM, a table-land bounding the Nilgherry to the north.
DAVERSOLABETTA, a peak in lat. 11° 27' N., long. 76° 43' E., in the Neighlighers, two miles north of Ootacamund; 8380 feet above the sea.

DAVID, Fort St. David, a ruined fort, in lat. 11° 44' 20" N., and long. 75° 49' 30" E., 11 miles north of Chidalore, of which it may be said that it is the only seat of the Madras College. Governor was appointed governor of it in 1756. In 1758 the French dismantled the fort, but sufficiently restored it in 1783 to withstand an attack by General Stuart.—Imp. Gaz.

DAVIS, CAPTAIN JOHN, in 1558 made the first of his three voyages to the north-west, and discovered the Strait which bears his name. On the eastern side of this wide sea, improperly termed a strait, he discovered and named what has remained his apppellative, Cape Desolation; and on the western shore, Mount Raleigh, Cape Walsingham, Exeter Sound, and some other places still bear the names he gave them. In his second voyage, in 1586, he examined the coast on the west side of the strait between Cumberland Island and lat. 66° 3' N. In 1587, not discouraged by his want of success, he made a third voyage, and affirmed that he reached lat. 73° N. He examined the coast which he had seen before, gave names to some other places, but made no advance to solve the problem of the north-west passage. The discoveries which he made in his three voyages proved of great commercial importance, since to him more than any preceding or subsequent navigator has the whole fishery been indebted.

He was chief pilot in a Dutch mercantile voyage to the Malay principality of Acheen, the north part of Sumatra, and he wrote the story of this adventure. The two brothers Houtman were chief commanding officers of the Lion and Lioness; but one of them was slain, with a large number of his men, by a sudden and insidious attack from the Malays while feasting on board ship, and the other was taken captive. Both ships were then safely brought back to Holland by Davis, who survived to encounter a similar tragic fate in 1605. He was fifty-five years of age when he thus met with his death, and was on his third voyage to the Straits of Malacca. His second, from February 1601 to September 1603, was in the capacity of pilot-major to the Red Dragon, one of the English East India Company's first squadron of vessels, under Captain Sir James Lancaster. The last voyage, which proved fatal to Davis, was made by him as pilot of the Tiger, a vessel fitted out by Sir Edward Michelborne, who personally commanded, as it appears, without regard to the East India Company's exclusive privileges. Michelborne wrote the report given by Purchas. A gang of Japanese pirates, whose vessel lay alongside the Tiger in a harbour off Patna, not far from Singapore, were imprudently permitted to come aboard for hospitality. Michelborne says that Davis neglected to keep proper guard, or to remove their weapons; however that may have been, they attempted to seize the English ship, and in the fighting Davis and other men were killed.—Sir John Ross, N. W. Passage.

DAVIS, SIR JOHN FRANCIS, author of a General Description of the Empire of China and its Inhabitants; Sketches of China.

DAWA. Hind. Medicine. Dawa-i-Atishak, gentian root. Dawa-i-Mubarak, Clerodendrum siphonanthus. Dawa-i-Pechial, Ophelia elegans. DAWAN. Hind. Threshing the corn by bullocks, attaching six or eight in a row, and driving them round a central pivot over the corn strewn on the floor.

DAWAR, known in old times as the Bilad-ud-dawar, and by the modern inhabitants as Zamind-i-dawar. A large province, contiguous to Rukh-khan, Bast, and Ghor, and the opening of the latter to Seistan. Elphinstone says, on the right bank of the river Helmand lies the rich country of Zamindawar, which has the Paropamisus mountains on the north, and some hills connected with that range are found within its limits. This fine country extends for forty or fifty miles to the west of the Helmand.—Elph. C'bud, p. 122; Reinhard, Mem sur l'Irude, p. 173.

DAWAT, invitation, also exorcism, practised by Mahomedans in India to command the presence of genii and demons; for the protection from evil, casting out of devils, to create eminities, friendships, or love between people, to destroy or injure enemies, detect crimes. These are effected by philters, faeletals or lamp-charms, smoke-charms, amulets.—Herkl.

DAWN.

The first grey luminosity is known as the Subb'i-Kazib, or false dawn, the true dawn being Subb'i-Sadiq. Where false dawns are visible, about two hours before dawn of day, the horizon becomes quite light, and is succeeded by impenetrable darkness. It is chiefly visible about August. An African traveller on the skirts of the Sahara, says he has seen it equally bright, though not equally beautiful, with the Subb'i-Kazib of Persia. It is, in fact, nothing but the zodiacal light, respecting the nature and cause of which crude conjectures only have hitherto been put forward.

'Tis dawn!—at least that earliest dawn
Whose glimpses are again withdrawn,
As if the morn had waked, and then
Shut close her lids of light again.'

The dawn of the Rig Veda is personified as a lovely maiden, under the names,—Arjuni, for whom the Greeks have Argyronyla; Brisaya, Brisisa; Dahanu, Daphne; Usas, Es; Sarama, Helen; Saranya, Erinys.

Pausia, a wicked monster, is said to have tempted Sarama to be unfaithful to India, and among the Greeks Paris tempted Helen.

DAY. Mn., a servant of the English East India Company, who founded Madras in 1639.

DAY. Deputy Surgeon-General Francis Day, a Madras medical officer, who wrote on the fishes of India, Malabar, Cochin, and the British Islands. As Inspector-General of Fishes in India, he examined the rivers and seas from Persian Makran in the west, along two thousand miles of coast eastwards to Singapore; and from 1865 to the present time (1889), in reports to Government, which have all been printed, and in numerous articles to scientific journals, he has contributed to his favourite science an amount of information which no man of science working single-handed has, perhaps, ever before accom-
plished. The more prominent results of his great labours are given in the following volumes:

In 1865, he published his Fishes of Malabar,
1873, Reports on the Sea and the Fresh-water Fish and Fisheries of India and Burma.
1875-1879, Fishes of India.

DAY.

1. Yom, ARAB. Giorno, FR. Divous, CAN. Dia, SP. Jour,
2. Tam, Tag, Ger. Dinam, Herz,
3. Saxon, Roz, Din., HIND, PERS. Ghyun, TURK.
4. a Sp. Tamil.

The remoter times, amongst the Chaldeans, Egyptians, Arabians, Hindus, Greeks, and the nations of northern Europe, there has been a hebdomadary division of the month. In general, the days are commenced by the day of the sun, followed by the moon, and the five planets, Mars, Mercury, Jupiter, Venus, and Saturn.

The following origin of the ancient names has been suggested in connection with astronomical science. The planetary arrangement of Ptolemy was thus:—1. Saturn; 2. Jupiter; 3. Mars; 4. the Sun; 5. Venus; 6. Mercury; 7. the Moon. Each of these planets was supposed to preside successively over each hour of the 24 of each day, in the order above given. In this way Saturn would preside over the first hour of the first day, Jupiter over the second hour, Mars over the third, the Sun over the fourth, and so on. Thus the Sun, presiding over the fourth, eleventh, and eighteenth hours of the first day, would preside over the first hour of the second day; and, carrying on the series, the Moon would preside over the first hour of the third day, Mars over the first hour of the fourth day, Mercury over the first hour of the fifth day, Jupiter over the first hour of the sixth day, and Venus over the first hour of the seventh day. Hence the names of the days yet used in the learned professions throughout Europe.

Four of the present English names of the days of the week are derived from the Saxon. Tiw, Woden, Thor, and Friya were deities of the pagan Saxons. Thor was the god of thunder, as well as the ancient Jove, and Friya a goddess, the wife of Woden.

The Hindus, however, reckon by the light and dark halves of the moon, which they designate kista (or Krishna), paksham, and sakla paksham, though they, too, have a weekly arrangement. In the Rajput names of the day, Sooraj-war, or Adit-war, is Sunday, and the days of the week are from the other planets. Mangala is one of the oldest names of the Hindu Mars, Kumara, to whom the Woden's-day of the North-men, the Mardi of the French, and the Dies Marsi of the Romans, are alike sacred. Mangala also means happy, the reverse of the origin of Mongol, said to mean sad. Vris'hput-pati is he who rides on the bull, the steed or vahan of the Rajput god of war; and Sucra is a cyclop, regent of the planet Venus.

The manner of reckoning the days by the ancient Jews, and which subsists amongst that people at the present time, is to commence the day at a certain hour of the evening, and to finish it on the next evening at the same hour. Thus their Sabbath begins on the afternoon of Friday, and is completed on the afternoon of Saturday. The Roman Catholic Church also commences its festivals in the evening; and this custom is retained in Britain in some of the popular observances, such as the eve of St. John and Christmas eve.

The civil day of Great Britain now commences at 12 o'clock midnight, and lasts till the same hour of the following night. The astronomical day begins at noon, and is counted up to 24 hours, terminating at the succeeding noon. This mode of reckoning the day is that used in the Nautical Almanac, and it sometimes leads to mistakes with persons not familiar with this manner of computation; a little consideration will obviate the difficulty. Thus January 10, fifteen hours, in astronomical time, is January 11, 3 in the morning civil time. In France and most of the states of Europe, as with the British, the hours are counted up to 12 from midnight till noon, and from noon till midnight. In parts of Italy and of Germany, the day is held to commence about sunset, and the hours are counted on till the next sunset. This mode is very inconvenient to travellers, as the noon of the 'Italian hours' at the summer solstice is 16 o'clock, and 19 o'clock at the winter solstice.

The division of the day among Mahomedans is chiefly subservient to the stated time of performing their devotions, and is not generally very accurate. They begin their account at sunset, reckoning twelve hours from thence to sunrise, whether the night be long or short; from sunrise to sunset they also reckon twelve hours, and consequently a night hour is longer in the winter.

From the remotest times, amongst the Chaldeans, Egyptians, Arabians, Hindus, Greeks, and the nations of northern Europe, there has been a hebdomadary division of the month. In general, the days are commenced by the day of the sun, followed by the moon, and the five planets, Mars, Mercury, Jupiter, Venus, and Saturn.

The following origin of the ancient names has been suggested in connection with astronomical science. The planetary arrangement of Ptolemy was thus:—1. Saturn; 2. Jupiter; 3. Mars; 4. the Sun; 5. Venus; 6. Mercury; 7. the Moon. Each of these planets was supposed to preside successively over each hour of the 24 of each day, in the order above given. In this way Saturn would preside over the first hour of the first day, Jupiter over the second hour, Mars over the third, the Sun over the fourth, and so on. Thus the Sun, presiding over the fourth, eleventh, and eighteenth hours of the first day, would preside over the first hour of the second day; and, carrying on the series, the Moon would preside over the first hour of the third day, Mars over the first hour of the fourth day, Mercury over the first hour of the fifth day, Jupiter over the first hour of the sixth day, and Venus over the first hour of the seventh day. Hence the names of the days yet used in the learned professions throughout Europe.

Four of the present English names of the days of the week are derived from the Saxon. Tiw, Woden, Thor, and Friya were deities of the pagan Saxons. Thor was the god of thunder, as well as the ancient Jove, and Friya a goddess, the wife of Woden.

The Hindus, however, reckon by the light and dark halves of the moon, which they designate kista (or Krishna), paksham, and sakla paksham, though they, too, have a weekly arrangement. In the Rajput names of the day, Sooraj-war, or Adit-war, is Sunday, and the days of the week are from the other planets. Mangala is one of the oldest names of the Hindu Mars, Kumara, to whom the Woden's-day of the North-men, the Mardi of the French, and the Dies Marsi of the Romans, are alike sacred. Mangala also means happy, the reverse of the origin of Mongol, said to mean sad. Vris'hput-pati is he who rides on the bull, the steed or vahan of the Rajput god of war; and Sucra is a cyclop, regent of the planet Venus.

The manner of reckoning the days by the ancient Jews, and which subsists amongst that people at the present time, is to commence the day at a certain hour of the evening, and to finish it on the next evening at the same hour. Thus their Sabbath begins on the afternoon of Friday, and is completed on the afternoon of Saturday. The Roman Catholic Church also commences its festivals in the evening; and this custom is retained in Britain in some of the popular observances, such as the eve of St. John and Christmas eve.

The civil day of Great Britain now commences at 12 o'clock midnight, and lasts till the same hour of the following night. The astronomical day begins at noon, and is counted up to 24 hours, terminating at the succeeding noon. This mode of reckoning the day is that used in the Nautical Almanac, and it sometimes leads to mistakes with persons not familiar with this manner of computation; a little consideration will obviate the difficulty. Thus January 10, fifteen hours, in astronomical time, is January 11, 3 in the morning civil time. In France and most of the states of Europe, as with the British, the hours are counted up to 12 from midnight till noon, and from noon till midnight. In parts of Italy and of Germany, the day is held to commence about sunset, and the hours are counted on till the next sunset. This mode is very inconvenient to travellers, as the noon of the 'Italian hours' at the summer solstice is 16 o'clock, and 19 o'clock at the winter solstice.

The division of the day among Mahomedans is chiefly subservient to the stated time of performing their devotions, and is not generally very accurate. They begin their account at sunset, reckoning twelve hours from thence to sunrise, whether the night be long or short; from sunrise to sunset they also reckon twelve hours, and consequently a night hour is longer in the winter.
DAYA.

than an hour of the 'day, and in summer the hours of the day are longer than those of the night. At the equinoxes alone, all the hours are of equal length, and then they coincide with those adopted by the British, French, and Germans, in commencement and duration, differing of course six hours in enumeration, so that six o'clock of Britain is their twelve, seven is their one, etc. At other periods of the year, also, their six o'clock coincides with British twelve, but every other hour differs more or less from those of Britain. The time of sunrise, and consequently the length of the day, being known, the length of each hour will be easily found by division, and the period of any given hour determined. Thus, if the sun rise at 7 o'clock, the length of the day will be ten hours (of 60 minutes each), and that of each hour 50 minutes. One o'clock, Mahomedan reckoning, will then be at 50 minutes after 7; 2 o'clock, 40 minutes after 8; and 3 o'clock will be half past 9; and so on of the others. When the sun sets at 6 o'clock, the first three hours of the day will be completed severally at ten minutes after 6, twenty minutes after 7, and half past 8. In every case 6 o'clock arrives exactly at midnight, which in India is called Do pahar, or the second watch. Mahomedans in India also reckon part of a day for the whole; thus, what they mean by three days, is the day on which an event happens and the two following. The Mahomedans reckon the sidereal day in their time, from sunset to sunset, differing thus from the European civil day, midnight to midnight, or solar day, midnight to midnight.

Though the Gothic and Scandinavian nations have, in the cases of Tuesday, Wednesday, Thursday, and Friday, given the names of Scandinavian deities, Tuisco, Woden, Thor, Friya, to four days of the week, most of the northern nations have preserved the Latin names, as in French—Mardi, Mercredi, Jeudi, Vendredi; Spanish—Martes, Miércoles, Jueves, Viernes; Italian—Martedì, Mercoledì, Giovedì, Venerdì, while for Saturday they have taken the sabbatical word. — Tod's "Rajasthan," i. pp. 232, 595; "Boerings's Siam."

DAYA. SANSK. Gift, donation, inheritance.

DAYA BHAGA, a treaty by Jumuta Vahana on the law of inheritance current in Bengal. The Daya-Krama-Sangraha is by Sri Krishna Tarakankara, and that by Raghunandana Bhatta Charya is called Daya-Tatwa.—Dowson.

DAYAK is the name given to all the wild tribes of Sumatra and Celebes, but is particularly applied to those of Borneo, where they are most numerous; some are wild savages, but others have fixed habitations, large lagoon-like luts containing many families. They are ignorant of any written character. In their wars they clothe in prepared skins, their arms are the sword and spear, and blow-pipe. The Kayan Dayak are idol-worshippers, keep their dead for some days, and inter in a coffin made of the hollow trunk of a tree:—See Dyak.

DAYAL BIRD. Coryphas sulpharis. See Robin.

DAYAMUR, a magnificent peak in the Bara Lahd or Western Himalaya, visible from Ramgar in the Panjab.

DEAD. The remains of the several races in South-Eastern Asia are variously disposed of. One of the most ancient of the races, the Parsee or Guebre, the followers of Zerustush or Zoroaster, expose their dead on a platform in a circular tower. The Buddhist Tibetans allow the dead to be dragged in an unseemly manner to a distance, and then exposed. The dead of the Buddhist Burmese of rank, particularly of the religious Phoungye monk, is laid in honey for a year, and then conveyed with much seeming rejoicing to the burning place, and burned amidst fireworks. The Chinese revere the dead, and make pilgrimages to their ancestors' graves. Their dead are placed in coffins made of great logs of wood, and lodged in chambers above ground in the manner of the ancient Jews. Some of these logs are costly, and it is usual for the rich Chinese to keep their coffins ready for their own use. The Saiva Hindu, the Jangum or Lingadari, the Pariah and non-Aryan races, and the five artisan classes of India, all inter their dead with their faces to the north. The Lingadari artisan dead are seated in the grave facing the north, and in some places are carried to the grave seated on a chair. The Vaishnava Hindu who leave no sons or other heirs build their funerary pyre; and it was not unusual amongst the burning classes of the Rajputs and Hindus of the Mahratta country and Northern India, for their widows to immolate themselves alongside the bodies of their deceased husbands. Amongst the Balinese, the widow and slaves of the deceased great are burned along with the deceased. But with the Vaishnava Hindus, unmarried persons, or such as have died of smallpox or cholera, are buried. The Mahomedan dead are all buried, and visits are paid to their graves. Dr. Livingstone describes the practice of the Balonda of S. Africa to be, to abandon the spot where a favourite wife has died.—Livingstone, Travels. See Burial Ceremonies.

DEADLY NIGHTSHADE, Atropa belladonna, L., a powerful narcotic poison employed in medicine. It is a herbaceous plant of Europe, with solitary squirre-like flowers, and violet-black berries on short stalks, springing from the bases of the rather large ovate leaves.

DEAD SEA, called now Bahr-ul-Lat, or the Sea of Lot, into which the river Jordan disemboques. It is the largest lake in Palestine, being 40 miles long, with an average breadth of 9 miles. It occupies the valley of Siddim, in which were the cities of Sodom, Gomorrah, Admar, Zeboim, and Zoar, which sank by some conversion of nature. It is called the Sea of the Plain, Deut. iii. 17, the Salt Sea in Deut. iii. 17, Josh. xv. 5, from the extremely salt and bitter taste of its waters, which hold 2 lbs. of salt in a gallon; and the East Sea in Ezek. xlvii. 18, Joel ii. 20, from its position with respect to the Judean mountains. Josephus and the Roman writers call it the Lake Asphalitites, from the abundance of bitumen found in it. The more familiar name, the Dead Sea, is in allusion to the ancient tradition, erroneous but generally received, that no animal could exist in its salt and hydrophilic waters. Its surface is 1312 feet below that of the Mediterranean, and in places the water is 1320 feet deep. Hot springs abound near the mouth of the river Jordan. It is 4000 feet below Jerusalem; but the general slope of the intervening district is so regular, that from the spires of the city and the Mount of Olives one can look down directly upon its waters. — Taylor, Saracen, p. 63; Maury's Phys. Geog. p. 186; Robertson's Tr. p. 68.

DEAD SEA APPLES. See Hymenoptera.
DEATH'S HEAD MOTH.

DEATH'S HEAD MOTH, Acherontia satanat. DEB. BENG., URITA. A cognomen appropriate to Brahmins, as Chandradeb.

DEBAI, or Dewal. SIND. An ancient city, celebrated as theemporium of the Indus during the middle ages. It has been supposed to have been the city of Brahmanas, but site now unknown; supposed by Burnes and Burton to be the modern Tatta, which is styled Debal or Dewal (temple) by the Arabs and Persians. Mr. Elphinstone and M. Reinaud point to Kurachee, and Dr. Burnes and Mr. Crow indicate a site between Kurachee and Tatta. Mr. Thomas also gives Kurachee as the ancient Debal. The temple was probably on the promontory now occupied by Fort Manora, and was occupied by a pirate tribe called Tangamura.

—Eliot's Hist. of India.

DEBAR, a celebrated artificial lake in Mewar, 20 miles S.E. of Udaipur (Oodeypore) town, Mewar, 10 or 12 miles N.W. from Chhoand, where Pratap destroyed the army which Akbar had sent under the command of Farid Khan. Debar was formed by Jye Singh in A.D. 1681, raising a dam across the stream escaping from the Debar pool, and he named it Jye-Samudra, the Sea of Victory. It is 8 or 10 miles long, about a mile broad, and 900 feet above the sea. Its northern shore is dotted with picturesque fishing hamlets, and its surface with small wooded islands, adding greatly to the beauty of perhaps one of the largest artificial sheets of water in the world.

DE BARROS, JOAO, and Diego De Conto, two Portuguese writers, who, in concert, gave a history of the Portuguese in Asia. Jaoa de Barros held at Lisbon the office of Custodian of the Records of India. He was a contemporary of Albuquerque. He published three decades, his fourth being posthumous, but in these he celebrated the achievements of Albuquerque, to whom he stood in the same relation as Orme, the British historian, does to the British conqueror Clive. His companion writer was Diego de Conto, and their book was entitled De Asia dos Feitos que as Portugueses fizeram no descubrimiento e conquista das terras e mares do Oriente, Lisbon, 1778. De Barros was born in A.D. 1496, and died in 1570. The first decade of his work was published in 1552, the second in 1553, the third in 1563, and the fourth after his death, in 1777-8.

Tennent; Bikmore.

DEBAR RUMI, thin crimson silk.

DEB PATAN, a village in Gonda district, Oudh, with temples. Lat. 27° 32' 8" N., long. 82° 26' 30" E. Stated to be probably one of the oldest seats of the Saiva form of Hinduism in Northern India. A large religious trading fair, lasting for about ten days, and attended by about 100,000 persons, is held here each year. —Imp. Gaz.

DEBKI, BENG., a dance of the Arabs resembling in some respects that of the Albanians, and those who perform in it are scarcely less vehement in their gestures, or less extravagant in their excitement, than those wild mountaineers. They form a circle, holding one another by the hand, and, moving slowly round at first, go through a shuffling step with their feet, twisting their bodies into various attitudes. As the music quickens, their movements are more active; they stamp with their feet, shout their war-cry, and jump as they hurry round the musicians. The motions of the women are not without grace; but, as they wrap themselves in their coarse cloths before they join in the dance, their forms, which the simple Arab shirt so well displays, are entirely concealed.—Layard, Nineveh, p. 119; Baron de Bode's Travels.

DE BODE. Baron C. A. de Bode, a traveller in the lands of Southern Persia, Luristan, and Arabistan.

DE BOIGNE. Benoit de Boigne, born 8th March 1751, at Chambers. He was the son of a furrier, and he joined the Irish Brigade in 1768 as an ensign. After a short service, he entered the Russian army, but, quitting that, after several misfortunes, he landed at Madras in 1777. He entered the 6th M.N.I. as an ensign, which he soon after quitted. In 1784 he took service with Madhaji Sindia, and shared in the battles of 1787, 1788. He then left, but again entered Sindia's service.

DEB-RAJA, the temporal ruler of the Bhot, from Deo, the deity.

DEBRA TABOR, a town in Ambara in Abyssinia, formerly a small village. It was afterwards a place of considerable size, and the residence of the emperor Theodore.

DEBRÈGAESIA EDULIS. Weidell. The Janatis-itsigo or Teon-itsigo of Japan, is a bush with edible berries, and a fibre valuable for textile fabrics. D. dichotoma occurs in Java, and D. hypoleuca, D. velutina, and D. wallachiana ascend the Himalayas for several thousand feet. —F. von Mueller.

DE BRITO. Philip de Brito y Nicote, surnamed Chango, i.e. Good Man, a Portuguese adventurer, who, about A.D. 1600, aided Shimi Shah, king of Arakan. He got possession of Syrian, and became virtually sovereign of Pegu, and conquered the neighbouring kingdom of Tenmghoo, reducing its king to vassalage. At last, meeting with reverses, he was betrayed to the king of Ava, A.D. 1613, who imprisoned him on a hill over-looking Syriam, for a fortnight, after two days of great agony. His wife, a Goanese lady, Donna Louise de Salinha, with other captives, was carried to Ava, and their descendants are still distinguishable.

DEBROOGHUR, the chief station of Lakhipmur in Assam. From Debrooghur as far as Gowhtee in Lower Assam, there are immense tracts of land on both sides of the Berhamputter, suitable for tea cultivation.

DEBURAH. Hen. In the Hebrew Scriptures are several Hebrew words which in the English version have been translated Fly, viz. Oreb, Zebub, Deburreah, Tair, Sarabin, Bak, Cimmim. The Orov or Orob, Hen., a swarm or assemblage, is translated in Psalm cv. 31, swarms of flies; but Exodus vii. 31, also Psalm lxxxv. 45, is supposed to allude to the mosquito. The Hebrew Zonen or Ecclesiastes x. 1 and Isaiah viii. 18 is not known. Flies are undoubtedly very troublesome at some seasons in tropical Asia, but an infusion of quassia sweetened with sugar, on a plate, destroys them. See Fly.

DECAISNEA, sp., a very remarkable plant, which Dr. Hooker saw in flower in the Lachen valley, and called Loodoma by the Bhutia, and Nomorchi by the Lepcha. It grew on the ridge near Tumloong and the Ryot valley at 7000 feet; it bears a yellow fruit like short cucumbers, full

DECIUS. Ephesus,

the chief town of Ionia, in
Asia Minor, 46 miles south of Smyrna, was famous
for its temple of Diana ; and amongst the Mahomedans of the East, its Btory of the seven sleepers
is cuntiuucd, through the Koran.
The legend is
that when the emperor Decius persecuted the
Christians, seven noble youths concealed themselves in a cjivern, which was then blocked up
with stones. They immediately fell into a deep
slumber, which lasted for 187 years. At last the
slaves of Adolius removed some of the stones for
building materials, on which the seven sleepers
were aroused, and despatched Jamblichus, one of
their nmnber, to the city, to procure food, on which
the altered appearance of Ephesus, the age of the
coin he present<?d to the baker, and his long beard,
led to a discovery of the marvellous occurrence.
The bishop of Ephesus, the clergy and magistrates,
visited the cavern, and, after conversing with the
somnambulists, they quietly expired. James, a
Syrian bishop of the fifth century, devotes a homily
to its praise
and the story of the seven sleepers
is found in the Roman, Abyssinian, and Russian
calendars.
Mahomed introduced the tale in his
Koran, as the Companions of the Cave, and says
God caused them to turn over occasionally from
right to left to preserve their health.
Afilner's
Seven Churches, p. 171 Salens Koran, p. 219.
DECOITS are gangs associated for the purpose
of plunder, who assemble by night, fall on an
unsuspecting village, and kill those who offer
resistance.
Elph. India, p. 377. See Daka.
DE CONTO. Diego de Conto, an officer of
the Portuguese, who served in India, and died at
Goa, 1600. He brought down from 1539, to his
own time, the history of the Portuguese in India,
commenced by De Barros.
The joint history
consists of 24 vols. 8vo.
Sec De Barros.
DEDH, a race in Cutch, who are tanners, and
who B2)eak a dialect of the Cutchi. The word
seems a modification of Dher.
Hind. Alluvial soil,
or Dewara.
or an island formed in the bed of a river.

DEG.

Hind.

Steel filings, used in firework-


making. A large copper caldron or globular vessel, a cooking pot. Deg-cha, a small pot.

DEHEL, pronounced Dehnegi. The supreme god in Fiji, and known in the other groups as Tangaroa or Ta'a-rona, Tanga being his proper name, Rang an adjective signifying the far-renowned, perhaps also the most high. To him is attributed the creation and government of the world; and there are no images of him, nor of any of the minor gods, collectively termed Kalou. His sway was everywhere acknowledged by the natives, and no attempts were ever made to elevate any local gods above him. Bare-Kalon is the temple.—*Galton's Vacation Tourists*, p. 266.

DEHGA CHUR. Bassa Islands formed by deposit of the alluvial soil brought down by the Ganges, Brahmaputra, and Moga rivers. So soon as they emerge from the water and cease to be overflowed by the tide, contracts are made for the land at a nominal rent. When bushes and grass appear, wild men, speaking a barbarous patois, come down to pasture large herds of cattle on the young herbage, putting up sheds for the beasts, but themselves bivouacking in the open. They pay grazing rent to the contractor of the island, and rent for cutting fuel. As the land becomes settled, contractors are ready to cultivate, and at length settle on it. They dig large tanks for fresh water, and raise high mounds for the foundations of their homesteads in the low country, which is intersected by numerous water-courses, and plant them round with betel, coconut, and date palms, plantains, and other plants.—*Geo. Mag.* June 1877.

DEH. Peers. A village; hence Dehgan, a villager, a cultivator. Dehi, pertaining to a village. Dehat, villages. Dehkan, a villager or cultivator.—*Wilu*.

DE HAVILLAND. Colonel Thomas Flott de Havilland, eldest son of Sir Peter de Havilland of Guernsey, born 1776. He received a cadetship for the Madras Infantry at the age of sixteen, but on the formation of the corps of Engineers he obtained a lieutenant's commission. He was present at the taking of Seringapatam as field engineer, was taken prisoner by the French at sea, but was soon released, and remained with his corps till 1812; then returned to Guernsey, and built Jersey barracks. Having returned to Madras, he planned and constructed the Mount road, built St. George's Church, now the Cathedral; also St. Andrew's Church, or the Scotch Kirk, which was long considered the perfection of architecture in Madras, and of which the steeple is still the tallest piece of masonry and its dome the finest in that city. He constructed the North Bench road as a bulwark against the encroachments of the sea, which then threatened to submerge the whole of Black Town.

DEHGAN or Deggan, a supposed Aryan tribe, once spread over Afghanistan, but latterly in the Kunair valley. Elphinstone says they are distinct from the Hindis, and must not be confounded with the Tajiks, whom the Afghans sometimes call Deggan, by corruption from Dehkan, a husbandman. The Deggans speak the language which is mentioned under the name of Lughmanee in the Commentaries of Baker, the Ain-i-Akbari, and other books. The language seems to be composed of Sanskrit and modern Persian, with some words of Pushtu, and a very large mixture of some unknown root. The greater part of the words, however, are Sanskrit.

DEHILI. A city of Hindustan, built on the right bank of the Jumna, in lat. 28° 39' N., and long. 77° 18' E., and 800 feet above the sea. It gives its name to a revenue district under the Lieutenant-Governor of the Panjab. The whole country, for some 10 or 12 miles around the modern Dehili, is covered with the debris of ruined cities, which extend over an estimated area of 45 sq. miles. About fifteen centuries before the Christian era, the town of Indraprastha was in existence on the Jumna, in the vicinity of the site occupied by the modern Dehili. For the site of the first pass or boundary viz. Panipat, Soanpat, Indrapat, Tilpat, and Baghpata, which Dhirotarashtra gave to the Pandu. Now, however, Purana Killa and the Negumbod ghat on the Jumna are the only places which can be pointed to as probably connected with the ancient Indraprastha, and the ghat seems to have been a sacred place of pilgrimage even before the Pandu family settled there. The people still call Purana Killa, Indrapat, though Humayun-new-named it Din-Panah, and Sher Shah styled it Sherghar. Thirty princes of the line of Yudishtira succeeded him on the throne, but only their names are known; and the last of them was Kashemaka, who was murdered by his minister Viserva, whose line of fourteen princes held sway for five hundred years. The last of the Mauryas was slain by the rajah Kema-youn, styled Sasaditya, or chief of the Saka, who subsequently fell before Vikramaditya, and Avanti or Ujjan became the capital. Dehili was then in existence, because Vikramaditya was described as possessing it.—Dilli-pat-kahayo became king of Dehili. Ancient Dehili was 5 miles distant from Indraprastha, on a rocky hill to the S.W., and 11 miles from the modern Dehili. It is surmised that on the removal of the capital to Ujjan, the cities in that locality lay waste and desolate for eight centuries. Fa Hian, A.D. 400, and after him Hiwen Thang, who travelled in the 8th century (A.D. 750), make no mention of Dehili, nor is it mentioned in the time of Mahmud, who sacked and plundered both Muttura and Thanesar. In A.D. 1052, however, Anangpal rebuilt it.

In A.D. 1191, Prihij-raj utterly routed Maha-
med Gori at Tiruri, 14 miles from Thanesar, and compelled him to recross the Indus. But in 1193 Mahmud re-entered Hindustan with a mixed Turk, Tartar, and Afghan army, defeated the Hindu princes, murdered the king of Dehili, took Ajmir, and returned to Ghazni. From that time until the early years of the 19th century, ending in the mutiny of the Bengal army and the rebellion of the northern people in 1857, Dehili continued in the possession of successive rulers of different races,—Turk, Moghul, Persian, Afghan,—but all following Mahomedanism.

For nearly a hundred years, however, the nominal ruler had been merely titular. The emperor Shah Alam entered Dehili a prisoner with the Mahrattas on 22d December 1771. He con-
menced a mere state prisoner in their hands till 1803, when he was released by Lord Lake. All the territories and resources assigned for his use were continued to him, and a pecuniary provision was granted in addition, fixed at Rs. 60,000, but afterwards increased to Rs. 1,00,000 a month. Shah Alam died on
DEHLI.

the 19th November 1806, and was succeeded by Akbar Shah, who was succeeded in 1837 by his eldest son, Bahadur Shah. He was restricted to the neighbourhood of Dehli, he was not allowed to confer titles or to issue a currency, but he had the control of civil and criminal justice within the palace. When the mutiny of 1857 broke out, the mutineers in Dehli took possession of the town, fort, and stores, and applied to the king. Bahadur Shah's conduct was vacillating, but he subsequently identified himself with the rebel cause. After the fall of Dehli on the 29th September 1857, he was captured, and tried on the charges of—1st. Aiding and abetting the mutiny of British troops; 2d. Encouraging and assisting divers persons in waging war against the British Government; 3d. Assuming the sovereignty of India; 4th. Causing and being accessory to the murder of Christians. He was convicted on each charge on the 9th December 1858, and sent to Rangoon, where he died in 1862; and thus, after nearly five centuries of sovereign power, the Timurides ceased to reign. The prospect of sovereignty was short-lived. The Dehli massacre of Europeans occurred on the 11th May 1857. Dehli was assaulted on the 14th September 1857. From the 14th to the 17th of September, the Church, the Cutcherry, the College, the Kotwali, the Magazine, and the Dehli Bank House were one after the other carried and recovered. On the 18th, the line of communication between the Magazine and the Kâbul gate was completed. On the 19th, the Burn bastion, near the Lahore gate, was taken possession of by a surprise. This bastion is so called from Colonel Burn, who with a handful of men made a most memorable defence of Dehli in 1804, against an overwhelming army of Holkar, and the cannonade of 180 guns. Sir D. Ochterlony, then Resident, wrote of this defence, that it cannot but reflect the greatest honour on the discipline, courage, and fortitude of British troops in the eyes of all Hindustan, to observe that with a small force they sustained a siege of nine days, repelled an assault, and defended a city 10 miles in circumference, which had ever before been given up at the first appearance of an enemy at its gates. The 20th of September was the day of the final recapture of Dehli. On that day the imperial palace was entered and found deserted. The main picket of the British forces was at the house of Hindu Rao, on the top of the ridge that is to the north-west of the city. The chief efforts of the rebels were directed against this post of the besiegers. From the 8th of June 1857, until the fall of Dehli, it had to sustain twenty-six attacks. On the 14th of September, the attacking force for the taking of the city was divided into four columns, with a reserve. The party fixed upon to blow open the Kashmir gate consisted of Lieutenants Salkeld and Home, Sergeants Carmichael, Burgess, and Smith, bugler Hawthorne, who accompanied the party to sound the advance when the gate was blown in, and eight native sappers under Havildar Madhu, to carry the bags of powder.

Muhammad of Ghor found Dehli occupied by the Tomara clan, Ajmir by the Chauhans, and Kanauj by the Rajtars. These Rajput states formed the natural breakwaters against invaders from the north-west. But their feats are said to have left to the king of Dehli and Ajmir, then united under one Chauhan overlord, only 64 of his 108 warrior chiefs; and when, in 1193, the Afghans again swept down on the Panjab, Prithi-raj, of Dehli and Ajmir, was defeated and slain. His heroic princess burned herself on his funeral pile. Muhammad of Ghor having occupied Dehli, pressed on to Ajmir, and in 1194 overthrew the rival Hindu monarch of Kanauj, whose body was identified on the field of battle by his false teeth. The brave Râhtor Rajput's of Kanauj, with other of the Rajput clans in Northern India, quitted their homes in large bodies rather than submit to the stranger. They migrated to the regions bordering on the eastern desert of the Indus, and there founded the military kingdoms which bear their name, Rajputana, to this day. Since then Dehli was burned by Timur, 1398; occupied by Baber, 1526; sacked by Nadir, 1739; taken by Maharrattas, 1758; taken by British, 12th September 1803; and again recovered by British, 20th September 1857.

Dehli town in 1868 had a population of 154,417. Dehli district population, in an area of 1274 square miles, comprised Hindus, 438,886; Mahomedans, 130,645; Sikhs, 560; and others, 38,739, the total population being 608,850. Jats number 107,856, of remarkably industrious habits, agricultural skill, and promptitude in the payment of revenue. North of Dehli the greater part of the land is in their possession, though they often share their villages with Brahman coparceners. Gujars (22,164) are pastoral and semi-nomade, in the hilly plateau of the south. They are addicted to cattle-lifting and thieving. The other tribes comprise 14,109 Ahirs, 10,677 Rajputs, 10,776 Puthans, and 8892 Sayyas. Akbar and Jahangir usually resided at Agra, Lahore, or Ajmir; and Dehli again languished in disfavour, till the reign of Shah Jahan. This emperor rebuilt the city in its present form, surrounding it with the existing fortifications, and adding the title of Shah-jahanabad, from his own name. He also built the Jama Masjid, and reopened the Western Jumna Canal. Dehli is still enclosed on three sides by the lofty wall of solid stone, constructed by the emperor Shah Jahan, and subsequently strengthened by the British, at the beginning of the 19th century, with a ditch and glacis. The eastern side, where the city extends to the river bank, has no wall, but the high bank is faced with masonry. There are many architectural remains. In Purana Killa is the Keelar Kona mosque, which was commenced by Humayun, and finished by Sher Shah. It has five horseshoe arches, decorated with blue tiles and mosaic. Some of them have been noticed under architecture.

The Palace of Shah Jahan—now the fort—measures 1600 feet east and west by 3200 north and south, exclusive of the gateways. Diwan-i-Khas, or Private Audience Hall (the most ornamented of all Shah Jahan's buildings), overhangs the river; nothing can exceed the delicacy of its inlaid work or the poetry of its design. A little to the south of the Chandni Chauk is the Jama Masjid, standing out boldly from a small rocky rising ground. It was built by Shah Jahan between the fourth and tenth years of his reign, and is one of the finest buildings of its kind in India.
The Kahl Masjid, supposed to have been built by one of the early Afghan sovereigns, and the mosque of Ioshan-ud-Daula, merit notice.

To the west, beyond the walls, is a little chapel in honour of a Muslim saint, Nizam-ud-Din, near whose shrine members of the late imperial family, up to the time of the mutiny, were buried, each in his own little enclosure, surrounded by very elegant lattice-work of white marble.

Iron Pillar.—The earliest authentic information regarding the city is derived from the iron pillar of Raja Dhava, set up in the 3d or 4th century B.C. (519). It consists of a solid shaft of metal, 16 inches in diameter, and about 50 feet in length, but less than half its height appears above the ground. A Sanskrit inscription, deeply cut on its western face, records the story of its origin. Mr. James Prinsep, the first decipherer of the legend, found that it commemorated the prowess of Raja Dhava, who obtained with his own arm an undivided sovereignty on the earth for a long period; while the letters appear to be 'the typical cuts inflicted on his enemies by his sword, writing his immortal fame.' It is the arm of fame (Kirti Bhusha) of Raja Dhava. There is another inscription on it, which has given rise to a tradition that attributes the erection of the pillar to Anang Pal, founder of the Tuar dynasty in the 5th century A.D. Anang Pal II. made Dehli the Tuar metropolis, surrounding it with a massive line of fortifications, whose ruins are still believed to exist in the great circle of a masonry lying around the Kutub Minar. The date of this restoration has been preserved by a second inscription cut into the more ancient pillar of Raja Dhava: In Sambat 1109 (1052 A.D.), 'Anang Pal peopled Dehli.' Just a century later, under the reign of a third Anang Pal, last of the Tuar line, Dehli fell before Visaldeva or Bisaldeo, Chauhan ruler of Ajmir. The conqueror permitted the vanquished raja to retain possession as a vassal; and from a marriage between the two houses sprang the celebrated Prithi-raj, the last champion of Hindu independence in Upper India, who thus succeeded to the joint realms of the Tuars and the Chauhans. Prithi-raj further strengthened the defences of the city by an exterior wall, which ran round the fortifications of Anang Pal, and of which remains may still be traced for a considerable distance. In 1191, Shahab-ud-Din made his first invasion of Upper India. As above mentioned, the Rajput ruler Prithi-raj successfully defended his kingdom for the time; but two years later the Mahomedan invaders returned, utterly overthrew the Hindus in a great battle, and put their prince to death in cold blood. Kutub-ud-Din, the Sultan's viceroy, attacked and took Dehli, which became thenceforward the Mahomedan capital. On the death of Shahab-ud-Din in 1206, the viceroy became an independent sovereign, and founder of the Slave dynasty, to whom old Delhi owes most of its greatest ruins.

Kutub-ud-Din's Mosque, according to the inscription on its entrance archway, commenced immediately after the capture of the city in 1193. It was completed in three years, and enlarged during the reign of Altamash, son-in-law of the founder. Eleven magnificent arches close its western façade, Mahomedan in outline and design, but carried out in detail by Hindu workmen, as the intricate lasework which covers every portion of the arcade sufficiently bears witness. Ibn Batuta, who saw the mosque about 150 years after its erection, describes it as unequalled either for beauty or extent.

The Kutub Minar, another celebrated monument of the great Slave king, stands in the S.E. corner of the outer courtyard. It rises to a height of 238 feet 1 inch, tapering gracefully from a diameter of 47 feet at the base to nearly 9 feet at the summit. The shaft consists of five stories, enclosing a spiral stair-case, and is crowned by a now broken cupola, which fell during an earthquake in 1803. The original purpose of the minaret was doubtless as a mausoleum's tower, whence the Assan summons to prayer might be heard throughout the whole city. The site chosen for the mosque was that already occupied by Raja Dhava's pillar, which forms the central monument of the inner courtyard. Around, in every direction, spreads a heap of splendid ruins, the most striking of which is the unfinished minaret of Ala-ud-Din, commenced in 1311. The Slave dynasty retained the sovereignty till 1288, when Jalal-ud-Din founded a new line.

Firoz Shah Tughlaq removed the site of Delhi to a new town, Firozabad, which appears to have occupied the ground between the tomb of Humayun and the ridge. Amid the ruins of this prince's palace, just outside the modern south gate, stands one of Asoka's pillars, erected in the 3d century B.C. This monolith, 42 feet in height, known as Firoz Shah's lathi or club, contains a Pali inscription, which was deciphered by Mr. James Prinsep. It is supposed to have been brought from Shrughna, in A.D. 1556, by Firoz Shah on a truck to Khirzabad, and thence, by water to Dehli, then called Firozabad, and set up in the courtyard of the palace of Firoz. Its head is now bare; but so late as A.D. 1611, when William Finch was there, it had a golden pinnacle, which gave it the name of Minar-i-Zamin, or golden minaret. It is a single shaft of pale-pink sandstone, and, like all Asoka's pillars, is 42 feet 7 inches high, of which the upper 35 feet are very highly polished.

In 1526, Baber, the sixth in descent from Timur, was the founder of the dynasty which lasted till 1567. He marched into India with a small force, overthrew Ibrahim Lodi, the last Afghan ruler, at Panipat, and entered Dehli in May of the same year. His son for a time was driven from India, but in 1555 Humayun regained his throne. He died within six months of his restoration. His tomb forms one of the most striking architectural monuments in the neighbourhood. Its white marble dome is a conspicuous object for miles around. It cost fifteen lakhs of rupees, and was erected by his widow, Hamida Banu, who is also interred near.

Bhoot Khan近距离。—In Prithi-raj's capital were twenty-seven Hindu temples, of which several hundreds of richly-carved pillars still remain, to attest both the taste and the wealth of the last Hindu rulers of Delhi. The Bhoot Khan is a colonnaded courtyard, the materials of which were obtained from the demolition of the Hindu temples.

The Alai Durawaz, built by Ala-ud-Din, A.H. 710, A.D. 1310, is a beautiful specimen of Pathan architecture.

Roushan Charagh, built by Firoz Shah as a shrine to the memory of a famous saint, is at the S.W. corner of Siri or Shabpur.
DEHRA.

The fortifications of Tughlaqabad form a stupendous structure.

The Shalimar gardens were made by the emperor Shah Jahan at a cost of a krur of rupees. The Zinat Masjid, called also the Kunna Masjid, was built by Zinat-un-Nissa, the spinster daughter of Aurangzeb.—Imp. Gaz. See Architecture.

DEHLA, a small town in the N.W. Provinces of British India, in lat. 30° 19' 29" N., long. 78° 5' 57" E., 2300 feet above the sea, with 7316 inhabitants. It is the principal station of the Dehra Doon revenue district, of 1091 sq. miles, with 116,945 inhabitants. The district consists of the double valley of Dehra proper, and the outlying mountain tract of Jaunsar Bawar. To the S. are the Siwalk Hills, a mass of Himalayan debris. It is cut off from the Doab of the Ganges and Jamna by the Siwalk Hills. It has been largely occupied with tea plantations, and many Europeans reside in the town of Dehra. Dehra seems a corruption of Darrah or Tarai, a valley, or, amongst the Maharrat, Therrhi, as Bhuna therrhi, seen therrhi. The Ganges, passing between this district and Garhwal, pours rapidly over beds of boulder, through several channels, encircling jungle-clad islets, and debouches at length upon the plains of Hardwar. The Jamna sweeps round the whole south-western boundary, and reaches the level uplands near Baidhah Mahal, in Saharanpur district, an ancient hunting seat of the Dehil emperors. The Brahmanas (10,279) and Rajputs (33,125) are each divided into the mountain and the lowland clans. The hillland Brahmanas will eat any kind of meat except beef.

The Mehra race inhabit the remoter portions of the eastern Doon, inferior both in physique and intelligence, and timidly averse to intercourse with strangers. The Dorn or Bhuma have dingy black skins and woolly hair; they form the servile class, only just emancipated from actual slavery under the rule.

DEHLA GHAZI KHAN, a town and a district in the Dehraghat division of the Panjab. The town is on a low alluvial tract, 4 miles from the right or west bank of the Indus, in lat. 30° 3' 47" N., and long. 70° 49' 8" E. It commands important routes and the navigation of the Indus. It leads to the commercial towns of Multan and Bahawulpur, which adjoin it, and is about equidistant from Amritsar and the opulent town of Shikarpur in Sind. The district has an area of 4740 square miles, and in 1868 had 308,840 inhabitants, viz. 38,467 Hindus, 264,527 Mahomedans, and 1124 Sikhs. The plain tribes are the Kootkani, Lund, and Dreshuk, all of them well conducted. Their lands are classed as Pachad, or lands irrigated by hill streams, and Sind, or lands within the influence of the river. The latter class has enormously increased. The soil is a tenacious clay, fertile if well irrigated, but almost entirely sterile if without water. The canals have been greatly extended, partly by the chiefs of the Baluch clans, and partly by the Government. The geographical boundary between the Pathan and Baluch races in the hills nearly corresponds with the northern limit of the district, and it naturally follows that the Baluchis are more numerous in Dehra Ghazi Khan than in any other portion of the Panjab. Each clan owes allegiance to a feudatory chief or tundar.

DEHLA ISMAIL KHAN, a town and a revenue district in the Dehraghat division of the Panjab, the town being built on the right or west bank of the Indus, in lat. 31° 50' N., and long. 70° 55' 44" E. In 1868 the town had 24,906 inhabitants, a third part Hindus. The population of the district in 1868 was 394,864 souls,—338,387 Musalmans, 48,756 Hindus, 1587 Sikhs, and 6134 others. Amongst the Hindus, the Arora numbered 42,087; they comprise the principal trading classes, a few wealthy families being found in the larger towns, the majority being petty dealers in corn or money throughout the country villages. Dehra Ismail Khan is the market town of the Lohani merchants. It is subject to alteration from the inundations of the river, which on one occasion swept away the entire town. It is nearer to the great commercial city of Amritsar than any of the other places on the Indus, and lies on the road between it and Kabul. It is one of the eligible commercial sites on the Indus. It yields iron, coal, and sulphar.

—Bengal As. Trans. vii. 259; P. of E. of India (Cabl and Afghanistan); Imp. Gaz.

DEHRJAT, a revenue division of the Panjab, lying between lat. 28° 27' and 33° 15' N., and long. 69° 35' and 72° 2' E.; area, 15,007 square miles, and population 991,251 in 1868. It comprises the districts of Dehra Ghazi Khan, Dehra Ismail Khan, and Bunnun. It is on the right bank of the Indus, below the Salt Range, and to the point where that river is joined by the waters of the Panjab. It comprises about two-thirds of the narrow strip of land which lies between the Indus and the Sulman mountains, and extends from the hills and valleys of the Kohat district to the Sind frontier. The lower part bears the local name of Sind from bordering on the Indus, and the upper that of Daman, or skirt, from its bordering on the Sulman mountains. The country is flat and in many places fertile, but to the westward of the river there are no wells. A fringe of cultivation and jungle extends along the bank of the great river, and terraces, as you advance into the interior, in a flat desert country, where a precarious supply of water from the hills affords a poor cultivation in the vicinity of the thinly scattered villages. The Tank chief is a Pathan of good family. The nawab of Dehra Ismail Khan belongs to the formerly Sadozai race. South of Dehra Ismail Khan lies the large tract of Dehra Ghazi Khan, which extends as far west as the mountains and along the Indus to Sind. Its principal chiefs usually behaved well, even at times when their brethren of the hills were in a state of hostility against British subjects. The plain tribes are the Nutkan, Lund, and Dreshuk; all of them well conducted; they had a certain number of fighting men, but they were long victimized by the Bozdar and Gureghan.

The Dehra Ghazi Khan district has the Dreshuk and Maziari. Adjoining the frontier of Dehra Ghazi Khan district are the Khurtran, Kasa, Laghari, Gureghan, Murri, and Bugti. Dehra Ismail Khan district, Bunnunesh, Murwali, Butani chiefs of Tank, chiefs of Kohlae, chiefs of Dehra Ismail Khan, Notkani, Lund.

Adjoining frontier of Dehra Ismail Khan district are Sioeonani, Osterani, Kusranii, Bozdar.

Adjoining frontier of Kohat district, Buozati, Sipah, Orakzai, Zymoosith Afghans, Turi.

Adjoining frontier of Kohat and Dehra Ismail Khan district, Waziri.

907
The tribes, from north to south, of the Dehrajat frontier come in the following order:—

Pathan tribes—Balouchi—Kusrani. 
Utmanzai, \[\ldots\] Boddar. 
Mahrud, \[\ldots\] Laglihari. 
Usternah.

—Papers, East India (Calcut and Afghanistan), 1859; Elphinston's Cambal; The Deراجat, or Hist. of the Panjab; Aitchson's Treaties.

DEHWAL, in Central Oudh, a village official who performs some duties for the cultivators. He also sets up the holi, a stem of the castor-oil plant, and five pieces of cow-dung fuel, on the Baktan Panchani.

DEHWAL, Pers. A village, a farmer. The Tajak race on the northern borders of Afghanistan are called Dehgan. The Dehwar residing with the Babi, at Kalat, are supposed to be descendants of Tajak from Bakh. They are an agricultural, hard-working, poor people, who dwell in villages, and do not migrate. Their language is nearly pure Persian.—Dr. Cooke in Bo. Med. Trans., 1860.

DEHWAL, also written Dewar and Dechwar, in Northern India, the village deity, the deity under whose care the village is placed; the genius loci, to whom, at each harvest, a portion of grain is set apart. The corresponding term in the north-west is Thanapati, the lord of the place; in Bundelkhand, Gran deota or Gran-deva. In Saugor the deity is styled Miroya, from the fact of his being the guardian of boundaries. The Dehwar is also very commonly, and even where these local names prevail, styled Bhoomia, from Bhoom, land. The occupation of the Dehwar is very much like that of the Roman Lareus rurales, 'qui compita servavit,' Et vigilant nostra semper in urbe Larese.

The Dehwar deities have various local names, such as Kutesuree, Burnaiuch, Humwut, Bhoon Sen, Chunwar, Cashenath, Munsa Ram, Humdour, Rutnou, Huree Ram, Jakhrhound Esoor, Kall Sen, Bisharce; oftentimes they are the spirits of good men, of Brahmins or village heroes, but who, when they become objects of worship, come to be generally considered very malicious devils; and oftimes they are nothing but mere epithets of the Dii majores. In some places their images are of male, in others of female, figures. In many places the villagers, for fear of misrepresenting their Gramma deota, erect a stone without form or feature, like the si Deo si Deo of the Romans, which ambiguous expression was addresssed to their tutelary gods, to obviate all chance of mistake. The worship of these village gods is fixed to no stated day. In some places it occurs on the 14th of every month; in others, on the full moon of Cheet; at others, on the full moon of Katik, and so on. The unslipped stone or log of wood is a common form of the village deity of the Peninsula, but Hanuman is a frequent form between the Nerbadda and the Khas rivers; and to the south is the Aai, the Amun or Ama, or some defined hero, or a shapeless stone from the bed of a river. These Dehwar or Gramma deota are ante-Brahmanical; and with respect to the gods of the south of India there are many circumstances of their worship which are not of Hindu origin.—Elliot, quoting Bombay Literary Trans-
spurs from the western range attain to 6000 and 8000 feet above the level of the sea. The Western Ghats, on the side next the sea, at places sink precipitously to the level belt below. The Eastern Ghats do not fall so abruptly; but both ranges are covered with thick forests, through which a few passes lead from the coasts into the interior of the country, which is upraised by the mountains into table-lands from 1200 to 3000 feet above the sea, the general declivity of the land being from west to east. The Bombay and Madras armies are distributed over the Dekhan and branch out to adjoining provinces. Thus the Bombay Presidency has its troops in Gujerat, Cutch, and Sind on the north-west of the Peninsula; and the Madras troops hold British Burra, Mysore, Travanore, and Cochin. Though Dekhan signifies the south, as Poorub does the east, when applied to Bengal and its dependencies, at the present day the term is generally restricted to the Hyderabad and Dowlatabad provinces lying between Berar and the Kistna, and from the Syhadri or Western Ghats eastwards to Telingana. The Hindus and British in Northern India, however, make the Dekhan more extensive, and regard it as including all the southern table-land, supported as it were by a triangle formed by the Satpura or sub-Vindhya on the N., the Syaduri or Western Ghats on the west, and the Eastern Ghats on the east, the Satpura range constituting the base of the triangle. The length from the Satpura range to Salem, and breadth from Mahableshwar to Siruga, are about 80 miles. At Nagpur, its southern extremity, it is said to be 200 miles in breadth, and its length is estimated as far as Ghatempur. It is generally supposed that the Dekhan may be said to extend nearly 250 miles further in a N.E. direction, or about 950 miles in all. Its highest parts are those nearest the Western Ghats, and in the centre of Mysore. Mahableshwar, in lat. 18° N., and long. 76° 30' E., is 4700 feet; the source of Kistna, 4500 feet; source of Godavery, 3000 feet; Poona, 1823 feet; source of Manjena, 3019 feet; and the rivers rising in ravines between spurs of the Western Ghats, wind their way through Eastern Ghats across the Dekhan, the slope being in that direction. The plains of Nagpur, 1000 feet, slope to S.E., drained by Wain-Ganga, which falls into the Godavery. Hyderabad is 1800 feet; Secunderabad, in lat. 17° 26' N., lat. 78° 33' E., is 1837 feet. Beider, in lat. 17° 58' N., long. 77° 36' E., is 2550 feet. From the Wain-Ganga the surface rises towards N.E., where Ryipur, lat 21° 13' N., long. 81° 40' E., is 1747 feet; source of the Mul, 2111 feet. UmbDITION.-Mineral, in Mysore, 4806 feet, slope from hence on all sides, to Bangalore, 3000 feet; to plains of Carnatic-Chitooor, 1100 feet; to plains of Gooty, 1182 feet; and those of Bellary, 1600 feet; Gooty plains, 1182 feet; Cuddapah town, 507 feet; and E. part of Cuddapah district, 450 feet.

A great outburst of greenstone or trap rock covers all Berar from the Nerbadda to Bombay, and southwards through Nirmul to Naldurg; between Naldurg and Beider, and for 100 miles north and south of Beider, are great hills of laterite. The area covered by trap in the Peninsula of India can be little less than 200,000 square miles. Except the hollow of the Lonar lake, there is no trace of any crater in this volcanic region: 20 miles to the east of Nirmul, and a few miles south of the mountains, hornblende slate occurs, resting on granite and quartz rock. The countries through which the Ghatpar and the Malparha run, and the lower course of the Kistna, Bihma, and Tumbudra, and all about Kallalgi, Kurnool, and Cuddapah, are formed of strata of limestone and clay-slate. The granitic platform of the Dekhan, which intervenes between the Kistna and the Godavery, is intersected by numerous greenstone dykes, sometimes porphyritic, having for the greater part a direction from E. to W. The inhabitants of this great table-land region are relations both of Gondi, Mahtrati, Telugu, and Cunaresi, and of Gondi, Mahtrati, and Cunaresi, and from Gondi, Mahtrati, and Cunaresi, and for that reason, the Godavery is formed of strata of limestone and clay-slate. The granitic platform of the Dekhan, which intervenes between the Kistna and the Godavery, is intersected by numerous greenstone dykes, sometimes porphyritic, having for the greater part a direction from E. to W. The inhabitants of this great table-land region are relations both of Gondi, Mahtrati, Telugu, and Cunaresi, and from Gondi, Mahtrati, and Cunaresi, and for that reason, the Godavery is formed of strata of limestone and clay-slate. The inhabitants of this great table-land region are relations both of Gondi, Mahtrati, Telugu, and Cunaresi, and from Gondi, Mahtrati, and Cunaresi, and for that reason, the Godavery is formed of strata of limestone and clay-slate.
the most devoutly worshipped relic of their religion which is possessed by the Buddhist nations of the East. Long before the Christian era, it was adored by the Buddhist sovereigns of Orissa, and was originally deposited in the great temple of Jagannath, then a Buddhist foundation. Its first deposition in Ceylon was in the 4th century A.D. The Buddhists of Ceylon have a tradition that whoever can succeed in retaining it must of necessity become the sovereign of the country. The Chinese traveller, Fa Hian, mentions amongst the precious relics worshipped in the 5th century by the Buddhists of Ladakh, a vase in which Buddha had spat, and one of his teeth; another tooth was similarly cherished by the king of Naka, in Afghanistan, eastward of Ghazni. In an adjoining monastery the monks preserved the cuttings of his hair and nails. Fa Hian also describes a shadow of Buddha, which was shown to him at Naka, but admits his inability to describe the process of its preservation.—Tennent's Ceylon, p. 239. See Buddha.

DELAI LAMA. Lives in the Boudhha La monastery outside of Lhasa, and is believed to be the living incarnation of the deity. But there are four or five subordinate incarnations in different parts of Tibet and Mongolia, objects of worship in the places where they reside, and by particular sects of Buddhists. In the centre of the Boudhha La is a building of four storeys, crowned by a dome covered entirely with sheets of gold.—Perry's, p. 312.

DE L'HOSTE, CAPTAIN, an officer of the Bombay army, author of Memoirs on Scinde; On the Nerbudda River; Journal of a March from Ahmadabad to Sukkur, Upper Scinde; Notes on the Meteorology of the Phooma Ghaut.—Dr. Baw's Cat.; Rom. Geo. Trans. i. p. 22.

DELMAR HEBECEARPA, a creeper of Penang and Java. D. Sarmontosa,ليم., a shrub with small white flowers in panicles; grows in the southern parts of Ceylon up to an elevation of 1000 feet.—Thuc. p. 21; Riddell; Voigt.

DELM, also called Buya, a family who over-threw the Samani. They were from the district of Mardeneram, in which their founder was a fisherman. They seized the western part of Persia, seized on Baghdad and the person of the khilif, and ruled (a.d. 932-1055, A.H. 321-448) for 100 years over an extensive territory in his name. The Amir Azan, Delmi, built the dam called Band-i-Amir, the Bendamir of Europeans.—Elph. p. 272. See Bendamir.

DELPHINIDÆ, a family of mammals of the order Cetacea, or the whale tribe, which live in the ocean. Amongst them are the whales, the largest of creatures now existing; also the dolphins, the porpoises, and the dugong. They have fin-like anterior extremities, the posterior extremities being absent, or rather their place supplied by a large horizontal caudal fin or tail. They have no hair on their skin, have no outer ear, and the bones of the neck are so compressed as to cavel the animal without the appearance of a neck. Some of them eat plants, or are phytophagous; some are zoophagous, or animal-eaters. Seven species of cetacean have been described from the Bay of Bengal, six of the family Delphinidæ, the seventh belonging to the sperm whales, Physeteridae, and called Physeter (Euphysetes) simus. The family Delphinidæ, or porpoises, has 5 genera and 14 species, viz. Delphinus, 8 species; Steno, 2 species; Neomeris, 1 species; Platanista, 2 species; and Globiocephalus, 1 species. The family Baleenidæ, or whales, has 4 genera and 7 species, viz. Balaenoptera, 1 species; Balaen, 4 species; Physeter, 1 species; and Phocoena, 1 species. Sub-order Sireniæ, herbivorous Cetacea, has 1 genus, Halicore, and 3 species.

DELPHINE. Neomeris phocoenoides, Gray, Delphinus melas, Term. A dolphin of the Indian Ocean.

Phocoena communis, Ph. Rondeletii, Willoughby, Delphinus phocoena, Linn. Common porpoise.

Platanista gangetica, Schlegel, Sakam Kusira, Japan. Found off the coast of Japan.

G. Sieboldii, Naiso gata, Japan. A native of the coasts of Japan.

G. macrocephalus, black fish of the South Sea whales, inhabits the S. Seas.

Delphinapterus Peronii, right whale porpoise of whalemen. Is found on the Brazil bank, off the coasts of New Guinea, and the higher southern latitudes. It lives in large shoals, and its flesh is esteemed a delicacy. It is black, but the back, the pectoral fins, and under part of the body are white.

Delphinus.—Seafaring people call the species of this genus bottle-nose, bottle-head, flounder-head, gunnel, or rough-bill, and give to the species, irrespective of whether they are whale-eaters or not, the generic name of Delphinus, and give the name of dolphin to the Coryphena, a scoteroid fish which changes colour when dying. There are several species of Delphinus recognised.

D. delphis. The dolphin attains a length of 9 to 10 feet. Greek legends make it the friend and companion of man.

D. clausus, measures 25 feet in length, and is 12 or 13 feet round. It is the most voracious of all the Delphinæ.

D. Heavisidii, hastated dolphin, the South Sea and Cape of Good Hope.

D. obscurus, the dusky dolphin, inhabits the Southern Ocean and Cape of Good Hope.

D. abula, inhabits Madagascar.

D. cutropus, Pacific Ocean and Chili.

D. Nove Zelandiae, the New Zealand dolphin, New Zealand and Cape Gable.

D. Forsteri, Forster's dolphin, Pacific Ocean between New Zealand and Norfolk Island.

D. Sco, inhabits Madagascar.

D. longirostris, Cape dolphin, about the Cape of Good Hope and the Southern Ocean.

Steno Melanurus, Delphinus phocoena, Dusumier, Cat. Delphin; Delphinus melas, Lichtenreut. Cetacea. Parambun Laut, MALAY; Dolphin ventre roux de Paris Museum. Inhabits the Malabar coast and coasts of Penang. It is numerous, and rather lively in its movements, but is rarely captured, except by chance in the state-nets. It eats small fishes, Clupea and Gymnophis incolumis, Cuvier.

S. frontatus, inhabits the Indian Ocean and the Pacific.

Platanista Gangetica, Gray, Delphinus Shawensis, Bl.; Delphinus, Röth., Platanista of Pliny; Delphinus du Gange, F. Cuvier.; Sou-sou of India; Sussa of Buffon. Inhabits the Indian seas, the Ganges, and Irrawadi.

Haiicore Dugong, Trichechus dugong, Gould.; Dugongus dugong, McC.; Haicore Indian dugong, Exs.; Le dugong des Indes, Fr. Inhabits the shallow of the Indian Ocean and about Ceylon, where the water is not more than two or three fathoms deep. It does not appear to frequent the land or the fresh water. Its flesh is delicate. The dugong is noticed as occurring in Ceylon by the early Arab sailors, by Megasthenes (Fragm. lxxv.) and Alìan, and subsequently by the Portuguese. It is this creature which has given rise to the tales about mermaids, which have till the present day occupied the world, and doubtless had their origin in the tales of the Arab sailors. They are phytophagous, or plant-eaters.

H. Indicus, Orca, the Malay dugong, inhabits the narrow seas of the Eastern Archipelego.
DELPHINIUM.

H. tabernaculi, Kappell, the dagon of the Red Sea, has a feeble voice, and feeds on algae. It is about ten feet long. In February and March, bloody balles occur by the males. Its flesh, teeth, and skins are utilized.

H. australis, manate of Dampier, white-tailed manate of Pennant. It is a native of the west coast of Australia.

H. indica, F. Cuvier; Trachelium dagon, Erxleben; Halicore eetecus, Heger; Halicore dagon, Cuvier apud Bajella; Halicore tabernaculun, Kappell; Dugungus Marinus, Tiedemann apud Schinz.

Dugong of Bvlon. [Parapramn laut, Malay.]

Under these synonyms Dr. Theodore Cantor makes all the above, which he says inhabits the Red Sea, the seas of the Malay Peninsula, Singapore, Sumatra, the Philippine Islands, Maloucas, Sunda Islands, and New Holland. — Cat. Man. Mus.; E. I. C. Hartwig; English Cyclopedia, p. 913; Mr. Blyth in BENG. AS. SOC. Journ.; Tennant's Ceylon; Dr. Theodore Canton in BENG. AS. SOC. Journal of 11th December 1846.

DELPHINIUM, a genus of plants of the natural order Ranunculaceae, of which several species, D. ajacis, D. Brunonianum, D. consolida, D. glacieale, and D. Oliverianum, occur in India and the south of Asia.

Delphinium ajacis, Linn.

Larkspur, . . . Engr. [Na-fnrman, Na-fnrman, Hind.]

Is cultivated in gardens in India during the cold season. The properties of the seeds agree with those of the stavesacre kind.—O'Sh.

Delphinium Brunonianum, Cleg.

Musk plant, . . . Engr. [Na-fnrman, Nerpri, Panj.]

Grows in the Sutlej valley between Rampur and Singnamp, at an elevation of 14,000 feet. Smells powerfully of musk.—Cleghorn's Panj. Rep.

Delphinium glacieale, Hooker, of E. Nepal, is one of the most alpine plants in the world, growing at an elevation of 17,000 feet. It is abundant in the valley of the Chomiocho near Tungni, in Tibet, and exhales a rank smell of musk.—Hook.

Delphinium paniculorum, O'Sh.

Judwar, Hind, of Bombay, [Nirbiss of Himalaya.]

A tuberous root in Sirmoor, without poisonous properties. The best comes from Lahore.—O'Sh.

Delphinium staphisagria, L., the stavesacre or loosewort, a biennial plant, native of the Levant, Tenerife, and Asia Minor. The powder taken internally acts as a violent cathartic and emetic. It is made into an ointment used for destroying vermin in the hair. The seeds intoxicate fish.—O'Sh. p. 168.

DELPHIOS, a town in Greece where was an ancient oracle and place of worship. In a cave of the earth called Delphi, the word Delphi being synonymous with Yoni. See Delphi; Yavan.

DELCUDE.

Tutan, . . . ARAB., TCHE. [Diluvio, . . . IT., SP. Uberschwemmung, GER.]

The deluge of the Old Testament was known to the Chaldeans, the Aryan Hindus, the Parsees, the Hebrews, Christians, and Mahomedans. The last three religionsists have their account of it in the 6th to the 9th chapter of Genesis, in which it is related how the Almighty, in consequence of the wickedness of mankind, brought a flood of rain for forty days on the earth, and destroyed all but Noah, his wife, his sons, and their wives, with pairs of all animals.

The Chaldeo-Babylonian narrative of the event is recorded in the great epic poem of the town of Uruk, three copies of which were made for the royal library, in the 8th century B.C., by order of Assur-lani-pal, king of Assyria, from a very ancient copy of it in the sacerdotal library of the town of Uruk, seemingly of the time of Abraham.

The narrative follows with great exactness the same course as that of Genesis, which, in chapters vi. vii. viii. and ix., gives two different narratives. The cataclysm there noticed corresponds with the rising and overflow of the Tigris and Euphrates, from the middle of March to the end of May, and 26 days later the Jehovah makes Noah leave the ark.

Berosus, who had access to Babylonian records, says a god appeared to Xisuthros in a dream, prophesied a flood, and bequeathed to the city for ever sacred records in the City of the Sun at Sippurn. The flood came, Xisuthros released birds to ascertain the state of the country, the occupants disembarked, and recovered the interred records.

The account which the Hindus have of the deluge is described in the Satapatha Brahmana of the Rig Veda, also with variations in the Mahabharata, in the Bhagavata Purana, in the Agni Purana, and in the Matsya Purana. The first of these does not indicate who was the person saved; the Mahabharata indicates Brahman, and the Puranas, Vishnu. The first of the Hindu accounts of this is found in the Satapatha Brahmana.

In it the 7th Meni Vaivasvata one morning caught a fish, which told him of the coming flood, and, on the advice of the fish, he built a ship, which he attached to the horn of the fish, sailed over the northern mountain, and attached it to a tree till the waters subsided, who found all living things destroyed.

The essence of the extract from the Agni Purana is this:—When ocean quitted his bounds and caused universal destruction by Brahman's command, Vaivasvata Meni (Noah), who dwelt near the Himalaya mountains, was giving water to the gods in the Kritula river, when a small fish fell into his hand. A voice commanded him to preserve it. The fish expanded to an enormous size. Meni, with his sons and their wives, and the sages, with the seed of every living thing, entered into a vessel, which was fastened to a horn on the head of the fish, and thus they were preserved. In this fable the grand northern chain is given as that to which the abode of the great patriarch of mankind approximated.

In the Puranas it is not Meni Vaivasvata, the 7th Meni, whom the divine fish saves from the deluge, but Satyavata, the king of the Dasya, the man who loves justice and truth. The Bhagavata Purana says, In seven days said Vishnu to Satyavata, 'tomorrow the worlds shall be submerged.' The West Indians, now represented by the Parsees, had a knowledge of a deluge, in which Yima, the father of the human race, was warned by Ahuramazda to hedge in a square garden (yarn), and cause the gerns of men, beasts, and plants to enter it, in order to escape annihilation.

The Greeks had two legends as to deluges, one connected with Ogyges, king of Boeotia, the other the Thessalian legend of Deucalion, who, by the advice of Prometheus, built a coffin, which, floated at the mercy of the waves, and after ten days stranded on Mount Parransus. The former seems connected with a rise of the lake Cupas; the latter seems to relate to the whole earth.
The great inundation recorded in the historic books of China, as having occurred B.C. 2357, in the reign of the emperor Yao, seems to have been occasioned by a rise of the Hoang-ho, a local event long subsequent to the fully historic periods of Egypt and Babylon. The date of the completion of the works undertaken by the minister Yu, to repair the damage done by this flood, lies between B.C. 2278 and 2062.

DEMAVAND, in lat. 35° 50' N., long. 52° E., a lofty peak on the Elburz range, between Irak Ajuni and Mazandaran. A high road leads from Teheran by the town of Demavand to Ask, the capital of the district of Lurijan. The hot baths of Demavand are situated in this locality, at Garn-sair, near Garn-ab. They are two in number: one, the tepid bath, is situated within 100 yards of the town of Ask, on the right bank of the river. It rises in an oval basin, measuring about 20 feet by 20, and about 3 feet in depth, formed by deposit from the spring, which gushes up with great force in the centre of the basin, together with a considerable amount of gas. The water contains sulphur, iron, soda, and magnesia. The other spring, which is situated about two miles further down the valley, and on the mountain of Demavand, is so intensely hot (148°), that the water has to be conducted through canals for some distance before it is collected in an artificial basin, in which the patients bathe. This water contains magnesia, iron, and sulphur in much larger proportions. Near Ask there is also a spring of cold water, strongly impregnated with iron. From Ask a road leads down to the town of Amill, but it is extremely dangerous, lives being lost annually from mules and their riders falling over the precipice, along the face of which it runs. Demavand bears N. 69° E. of Teheran, about 40 miles distant, and its pale lofty summit forms a magnificent pyramid as it shoots up from the high range of Elburz. The cone of Demavand is doubtless of volcanic origin, and consists of a number of ridges, which run from the summit to the base, leaving between them deep ravines filled in general with snow and ice, beneath which lies a mass of debris fallen from the upper part of the mountain. The height of the mountain is 21,520 feet. The cone terminates in a crater about 85 yards in diameter, which is nearly surrounded by jagged rocks. — Chesney, p. 15; MacGregor.

DEMETRIUS. Greek kings, successors of Alexander, rulers in Syria; there were three of this name:—Demetrias I., surnamed Soter, B.C. 162; Demetrias II., surnamed Nicator, B.C. 147; Demetrias III., surnamed Eucerus, B.C. 94.

DEMACRITUS, of Abdera, B.C. 360. Praised by the Mahomedans as a sage, but as his doctrine of atoms was contrary to their religious views, he was deified and worshipped as a deity, in addition to the worship of Shari, or the demon-god of the Aryan races. Amongst the evils genii of all India is a being or beings called Rakshasa, of giant bulk, terrible teeth, who feast on dead bodies; and the Rakshasa is recognised by Aryan and non-Aryan. The bhooth acknowledged all over India, more resembles the ghost of Europe. The Rev. Dr. Caldwell, in his work on the devil-worship of the Shanar, has shown how continuously the people of India are making new deities or demons. On the left bank of the stream, at the village of Assaye, at which Sinha's artillery was posted during that battle, is a tree beneath which is the tomb of an officer who fell during the battle, and his spirit is punctually worshipped by all the people of the neighbourhood. Sir Battle Frere found an order in existence at Government House, Dapoorie, handed down by each non-commissioned officer, for the native sentry on guard, to present arms if a cat or dog, jackal or goat, entered or left the house or crossed near his beat during certain hours of the night, because it was a ghost of a former governor, who was still remembered as one of the best and kindest of rulers. The raja of Wanparty, one of that Reddi race who have founded small principalities along the banks of the Kistna river, died in 1868 at Hyderabad. He had led a turbulent life, and retained to the last much of the spirit of his youth. At the close of that year an outbreak of cholera occurred in that neighbourhood, which the people attributed to the spirit of Wanparty, and they made a clay image of him, riding on an elephant, and placed near him the clay image of a Brinjari, and worshipped all with the Mahabali sacrifice. In India, the Jan, the Gin of the Arabian Nights, is only known amongst the Mahomedans. In Sind, the Jan resembles the Pweeca, or Pack of Britain; the Jan of the Baluch hills is wayward and often morose, but not necessarily malignant. He is described as dwarfish, with large eyes, and covered with long hairs, and often changes to the form of a camel, goat, or other animal. On meeting a Jan, it is essential not to be alarmed, to use civil language. The Jan can become the servant of man, and work hard. The deep-rooted belief in devils and in demoniacal possession was proved by the mortuary statistics of India, the year 1866, from which it appears that in 3463 cases, the relatives of the deceased would assign no other causes of death than witchcrafts, evil spirits, and devils.

In Ceylon is a class of demigods, who, under the name of Yakshyo, are supposed to inhabit the waters, and dwell on the sides of Mount Meru, and who are distinguished not only for gentleness and benevolence, but even by a veneration for Buddha, who, in one of his earlier transmigrations, was himself born under the form of a Yakshyo. The Yakka, malevolent spirits of Ceylon, are the authors of indefinite evil; and the Singhalese have a demon or Same for each form of disease, who is supposed to be its direct agent and influenter, and who is
accordingly invoked for its removal; and others, who delight in the miseries of mankind, are to be propitiated before the arrival of any event over which their pernicious influence might otherwise prevail. Hence, on every domestic occurrence, as well as in every domestic calamity, the services of the Kattadia or devil-priests are sought, and their ceremonies performed, generally with observances so barbarous as to be the most revolting evidence still extant of the uncivilised habits of the Singhalese. Especially in cases of sickness and danger the assistance of the evil-omened is more or less relied on. An altar, decorated with garlands, is erected within sight of the patient, and on this an animal, frequently a cock, is to be sacrificed for his recovery. Another kind of demon-worship in Ceylon is a debased form of Hinduism, where the priest or Kapa is the performer.

Mr. Forbes, in the Ras Mala (p. 378), says the bhoot and pret of Gujarat are believed to reside in the place where funeral piles are erected, in trees which are not used for sacrificial purposes, such as the tamarind and the acacia, in desert places, at the spot where a death has occurred, or at cross-roads,—for which reason people set at these places food for the use of the bhoot. He is most at a loss for water to drink. The pipe of his throat is, it is said, the size of the eye of a needle, and he is continually thirsty enough to drink twelve gallons of water. The watchmen of Wuroon Dee, however, are stationed wherever there is water, to prevent the bhoot from drinking, and the thirst is therefore as continual as it is intense. The bhoot feed upon all kinds of refuse. The goblin of the best class,—he, that is to say, whose funeral ceremonies have been duly performed, but who has been debarred from liberation by his own intense affection for earthly objects—is called a ‘Poorwuj Dee,’ and resides in his own house or in a sacred fig-tree. The Poorwuj Dee, like the Etruscan Lur, or the Grecian hero, is regarded as hovering about his former abode, averting dangers from the inhabitants, and bestowing blessings upon them. He frequently appears in the character of a serpent, and is then treated with great respect by the inmates of the house near which he resides. It is a common belief in Gujarat that serpents are always to be found wherever a hoard is buried, and that these are the bhoot of the deceased owners, who have remained upon earth from affection to their wealth. The Arabian Jin also frequents cross-roads; and the fairies of the Scottish lowlands carry bows made of the ribs of a man buried where three lairds’ lands meet, as in A Midsummer Night’s Dream (Act iii. sec. 2).

‘Damn’d spirits all,
That in cross-ways and floods have burial.’

‘Desert places’ in Gujarat correspond exactly with the ‘dry places’ (κατανεκρό τόπος), assigned to the evil spirits in Matthew xii. 43, Luke xi. 24. The custom of placing food for spirits is very general throughout the world. In the dialogue of Dives and Pauper, printed by Richard Pynson in 1493, among the superstitions then in use at the beginning of the year, the following is mentioned: ‘Alas that take heed to dynamal days, or use eye-observances in the new moon, or in the new yeare, as setting of mete or dryneke by nighte on the benche to fede alhole or gobelyn.’ The powers which the bhoot and pret exercise are the following: They take possession of a corpse, and speak through its mouth; they exhibit themselves in the form which they possessed when living; they enter into a living man, and cause him to speak as they please; sometimes they afflict him with fever or various other diseases; sometimes they assume the forms of animals, and frighten people by suddenly vanishing in a flash of fire; sometimes, remaining invisible, they speak in whispers. A bhoot has been known to come to fictitious with a man, and guide him thus away from home and set him down in a distant place. It is even said that women are sometimes found with child by bhoots.

The Jain Sthaviras teach a different doctrine in regard to spirits from that which is taught by the Puranas. They assert that there are eight kinds of Vyuntur Dee, and eight of Wan-Vyuntur Dee, who reside below the earth. Each of these has two Indra, or sovereigns, ruling respectively the northern and southern regions, and who are in colour black, white, or blue. The Vyuntur and Wan-Vyuntur Dee appear upon earth, where they possess the bodies of men, exhibit themselves in various shapes, and perform many strange feats, whence their common name of Kootohulee (or surprising) Dee. Below them reside the Bhunwunttee Dee, who also sometimes appear on earth. Below these, again, are the Narkina or infernal spirits. Above this earth, in the atmosphere, five kinds of ‘Deo of splendour’ reside, the sun, moon, stars, and others. Above them, in twelve Dee Loka, the Deo who ride in chariots dwell; these, sometimes drawn by their own desire, or compelled by charms, appear in the world, but they do harm to no one. Above them are nine classes of Grivek, and five of Unootar Vimany. They are of great power, and never visit the earth. Men who have lived a life of austerity and righteousness are born again in these classes of upper or lower Dee, but the sinner is not born in them. Of old, a man who had performed the rite of ‘Uthun’ by fasting for three days, acquired the power of calling the Deo to him; but now, it is said, these Dee never visit the earth at any one’s call.

In Gujarat, where people wish to prevent the removal of a jangal tree, they post a titrant upon it with vermilion, or, if that be inconvenient, throw down a number of stones at the root of the tree. Whoever, after this, passes by, is sure to add a stone or two to the heap, believing the place to be the residence of a bhoot. If stones are not easily procurable, a bit of old rag is thrown so as to adhere to the tree, and every one who passes by follows the example once set. They call the spot the ‘Rag-uncle’s.’ In places where trees are scarce, these ‘uncles’ are very common, and people are much annoyed with the dread of touching them. The name ‘uncle’ is given to the bhoot by women as a term of respect. Men are less superstitious. Similarly, whenever in any place there is a hilllock or mound upon which a few stones have been piled one above the other, every passer-by considers himself bound to add a stone to the heap, considering that the spot is the residence of some Dee, and that if any one raise a little temple there his house will flourish. Such monuments are also set up in places where a person has been slain or wounded. Cairns of
DENAR.

this kind are frequently connected with the dead.—

'On many a cairn's grey pyramid,
Where urns of mighty chiefs lie hid.'

—Rasamala, India Annals, ii. pp. 379, 387;
Brand's India Annals, ii. p. 378. See Amma ;
Dehwar; Devils; Devil-Worship.

DENAR, a coin of Turkish Armenia. It is the
denarius of the Romans. Dirhem is the drachma,
and Fals (in the singular) is the follis of the
Romans (Ouseley's Travels, ii. p. 490). The
denarius was reduced by Augustus Caesar from
90 to 60 grains, and by Constantine to 40 grains.
—Prinner; J. B. A. S. Sept. 1832.

DENDENG. MALAY. Jerked beef; animal
muscular fibre, preserved by drying in the sun,
neatly the only mode of curing flesh in the Archi-
pelago. Dendeng is made of the flesh of deer,
oxen, and buffaloes, and by the Chinese of that
of the wild hog. It is a considerable article of
native trade.—Crawfurd's Dict. p. 120.

DENDROCALAMUS, a genus of air-plants of the
natural order Orchidaceae, which occur in south-
eastern Asia and Australia.

The most interesting of the air-plants of the
Tenerasian coast is a dendrobium, the flowers of
which are white, with a yellow lip, three or four
inches in diameter, and exquisitely fragrant.
The plant blooms in March, but it flowers to the
close of October, and may be seen whitening
under the emerald foliage of the groves nearly
six months of the year. The Burmese call the
silver flower.

Dendrobium Cerina.
Shih-huh, . . . CHIN. | Hwang-ts'au, . . . CHIN.

This Chinese species of dendrobium grows on
stones.—Smith; Mason.

DENDROCALAMUS GIANTEAUS, Munro, of
Malacca and adjacent islands; one of the
mightiest of all bamboos. —V. Mueller.

DENDROCALAMUS HAMILTONI, Nees,
ascent the Himalayas from 2000 to 6000 feet,
and rises 60 feet high. Its young shoots are edible.
—Brandis; Kurz; V. Mueller.

DENDROCALAMUS STRICATUS. Nees.

Male bamboo, . . . ENC. | Sadhanapu vedar. | TR.

The male bamboo has nearly solid stems, and is
much in use for spear-shafts, building purposes,
and many other uses. It is absent from Ceylon,
except in a cultivated state. It is very general
throughout the Madras Presidency, on the dry
slopes of the mountains up to 3000 feet elevation.
It is common in Bombay, Bengal, and Burma,
and extends to Singapore and Java. It flowers
frequently, Colonel Beddome believes every year,
and does not die down after flowering.—Beddome.

DENDROCALAMUS TULDA. Nees.
Bambusa tulda, Roxb. | Pkae banh, HIND. | Tulda banh, . . . BENG. | Bashine banh, . . .

The common bamboo of Bengal. Its tender
shoots are used as pickles.

DENDROCYENA, a genus of water-fowl,
known in India to sport as the whistling
duck. They are common to the northern and
southern hemispheres. See Aves; Birds.

DENDRIOPHIDE, a family of harmless snakes,
consisting of the following genera:—

Gonyosoma oxycephalum, Boie, Assam, Assam,
Pegu, Mergui.
G. gramineum, Gunth., Khassya.
G. rematum, Gray, Khassya.
Dendrophis pictus, Gunth., Bengal, Assam, Assam,
Arabia, Pegu, Malacca.
Rhodoleurom, Schl., Ambouya.
Chrysopeolus ornata, Shaw, Shang-hal, Malacca.

The Dendrophyis genus is common, known as
snake-trees, the name being from the Greek,
Dendron, a tree, and Ophis, a serpent. They
are also called whip-snakes.

DENG, the common passage and ferry boat
on the river Ganges. It is a comfortless rickety-
looking boat, and dangerous to travel in. Caught
by the bote even in the middle of the river, if
crowded, the dengis are swamped. The puntis
is a light and fast boat, longer, broader, and
bolder than the dengi, and more comfortable.

DENGUE, a febrile and ague epidemic
rheumatism. This disease, when it first ap-
peared in the British West India Islands, was
called the dandy fever, from the stiffness and con-
straint which it gave to the limbs and body. The
Spaniards of the neighbouring islands mistook the
term for their word Dengue, denoting prudery,
which might also well express stiffness, and hence
the term Dengue became at last the name of the
disease.

DENKENACOTTA, the finest forest in the
Seringapatam collectorate of the Madras Presidency. It
contains sandal-wood and clove-wood.—Crawfurd.

DENMARK, a kingdom in the north of Europe.
Tranquebar was the first possession of the Danes in
India. It was purchased by them from a raja of
Tanjore. They also held Serampore in Bengal, and
Porto Novo on the Coromandel coast; Eddo and
Kolchery on the Malabar coast, and other
forts and factories. On the 22d February 1845,
for £125,000 sterling, Denmark ceded, by treaty,
all its Indian possessions at Balasore, Tranquebar,
and Frederick's Nagore, or Serampore.

DENWAR, a name given by Mr. Hodgson to a
border tribe between Nepal and the Bhot country.
See Chepang; Haiyu.

DEO. DEO, Dev, Deva, Dewa. SANSK. A god, a
devity; hence Dewali or Dewal, a house of idols;
a temple, a pagoda. It is the Zeus of the Greeks
and Deus of the Romans, and is possibly the
original of the name of Siva, often called Shanker,
Sheo, Shev, or Shub; Devi is a goddess. Deo is
also used to designate a demon, an idol, genii,
giant, a spirit, shade, or ghost, and a holobgin.
The village tutelary deity or Dewar of Hindu-
stan, the Granvadeva of S. Indus, has a portion
of grain set apart at each harvest. It is commonly
represented by a shapeless stone, but has distinct
names, as Bhum-seen, Kateswari, Hanwar, HariRam.
In his concluding letter on Comparative Philo.
DEO.

DEO, seat of the Deo rajas, one of the most ancient families of Behar, in the Aurangabad subdivision, Gayas district. They trace their descent from the Ranas of Udipur (Oodeleypore). Four generations of unserving loyalty to the East India Company and the Queen Empress have been rewarded by liberal grants of land and villages; and Sir Jai Prakash Singh, K.C.S.I., received the title of Mahanand Deo, and is a Knight Commander of the Star of India for his services in 1857. It is the seat of a famous temple, at which thousands of people congregate twice a year, to hold the Chhat festival in honour of the sun-god.—Imp. Gaz.

DEOBAND, from Deo-ban, a sacred grove; a small town in Saharanpur district, N.W. Provinces, of the same name. Half a mile from the town is a small lake, the Devi-kund, whose banks are covered with temples, ghats, and sati monuments, which are much frequented. Deoband is of Hindu origin, with a legendary history of 3000 years. The Pandava are said to have passed their first exile within its precincts. The fortress was one of the earliest to fall before the Musalmian saint, Sklar-Masud Ghazi. A religious assembly takes place yearly in a neighbouring wood.—Imp. Gaz.

DEODAR. Hind. The Cedrus deodara, London, is a valuable timber tree in the forests of the N.W. Himalaya under the Panjab Government, and in the Feudatory States of Jammut and Kashmir, in the Laiwa and Uj divisions, on the banks of the Chenab, with the Bhutna, the Marrn Wardan, the Jhelum below Baramula, also the Kishenganga. The cones of the deodar are identical with those of the cedar of Lebanon; the deodar has generally longer and more pale bluish leaves and weeping branches, but these characters seem to be unusually developed in English gardens, for several persons, well acquainted with the deodar at Simla, when asked to point it out in the Kew Gardens, have indicated the cedar of Lebanon; and when shown the deodar, declare that they never saw that plant in the Himalaya. Decdar is also applied to the Chickrasia tabularis and Juniperus excelsa; and in Kulu and on the Bas, deodara is applied to the Cupressus torulosa and the Sethia indica.—Hooker's Himal. Jour., p. 41.

DEO-DHANGA, or holy hill, is a peak in lat. 87° E., upwards of 29,000 feet high? Deo-dhanga and Mount Everest, 29,002, are about 100 miles N.E. of Khatmandu; both are midway between Gosaintham and Kangshem.—Beng. As. Soc. Jour., 1866.

DEO-GHANTA. Hind. Sacred metal bells.

DEOGHUR, or Byijnath, is a small town in the zilla of Birbhum, famous for its temples, visited every year by thousands of pilgrims from the North-West Provinces of India. It is situated in the great table-land which extends from near

Bardwan to Durna Ghat, in Behar. Granite, syenite, and gneiss, traversed by greenstone dykes, are the prevailing rocks around. Velthi is a lead ore, partly pure, partly in the state of galena or sulphuret, traversed the principal copper vein at right angles. Both have been analyzed, and found of remarkable richness. The nearest coal is forty miles off; the nearest point on the river where the ore could be shipped for Calcutta is sixty, the road being tolerable all the way. The copper might in all likelihood be separated from the malachite by stamping and washing.

DEOGIRI, now called Dowlatabad, is about 12 miles from Aurangabad, in the Dekhan; is a scarped rock of considerable height, with a roadway leading up through the rock. Its position is commanding, and from the most ancient times was a stronghold of the rulers in that part of India. The name seems to have been sometimes written Deoghur. Ala ud-Din, nephew and general of Jalal-ud-Din, in A.D. 1294 swept across Nepal and took Deogiri, and besides money and jewels, obtained the possession of Ellipour and its dependencies, and the raja was further to pay tribute annually. Ala-ud-Din, on his return, was met by his uncle, Sultan Jalal-ud-Din Khilji, whom he assassinated, 1295, as he was panned on the cheek, and then ascended the throne. Subsequently he invaded and conquered Gujerat, and took its beautiful hill, Kamala Devi, into his household. About A.D. 1300 he repulsed an invasion of the Moghuls under Katallah Khan. In A.D. 1303 he captured the fort of Chittore, but was immediately recalled to check an invasion of the Moghuls, whom he repulsed a third and fourth time in 1305 and 1306. In 1306 he sent Malik Kafur, his general, a cunning, and who had been the slave of a merchant at Cambay, to chastise the raja of Deogiri, which Kafur effected, and also subdued the Maharrattas. In A.D. 1309 Malik Kafur captured Warangal, then the capital of Telangana. In 1310 he reduced Bela, raja of the Karnatic, with whom the Bela dynasty ended. He overran the whole of the eastern provinces as far as Ramissaram, opposite Ceylon, where he erected a mosque to commemorate his victories; and in A.D. 1311 he returned to Dehi, laden with plunder. In 1312 he despatched Kafur a second time to punish Ram Deva, king of Deogiri, and son of the former Ram Deo, who was put to death, and the kingdom annexed. He next carried his arms over all the Maharratta territory and the Karnatic, and soon after died.—Briggs's Nizam.

See Dowlatabad.

DEO-KORA, the household god of the Garo race. It is a small bell-metal dish with embossed figures, hung up in the house and worshipped, and sacrifice offered. See Deo-Ghanta.

DEOLEE, in Rajputana, in lat. 25° 54' N., and long. 74° 53' E., is the headquarters of the Hararot and Tonk political agency, comprising the states of Bundi, Kotah, Tonk, Jhallawar, and Shajpura. It is 57 miles S.E. from Nasseerabad.

DEO MUNNI? sacred beads of Assam.

DEOOLA are temples sacred to Jaganath; they rise from the foundation in a gradual slope like a sugar-loaf, with an iron image of Garuda on the pinnacle. These temples, made of brick, are ascended by a flight of steps, and contain only one room. The word is Deo-alaya, the House of God.
DEO-PANI. DEET.

DEO-PANI, a stream which falls into the Brahma Kund.

DEO PATTAN, a district in the S.W. of India, in which was the temple of Somanath taken by Mahmud of Ghazni in 1024.

DEOPRAYAG, a village in the Garhwal district of the N.W. Provinces, in lat. 30° S N., and long. 78° E., at the confluence of the Alaknanda and the Bhagirathi, and 2266 feet above sea-level. The united stream takes the name of the Ganges, and the point of junction forms one of the five sacred halting-places in the pilgrimage which Hindus make to Hardmatal. The village is perched 100 feet above the water's edge, on the scarped side of a mountain, which rises behind it to a height of 800 feet. The great temple of Rama Chandra, built of massive uncemented masonry, stands upon a terrace in the upper part of the town, and consists of an irregular pyramid, capped by a white cupola with a golden ball and spire. Religious abstentions take place at three basins, excavated in the rock at the point of junction of the holy streams.

DEORA is the tribe of the Sarohi princes, chiefs of Abu and Sarohi. It is a branch of the Chauhan Rajputs, whose cradle is said to be on the summit of Abu, whence they spread over the regions skirting the Aravalli to Ajmir, establishing many minor principalities, as Nadol, Jhalor, and others, long before the Rajtor of Jodipur had set foot in Maroo, but were yet enjoying all the pomp of royalty in the splendid city of Kanauj. Sarohi, Abu, and Chandravati then appertained to the Pramara race; nor was it until the thirteenth century that the uncle of Kana Deo, prince of Jhalore, treacherously obtained possession of the former with its dependencies, by the slaughter of the Pramara race. The city, now the residence of the Deora princes, is comparatively of modern date, the ancient Sarohi lying behind a second range of mountains. The Rajtor and Deora are the bravest of the Rajput races. Achiglarh, or the immoveable castle, is the name of the fortress of the Deora.—Tod's Tr. p. 61; Rajasthan, ii. pp. 59, 57; Annals of Mewar, p. 384.

DEORHI. HIND. A threshold, a household; the household of a person of rank, generally of a Mahomedan noble, answering to the Bab of the Constantinople palace, or the Porte, also to the foot of the throne.

DEORI, priests of the Aka race. Deoti, the sacrificial priest of the Kooch. Deota, a deity.

DEOTSA, a small plateau or table-land adjoining that of Balti. It and the Balti table-land form a territory 60 miles long and 36 broad, and are part of the territory of Balti. It is high above the rest Balti, or birch region, and tenanted only by the marmot, with a few dwarf willows and herbaceous species as its plants. It is a thinly-inhabited steppe, 13,000 feet above the sea-level, between Skardo and Kashmir, belonging to Baltistan.—Vine.

DE PAYVA. See Pedro da Covilam.

DERA BULLU, a small territory, in the Koun Iam valley, in Turkestan; the valley of the Yarkand river, near this, is 16,883 feet above the sea, in lat. 35° 49' N., and long. 77° 31' E.

DERAH or Darah, HIND., answers to Chur in Lower Bengal, and signifies the long rich alluvial flats which generally line the banks of such rivers as the Gunduk, the Ganges, and the Kossi, and increase, diminish, or completely melt away, owing to the action of the stream in the rainy season.

DEREH. HIND. Bhera, MAUR. A wood of the Nagpur forests, of great strength; the average logs are from $\frac{3}{4}$ to $\frac{10}{4}$ feet long, and from 2 to 3 feet in girth. It has a winding, and, as it were, a mellow grain, from which, as well as the extraordinary toughness of its fibres, butchers invariably use it for chopping blocks.—Captain Sankey.

DERI, a dialect of the Persian language, which is used by the Zoroastrians in Persia; it is not the Zend. It is also described as an ancient dialect of Persian spoken at Balkh, but also as the modern Persian tongue. It is derived from the Parsee, which displaced the rougher Pelehvî, though PELEHIV is still used in the sacred writings at Sherwan.

DES, Desa. SANSK. In Rohilkhand, the Des is the cleared villages on the borders of the Terai; in the Himalayan regions it means the plains of Hindustan. With the Mahtrattas, it means the country between the Syhadri and Balaghat hills and the Godavery river; it also means any plain, open, or champagne country. In the Dekhan it is used to signify a champagne country. Of the words derived from it and its other applications, Des is a native country, Desmukh and Despande are Maharrata revenue officers; Desai, a superintendent of a district—Desatha, Desath or Dashaath, a Maharrata Brahman—Par-desi, a foreigner.

DESSERTS. DESERTS.

DESERTS of Asia,.biasan of the Persians, and Chul of Turkestan. A chain of deserts extend from the Canary Islands in the Atlantic Ocean to the Yellow Sea, crossing Africa and Arabia, through parts of Central Persia, Seistan, Korsan, Afghan-istan, and Baluchistan, onwards to the east of the Indus, into Rajputana; and the link, broken by the Himalaya, is found in the great sand sea of the Gobi. This area is mostly uninhabitable, from the absence of water and the intense heat, but has occasional cases of rich vegetation, where water springs occur, or where the Nile, the Tigris, the Euphrates, the Indus, and their affluents enrich the country. To the westward, the seas of sand of the Arabian and African wastes are seldom raised above, often sink below, the level of the sea. To the eastward of the rich tract in Persia Kerman, Seistan, Chinese Tartary, and Mongolia the desert consists of series of plateaux, having from 3000 to nearly 10,000 feet of elevation.

The Eastern Desert of Egypt, near Jabl Ghar, has an ancient green, red, and purple porphyry quarries at Jabl Dukkan (Mons Porphyratis); and breccia quarries occur at Wadi Keuch, which were worked in the time of the first Osiris, supposed to have been the Pharoh who ruled over Egypt in the time of Joseph.

The Desert of Arabia extends from where the borders of Syria touch the Euphrates in the north to near the coast of Hadramaut in the south. It is continued between Syria and the Euphrates between Hejaz and Jabul Shammar and the Najd provinces, and between Yemen and Oman, and again on the east, between the provinces of Najd and Al Hasa on the Persian Gulf.

There are oases in this desert, and in the winter and after rains are scattered patches of grass, and the Bedouin find pasture on the borders; but is
DESERTS.

The hot season the sun pours down its heat in unopposed fierceness. That part miscellaneous the Syrian desert by Europeans, was the Arabia Deserta of Ptolemy, and is now known as Al Hammad. That in the neighbourhood of Damascus is called Batyiah us Sham.

The Desert of Syria lies between Mesopotamia and the coast region of Syria and its southern part, Palestine. It is a great chalk plateau, about 1800 feet above the sea, bounded on the west side by a great depression.

Desert of Khurasan.—Between the Caspian and the Oxus is a desert tract of firm gravel, broken into undulations, and covered with a rich pasture of aromatic herbs, and water is found in some of the hollows on its surface. It is known as the desert of Khiva or Khurasan, also as the Regan, and from June to September is liable to destructive hot winds, in which beast perish, even the hardy camel persisting miserably. The Balschi call this wind Julo, the flame, also Bad-i-Simoom, or the poison wind. There is great heat of skin, quickly ending in death. The approach of the wind is ushered in by an oppressive calm in the air, and a degree of heat that affects the eyes; the precaution then adopted by travellers is to cover themselves over, and lie prostrate on the earth. Pottinger says (Travels, p. 136) that any cloth, however thin, will obviate the deleterious effects of the Bad-i-Simoom on the human body.

The Great Salt Desert of Central Persia is called the Daria-i-Kavir. It stretches north and south across the eastern part of that country from Nishabor in the north, to Kirman on the south, and sinks to its lowest level opposite to the Seistan basin. It may be below the sea-level, and is certainly not far above it. It is the principal of the Kavir or Kafch salt swamps of Persia. Where the alluvial soil of the plain beneath is exposed to sufficient moisture, either by the overflow of rivers, by surface drainage from the hills, or by the want of sufficient slope to carry off desert rainfall, a saline efflorescence is produced, which, forming a thin whitish crust on the surface, retains the moisture beneath for a considerable time, and thus creates in winter and spring a treacherous and impassable bog. About lat. 34° N., it is 6 miles wide.

The Great Desert of Khurasan commences east of Koom, and stretches almost due east to the north of Khoor. From near this it turns to the south, and gradually lessens in width. At its broadest, S. of Damghan, it is about 150 miles broad, but generally where the roads cross it its breadth is from 80 to 100 miles. It is a barrier more difficult than any mountains in N. Persia and Khurasan (MacGregor, Khorasan), a desert than without one blade of grass, one leaf of any kind, or living thing of any sort. Its dark soil is covered with a thick saline efflorescence, which glitters painfully on the eyes, and is felt crunching under the feet. Here and there are darker moist patches. The Kavir is honeycombed with holes about 9 inches deep, and the size of a man’s head.

The Desert of Kizil-Koom (red sand) extends over an area of 35,000 square miles.

The desert called Reg-i-Sistan or Reg-i-Baluchistan, on the S.W. part of Afghanistan, extends from the highlands of Kalat to the boundary or Sarhad mountains south of Seistan. It extends from the Mushi range in the south, to the plain of Kandahar on the north, where it ends in a belt, ten or fifteen miles wide, of high desert cliffs, called Chol or dry land. The nomades pasture their cattle there in winter, as it produces a rich pasture at that season of the year.

The Great Indian Desert, on the eastern side of the Indus, lies between Sind and Rajputana. It is a sandy tract, but is covered with shrubs, and in places small trees grow. The population is thin, but villages are found throughout; and immense herds of camels, cattle, sheep, and goats are pastured. It is entirely destitute of streams of water, with but few hills of rock, and a large portion of the surface consists of sandhills of considerable height, called Thar or Thurr, or Thul. When rain fails, crops of bajra (Penicillaria) are raised; and when they fail, the population live principally on the milk of cattle and on imported grain. Throughout the sandy tracts of this desert the vegetation consists of the Calligonum polygonoides (Phog, Hind.; Tob, Sind.), Areus javanica (Bhui, Hind.; Bahuss, Sind.), Anabasis multiforma (Lana, Hind.), and Mart, a coarse grass growing in tufts, abounding on the sandhills, and spreading for miles on the plains. Phog and Bhui, also Oranthera viminea (Kip, Hind.), are peculiar to the sandhills. Between the sandhills, Calotropis procera, Salvadoria Persica, Acacia rupestris (or Kejri), Capparis aphylla, Zizyphus jujuba, and a few other plants, are commonly found. After rain, numerous herbs spring up, and a grass called Brut (? Cenches bubiforus), the spiny seeds of which attach themselves to one’s clothes like burrs. Divested of their spiny covering, they are made into a kind of bread. Birds are numerous; hyenas, wolves, jackals, the desert fox, Vulpes leucopus, V. Boulengeri, also Lynx Felis cascaric; and the desert jerboa rat, Gerbillus huricane, in incredible numbers, perhaps a burrow in every square yard.

A traveller proceeding from the ‘Khachee’ or flats of Sind to the east, sees the line of the desert distinctly marked, with its elevated teebah or sand ridges, under which flows the Sankra, which is generally dry, except at periodical inundations. These sandhills are of considerable elevation, and may be considered the limit of the inundation of the ‘Sweet-river,’ the Meetha Muran, a Seythic or Tartar name for river, and by which alone the Indus is known from the Punjab to the ocean. The teebah or sandhills occupy a large tract in Eastern Sind, extending the whole length of the province along the edge of the Indus alluvium. They are in ridges which run E. and W. or N.E. and S.W. Sir B. Frere says some of them are 400 or 500 feet high.

The Rumm, Ran, or Rimm is a salt marsh, 150 miles broad, into which the Loni or Looni or salt river enters, and then runs on to the sea. The Looni rises in the Arvali. In Marwar it separates the fertile land from the desert, afterwards runs through the Chauhan territory, dividing it into the eastern part, called Raj-Bah or Sooi-Bah, and the western part, called Parkar or beyond the Khar or Looni. The Kagger rises in the Siwalik Hills, flows under Bhatnair walls, and once emptied itself between Jeyulsmir and Rori Bukkur. The rainfall is 18 inches at Nagar Parkar, 11.8 inches at Omerkot, but much less near Jeyulsmir and the centre of the desert.
DESERTS.

The Desert of India is known on its borders as Maroost'hali, the region of death, from Mr., Sansk., to die, and S'hali, arid or dry land, but it is also known as the desert of Rajputana. Maroost'hali is bounded on the north by the flat skirting the Gara; on the south by the Rumm, and Koliwara; on the east by the Aravalli; and on the west by the valley of Sind. It covers an area of 77,600 square miles. But for the Aravalli, which runs N.E. and S.W., dividing Rajputana into two equal parts, Central India would be submerged in sand; nay, lofty and continuous as is this chain, extending almost from the sea to Dehli, wherever there are passages or depressions, there floating sand-clouds are wafted through or over, and form a little th'ul even in the bosom of fertility. Whoever has crossed the Bunas near Tonk, where the sand for some miles resembles waves of the sea, will comprehend this remark. This desert has small scattered spots of fertility, with great arid portions called thar, thur, or th'ul, denoting tracts particularly sterile, therefore the converse of the oasis of the Greeks, and each with a distinct name, as the th'ul of Kawur, the th'ul of Goga, and others. A tradition exists to the effect that in remote ages it was ruled by Powar or Pramara Rajput princes from nine fortresses, viz. Poogul, Mundore, Maru, Abu, Kheralu, Parkar, Chotun, Omerkot, Arora, and Lodorva. From Bhalotra on the Looni, throughout the whole of Dhat and Oomra-i-Soomra, the western portion of Jeyusulmir, and a broad strip between the southern limits of Daodputra and Bikanir, there is real solitude and desolation. But from the Satlej to the Rumm, a space of 500 miles of longitudinal distance, and varying in breadth from 50 to 100 miles, numerous oases are found, where the shepherds from the valley of the Indus and the Thul pasture their flocks. The springs of water in these places have various appellations, ter, par, rar, dur, all expressive of the element, round which assemble the Rajur, Sods, Mangnial, and Sahrai, inhabiting the desert. The whole of Bikanir and that part of Shekhvatt north of the Aravalli are comprised in the desert. Jeyusulmir is nearly in the centre of what may be termed entire desert, is in fact an oasis, but the largest oasis of the desert, everywhere insulated by immense masses of th'ul, some of which are 40 miles in breadth. The rock on which the castle is built has three peaks or tri-cuts. Westward from this, from 400 or 500 miles, with 100 or 200 miles in breadth, are little scattered oases, on which the shepherds of the tribals pasturage.

The whole of the Bikanir principality, with the exception of a few isolated spots or oases scattered here and there, consists more or less of sand. From the eastern to the western boundary, in the line of greatest breadth, it is one continuous plain of sand, though the teeba or sandhills commence in the centre of the country, the principal chain originating in the tracts bordering the eastern valley of the Indus, and terminating its elevations about the heart of Bikanir. On the N.E. quarter, from Rajgurh to Nohur and Raotsir, the soil is good, being black earth, slightly mixed with sand, and having water near enough to the surface for irrigation; it produces wheat, gram, and even rice in considerable quantities. The same soil exists from Bhatnair to the banks of the Gara. The whole of the Mohilla tract is a fertile oasis, the teeba just terminating their extreme offsets on its northern limit; being flooded in the periodical rains, wheat is abundantly produced. In 1881, the population of Bikanir was 509,021.

The deterioration of the Bikanir region, within three centuries since the Rajput supplanted the Jit, almost warrants our belief of the assertion that these deserts were once fertile and populous. The princes of Bikanir used to take the field at the head of 10,000 of their kindred retainers. The commercial towns of Churu, Rajpur, and Rimne, as entrepôts, supplied the country with the productions of Sind and the provinces to the westward, or of those of Gangetic India. The same cause affected Jeyusulmir, Bikanir, and the more eastern principalities. The Maldote of Jeyusulmir, and the Larkhani of Jeypore, were as notorious as the Beedlouw of Bikanir; and to these may be added the Sahrai, Khossa, and Rajjur, in the more western desert, who in their habits and principles Tod described as demoralized as the Barbouins of Arabia. The line of greatest breadth of Bikanir extends from Poogul to Rajpur, and measures about 180 miles, while the length from north to south between Bhatnair and Mahajin is about 160 miles; the area may not exceed 22,000 miles. Formerly they reckoned 2700 towns, villages, and hamlets scattered over this space, one-half of which are no longer in existence. The tract to the N.W. of Jaetpur in Colonel Tod's time was perfectly desolate, and nearly so from that point to Bhatnair; to the N.E. the population was but scanty, which observation also applied to the parts from the meridian of Bikanir to the Jeyusulmir frontier; while internally from these points it is more uniform, and equals the northern parts of Marwar. Three-fourths of the people are Jit; the rest are their conquerors, descendants of Beeka, including the Sarsote Brahmanas, Charans, Bardas, and a few of the delaced classes, whose numbers are not one-tenth of the Rajputs. In Colonel Tod's time the Jit were the most wealthy as well as the most numerous portion of the community. Many of the old Bhumia landlords, representatives of their ancient communal heads, were men of substance. Sarsote, properly Saraswati, Brahmanas are found in considerable numbers throughout this tract. They aver that they were masters of the country prior to the Jit colonists. They are a peaceable, industrious race, and without a single prejudice of the order. They eat meat, smoke tobacco, cultivate the soil, and trade even in the sacred kine. The Charans are the sacred order of Marwar. They the wandering herdsmen and the heroic lays of the Bard more than the homily of the Brahman. The Charan are throughout reverence by the Rahtor, and hold lands, literally, on the tenure of an old song.

The Jhalawar or Jhalore tract is one of the most important divisions of Marwar. In 1881 its population was 340,488. It is separated from Sewanchi by the Sookri and Khari, which, with many smaller streams, flow through them from the Aravalii and Abu, aiding to fertilize its 360 towns and villages, forming a part of the fiscal domains of Marwar. The important fortress of Jhalore, guarding the southern frontier of Marwar, stands on the extremity of the range extending north to Sewanchi. Sewanchi is the tract between...
DESECTS.

The looni and Sookri. Macholah and Morson are the two principal dependencies of Jhalore. Beemun and Sancheore are the two principal divisions to the south, each containing 80 villages. Bhadrajoin, a fief of Jhalore, has a Joda chief and Meena population.

The Thul of Goa is very thinly inhabited; it has many sandhills, thul-ka-teebah. The Thul of Tiruoe lies between Goa Deo and Jeyulsuir.

The Thul of Khawar is between Jeyulsuir and Barmar, in the most remote angle of Marwar. Barmar thul, also called the Mulli-nath-katul, is occupied by cattle-breeders.

The Khedar, or land of Kher, and Nagar Goooroh, on the Looni, are the chief thul.

The Chauhan Rajput of the desert has, on the N. and E., the above tracts of Marwar, to the south Kolivara and the Rumm, to the west the desert of Dhat. The sterile ridge which passes through Chatun to Jeyulsuir passes west of Bankai on to Nagar Parkar. The wells are 65 to 130 feet deep. The Sahrai, Khossa, Koli, and Bhill inhabitants are predatory. The Chauhan Rajput does not wear the zonar, and does not much respect the Brahman. The Pitthil and Banya are farmers and traders.

Malli and Noe, gardeners and barbers, are important members of every Rajput family, and to be found in all the villages, of which they are invariably the cooks.

Choora and Thaor were, in Colonel Tod's time, actually castes of robbers, the former from the Lakhi jungle, the latter from Mewar. Most of the chiefs had a hand in their pay, entertained for the most desperate services. The Babadewan chief had expelled all his Rajputs, and retained only Choora and Thaor. The Choora were highly esteemed for fidelity, and the barriers and portals throughout this tract were in their custody. They enjoyed a very singular perquisite, which would go far to prove their being the aborigines of the country, namely, a fee of four copper coins on every dead subject, when the funeral ceremonies are over.

The Rahtor of Bikanar bear a mortal reputation. The Rahtor of the desert have fewer prejudices than their more eastern brethren; they will eat food without inquiring by whom it was dressed, and will drink either water or wine, without asking to whom the cup belonged. They would make the best soldiers in the world if they would submit to discipline, as they are brave, hardy, easily satisfied, and very patient; but in the midst of opium and in accordance with intoxicating herbs, are said to exceed all the Chatees Rajuela, the thirty-six royal tribes of India. The piala or 'cup' is a favourite with every Rajput who can afford it, and is, as well as opium, a panacea for ennui, arising from the absence of all mental stimulants, in which they are more deficient, from the nature of the country, than most of their warlike compatriots.

Bhatnair, now an integral part of Bikanar, was anciently the chief abode of another Jit community, so powerful as at one time to provoke the vengeance of kings, and at others to succour them when in distress. The Bhatti annals confirm what might have been assumed without suspicion, that to a colony of this race Bhatnair owes its name, though not its existence. The whole of the northern part is called Nair in the ancient geographical nomenclature of Maroosthali; and when some of the Bhatti clans became Mahomedan proselytes, they changed the vowel a to u, to distinguish them from the parent stock, viz. Bhatti for Bhatti. In all probability, the Yadu-Bhatti is the original Yiti colony from Central Asia; and the Jit prince of Salpur was the predecessor of these very races. Bhatnair has attained great historical celebrity, from its position being in the route of invasion from Central Asia to India. It is more than probable that the Jit name was transferred to the Mahomedans who seized Ghazni in a naval warfare on the Indus, and long before that period established themselves in the desert as well as in the Punjab; and as we find them occupying a place amongst the thirty-six royal tribes, we may infer that they had political power many centuries before that conqueror. In A.D. 1205, only twelve years after the conquest of India by Shahab-ul-Din, his successor Kutub-ul-Din was compelled to conduct the war in person against the Jit of the northern desert, to prevent their wresting the important post of Hansi from the empire; and when the unfortunate and intrepid queen Razia, the worthy heiress of the great Firoz, was compelled to abandon her throne to a usurper, she sought and found protection amongst the Jit, who, with their Scythic brethren the Ghikar, assembled all their forces, and marched, with their queen at their head, like Tomyris of old, to meet her foes. She was not destined to enjoy the same revenge, but gained a glorious death in the field of battle, and at the feet of the law of India. Again, in A.D. 1397, when Timur invaded India, Bhatnair was attacked for having distressed him exceedingly on his invasion of Multan, when he in person scouried the country, and cut off a tribe of banditti called Jit. In short, the Bhatti and Jit were so intermingled, that distinction was impossible. Shortly after Timur's invasion, a colony of Bhatti migrated from Marote and Phooha, under their leader Berti, and assaulted and captured Bhatnair from a Mahomedan chief.

The Indian desert differs very materially from that portion of the great African desert in the same latitudes. Water at 20 feet, was found at Mourzuk by Captain Lyon; this, in the Indian desert, is unheard of. At Daisnokh, near the capital, the wells are more than 200 cubits, or 500 feet, in depth; and it is rare that water fit for man is found at a less distance from the surface than 60 feet, in the tracts decidedly termed Thul or desert tracts. Some of the flats or oases, such as that of Mohilla, are exceptions, and abundance of brackish water fit for cattle is found throughout at about 30 feet. All the wells are lined with basketwork made of p'gok twigs, and the water is generally drawn up by hand-lines. Water is sold in all the large towns by the Millari race, or gardeners, who have the monopoly of this article. Most families have large cisterns or reservoirs called tanka, which are filled in the rainy season. They are of masonry, with a small trap-door at the top, made to exclude the external air, and having a lock and key affixed. Some large tanks are established for the community, and this water keeps sweet for eight and twelve months' consumption.

It was through this tract that Humayun sought refuge to the Dhat country; and at Omerkot, its capital, Akbar was born. Omerkot was
wrested from the Soda race by the Rahtr tribe of Marwar, and since then the chiefs of the expelled clan have dwelt in Chore, 15 miles N.E. of Omerkot. At one time every third year brought famine. The Soda women of this desert tract of Bhatta are proverbially handsome. In this desert and in the valley of the Indus are the Soda, Cat'hi, and Mallani, descendants of the sogdi, Cat'hi, and Malli, of Getes and Yuti, many of whom call themselves Baluch, or keep the ancient name of Numri, whilst the Zj'hut or Jut retain their primitive appellation; also remains of the Johya and Dahya, who, with the Geta, Jut, or Jum, hold places amongst the 36 royal races of ancient India. The Baraha and Lohana tribes are there, the Sahrai, the great robber of the desert, the Bhatti, Rahtr, Joda, Chiefan, Kaorwa, Johya, Sultan, Arora, Khoomra, Sinuli, Malsuri, Bishnavi, Jakkur, 'Shig, Ashig, and Poonda.

The origin of the Mahomedan Kullora and Sahari is doubtful, but the Nyad or proselytes from Rajput or other Hindu tribes are Jut, Rajur, Oomra, Soomra, Mair or Mer. Mor or Mohor, Baluch, Loomri or Looika, Sameicha, Mangulia, Bagcreah, Dahya, Johya, Khairowii, Jangurea, Onoudur, Bairowi, Bawuri, Tawuri, Chrendea, Khossa, Sudani, Lohana. These converts were ferocious and intolerant.

Arora, a thriftye race, tradesmen and farmers. Bhattiah, formerly martial, now traders like the Arora, and both these have commercial agencies all over India. Brahman, Bishnavi, cultivators and graziers, numerous in Dhat, some in Chore and in Omerkot, Dharms, and Mittii. Daudpura, founded by DAoud Khan from Shikarpur. Dute or Dhati, like the Kaorwa, a pastoral race of Dhat; their cows give 8 or 10 scores of milk daily. Kaorwa, a peaceable nomade race, chiefly in the t'hul of Dhat, rear cattle.

Kullora and Talpur, Sind tribes, which furnished the last two ruling dynasties. The Kullora claim descent from the Abbasside khalifs, and the Talpuri from Mahomed, but both seem to be Baluch, which are essentially of Jit or Gete origin. The Talpuri (Tal' or Tar, Borassus flabelliformis or palmyra, and Para, a town) amount to one-fourth of the population of HydeTABAD, which they call Lohri or Little Sind. There are none in the Thul. Lohana, numerous in Dhat and Talpura; they are scribes and shopkeepers. Jakkur, 'Shig, and Pooviah, harmless, industrious, in the desert and the valley, are denominations of the Jit race, but most of these sections have become Mahomedans, and call themselves Zj'hut.

Johya, Dahya, and Mangulia, once Rajputs, are now Mahomedans; are few either in the valley or desert, as also are the Baluch, Bairowi, Khairowii, Jangurea, Onoudur, and Bagcreah, descended from the Pramar and Sanka Rajputs. Zj'hut, Jut, or Jit, dwell in Sind from the sea to Daudpura, but not on the Thul. They are the old-stock of the proselytes to Mahomedanism.

Mair or Mer, of Bhatti origin. Mor or Mohor, of Bhatti origin.

Neouri, Loouri, or Looka, all of which mean fox, a subdivision of the Baluch race. Daudpura and Soomra are converts from the Pur or Pranara race; have mixed largely with Mahomedans. Rajur, a convert from the Bhatti, cultivators, shepherds, and thieves, and evil-livers. Rebarri, a race who in Hindustan profess Mahomedanism, and rear camels, here were a tribe who rear camels, or, with the Bhatti, stole them. Sahrai is the most numerous of the Mahomedan tribes of the desert, of which he was the terror. The Khossa is a branch of the Sahrai, whom in habits he resembles, plundering on camels, but they are cowardly and faithless.

The Soda is scattered over the desert, some are Mahomedans; the Sumeicha is a Mahomedan proslyte from the Soda.

Sumeicha, converts to Mahomedanism from the Soda race; some are pastoral, some are plunderers. They are dirty, and never shave. Tawuri, 'Thor, or T Ori, dwell in the t'huls of Daudpura, Beejnot, Noke, and Noakote, and Oudur; they own and hire out camels, but, like the Bawuri and Khengar, are great thieves, and are called 'bhoott,' or evil spirits, and sons of the devil.

Desert of Gobi. The great highway between Pekin and Europe from time immemorial, has been the caravan tract from the western end of the great wall across this desert. The route issues from the western end of the great wall, and, moving through the Kaiyau pass, has to traverse N.W. 500 miles of a desolate sand desert to reach the city of Khami. At this town the road bifurcates, the upper branch leading through Barkui, Urumchaj, and Kurkur-usu into Zungaria; the lower through Pijan, Turfan, Karasalar, and Kuchu to Aksa in Eastern Turkestan. While Chinese rule prevailed, Zungaria and Eastern Turkestan formed the province of Il. Gobi desert in 1860 reached within 6 miles of the town of Ichi on the N.E., but its shifting sands move along in vast billows, overpowering everything. Mr. Johnson was told that on one occasion, in the space of 24 hours, 360 towns were buried. Ichi and Yarkand are said to have been founded after this event. Near Ichi, the edge of this desert has the appearance of a low range of broken hills, and consists of hillocks of moving sand, varying in height from 200 to 400 feet. The belief that wildernesses are haunted places, is a very old and general one. Jesus himself, in a very solemn passage (Luke xi. 24), adopts the Jewish phraseology as to this belief. Pliny says (vii. 2) that in the deserts of Africa phantoms in human shape appear to travellers, and immediately vanish again. But the belief is especially prevalent among the nations of Central Asia. By them deserts are held to be the special headquarters and rendezvous of malignant spirits; hence the wilderness of Turan, and particularly the great sand waste of Gobi, have from hoar antiquity had an evil fame. The Turks have a saying that evil spirits play at ball in desert places. Both Pa Hian and Marco Polo allude to the evil genii of the deserts of Central Asia; and Rubraquis tells of a frightful defile, where the demons were said to snatch travellers off their horses. The Afghan believe each of the nume-
rous solitudes in the mountains and deserts of their country to be inhabited by a lonely demon, whom they call the Ghoul-i-Biaian, or spirit of the waste, a gigantic and frightful spectre, which devours passengers.—Schmidt, p. 352; Tude's Cathay, i. p. 157; Tod's Rajasthan, i. p. 19, ii. pp. 196, 202, 211, 289; Migman's Travels, p. 32; MacGregor, Khorasan; Mr. Johnson, R. Geog. Soc. Jr. 1847; Sir Bartle Frere on the Rann of Cutch; Pottinger's Travels; G. Rawlinson, i. p. 1; Major R. D. Upton, p. 165.

DESHASTH. Muni. A native country. Deshasthulu, native of Deshasth is a term by which the Brahmins of Maharastha are designated. They are described as a class of sedentary habits, extremely fond of their native place, very fond of display, and fond of rich and splendid clothes. On occasions of marriage and other festival ceremonies, they are lavish. Deshasth Brahman have acquired some literary celebrity, and have been largely employed under the several governments of India, chiefly in the revenue departments. The few Prakrit poets that have made their appearance are Deshasth, such as Wamun, Moropant, and Jagnath. Deshasth Brahman are better-featured than the Konkanasths, but the Konkanasth Brahman is fairer.

The social and political life of the Konkanasth Brahman has undergone a complete change since the beginning of the 18th century. Before that they were solely an agricultural class of people, visiting towns only on very unavoidable occasions. They possessed a good knowledge of the Vedas and Shastras, and were liberally rewarded on that account by the patrons of those branches of learning. They rarely held offices under Government, or in mercantile houses; on the advent of the British, they were compelled to come out for employment, and they at once spread all over the extensive table-land of Syhadri, called the Desh. Every department of Government contains Konkanasth Brahman, and they have shown themselves active, intelligent, liberal-minded men. The Deshasth from time out of mind have been in the possession of the rich table-land, and been Zamindars, Deshmukhs, Deshpandies, etc. They have never been distinguished for their knowledge of the Vedas or the Shastras. Once they were in sole possession of Government offices, but they have been greatly thrown into the background by the Konkanasth. All the lower class of offices, such as village accountants, etc., are, however, still in their hands.

DESIGN. Indigenous, belonging to the country. Par-desi, a foreigner, a stranger, a native of Northern India.—Elliott; Wilson.

DESIDEIRI. Pero Desideri, a missionary, started from Goa in November 1713, and, passing through Dehli and Kashmir into Baltistan, arrived at Leh or Ladakh on the 25th June 1714, and remained there for an entire year. From thence he continued his journey, in the autumn of 1713, to Lhasa, by a route of extreme elevation and great cold, which occupied from August 1715 to March 1716. Desideri found the temporal sovereignty of Lhasa in the hands of a Tartar prince (a Si Fan), who had recently conquered the country. —Princep's Tibet, p. 15.

DESIMA. The commercial site long occupied by the Dutch in Japan. It stands upon, and wholly covers, a little artificial fan-shaped islet, about 600 feet in length by 240 in breadth, and is joined to the island and town of Nagasaki by a small stone bridge, at the end of which was a strong Japanese guard-house.—MacFarlane's Japan, p. 51.

DES-KULKURN, under the Maharatta government, a revenue officer.

DESMANTHUS NATANS. Wilde.

Pani najak... Beng. | Sunday kiray... Tam.

This sensitive plant, with reddish flowers, floats in the tanks of India. Spongy bodies, formed between the leaflets, or as floats. When the water leaves it, it soon perishes. The leaflets and pods are eaten by the natives.—Jaffrey; Voigt; Thwaites.

DESMODIUM, a genus of small trees and bushes of the natural order Fabaceae. Voigt enumerates twenty-eight species in India. The bark of D. argenteum is steeped in water and made into ropes, which, when as thick as the wrist, bore a heavy strain where English rope snapped. The bark of D. tilaeolia is also made into rope, and its leaves are the shal-purni of the Panjeb bazar. Dr. Cleghorn says the Desmodium paper-shrub is exceedingly plentiful in the districts of Chota and Bara Bungalow, and in the Ravi valley; the plant having a wider range, and the bark being more easily stripped off, the fibre would be available in the plains at less cost than that of Daphne papryacea.—Drs. J. L. Stewart, Punjab Pl.; Voigt, Riddell, Cleghorn, Punjab Report.

DESMODIUM ARGENTEUM. Wall.

Sambar... Chienap. | Miss, Chiti of... Sueley.

A shrub of some size, which is found on several of the rivers, where the climate is somewhat dry, at from 3500 to 9000 feet. In Kanawar its bark is used for ropes, after steeping in water. These are not lasting, but very strong; and on the Hindustan and Tibet road, when plaited as thick as the wrist, were found to stand under a heavy temporary strain when English rope snapped. Cleghorn states that in Kanawar the bark is used for making paper.—J. L. Stewart, M.D.

DESMODIUM GYRANS, D. C.; Hedysarum gyrans, Linn. This small plant has pale yellow flowers, tinged with blue; its leaf is composed of three parts, a large broad leaf, having at its base two straight leaves. And during the entire lifetime of the plant, night and day, in drought or in humidity, exposed to the sun or in darkness, these small leaves make unceasingly little droppings, somewhat resembling the movements of the second hand of a watch. One of the two rises, and at the same time its twin leaf falls to a like amount. When the first descends the second remaints, and so on. These movements are more or less rapid in proportion to the heat and moisture of the weather. In India, these have been counted up to sixty regular falls in a minute. The large leaf makes similar movements, but less marked.

DESMODIUM TILLEFOIUM. Don.

Kathi... Beas. | Chmakat... Jilcum.

Gurkats... Chen. | Marra... Kangra.

Dud shambat... Kalaunchi... Panj.

Gur shagel... Ravi.

Chumgar, Chumara... Jil. | Laber. Kali-mort, Sultell.

This large, pretty flowering shrub grows near all the Panjeb rivers at 2800 to 8000 feet of elevation. It is browsed by cattle; the twigs are
DESMODIUM TRIFLORUM.

used for tying loads; and its tough bark is recommended for papermaking. Its lilac-coloured flowers grow in clusters.

DESMODIUM TRIFLORUM. De Candolle. D. heterophyllum, D.C. [H. stipulaceum, Burm.]

Hodysaryum tril., = Willy. Ascleynomene tril., = Poir.

Kudula, = Beng., Hind. = Munudma-mudda, = Tel.

Grows in Bengal and Peninsular India in several varieties. The fresh plant is applied to indolent sores.—Dryov; F. v. Mueller.

DEMOSTEMON ZETLANICUS. Thu. Wallakum-gala of the Singhalese. Central province of Ceylon, up to 4000 feet. Timber used for ordinary work.—F. Wright; Ferguson.

DESWAL or Dehmukh, a hereditary native officer under the Maharata governments, exercising chief police and revenue authority over a district. In the Akola district of Bora there are many Mahomedan Dehmukhs, descendants of Maharata and Brahman converts.

DESPANDYA, the hereditary revenue accountant of a district.

DESWAL, a tribe of Taga, in villages of Bhagpur.

DESWALA. Hind. Applied by Mahrattas to a native of the N.W. Provinces.

DESYADES. Panj. Land beyond the influence of inundation.

DETERGENTS. The Hindu and Mahomedan natives of India employ the following vegetable substances as detergents in the place of soaps:—Elapa kottai, kallee munnoo, kuppoo munjal, kushtoo munjal, mara kalm patatt, nalla yennal, paloo, paamshumung kattai, sikai, alkaranthool, villam cuumbo.

DEDICUS, sp., insects of the grasshopper tribe; they are kept by the Chinese in cages, for combatting. They live for months in captivity.—G. Bennett, p. 271.

DEUTZIA STAMINEA.

Phul kanri. = of Hazara. Sai. = of Chambara.

Phurri. = of Kashmir. Anuchi, Deus, of Bishahar.

A small-sized Panjabi wood, white and close-grained. The Deutzia genus is of the natural order Philadelphaceae. The leaves of D. scabra of Japan are so rough, that they are used for joiners’ work.—Powell.

DEVA, a deity; Devi, a goddess. The term is Sanskrit, and from the root Div, to shine, or Diu, the sky, the air, and is written and pronounced Deo, Deb, Dewa. Deva is cognate with the Latin Deus, Greek Zeus, Lithuanian Dievas, modern Persian and Hindi Deo, = Dewal (deo and alaya) being the house of God. Maha-deva, a title given to Siva by the Saiva sect, means great or supreme god, as Maha-devi, his wife, = title of Bhavani or Purvati, = means the supreme goddess. Deva, however, may equally, by the Vaishnava, be Vishnu. The word may also denote an idol, a man of high rank or sovereign, or a Brahman, or as a cognomen suited to Brahmanas, as Chandra-deb. Amongst the compounds of this word are Dewal or Deval, a Hindu temple, from Deva-alaya, a house of God; Deva-sera, from Deva, a god, and Sera, a soldier; Deva-jani, from Deva, a god, and Jaya, a wife; Devarshi, from Deva, a god, and Rishi, a sage. The Devata are subordinate deities in Hindu mythology; divine beings, celestial. They are not superior deities, nor are they deified mortals. The Devata people Swarga, the paradise of Indra, but are found also in Kailasa, that of Vishnu. When the Western Aryans broke off from their brethren the East Aryans and rejected the worship of their gods, the word Deva, which they specially applied to them, came to have a meaning equivalent to flesh, devil. The last term comes from the Greek, Latin, Italian, French.

Amongst the Hindus, there are three kinds of Devata, or deities to whom worship is given,—the Granadvata, or village god; the Kula Devata, the race or household or family god; and the Ishta Devata, the patron or personal deity of individuals. Adhi-devata is a primitive deity, Sthana Devata is a local deity. The Aryan Hindu does not recognise the village gods of S. India, but the non-Hindu Turanian races largely worship them; and even many of those Turanian races who have been converted to Hinduism worship them. They are mostly shapeless pieces of wood or stone smeared with vermillion, and mostly represent evil spirits or devils. These are the Amma, Ammum, and Amur of the eastern and southern districts of the Peninsula, and the Satwai, Bhaloo, Maha-devi of the Thalipeeth, and the Manoo, Gedh, Mang, and Muna of the northern and western parts of the Peninsula, all of whom are recognised as causing harm to individuals. In health they are neglected; but when sickness occurs, either to individuals or as an epidemic, these spirits of evil are worshipped with much solemnity, and bloody sacrifices are made to them of goats and sheep and bullocks and buffaloes.

DEVA-DARA. Hind. Cœdrus deodara, Large; Erythroxylon arceatum? Devadarum, Tam., is Sethia Indica, D.C.; and Guatteria longifolia, Wall.

DEVA-DARSA. Sansk. In the south of India, a visit to an idol by a bride and bridgroom, with their friends, at a particular period after marriage.

To the temples of Venus in Western Asia, and in later times in Greece, large bodies of hierodulies were attached, who were at once prostitutes and ministers to the goddess. The daughters of the most illustrious families in Armenia passed from the service of the goddess Anaitis into matrimony with those of equal rank, and no stain adhered to them from their former mode of life. We find traces of the same usage in the distant settlements of the Phoenicians on Mount Eryx, and at Siege Venereca in the Carthaginian territory. In Babylon, no woman, of whatever rank, could escape the obligation of once prostituting herself in the temple of Mulfitta. This debt once acquittet, as the necessary preliminary to marriage, they were ever afterwards faithful to its obligations, with whatever price they might be tempted. In Hindu mythology, the Devas are the attendants and the courtresses of Swarga, the heaven of Siva. The earthly Deva-dasa women, or dancing girls in attendance at the temples of the Hindu deities, by their name of Deva-dasa call themselves the servants or slaves of the god. Exodus xxxii. 19 tells us of the Israelites dancing in the presence of the idol which Aaron had made for them in the form of a calf, doubtless the Nandi bull, the vahan of Siva of the Hindus of to-day, and dancing before the
Hindu idols is a daily rite, and takes place at every Hindu festival.

The temple women of the Hindus originally appear to have been intended for the gratification of the Brahmanas only; but they were, in some parts of India, obliged to yield to all who solicited them, though consecrated in a special manner to the worship of the Hindu gods. Every temple, according to its size, entertains a band of them, to the number of eight, twelve, or more.

The service they perform consists of dancing and singing. The first they execute with grace, though with lascivious attitudes and motions. Their chanting is generally confined to the obscene songs which relate to some circumstance of the licentious lives of their gods. They perform their religious duties at the temple to which they belong twice a day, morning and evening. They are also obliged to assist at all the public ceremonies, which they enliven with their dance and song. They are reared to this life from their infancy. They are taken from any caste, and are not unfrequently of respectable birth. It is nothing uncommon to hear of pregnant women, in the belief that it will tend to their happy delivery, making a vow, with the consent of their husband, to devote the child then in the womb, if it should turn out a girl, to the service of the pagoda. And in doing so they imagine they are performing a meritorious duty. The life to which the daughter is destined brings no disgrace on the family.

Until towards the middle of the 19th century, these women were the only Hindu females in India who might learn to read, to sing, and to dance. Such accomplishments belonged to them exclusively, and were for that reason held by the rest of the sex in such abhorrence, that every virtuous woman would have considered the mention of them as an affront. That feeling has now greatly changed. They are now very generally kept by the wealthiest Hindu men. In some of the Hindu temples they are numerous. The temple of Kamakhya or Kamleucha is sacred to Durga, the Sakti of Siva. It is built on a hill rising about 700 feet from the river Brahmaputra, just below Ghowatty. It is said that in former times there were 5000 young girls attached to the temple. In 1872 there were still some hundreds there. In an inscription on a slab in the Bengal Asiatic Society's Museum, of date Sushat 32 of the Gaur era, about A.D. 1174, mention is made of Bhava Deva giving 100 damsels to a temple.

The eldest daughter of every family of the weaver caste, at the small town of Tiru-kali-kundram in the Chinglepunt electorate of the Madras Presidency, is devoted to the temple. She is reared in the weaver's habitation, being devoted to the gods to the exclusive of all other the labors of the weavers. Weaving, dancing, and music masters are provided. The Murli' girls of the Mahbratta country correspond to the Basava of the Teleng race. The Basava women are usually devoted to the goddess Siva, and become prostitutes. They are called the Linga or Garudu Basava, according as they are devoted to one or other deity. They are called also Jogin, and they are married sometimes to a dagger, sometimes to an idol. In making female children over to the service of a temple, a girl, generally an infant, is taken and dedicated for life to the service of some idol by a ceremony called Shej. A khanjar or dagger is put on the ground, and the girl who is to undergo the ceremony puts a garland on the knife. Her mother then puts rice on the girl's forehead. The officiating Bhutt then weds the girl to the dagger, just as if he were uniting her to a boy in marriage, by reciting the Mangalasalok, or marriage stanzas, a curtain being held between the girl and the dagger. The girl thus becomes a Bhavin, dedicated to the service of the temple. In many parts of the south of India, the non-Aryan races thus devote their young women, in order that they may follow prostitution openly, under the cloak of a religious rite. It is not easy to trace the origin of this custom; but at the Myllita festivals, which were connected with the worship of Baal or Moloch, the women, as slaves to the goddesses, were obliged to purchase exemption from being sacrificed by prostitution.

The devout Deva-dasa or temple servants are in a recognised office, and are obtained from Hindu races whose custom it has been for ages; or by Hindus vowing, in sickness or other affliction, to give one of their daughters to some particular temple, and the vow is scrupulously kept at the proper time; or by adoption. In the selection of girls for adoption in this profession, good-looking, well-made girls are chosen, and they are taught to dance at the early age of five. Older girls, when they adopt the profession, are also taught to dance. The lessons in dancing are given daily, two hours before daylight in the morning, one of which is devoted to singing and the other to dancing. At 4 P.M., the same number of hours are devoted, so that each girl has to practise for four hours daily, and in about three years she is supposed to have mastered the arts of singing and dancing. In Southern India there are reckoned six chief kinds of dancing:—1. Audo girathoo; 2. Ananeem; 3. Lencenhe nateem; 4. Moodelyido girathoo; 5. Hereaceothoo; 6. Colu autem. And the art of dancing, or Abinayam, is said to be exhibited in six different ways during these performances,—1. By the movements of the eyes, and 2. action of the features, and 3. attitude of the breast and chest, and 4. position of the hands, and 5. action of the feet, and 6. by calisthenic performances. By commencing their studies at the early age of five, these girls are able to make their appearance at about seven or eight years of age, very rarely earlier than that, and they continue dancing till thirty or forty years of age. When these girls, pagodas, as they are called, are worn as wages, the amount which is dependent on the wealth, sanctity, and popularity of the particular temple which they have joined. The money salary they receive is nominal, seldom exceeding a few annas, and sometimes a rupee or two a month. The chief object in being paid this sum as a salary, is to indicate that they are servants of the temple; in addition to this, one or more of them receive a meal a day, consisting merely of a mass of boiled rice rolled into a ball. They are required to dance six times a day at the temple before the deity, while the priests are officiating, but this duty is performed by turns. Dancing girls attached to pagodas are generally wealthy, and when they appear before
the public are well covered with the usual gold ornaments; if poor, tinsel is used, or golden ones are borrowed from others. Their heads, ears, nose, neck, arms, wrists, fingers, ankles, and toes are overlaid with jewels, and their hair frequently has flowers. The hair is divided in front along the centre, combed back, and parted into a single plate, falling loose on the back like a tail, averaging from two to two and a half feet in length, and always ornamented with jewels and flowers. Their dancing dress comprises usually the short bodice or choli, a pair of ravake or string drawers tied at the waist, termed pajumna or pavadi (both these are generally of silk), and a white or coloured muslin wrapper or saree. One end of the saree is wound round the waist, and two, three, or more feet, according to the length, is gathered and tucked into the portion encircling the waist, and permitting of a folding fringe or gathering of the cloth in front; while the other end, taken after the usual native fashion over the left shoulder, falls towards the waist, where the end or muthani is opened out and allowed to drop in front, one end of it being tucked into the waist on the side and the other left free. This portion of the saree is usually highly ornamented with golden thread, tinsel, etc. The free end descends to the middle or lower part of the thighs; the other free end of the saree hanging down towards the legs is now caught hold of, passed between the legs, and fastened to the tie around the waist at the back, and the whole encircled by a gold or silver waist-belt. By this mode of dress a fold of the muslin saree forms a loop round each leg, and descends nearly down to the ankles, whilst the gathering hangs in the front between the legs free. At home they wear the choli and saree, with a petticoat or pavadi; this, in fact, is their usual dress, except when about performing they exchange the pavadi for the pajumna or sharni. The pavadi is made of chintz or silk, according to the means of the individual. A string of small brass bells, known by the name of shulluagy or jeydim, is tied around each leg immediately beneath the ankles.

The dancing girl caste have peculiar laws for adoption and inheritance. A dancing girl can adopt a daughter, with the permission of the authorities of the pagoda to which she belongs; but she cannot adopt a son for the transmission of property, it being immoral whether she have a son or not. The adopted girl cannot share her mother's property during her lifetime; and although she may be the heiress, she is not bound by the laws of caste to support her brother's widow. Among dancing girls property descends in the female line first and then to males as in other castes. In the failure of issue, the property of a dancing girl goes to the pagoda to which she belongs. A simple recognition on the part of a dancing girl of a child as her daughter, in the presence of one or more individuals, is sufficient to constitute her claim to adoption.

Dancing girls are respected by the several castes or sects of Hindus, and are allowed to sit in the assembly of the most respectable men, such honour not being accorded to their own wives and daughters. As a rule, it is seldom that these women have children of their own, unless, perhaps, they had lived in continual concubinage with some single individual; consequently they are always anxious to adopt girls, not only to become their successors in the temple, but that they may inherit their property likewise. Formerly a large trade was carried on by kidnapping good-looking girls from large towns and remote villages, who were sold to these women. Females in Ganjam, Orissa, and Bengal were taken advantage of, not only by abandoned characters, but also by immoral native princes, for the basest purposes. During a criminal session in Calcutta, two women were sentenced to seven years' imprisonment each, for having purchased a girl under sixteen years of age, for one rupee ten annas. In some places there are said to exist two kinds of dancing girls,—the dancing women differing from the pagoda dancers. The latter are said to live in concubinage as a rule. They are a privileged class under the Aylah Santanam, or descent by the daughter's children, or in the female line, and the law of Dhyia applies to them; Dhyia Baga, or division by favour, Merasi heritage of right to official emoluments, operates as an accommodation. These classes are recognised as Dasi and Deva Dasi. The Deva dancing women belong for the most part to itinerant bands, and are frequently made up of women of low caste, who practise their professional accomplishments and prefer living in concubinage. The Siva temple of the Souarnamookie (Kalastry), a zamindari in the North Arcot district, maintains a large establishment of what is termed Deva Dasi or pagoda dancers, forming a distinct community there (Audapalpu), who live exclusively in concubinage. Their sons, who know no father, pass by the appellation of Nagari Kumara, or sons of the country, and are slaves to the zamindar. Of the daughters, after supplying the vacancies in the pagoda staff, the remainder are brought in the list of drudges of the palace. The dancing-master or teacher receives from fifty to five hundred rupees, with other presents, for teaching a girl the usual dances. This generally forms a contract which is greatly dependent on the wealth and position of the parties.

Dancing girls, when performing, are accompanied by two men singers, termed Nuthvan and Padowen, who, while singing, also play the cymbals; these instruments are of two kinds and sizes. While the cymbal is played with the right hand, the left hand, open, is generally applied to the left ear while they sing, bowing their bodies forward as well as from side to side, contorting their faces in like manner, and making grimaces. In singing they scream as loud as their voice and lungs will admit; one or more old women join in the song, and frequently clap their hands during the performance; they are generally dancing girls who have given up the profession from age or other causes. Some of the girls are very good-looking, handsome, with open countenances, large sparkling eyes, regular features, and intelligent pleasing appearance. They are perfectly self-possessed in manner, verging on assurance, staring at one with their large, intelligent-looking eyes. Notwithstanding, they possess a vast deal of courtesy and polish, tempered with languid grace and serene self-possession, whilst their manners are courteous and their bearing unembarrassed, possessing all the teaching which experience of the worst side of human nature gives, and they know but one form of pleasure, the degrading manner in which
their lives are spent. The majority possess some natural gifts. As to conversational powers, they seldom possess any beyond the usual laugh and giggle, and monosyllabic replies given to common-place questions. Some of the Telugu girls are very handsome, of a light pale colour, somewhat yellowish in tinge, with softness of face and feature, a gentleness of manner, with a peculiar grace and ease, which one would little expect to find among them. A ladylike manner, modesty and gentleness, such beautiful small hands and little taper fingers, the ankles so neatly turned, as to meet to separate conveniently. They can generally read and write their own language, and pretty correctly—some two languages. One girl at Conjeveram wrote three; the third was English, in which she wrote her name in a fair round hand, and spoke the language with some fluency; Tamil and Telugu were the other two languages, which she wrote tolerably well. She was said to have received her education in a mission school at Madras, but did not appear ashamed of her profession. She was doubtless a girl who had been devoted to the temple in her infancy. A similar case of a mission-taught girl occurred in Mysore about 1870. Their songs generally comprise praises in honour of their several idols, filled with repetitions and unmeaning expletives. These songs are often vulgar and lewd, and sung before assemblies of men, and before the deities, but they time the quality of these songs to suit the place and audience before which they are to appear. Nanthches are given on all occasions of marriage ceremonies, feasts, and other public occasions. Among rajas, zamindars, and others, they are almost things of daily occurrence. A few of these girls can play the native guitar or violin tolerably well, and some of their songs have a mournful and melancholy tune; the harsh grating of the songs of the attendants, and the rattling of the wind instruments and tom-toms, are, however, disliked by European ears, though they charm the natives. When their services are demanded outside the temple, larger sums of money have to be paid for them, the charge being increased according to the renown and position of the girl, as some few will not give their services to any one unless a raja or some person of rank. Some travel to other districts when their services are needed by petty rajas or zamindars, and they are considered for as many days as they have to perform, in addition to being well paid. They frequently receive valuable presents, in money, shawls, gold bangles or rings, which are bestowed on them during the performance. Every village of importance has a temple with a few of these women attached to it, and in some of the large towns, possessing temples of repute for sanctity, these are filled with them. It is perhaps one of the worst institutions connected with Hinduism, from the recognition and support it receives from all classes of idol-worshipping devotees, the women being the victims of such a system, recognised and patronised in every part of India where Hinduism predominates. These poor creatures being taught to read and write their own and other languages, with a view to be better able to master the lewd immoral songs; whilst their own wives, the mothers of their children, are deprived of learning of any kind, and are carefully shut out from society, not even allowed to appear in public before any assembly of men, and are allowed, further, to grow up in the greatest ignorance and superstition. To some extent female education and enlightenment are now penetrating the masses, and the natives themselves are seeking enlightenment and intelligence, from which their own mothers, wives, and daughters have hitherto been secluded.—Dr. Shottt, the Anthropological Society of London Journ. iii., 1867-68.

DEVADAT, brother-in-law of Sakya. He raised a solemn against the teaching of Sakya, whom he attempted to kill, but, according to the Buddhist legend regarding him, the earth opened and destroyed him and all his followers, and as he fell down into hell he was transfixed with three perpendicular hot irons, whilst three others pierced his shoulders transversely. The Burmese consider that Devadat was Jesus Christ, and the Siamese think that Devadat is the God of Europe.

DEVADA or Deo-dat, a Hindu man's name, literally god-given—Theodotus.

DEVADI, an island in Bombay harbour, known to sailors as Butcher Island. The native name, properly Deva-dwipa, means the Island of the gods, or Holy Island.

DEVADIGAR, KARN. A low-caste member in the temples of the south of India.—Wils.

DEVAKI, sister or cousin to Kansa, king of Mathura, and the wife of Vasudeva. Krishna was their eighth child.

DEVALA, MAHER, also Devalanada, KARN, a Brahman of an inferior order, who attends upon idols, and lives upon the offerings made to them. Devalaya, from Deva, a god, and Alaya, a house, a temple; the house of God. The same term is applied to an oath taken in a temple.

DEVALAS. Several Sanskrit writers had this title. One was author of a code of law, one an astronomer, one was grandfather of Panini, and one a Hindu mendicant who resided at Hurdwar, and was one of the Srami writers.—War, iv. p. 28.

DEVALAS. Hind. An ordeal. See Divination.

DEVALA-LOKAS. SANSK. The habitations of the Deva. In Hinduism there are six celestial worlds between the earth and the Brahma-loka.—Harvy's Eastern Monachism, p. 453.

DEVANA, NAGAR, an alphabet in use in India. It was introduced into Tibet from Kashmir in the first half of the 7th century of the Christian era. Deva-Nagari is the ancient alphabet of India, inscriptive, in capitals, and is a modification of the inscrptional and monitory Pali. The alphabets of the various languages allied to the Hindi are modifications of the Deva-Nagari alphabet. It is the character in which Sanskrit is usually written. Mr. Wathen, like Mr. Prinsep, refers the modern Deva-Nagari, through various changes which he shows in inscriptions of different ages, to the Old Pali lat or column character.

DEVANGA, KARN. A Lingnet, one who carries the emblem of Siva on his person.

DEVANGA or Devanaga. TEL. Devangadha, KARN. The title assumed by the caste of weavers in the Karnatia.

DEVANGANA, amongst Hindus, the celestials minstrels who perform before Mahadeva. They are also called Gandharva, also Apsaras. Their instruments are the tambourine, cymbals, castanets, lute, and violin.
DEVANHALI.

DEVANHALI, a small town in Mysore, 23 miles from Bangalore. It was formerly the seat of a family of Polygars, who traced their descent from one of the refugees of the Morasa Wakkalka tribe, who founded petty dynasties throughout Mysore in the 14th century. The last of the Gaudas, as the chiefs were called, was overthrown in 1748 by the Hindu raja of Mysore. It was in the siege of Devanhalli, on this occasion, that Hyder Ali first gained distinction as a volunteer horseman, and it was here that his son Tipu was born. Hyder erected a fort of stone, which was captured by Lord Cornwallis in 1791.—Imp. Gaz.

DEVA PAL DEVA. From a copper tablet discovered at Monghir, Raja Deva Pal Deva appears to have reigned in the 9th century as far as the Karnatic and Tibet.?

DEVARAM, a famous Saiva poem, part of the so-called Tamil Veda.

DEVASTHALA. SANSK. A temple of the Hindus, any sacred place.

DEVASTHANAM, the superintendent of Hindu temples, conducted by trustees called Dharma Karta.

DEVATA, from Deva, a divinity, a spirit, a demigod. The Devata are benign spirits, governed by Indra, properly the inhabitants of the North Pole, for the Devata are said to have day when the Daitya have the night, and vice versa. Amongst the Hindus there are several kinds of Devata or deities to whom worship is given,—the Gramma-devata or village god; the Kula-devata, the race, household, or family god; and the Ishta-devata, the patron or personal deity of individuals; Adi-devata is the primitive deity; Sthana-devata, local deity. The Aryan Hindu does not recognise the village gods of Southern India, but the non-Hindu Turanian races largely worship them; and even many of those Turanian races who have been converted to Hinduism, worship them. They are mostly shapeless pieces of wood or stone smeared with vermilion, and usually represent evil spirits or devils. These are the Amma, Amman, and Amur of the eastern and southern parts of the Peninsula, and the Satwai, Bhairo, Massoba, Chamanda, Asra, Ai, and Marryai of the northern and western parts of the Peninsula, all of whom are recognised as causing harm to individuals. In health they are neglected; but when sickness occurs, either to individuals, or as an epidemic, these spirits of evil are worshipped with much solemnity, and bloody sacrifices are made to them of goats and sheep, and bullocks and buffaloes. Gotra or Kula mean a family, and is used amongst Kathariya and Vaisyas as well as Brahmas. The Gotra depend on a real or imaginary community of blood, and then correspond to what we call families. No Hindu house is supposed to be without its tutelary divinity, but the notion attached to this character is now very far from precise. The deity who is the object of hereditary or family worship, the Kula-devata, is always Siva, or Vishnu, or Durga, or other principal personage of the Hindu mythology; but the Griva-devata or household god rarely bears any distinct appellation. In Bengal, the domestic god is sometimes the Saligram, sometimes the tulsi plant. Sometimes he worships with a little rice in it, and sometimes a water jar, to any of which a brief adoration is daily addressed, most usually by the females of the family. Occasionally small images of Lakshmi or Chandi fulfil the office, or, should a snake appear, it is worshipped as the guardian of the dwelling. In general, in former times, the household deities were regarded as the unseen spirits of ill, the ghosts and goblins who hovered about every spot, and claimed some particular sites as their own. At the close of all ceremonies, offerings were made to them in the open air, to keep them in good humour, by scattering a little rice, with a short formula. Thus, at the end of the daily ceremony, the householder is enjoined by Menu (8.30) 'to throw up his obligation (ball) in the open air to all the gods, to those who walk by day, and those who walk by night. In this light the household god corresponds better with the genti locorm in than with the Lars or Pantes of antiquity.—Wilson's Hindu Theatre; Warren, Kala Saukita.

DEVA-TOTTHA-PANA. SANSK. Dismissing or releasing the deities who have been invited to a ceremony, at its conclusion.

DEVAYANAI or Devasena, one of Subrahmanya's wives.

DEVENDRA, the king of the Deva.

DEVER, the tribal designation of the Maravar race in Ramnad, Madura, Shriganga, and Tinnevelly. It seems identical with the Telugu Dewara or Devem, a respectful mode of address to a superior.

DEVI. SANSK. A goddess, the feminine of Deva, a god. It is one of the titles of the Hindu goddess Durga, also known as Kali, and when used alone is understood to designate Parvati, the sakti or wife of Siva. Devi, as Durga, in the south of India is represented in paintings as a beautiful woman riding on a tiger, but in a fierce and menacing attitude, as if advancing to the destruction of one of the giants, against whom her incarnations were assumed. Devi, as Kali, in another form, an especial favourite in Bengal, is represented with a black skin, and a hideous and terrible countenance, streaming with blood, encircled with snakes, hung round with skulls and human heads, and in all respects resembling a fury rather than a goddess. Her rites in those countries correspond with this character. Goats and sheep and other animals, and even human beings, are offered in sacrifice. See Chandra; Dasshara or Dashaara; Kali; Karari; Langa; Lustral Ceremonies; Mahadeva; Mahadevi; Parvati; Sacrifice; Satarupa; Serpent; Vishnu; Yavana.

DEVICOTTAH, a fortress on a small island at the mouth of the Colerun, in lat. 11° 22' N. Devicotah frequently changed hands during the contests between the British and French in the 18th century.

DEVIL BIRD of Ceylon has its ordinary cry like that of a hen just caught. Its screams are like those of a youth in agony. It is said to be an owl, the Sturnus Indrani, also a species of Gualama. Mr. Mitford supposed it to be a goat-sucker, a cuckoo, or a blackbird.

DEVIL GOAD.

Croton oblongifolium. R. l. p. 635.

Dhathamkasaam. SANSK. | Dhatala Bhai, TEIL.

The Telugu name signifies 'demon driver' or 'devil goad,' and sticks made of this tree are carried as a protection against evil spirits.

DEVILS and Devil-dancers. The ordinary
DEVILS.

word in use in the Tamil country to designate a devil is Paisacha or Pisacha, and the temple raised to a Paisacha is a Pekoll; but the former seems rather to be an evil spirit, and the latter a temple to an evil spirit. All the Aryan and non-Aryan Hindu and Buddhist races of India, and all the races in the Malaya and the Eastern Archipelagoes recognize the existence of spirits both good and bad; and the whole series of the funeral ceremonies from the date of the death of a Hindu until the demise of his son, are instituted from the belief that the spirit of the deceased is present and can accept oblations; and there are even instances where contracts have been entered into or renewed with the spirit of a deceased owner. The Hindus have a hell, Narakam, and a devil, but the spirits of the non-Aryan races seem to refer to evil spirits. In their belief, if any good man die, his spirit may occupy a tree or stone or other locality, and be an evil spirit; may even take possession of one of his votaries, in which event the screaming and gestulating of the possessed person are attributed to the spirit in possession, and in the Urdu tongue the phrase would be, 'Saya, uska angh bharo,' the shade has filled his body; and the possessed person prophesies. In their belief, every malady may be the infliction of an evil spirit. To dispossess the spirit, wild music and dancing are had recourse to, and the possessed, generally a woman, enchained, by her Partholong, falls down utterly exhausted, is seized with violent hysteria, or goes into convulsions. The non-Aryan races are constantly recognising new spirits from amongst deceased natives of India or Europeans, particularly from amongst those whom death or accident have suddenly cut off, and they have also introduced the deities of the Hindus as demons; but the Amman or earth-deity is in every village throughout S. India, and the worship of all the demon gods is by blood-sacrifices and ardent spirits. Amongst the Shanar race in the south of the Peninsula of India, the belief is that sometimes demons are content with frightening the timid without doing any real harm. Failures in trade or in crops are attributed to demons. People hear a strange noise at night, and immediately they see a devil making his escape in the shape of a dog as large as a hyena, or a cat with eyes like two lamps. In the dusk of the evening, devils have been observed in a burial or burning ground, assuming various shapes, one after another, as often as the eye of the observer is turned away; and they have often been known at night to ride across the country on invisible horses, or glide over marshy lands in the shape of a wandering, flickering light. In all their journeys they move along without touching the ground, their elevation above the ground being proportioned to their rank and importance.

Dr. Caldwell has known a village deserted, and the people afraid even to remove the materials of their houses, in consequence of the terror caused by stones being thrown on their roofs at night by invisible hands. Demons more malicious still have sometimes been known, under cover of the night, to insert combustible materials under the eaves of thatched roofs. Even in the day-time, about the close of the hot season, when the winds fail, demons may often be seen careering along in the shape of a whirlwind, catching up and whisking about in their fierce play every dry stick and leaf that happens to lie in their path. In short, writes Dr. Caldwell, the demons do much evil, but no good. They often cause terror, but never bestow benefits, or evince any affection for their votaries. They must be placated by sacrifice, because they are so mischievous; but there is no use supplicating their favour. If in any case the hope of obtaining a benefit seems to be their votary's motive in worshipping them, further inquiry proves that it is the supposition that the demon's malignity stands in the way of what would otherwise be obtained as a matter of course. And it may be said to be the object of the worship of all the non-Aryan races, to avert from themselves the evils which the demons could inflict; for gratitude for good received, or resignation to the will of a Supreme, are not parts of the Amman or spirit-worship. A similar superstition respecting goblins and demons exists all over India. Every Hindu work containing allusions to native life, and the dictionaries of all the Hindu dialects, prove the general prevalence of a belief in the existence of malicious mischievous demons, in demonical inflections and possessions, and in the power of exorcisms. The chief peculiarity of the superstition, as it exists amongst the Shanars, consists in their systematic worship of the demons in which all believe. In every part of India, innumerable legends respecting goblins and their malice are current; but scarcely any trace of their worship in the proper sense of the term, much less of their exclusive worship, can be discovered beyond the districts in which Shanars, or other primitive illiterate tribes, are found. In travelling down to Tinnevelly from the north, the first village which is found to be inhabited by Shanars, Virduputty, about thirty miles south of Madura, is the first place where Dr. Caldwell observed systematic devil-worship. In like manner, in Travancore, devil-worship appears to commence with the first appearance of the Shanar race in the neighbourhood of Trivandrum, from whence it becomes more and more prevalent as you approach Cape Comorin. The demon-worship of the Shanars and a few other illiterate tribes is a degradation beneath which the human mind cannot descend. The places in which the demons are worshipped are commonly termed Pe-coil, or devil-temples; some of the temples, especially those erected to the sanguinary forms of Kali, are small, mean, tomb-like buildings, with an image at the further end of the cloister. But the majority of the devil-temples are built neither with stone nor brick; the roof is neither terraced nor tiled, nor even thatched. A heap of earth, raised into a pyramidal shape, and adorned with streaks of whitewash, sometimes alternating with red ochre, constitutes both the temple and the demon's image; and a smaller heap in front of the temple, with a flat surface, forms the altar. In such cases a large conspicuous tree—a tamarind tree, an umbrella tree (Acacia planifrons), or even a palm tree, whose leaves have never been cut or trimmed—will generally be observed in the vicinity. This tree is supposed to be the devil's ordinary dwelling-place, from which he snuffs up the odour of the sacrificial blood, and descends unseen to join in the feast. Turnour mentions that an ordinance of one of the kings of Ceylon commanded that a devil-dancer should be provided for every ten villages.
Buddhists of Ceylon still resort to the incantations of the devil-dancers in case of danger or emergency. The educated European of the 19th century cannot realize the dread in which the Hindu stands of devils. They haunt his path from the cradle to the grave. The Tamil proverb in fact says, 'The devil who seizes you in the cradle, goes with you to the funeral pile.' The chief anxiety of the Tamil father, when his child is about to be brought into the world, is to see that the leaves of the margosa tree are carefully fixed over the threshold, to prevent the devils from entering and seizing upon the child, while there are two boys and a daughter. If not, a bracelet is placed upon the child's arm as a safeguard, a golden ring is fixed in its nose, and it is solemnly dedicated to some particular demon, who is untreated to protect it. The child is then probably named Payen (the Devil's Own), a name of frequent occurrence in S. India. The ring is allowed to remain in the nose till the child is grown, a great feast is then made by the parents, and sacrifices of sheep or cocks offered at the shrine of the tutelary demon. The periods of marriage and pregnancy are times at which devils are supposed to be especially malignant, and ceremonies are then performed to avert the influence of the evil eye, ill omens, and devils. In so slight a matter as the boring of a child's ears for ear-rings, it is considered necessary to propitiate Karuppan with the sacrifice of a goat, or a cock at least. A European seeing a crowd assembled under an odina tree (Odina pinnata), which the massive iron chain hanging from its trunk be-tokened to be dedicated to Karuppan, rode up, and found there the quivering body of a ram just sacrificed to the demon. The head had been severed from the body by one blow of a large sickle-shaped weapon, which was courteously handed for inspection. It was made, handle as well as blade, of native iron, and had lately been presented to the shrine by a devotee. The sacrificer had made the present offering on the auspicious occasion of an infant son having his ears bored. The head of the ram fell, as usual, to the share of the officiating priest, while the body, slung on a pole, and carried on the moment of birth. If the head was not preserved the shrines where it was sacrificed to the demon. The head had been taken home to furnish the evening feast. No temple was near, but on a pedestal under the tree reposed a hideous object made of potter's ware. This particular demon is supposed to be, when propitiated, very liberal in the bestowal of benefits; and the pujari mentioned to the looker-on that if he would make a sacrifice of a goat or two, he would guarantee that his devil should obtain for him a lucrative appointment under Government. The sacrifice of goats is almost continuous—sometimes as many as twenty goats are sacrificed at one time. The flesh is generally cut up, cooked, and eaten on the spot; and round the shrines may often be seen a number of small earthen ovens. The strongest oaths a Sudra can take is to swear by the most famous demon of the district; and often, before a lawsuit is carried into court, the aggrieved party will say to his opponent, 'I will be satisfied if you will go to such a demon's shrine, and there, in the justice of your cause, blow out the flame of a lamp in the presence of the Kali.' A man who would not hesitate a moment to commit perjury in court, would never dare to perform this ceremony knowing his cause to be unjust, for then he firmly believes that he would immediately be stricken down by the demon. So swears Latinus in the Iliad:

'Tango aras, medios ignes et numina testor.'

Under this ever-present fear of demons, the Hindu often hesitates to go even a hundred yards in the dark. He will not enter a forest alone; he fears to stand on the borders of a lonely lake, for there dwells the spirit which in Scotland is known by the name of the Kelpie, and it is near the shore where, he has heard, may often be seen in the darkness of the night the 'furry-mouthed devil,' ignis-fatnus. But most of all he fears the sandy plain, for it is a notion thoroughly oriental, that the unclean spirit 'walketh through dry places,' which are called in Tamil, Padi Kaud, devil deserts. Devils are especially said to abound in the sandy wastes between Madura and Timevelly, where the mirage (in Tamil, Padi Ter, the devil's chariot), is frequently seen, and is said to be produced by them. When a fire takes place in a village, it is owing to the wrath of the village devil. His worship has been neglected, or some insult has been offered to him, and he thirsts for revenge. Near the village of Velliarpuram, in the Tanjore district, for about four or five years accidental fires had been of annual occurrence, and it was commonly reported to be owing to the anger of Aiyanaar, a demon, whose shrine is situated to the west of the village. A banyan tree near the spot, dedicated to him, was some years ago felled without his permission, and since that time the enraged demon, refusing to be propitiated by the usual sacrifices, yearly burned down a house or two. Many races besides Hindus are very prone to make vows in times of sickness. Formerly, we are told, people used to go from all parts of England to Canterbury, 'The holy blissful martyr for to seek, That them hath holpen when that they were sick.'

The Hindu makes a vow to go to a particular shrine, and there pour offerings of oil and spices. If a diseased member has been restored, oftentimes a golden image of it is made and presented to the shrine. A person suffered from a serious affection of the eyes. The row was made that in case of recovery two golden eyes should be made and presented to the shrine of Mari Amman. In like manner, the Filipinos, we read, when afflicted with emeralds, thought, after consulting with their soothsayers, that they could best propitiate the God of Israel by making and offering to him golden images of the emeralds. As may be expected, the devils are most busy in the

'last scene of all'

That ends this strange eventful history; and a young girl fears to cross a dying man, lest his latest breath should pass into her, in which case she would be possessed beyond recovery. For a similar reason, a Hindu at the point of death, is always removed to expire without the house, which would otherwise be haunted. As the corpse is carried away, parched rice is scattered along the route of the funeral procession. It is believed that the devils will stop to pick it up, and it is considered advisable to keep them so engaged till next sunrise, for should they return to the house before that time, they would probably not be satisfied without another victim. A native

928
DEW.

proverb says, 'A Saturday's corpse goes not alone.' When, therefore, a death takes place on a Saturday, to prevent evil consequences, a live cock is taken with the corpse to the burning ground, and it is there given away to some person of low caste, or, like the scapegoat of old, allowed to escape into the adjacent jungle. Brahmans, averse to bloody sacrifices, substitute for a cock the bolt of the door of the house, which they burn with the corpse. When a dead body is buried, instead of being burnt, as in the case of Suniyas (ascetic devotees), salt is placed in the grave, and frequently with it the leaves of the margosa tree, so famous as a charm against devils. Salt was till recently also in England placed on the corpse of Roman and Lutheran Christians, for the avowed purpose of keeping it secure from the evil one, and the practice is still said to linger in the Highlands of Scotland. It was seen in 1893, placed over the dead body of a young girl at Greenwich. The Highlanders, indeed, in many of their superstitions are remarkably similar to the Hindus. They formerly planted the rowan or mountain ash, regarding it as a safeguard against devils, just as the Hindus regard the margosa. Throughout India, the belief is as common as it was formerly in Europe, that a man who dies a sudden or a violent death becomes a demon. All the women in the district are immediately possessed by him, and innumerable mischiefs result. A Brahman, accidentally drowned in the river Cauvery, about the year 1870, became in consequence a Brahama Rakshasa, one of the fiercest of demons. An officer of artillery, killed at the battle of Assaye, was buried beneath a tree near the village, and his spirit is worshipped there to the present day. Dr. Caldwell mentions the ease of Captain Pole, an English officer who was mortally wounded at the taking of the Travancore lines in A.D. 1803, and has been traced by the Shanars. His worship consisted in the offering of various liquors and cheroots. About the middle of the 19th century, a Brahman who was sentenced to be hanged at Madras, for the murder of another Brahman going on pilgrimage from Benares to Rameswaram, threatened that though they were about to hang him, he would not die, but would become a Brahama Rakshasa, and torment all those who had given evidence against him.

Bells and chains are almost always used in devil-worship and exorcism; the notion involved seems less to be that of scaring the devil, than that of charming him, just as a snake-charmer charms a snake by music. Near the fanes of the popular devils there are massive iron chains hanging from the trees, with bells and knives attached to them. In the well-known Sanskrit work, the Hitopadesa, occurs a story relating to a famous devil, called Ghanta-karna or Bell-ear. This Rakshasa was believed to dwell on the top of a mountain near the town of Brahmapura. One day a thief, having stolen a bell (probably one of those near the demon's fane), was killed by a tiger as he was carrying off his plunder. The monkeys who dwelt in the adjacent forest obtained the bell, and amused themselves by ringing it. The people of the town having found the dead body of the man, and continually hearing the sound of the bell, were filled with intense horror, fully believing that the demon, enraged, had killed the thief, and was now ringing the bell. The town was in consequence nearly deserted, when an old woman, guessing the truth, went to the king, and said that for a small sum she would undertake to settle the demon. The king, delighted, gave her what she asked, and the old woman, after tracing the cabalistic circle,—the Kolam,—and pretending to go through certain incantations, entered the forest. By means of fruits which she strewed on the ground, she was enabled to decoy the monkeys, and, having obtained the bell as a trophy of her victory over the demon, she returned in triumph to the town. So little has the belief in devils been shaken, that in the India of the present day, it would, in a like case, be just as easy to deceive the people, and even their native Hindu rulers. Dr. Caldwell mentions that the process of demonification is still going on amongst the Shanars; and in every case the characteristics of the devil and his worship are derived from the character and exploits of his human prototype. There is a continued succession of devils claiming the adoration of the Shanars, and after a time sinking into forgetfulness. Among the demons most feared at the middle of the 19th century, he mentions Palavesham, a notorious robber during the latter period of the Mahomedan government. A few of the demons are forms of Kali, connected with a debased and comparatively modern development of the Brahmanical system.

Devil-worship in Ceylon by the Rodiya is performed in the jungle. A kind of altar is erected, and covered with the skin of the plantain tree. It is then scented with dammer resin, and cooked vegetables, placed on a plantain leaf, are laid on it, to which is added rice and flowers, and the blood of a red cock. The Kattidiya, or devil-dancer, then recites a charm, and the cure is supposed to be complete. The offering is left to be eaten by birds and animals. The devils Gorra and Meleyi are of two kinds.—Dr. Callebott on the Shanar; Kenrick's Phanimica, pp. 307, 314: Debosia India, quoted in Cole's Hind. Myth. p. 378: Sower's Voyage, p. 29; Dunsen, iv. p. 210; Williams' Story of Nala, p. 208.

DEWLS' HORSES. See Insects.

DEVISTHAN, a Hindu temple. Devisthana, temple revenue.

DEVOTTHANA. SANSK. Also Deotthan. The eleventh day of the light half of the month Kartik, when Vishnu is supposed to rise up from his four months' sleep at the end of the rainy season.

DE VRIESE, author of various memoirs on Malayian Island Plants, and also of a Monograph of Marrattiacae, a work of great labour.

DEW.

H'tung... Bumm. Shabnam, Aoes, Hind. Rosec... Fr. Raggiaha, Bir. Than... Grom. Ross. The devils Genre and Meleyi are of two kinds.

Some one has ventured the remark that at full moon, near the equator, more dew falls than at new moon, and to this are ascribed the moon heads (man hoofen), which, however, Jansen had but once seen during all the years which he had spent between the tropics. In British India, during the cold weather months, when rain very rarely falls, the dew is of very great importance to all the crops then in the ground.—Jansen, in M'urray's Phys. Geo. p. 146.
DEWA, a divine being, whether resident upon earth or in a deva-loka.—*Hardy*, p. 435.

DEWAK. HIND. Termes, white ants.

DEWALI. The Hindu temple in which the idol is placed, is called, as temples generally are, Dewal or Dewal, from Deva, a deity, and Aliya, a house, or, literally, a house of god. The British and other people call it pagoda, a word unknown in India beyond the reach of European colloquial instruction, but which has been supposed to be derived from But-khana, two Persian words, or But-gada, Telugu words, both meaning the ghost-house. It may, however, be from Paigudi, a devil temple; also from Dalgopa, a Buddhist relique shrine. Dewal, in Sind, was so called from its celebrated pagoda. Its site is now doubtful.

DEWALDA. HIND. Bankrupt.

DEWALDA DEVI, daughter of Kamala Devi. On the fall of Nerbudda, the ancient capital of Gujerat, Kamala Devi was captured and taken into the harem of Ala-ud-Din; but her daughter Dewalda Devi escaped with her father. She had been asked in marriage by the son of Rams, the king of Dowlatabad, but her father, proud of his Rajput origin, had refused to give her to a Mahratta, even though a prince. Kamala Devi, however, having expressed to Ala-ud-Din a wish to be joined by her daughter, Ala-ud-Din sent a strong army under a general to bring Dewalda Devi to Delhi. In this extremity her father accepted the Mahratta prince, and sent off her daughter under an escort, but the escort was overtaken, the fair maiden seized, and carried to Delhi, where she was married to Khizr Khan, son of Ala-ud-Din. A few years after the death of Ala-ud-Din, the throne of Delhi was filled by Kafoor, a converted Hindu, who put out the eyes of Khizr Khan, filled the capital with Hindu troops, put to death all the survivors of Ala-ud-Din’s family, and transferred Dewalda Devi to his own harem. See Kamala Devi.

DEWALDI, a heroine of Hindustan. When Chilan was on the throne of Delhi, Dewalda roused her sons to battle, and, observing other unwillingness, she said, ‘Would that the gods had made me barren, that I had never borne sons, who thus abandon the name of the Rajputs, and refuse to succour their prince in danger!’ They acceded to her request. She then said, ‘Farewell, my children, be true to your salt; and should you lose your head for your prince, doubt not you will obtain the celestial crown.’ When Akbar invaded Chitor, the mother of Putta of Kailwa charged her son to put on the safron robe, and die for his country.—*Calcutta Review*, No. 109.

DEWALI, properly Dipawali. SANSK. From Dipa, a lamp, and Ah, a row. A Hindu religious festival held about the end of October, in the last two days of the last half of Aswin and three days of Kartik, in honour of the goddess Kali and of Lakshmi, and to commemorate the destruction of the demon Taraki. The Hindus, after bathing in the Ganges or other river, anoint with oil, put on their best attire, perform a saadha, and at night worship Lakshmi. On this festival of lamps all Hindus propitiate Lakshmi, the goddess of wealth and fortune, by offering at her shrine. In Rajasthan, on the Amavus, or ides of Kartik, every city, village, and encampment exhibits a blaze of splendour from lamps. Stuffs, pieces of gold and sweetmeats, are carried in trays and consecrated at the temple of Lakshmi, to whom the day is consecrated. The rank of Dewar dines with his prime minister; and this officer and his near relatives offer an oblation by pouring oil into a terra-cotta lamp, which the sovereign holds. Every votary of Lakshmi tries his chance of the die, and from their success in the Dewali foretell the state of their affairs for the ensuing year. On the first day of the Dewali, the whole Hindu population of an Indian city bear branches of the sami, tulsi, and other sacred trees in procession, and walk round all the temples in the neighbourhood, offer salutation and prayer to their country’s gods, in their several incarnations. A rainfall at that period of the year is highly advantageous to growing crops, and a proved of the people of N. India is,—

‘Je min puya Dewali, Jiya phus, jiya hal.’

‘If showers fall about the time of the Dewali festival,’ [what matter] whether you are lazy (lit. a bundle of sticka) or a real ploughman, [the crops are sure to be equally fine.]—*Postans*’ *West. India*, ii. p. 177; *Todd’s Rajasthan*, i. 70, 279. See *Leviteus* xxiii. 40.

DEWAN. ARAB., PERS. In India, the chief officer of a second-rate sovereign. In Persia, a court of justice or of other business. A reception room is generally called the Dewan-i-Am, or public reception-hall. The Dewan Khana is the office room of the dewan, that part of the house of a Mahomedan where the master receives his visitors, and in which the men-servants reside; and the Dewani means pertaining to the dewan. The Dewani Adalat, under the E. I. Company, was a court of civil and criminal jurisdiction.—*Rich’s Kurdistan*, i. p. 88.

Dewan, PERS., a collection into one volume of the entire odes of an author, whether in the Persian or the Hindustani tongue. In bringing them together, they are arranged alphabetically according to the letters in which the verses terminate. The Dewan-i-Sadi and Dewan-i-Hafiz are generally known by the names of their compilers, and Dewani is the civil department, in contrast to the feudatory or criminal. Dewan-i-Am, a privy council chamber. The Dewan of Bengal, Behar, and Orissa was conferred on the British by Shah Alam II., on the 12th August 1766. The office was a vice-royalty, and comprised the collection of the revenue, then three kroo of rupees, and the administration of civil justice. The net revenue was two kroo.

DEWANAGI-WANLU. Tel. Religious mendicants in Southern India, who accept charity only from one or other of the artisan goldsmith castes.

DEWA PUJA, or worship of the implements in use as the means of subsistence, observed by all Hindus, and by all the Kayasth caste at the Dewali and Hooly festivals.—*Malcolm’s Central India*, ii. p. 167.

DEWAHR, Dewar, perhaps more correctly Deshwar or Dehwar, is the god under whose special care a village is placed; the gramma-deva or genius loci, for whom a portion of grain is always set apart at each harvest.—*Elliot*.

DEWAR-GIRI. HIND. Tapestry, or cloth for adorning a wall.

DEWAS. DEWA, a native state in Malwa, lat. 22° 42’ to 23° 5’ N., long. 75° 57’ to 76° 21’ E. The Dewas chieftaincy is held by a Mahrratta, whose
ancestors came to Malwa with the first Raja Rao. The revenue of the state is 4,25,000 rupees, the area 256 square miles, and the population 25,000 souls. The chiefs have each received a annual guaranteeing to them the right of adoption. The chiefs are equal in rank, and have an equal share in all receipts. Each receives a salute of fifteen guns.— Atcheon’s Treatises, iv. p. 334.

DEWAT. The 6th note in the musical scale, ‘Ja.’
DEXTRIN has the same composition as starch, but it is soluble in cold water.

DHA. BURLM. A bill, a sword; in various forms, it is the inseparable companion of every man among the hundred forest tribes of Trans-Gangetic India. Among the civilised Burmans, however, it is more confined to the lower orders, the peasant and boatman, except as a weapon of war. The Burman’s dha is a weapon about three feet long, with a slight uniform curve from end to end. About three-sevenths of this length is helve, the rest blade. The blade is generally about an inch and a quarter wide, with an obtuse point. It serves every purpose that a cutting weapon can serve, from making a toothpick to felling a tree, killing a pig or an enemy in battle. Very long and heavy dhals are worn by officials of the Burmese court.— Yule’s Embassy, p. 158.

DHAIE. HIND. A nurse. In Rajputana, the Dhabbas, or foster-brothers, often hold lands in perpetuity, and are employed in the most confidential places, on embassies, marriages, etc.— Tod’s Rajasthan, i. p. 278.

D’HAGHA. GUS. Thread.

D’HAGOBA. See Buddha; Dagoba; Dhatugarbha; Tupos.

D’HAMHIMA, a tribe of Rajputs recorded amongst the 36 royal races. They were the lords of Biana, and bore a high name for deeds of chivalry. Colonel Tod considered the tribe to be extinct, but they have three or four villages in Baghput. There are also Dhamhima Ahir and Dhamhima Jat in the same neighbourhood.— Rajasthan, i. p. 199.

D’HAI or Dahi. HIND. Curdled milk.

D’HAKH of Kashmir, a red and white bean, Phasoleus lunatus, etc.

D’HAKHA. JAP. or SANSK. A form of the drum that was one of the insignias of royalty of the Chalukya dynasty when ruling at Kalisar marriage ceremony.

D’HAKUN, a witch. Witchcraft is believed in all over Rajputana; but the people of Mewar, whose capital is Udaipur, have most faith in the belief. Her powers are believed to be unlimited, particularly at seasons of the Dassera and Dewali. In certain provinces a man will not marry into a family unless they have a witch among them, who may protect him from evil. Such witches are called Rakhvali, or guardians. The Jiggar Khor, or liver-eater of Sind, is the genuine vampire. An officer, after a long chase in the valley of Udaipur, spared a hyena, whose abode was the tombs, and was known as the steed on which the witch of Ar saullied forth at night. Evil was predicted; and a dangerous fall subsequently, in chasing an elk, was attributed to his sacrilegious slaughter of the weird sister’s steed.— Tod’s Rajasthan.

D’HAL. HIND. A shield, an ear ornament.

D’HALIZ-KOONDLANA, treading the threshold, a Mahomedan marriage ceremony.

DHAL-PHOR. HIND. A sept of the Kurmi, a great agricultural tribe in Hindustan; the words mean clad-breaker.

DHAIL SAHIB, a Maharamul am, or banner; literally, Mr. Shield.

DHAMA-PADAM, a Buddhist sacred book of high authority. It gives the most faithful picture of the ethical spirit of Buddha’s teachings.— Bunsen, Girl in Hist. i. p. 343.

DHAMAYANGYE. Flat arches of stone and brick are not uncommon in Burma. Captain Yule observed two of brick, in windows in the Dhamayangye temple at Pagan, where no suggestion of European or Indian aid could have helped. There is one flat stone arch in the northern gate of the fort, and another in a tomb, at Kunmool. There is one in the medieval building of Roslin Castle, and in the magnificent Saracen gateway of Cairo, called Bab-el-Fitoor.— Yule’s Embassy.

DHAMEE, this old Rajput state became independent of Kubler after the Gurkha war. The state was bound to supply forty begar, but this was commuted to a tribute of Rs. 720. Revenue, Rs. 4000; population, 2853.

DHAMEK, near Benares, a fine grove, the ancient Mriga-dawa, where Buddha first publicly preached his doctrine, which king Asoka commemorated by erecting a tower.

DHALI. HIND. A follower of Prannath, a Hindu reformer who flourished in the 17th century in Bundelkhand.— Wilson.

DHAMMA. PALL. Dharmas, SANSK. Law, duty; the doctrines or sacred writings of the Buddhists.—Hardy, Eastern Monachism, p. 435.

DHAMMAN or Dhanmon. PANJ. Grewia elastica, Royle; G. oppositifolia, Buch. Grewia tiliaefolia? are trees of Cuttack. G. elastica is a reddish —coloured wood, pliable, strong, very plentiful in the Santal jungles; used chiefly for cart wheels.— Calcutta Eng. Journal, July 1860.

DHAMNAR, about 40 miles S.E. from Nemuch, but close to Chundivassa, contains Buddhist caves with a Brahmanical rock —temple behind. The principal group are Buddhist.— Burges, p. 392.

DHANNI. HIND. Portulaca oleracea? P. sativa, DUKH, Helicteres isora.

DHAMUN. HIND. Green tea, in Ladakh; also brick tea, in Kashmir. Tea in cakes, both black and green.

DHAN. HIND. Oryza sativa, unhusked rice or paddy, also growing rice. Dhan marri, a rice field.

DHAN. HIND. Wealth. Tan, Man, Dhan, body, mind, and substance.

DHANA, the Gond portion of a Hindu village, which is always separate from the rest. Also applied generally in the north-west as Wuzra, Nurha, or Poorw.— Elliot’s Suppt. Gloss.

DHANAK. HIND. Very narrow gold ribbon.

DHANAPATTI or Srimanto, a romantic Hindu tale of adventures of a father and son, wealthy Banya merchants of the Ganges, who travelled to Coromandel, Ceylon, Java. Both of them were imprisoned in Ceylon.

DHAND. SIND. A pool of water, a marsh.

DHANDORA. HIND. Proclamation by beat of drum.

DHANGJI. HIND. Riot, rebellion; any hiding-place of robbers.

DHANGAR is the Danaga of the Carnarose-speaking races. The Dhangar in Telugana are in twelve tribes, who do not eat together nor internarry. In the centre and south of the Peninsula, Dhangar are shepherds and wool-weavers,
kitchen gardeners and labourers. In the hill country of Rangar and Chutia Nagpur, there is a tribe so called, some of whom descend periodically into the plains for labour. There are 8059 Dhangar in Amrooti. Many Dhangar are settled in the towns of the south of India, occupied as labourers, kitchen gardeners, and dairymen, and they arrange themselves accordingly. Dhangars have largely settled as cultivators in the Indapur, Bhimatherry, and Purandhar taluks of the Bombay Presidency. The Maharaja Holkar, the sovereign of Malwa, whose capital is Indur, is a Dhangar. The Asal, or pure Dhangar, are pastoral only. The pastoral Segar Dhangar also weave blankets. The Teling Dhangar are cultivators, milkmen, and weavers of coarse woollens. The Maharatta Dhangar graze cattle and sheep, and clarify their butter into ghi. The Bangar Dhangar are purely shepherds, as is indicated by the term 'Ban-gar,' wild man or forest man.

The Dhangar of the peninsular Dekhan are of two sections, the Kota Pullia Dhangar, who keep sheep, and the Barji Hatkar, or 'shepherds with the spears.' The latter still hold much land on the N. borders of the Nizam's territory, and, until the British took it over, were notorious for pugnacity and rebellion, and they still continue a quarelsome and obstinate race. They are supposed to have come from Hindustan in twelve tribes, and been impelled by the Gonds towards Hingoli and Bassim, which locality got the name of Bara Hatia, or the twelve tribes. They now occupy the hills on the north bank of the Pain Ganga. To die in the chase or in war is deemed honourable; and the Hatkar who is so killed is burned with his feet to the east; otherwise he is interred sitting with a small piece of gold in his mouth. The Hatkar are fine, able-bodied men, independent but arrogant; many of them never shave nor cut the hair of their face. The Hatkar can only have one laggan, but may have several pet wives. Their widows can contract a pit marriage.

The Dhangar in the centre of the Peninsula are dark, almost black men, of slender and spare forms; they are quite dissimilar from the Gaoli in personal appearance, and all the sheep (Kuru, Karnatica, a sheep) are under the Kurubaru or Kurumbar race. They are also wholly distinct from the Yedyan or Yadava cowherd race, who are known in all the Tamil country as 'Pillai.' In all probability the dispersed Kurumbar of the Peninsula of India, some of them in towns and others almost nomades, are the fragments of the great shepherd race who held sway in the Arcot district in the early centuries of the Christian era. The Kurumbar and Dhangar have no similarity in appearance.

Dhangar, in the Luki territory, bordering on Udaipur and Sultanpur, are short but muscular and able-bodied men, who speak a separate language. They do not follow Hindu rites, and they have no temples, but set up near their villages a stone with some rude carvings, which they worship in times of famine or sickness or calamity. They bury but sometimes burn their dead.

The Gaola is a cowherd, a dairyman, from Hindustan to Hyderabad.

The Kurubars are in the Canarese region, in the centre of the Peninsula. The Kurubur or Kurumbar and the Gaola dairymen keep aloof from each other.
DHAOLA DHAR.

DHAOLA DHAR, the four bearers, supporters of the platforms of Hindu temples.

DHAOLA. MAHI. Applied to the Koli, Paggi, and others, who habitually wear arms. 

DHAULI, name of a waterfall near the Hirumphal, or Deer's Leap, on the Nerbudda.

DHARICHA. Hind. Second husband of a widow.

DHARINJO. UDA. A common tree of Ganjam and Gumsur; extreme height 60 feet, circumference 4 feet. The bark is used medicinally by women after childbirth; the juice of the leaves is supposed to cure itch.—Captain Macdonald.

DHARMA, a tract of country in Kumaun district, N.W. Provinces, lying on the Tibetan side of the main Himalayan range, between lat. 30° 5' and 30° 30' N., and between long. 89° 25' and 80° 45' E. It is of considerable elevation, its chief peak, Lebong, rising 18,912 feet above sea-level; while the Dharma pass, on the northern frontier, leading into Hundes, reaches a height of above 15,000 feet. The habitable portion consists of narrow and very rugged valleys, traversed by the river Dhauli and its tributaries. The inhabitants are Bhotiya, a Tibetan race, who carry on a trade between Hundes and Kumaun, by means of pack-sheds, over the Dharma pass. Estimated area, about 400 square miles.—Lamp. Gaz.

DHARMA. HINDU. Sansk. Charity, law, virtue, morality, justice, religious ritual, religious law, legal or moral duty. Dharma, Artha, and Kama are the three principles on which Hindus base their ideas of life and its duties. Dharma, the acquisition of virtue and religious merit and obedience to the ordinances of religion; Artha, the acquisition of arts, friends, and property, land, gold, wealth, cattle, equipages; and Kama is the enjoyment of appropriate objects by the five senses. Dharmakartha, the manager of a Hindu temple, a churchwarden. Dharmasala, a resting-place for travellers. Dharmasala, a religious assembly. Dharmasasra, the Hindu code of laws, the whole science of law. Dharmakari, a judge. Dharmadas, a temple servant. Dharmaswama, literally faith (dharma), to his lord (swama). In the Dharmarcha or Dharma-avatara, the forms of the deities, dharmas and adharmas, virtue and vice, are covered with cow-dung and put in a covered vessel, and the accused is allowed to draw; if the dharmas image be withdrawn, he is innocent.

DHARMA, the eight scriptures of the Nepalese Buddhists.

DHARMAPADESAK, the teacher of Dharma, the ordinary term in use to designate a religious teacher.

DHARMAPURI, a mythological city of the Hindus, twelve months' journey from Yannapuri, another fabulous city of Hindu mythology. It is the same with the purgatory of St. Patrick in the gold island.

DHARMA-RAJA, the title of the spiritual ruler of Bhutan, literally king of virtue. He succeeds by incarnation.

DHARMA-RAJA, Shinje, Telugu, and Choigyal, Tibetan, is from Dharma, justice, and Raja, a king. A name of the Hindu deity Yama in his beneficent form. He is the king of justice, whose countenance the virtuous only see; the wicked see him as king of the infernal regions. In the Hindu religion he is the god of eternal justice. Antaka
DHARMA-SATRA.

is an attribute of Yama or Dharma-raja, in the character of the destroyer.—Cole's Myth, p. 379.

DHARMA-SATRA, the whole code of Hindu law, but more especially applied to the laws of Manu, Yajnavalkya, and other sages, variously ennumerated from 18 to 42, who are supposed to have recorded the Smriti, or recollections of what they received from a divine source. Of these, the greatest are Manu and Yajnavalkya. The works are generally in three parts,—Achara, rules of conduct and practice; Vyavahara, judicature; and Praya schitta, penance.—Dawson.

DHARMA-SUTRA, a term sometimes given to the Sutras of the charika rules.—Malle.

DHARMA-SASTRA, a work of learned men, both at home and in the Kangra district of the Punjab, in long. 76° 32' 46" E., and lat. 32° 15' 42" N. The houses are built up the hill, the lowest being at 4000 feet, the highest 7000 feet. The sanatorium is on one of the spurs running south from the great range of Dinola Dhar. This range runs east and west, at heights of from 18,000 to 19,000 feet, and forms a great wall on the north; it is due to this range that the climate of Dharmasala is so mild, and has such a heavy rainfall. Kangra, said by Lord Canning to be the most beautiful district in India excepting Kashmir, is surrounded by lofty mountains, interspersed with undulating hills, and situated between the rivers Ravi and Sutlej. On one side it has the territories of Kashmir and Chamba, on the other the wild but romantic hunting-fields of Kulu, Spiti, and Ladakh. Various races of men, speaking different languages, are distributed over its surface. Every tone of climate and vegetation is here to be met with, from the scorching heat and exuberant growth of the tropics, and barren heights destitute of verdure and capped with perpetual snow.—Dr. W. P. Dickson, 1870; India Annals, No. 227, 1870; Paharee.

DHARMSALA. Hind. A building erected for a religious or charitable purpose. It is like the sami or caravansari of Persia. A house for the accommodation of travellers or pilgrims, or for the reception of the sick or poor. In India they are of varied forms,—sometimes a quadrangle, open all round and to the sky, and with one entrance; sometimes small rooms, both on the inside and outside of the surrounding walls.

DHARNA BAITHNA. Literally, to sit Dharna, was a practice put in force in several parts of India by creditors, who sat down before the doors of their debtors, so as to close all exit unless over the sitter's body, and thus harrassed a payment of their claims. The practice, up to the 19th century, was familiar to Benares, and may be translated caption or arrest. It was used by the Brahmans to gain a point which could not be accomplished by any other means; and the process was as follows:—A brahman who adopts this expedient for the purpose mentioned, proceeds to the door or house of the person against whom it is directed, or wherever he may most conveniently intercept him. He then sits down in dharna, with poison or a poniard, or some other instrument of suicide in his hand, and, threatening to use it if his adversary should attempt to molest or pass him, he thus completely arrests the debtor. In this situation the brahman fasts; and by the rigour of the etiquette, which is rarely infringed, the unfortunate object of his arrest ought also to fast, and thus they both remain until the institutor of the dharna obtains satisfaction. In this, as he seldom makes the attempt without resolution to persevere, he rarely fails; for if the party thus arrested were to suffer the brahman sitting in dharna to perish by hunger, the sin would for ever be upon his head. This practice has become almost unheard of in late years; the last occasion in Madras was about A.D. 1846; but formerly even the interference of British courts often proved insufficient to check it, as it had been deemed in general most prudent to avoid for this purpose the use of coercion, from an apprehension that the first appearance of it might drive the sitter in dharna to suicide. The discredit of the act would not only fall upon the officers of justice, but upon the Government itself. The practice of sitting in dharna was not confined to brahman men. It was had recourse to by Benn Bhai, the widow of a man of the brahmanical tribe, who had a litigation with her brother-in-law, Bal Kishen, which was tried by arbitration, and the trial and sentence were revised by the court of justice at Benares, and again in appeal. The suit of Benn Bhai involved a claim of property and a consideration of caste, which her antagonist declared she had forfeited. Originally it was practised by brahmans, but was prohibited by Res. 7 of 1820 of the Bengal Code. In the south of India it is done before idols for obtaining the object of desire. It is an ancient practice. Genesis xxiv. says, 'I will not eat until I have told mine errand,' and a brahman sometimes went to a house, sat down, and refused to eat till he had obtained the object he had in view. The 'Englishman' was wont to say 'William, I am a Chutturhooj, son of a well-known and respectable Charan of Udaipur, carried to the late chief of that state certain grievances which he considered himself to be suffering in connection with his village. Failing to secure redress by ordinary measures, he took the unusual course of intruding on the chief without permission, for which breach of etiquette he was forbidden to enter the palace again. Accordingly, being under a sense of degradation, ill-feeling, and annoyance, engaged by the prohibitory order, he indulged in satires and philippics against his chief, who thereupon confiscated his village. Upon this, Chutturhooj proceeded to Suhumbar, which at that time was at enmity with the chief of Udaipur, and this step only incensed the chief all the more against him. Here he appears to have been provided for, but subsequently wandered about from place to place trying to obtain redress. But without having able to secure either the forgiveness of his chief or the restitution of his village. In this state of feeling he appears to have given way to the superstitions idea, still prevailing amongst the Rajputs, that the shedding of his own blood or the blood of his family would bring destruction upon those who had offended him, if it did not secure a ready attention to his real or imaginary wrongs. In 1859, therefore, whilst travelling through the jungle with his two wives, two slave girls, and a servant, together with a party of the Meena, who were his retainers, he one day disembowled and gave his horse in charge to the servant, and began to smoke. Then, advancing a little distance, he suddenly killed the servant, and called upon the Meenas to dismount the women. His orders were obeyed. One slave girl fled away with her boy to a neighbouring village, and escaped, but the three
other women were killed. The slave girl informed the villagers of what had occurred, and they went out and saw the dead bodies, and carried them away, and burnt them. The slave girl died the next year, and Chutherbhoor never turned up for six years after the offence had been committed. He then came in and confessed to having murdered the women and servant. Accordingly he was tried and convicted of murder, and the Viceroy was fully of opinion that the man deserved hanging, but that, considering the number of years which had elapsed, the prevalence of superstition, and the lawlessness which prevailed in that part of Rajputana at the period in question, when many such acts were committed with impunity, His Excellency commuted the sentence to transportation for life. The inviolability of a brahman, and the sin attached to causing the death of one in any way, is ineradicable, and to this, according to Sir William Jones, may be traced the practice of dharna.

**DHARWA,** a town which gives its name to a revenue district in the Southern Mahratta country, lying between lat. 14° 17' and 15° 50' N., and long. 74° 51' and 75° 57' E., with 986,087 inhabitants. Between 1787 and 1796, famine occurred from a succession of droughts, accompanied by swarms of locusts. The next famine was in 1802-3, occasioned by the immigration of people from the valley of the Godavery and the march of the Peshwa’s army through the country. In 1822, from want of rain, prices ruled very high. Owing to successive hot seasons, famines recurred in the years 1866 and 1877.—*Imp. Gaz.*

**DHASITI’-KI-PICHTAK,** the Sahara of Asia.

**DHASRA,** religious mendicants in Southern India, who hold an iron worshipping lamp in their hands, and perform on the jangata, tarte, and sinku. They walk before a corpse when being carried to the funeral pile.

**DHAT,** an isolated and now dependent chieftainship of which Oomerkote is the capital. It separates the Bhatti race from the Jareja race. Its prince is of the Pramara race and Soda tribe, ancient lords of all Sind. The Dhatti is the Rajput tribe inhabiting Dhat, and in no greater numbers than the Kaoura, whom they resemble in their habits, being entirely pastoral, cultivating a few patches of land, and trusting to the heavens alone to bring it forward. They barter the ghi, or clarified butter, made from the products of their herds, for grain and other necessaries of life. Rabri and chauth, or porridge and buttermilk, form the grand fare of the desert. A couple of seers of flour of bajra, joor, and kajri is mixed with some seers of chauth, and exposed to the fire, but not boiled, and this mess will suffice for a large family. The cows of the desert are much larger than those of the plains of India, and give from eight to ten seers (eight or ten quarts) of milk daily. The produce of four cows will amply subsist a family of ten persons from the sale of ghi; and their prices vary with their productive powers, from ten to fifteen rupees each. Rabri, analogous to the kous-kous of the African desert, is often made with camel’s milk, from which ghi cannot be extracted, and which soon becomes a living mass when put aside. Dried fish from the valley of Sind is conveyed into the desert on horses or camels, and finds a ready sale amongst all classes, even as far east as Barmair. It is sold at two doka (coppers) a seer. The poors, or temporary hamlets of the Dhatti, consisting at most of ten huts in each, resemble those of the Koowra.—*Toot’s Rajputan,* p. 45.

**DHATUGARHIA,** from Dhattu, reli, Garbha or Galsia, a casket, softened into the Dhagboga, is the altar, shrine, or reli receptacle in which the relics of Buddhism are kept. The Dhagboga is the descendant of the sepulchral tumuli of the Turanian races, whether found in Etruria, Lydia, or among the Seythas of the northern steppes. By some it is supposed to be the source of the word Pagoda. It is also known by the Sanskrit word Chaitiya. Dhagboga is a Buddhist shrine enclosing or protecting some sacred reli; but by some they are supposed to be shrines built over the remains of persons of the Buddhist faith, and consecrated to their saints.—*Prinsep’s Antiquities by Thomas,* p. 154. See Dhagboga.

**DHAVLI,** 20 miles south of Khatak, and 20 miles north of Jaganath, has two separate edicts of Asoka. The first edict is addressed to the public officers of the city of Tosali, and commands murderers to be imprisoned. Both edicts appoint two upas or colleges for meditation and the propagation of Heaven. The question of atheism in ancient Buddhism is set at rest by these edicts, which repeatedly speak of this world and the world hereafter; and these people are expressly commanded to propagate Heaven, and to confess and believe in God, who is the worthy object of obedience; or, more literally, ‘Him, the eternal, ye shall propitiate by prayer.’—*vi. p. 442.*

**DHAUARA,** Hind. Grislea tomentosa. The scarlet flowers, dhan ka phool, are considered stimulating, and given to women in labour; are also used in dyeing. The gum, dhaura or dhan ka gond, is white in colour, like the katira and tragacanth gums, swells in water. In dyeing cloth it is applied to those parts that the dye is not wished to touch. It is eaten in Luddoo. One maund costs ten rupees.—*Gen. Med. Top.* p. 133.

**DHAUSSA,** Hind. A kettle-drum, carried on horseback.

**DHAYA,** Hind. A thatch grass.

**DHAWALI,** a mountain in Nepal, in lat. 29° 11’ N., long. 82° 59’ E. One of the loftiest peaks of the Himalayas, rising 27,600 feet above sea-level.—*Imp. Gaz.*

**DHAWAR,** Mahi. A tribe of iron-smelters.

**DIANYA,** Hind. Land on a river bank, but subject to the occasional overflow of water; also ridges along the dry course of a river, which has turned in another direction.

**DHIE,** Hind. In the N.W. Provinces, a subdivision of the Jat tribe.

**DIEH,** Hind. Of the Cis-Sutlej. Old mounds yielding salt-petre earth.

**DIEKUDI,** Mahi. A water-lift, the pe-cotah of the Tamil, and dhenki of Hindustan. Dhenka or Dhenki is a lever of any kind; a pedal for husking rice. The rice is first dashed with water. It is a mortar with a pestle worked as a treadle.

**DIEHALLA,** Hind. Small weights for separating the gold strands in tinsel-making.

**DIEKLIE,** Hind. A water lever, a machine for raising water, the pe-cotah or yettan of the
Tamil countries. It consists of a horizontal lever, with a weight at one end and a bucket of iron or an earthen pot at the other, slung from or resting on an upright bamboo or pole; this, being lowered into the well and returned to its original place, brings up a bucket of water. The name is provincially corrupted into dhooblee, dhiblee, and in Gorakhpur into dheokul. The word appears to be derived from Dhulkana, to roll, to overturn. The posts which act as the fulcrum are called t'hoonya; the rope, iehte; and the bucket, kurwala. The chhakli is seldom used in the Terai proper, except for the irrigation of rice fields, and in river tracts for melons and tobacco. In the Peninsula of India it is in use in all the finer garden or even in field cultivation.—Elliot's Sup. Gloss.; Powell's Handbook, p. 208.

DHER, a non-Aryan race, many of them dwelling as predial slaves in parts of India, in the Panjub, rare in the N.W. Provinces, many in the Sauagor territory. In the Nagpur territory they have acquired some consideration from their employment as Dalal or writ-servers. In the Dekhan they are doubtless the same as the Hollar of the Canarees, the Mahr of the Mahattas, and the Pariah of the Tamil and Teling races. In the Western Provinces, though they are not often found in any numbers, they appear to have left the remembrance of their name, for it is a common term of abuse to call a man a Barra Dher, or a low caste fellow. They eat dead animals, clean skins and sell them to Chamar tanners. In Rajputana, the Dher will not eat hogs, either tame or wild; the latter they hold in great abomination, notwithstanding their Rajput masters look upon them as a luxury. Dherwarah, the locality outside the Hindu towns where the Dher race reside.—Elliot's Sup. Gloss.; Journal, R.A.S. p. 224.

D'HERBELOT, author of Bibliotheque Orientale La Haye, 1777.

DHERI, a Sufi sect in Persia, who believe the world is uncreated and indissoluble.—Malcolm.

DHEVARA, a tribe of boatmen.

DHEWUS. Hind. Dalberia Ujjainensis, a timber of Nagpur, of a light colour, liable to be devoured by white ants. Its strength is considerable. The young trees are cut for banyan poles. It sells at 8 annas the cubic foot. — Captain Sankey; Major Pearse.

DHIMAK. Hind. White ants; properly Dekaw.

DHIMAL, a race in the sal forest of the Terai, who, about the close of the eighteenth century, migrated to the north and east of the Koch from Nepal. The Dhimal dwell between the Kuki and Dhonla, between the open plains and the higher levels of the mountains, and their villages, though distinct, the people not intermarrying, are intermixed with the Bodo. The Dhimal differ from the Bodo in their language and their pantheon. The deities Data and Bidata preside over marriage, the feast of which is prolonged through three days, and costs from 30 to 40 rupees. They bury their dead. The Dhimal of the eastern portion of the Terai are estimated at about 15,000 souls. Latham's Descriptive Ethnology. See Bodo; India, Dhimar, a branch of the bearer or Kalar race, but sometimes considered offshoots of the Mullah or boatman race. They are chiefly employed in fishing and palingquin-bearing.—Wilde.

DHIMERE. Uria? A tree of Ganjam and Gumsur; extreme height 40 feet, circumference 4½ feet. Bandy wheels are sometimes made of the wood; but it is considered sacred, and is burnt when libations are offered. The fruit is eaten; a juice extracted from the root is used in rheumatism. —Captain Macdonald.

DHINGAN, in Purniah, an agricultural slave.

DHINGANA, vulgo Dheeegana (lit. a forfeit), a demand of a forfeit at a game. Dhingana Buddhnee, the earthen pot used on this occasion.

DHI R.A., SANSK. A monarch, an emperor, a ruler.—Gloss.

DHIRHOB, a tribe of the Ahir in Benares and Gorakhpur. They are reckoned in the Taehibul-Akwan amongst the Doab Ahir.

DHOB. It is customary for Hindu fathers to bind round the arm of the new-born infant a root of that species of the amirhob, the imperishable dhob grass, the Cynodon dactylon, well known for its nutritive properties and luxuriant vegetation under the most intense heat.

DHOBAL, a brahman tribe in Garhwal.

DHOB. Hind. A washerman; one of the lowest castes of Hindus. A woman is called Dhibi. Various subdivisions are recognised, the members of which do not eat, drink, or intermarry together. There are seven such in the N.W. P., but the septs differ, or are at least differently named in different provinces. Their names are the Magadhiya, Ajadhiya, Kanajija, Belwar, Gosar, Barhade, and Pagahiba. Other tribes, Shaikh and Bhaika, are Mussalmans. The cultivating Dhibi do not intermarry with the washing Dhibi. The class calling themselves Rajdhob are said generally to be engaged in the operation of rice-cleaning.

The cleansing is effected by steaming, and beating the clothes on a stone. The poorest Hindu does not wash his own clothes.—Sherring's Tribes; Calcutta Review, No. 110.

DHOBIS EARTH is a native carbonate of soda, called sajji matti in Hindustani, and applied in Tamil and Telugu. It is a whitish-grey, sandy efflorescence, which often covers miles of country where decayed white granite forms the surface soil. This earth begins to accumulate in the dry weather immediately after the rains, it can be spread on the surface to the depth of two or three inches, and by repeated boiling and the addition of a little quicklime the alkali is obtained of considerable strength. With a little care, very clean carbonate of soda can be obtained, fit for the manufacture of toilet soap, white glass, and glazes for pottery. The Nellore, Cuddapah, Masulipatam, and Chingleput districts yield this earth in great quantities; and it is also found largely at Puducotth, Hyderabad, Bellary, and Mysore. The richest in alkali is from the territories of the Nizam, the quantity of anhydrous carbonate being about 67 per cent. Repeated attempts have been made to prepare barilla from it for exportation, and very fair specimens have been exported at different times, but the moderate price of the carbonate of soda of England, prepared from sea salt, will always prevent this from being a remunerative article of export. The coloured frits for bangle glass, in making which it is used, have lately, however, become an article of export from the Madras Presidency. It exists in immense quantities in many parts of India, in Bengal especially, in the districts of Monghir, Purniah, and
DHOOTI.

Cawnpur. It contains from 40 to 50 per cent. of carbonate of soda, traces of sulphate of soda, organic matter, clay, sand, and oxide of iron. The salt can be extracted by washing the mineral without incineration, but the organic matter is dissolved at the same time, and gives a deep brown solution, from which pure crystals cannot be obtained. Firing destroys this substance, and then the solution is colourless. But care must be taken not to push the heat beyond redness, for the alkali at a higher temperature combines with the sand and clay, and the whole runs into green glass, insoluble in water. In Europe, barilla is prepared either by burning seaweed and fixing the ashes, the product being termed kelp and barilla, or by decomposing common salt by sulphuric acid, and then roasting the resulting sulphate with chalk, sawdust, and fragments of iron. The mass when washed gives the carbonate of soda.—Mr. R. Reynolds in Pharmaceutical Journal, 1853, xii.; M. E. of 1855 and 1857; Beng. Phar.

DHOOTEE. Kangra hillmen who work at iron-smithing.

DHOON. Hind. A large drum, both sides covered with leather, and played upon with the hands. Dholak or Dholkee, a drum only one side covered with leather; a small drum.

DHOLE. Hind. The wild dog.

DHOLO. Hind. A Gond tribe who dwell in jungly districts, and are employed as gotters.

DHOONA. Hind. A sort of amulet.

DHOLPUR, a town on the banks of the river Chambal, which flows for 100 miles through Dholpur territory. Dholpur state lies between lat. 26° 22' and 26° 57' N., and long. 77° 26' and 78° 19' E., with an area of 1174 square miles and 227,976 inhabitants. The most numerous classes are Brahmans 36,884, and Chamars 32,092. Thakurs number 23,703; Gujarats, 17,229; Kachhis, 15,090; Mina, 10,620; and Lodhas, 8050. The remainder of the population is divided among 75 other castes. There are 9964 Mahomedans, who reside for the most part in the towns of Bari and Dholpur. Lukindar Singh, king of the town of Gohud, was the first of the chiefs of Dholpur with whom the British Government formed political relations. The family belong to the Jat tribe, and first rose to notice under the Peshwa Baji Rao. After the overthrow of the Marattas at Panipat, the unce of Lukindar Singh rebelled, and possessed himself of the fort of Gwalior. During the Mahratta war which ended in the peace of Salbye, the British in 1799 formed a treaty with him. Much discussion, however, arose in 1803, 1804, and 1805, but ultimately the river Chambal became the boundary between Sindia's territories and Dholpur. Maharrana Keern Singh lived to a great age. He died in 1856, and was succeeded by Bhagwant Singh, who rendered assistance to the fugitives from Gwalior in 1857, but his minister Deo Hans incurred the displeasure of Government by plundering villages in the Agra district. Bhagwant Singh retained the right of adoption, and was declared entitled to a salute of fifteen guns. The military force of the state consists of about 2000 men.—Treaties, etc., iv. p. 108; Imp. Gaz.

DHONDAL. Mah. A black stony ground, retentive of water.

DHONDAL and Gogawat are two tribes amongst the most ancient of the alloidal chieftains of the Indian desert; the Dhondal being descendants of Rao Gango, the Gogawat of the famous Goga the Chauhan, who defended the Sutlej in the earliest Mahomedan invasion recorded. Both Goga and his steed Jowadia are famed in Rajasthun.—Rajasthun, ii. p. 90.

DHONEE. Hind. A fire lighted by fakirs, over which they sit, imbibing its smoke.

DHONI. Hind. A coating sloep. See Boat.

DHONPATTAA. Hind. A leaf used in tanning.

DHROR, Dhor. Hind. Most of the Mahorees are skinners, who reside in the Chambal, and who have fallen victims to small-pox and cholera, but those from some other diseases are burned; a pregnant woman dying is burned. They make leather from hides, and manufacture such articles as are used for water purposes, the mot bucket, the dhol and pak hal.

DHROR, horned cattle; also called Gai-gorun.

DHOORAVAR or Adhotar. Hind. Coarse muslin.

DHOOTEE or Dhatti is the Rajput tribe inhabiting Dhat. See Dhat.

DHOOTI. Hind. Dovati, Sankh. The unsewn garment which with Hindu men clothe the lower parts of their persons. It is mentioned by Near- chus, who tuck it round the waist, then between the legs, and fastened by being drawn in behind, and the appearance becomes that of wide or narrow trowsers. A coarse cotton one, worn by cultivators and labourers in the field, may cost about two rupees. One of yellow silk, called pitambar, is largely made at Benares. With every Hindu man, of all parts of India alike, the dhoti is an indispensable garment. Should he even wear drawers or trowsers, he will have a dhoti, large or small.
underneath. It is a single piece of cloth, from two and a half yards and a half yards long by two to three feet broad, with ornamented ends and borders; but may be somewhat broader and longer. As a general rule, there is literally no change up to the present day, from the costume of the male figures in Buddhist and Hindu sculptures of nearly two thousand years ago. All other articles of male attire are sewn garments, cut out by tailors and made by them; and there are, perhaps, as many varieties of vefts and tunics, angarka, joobiba, koorta, chapkun, mirzai, and the like, as there are surtouts, paletots, cambridges, etc., fashioned in Europe. Many of these are worn by Mahomedans and Hindus alike, the only difference being that the Hindu ties or buttons his vest on the right side, the Mahomedans on the left. Hindu tailors are found everywhere, possibly descendants of the needle-plying handiBawans who, like the weavers, smiths, and carpenters, found a place in the enumeration of trades in Muslim-instituted and the Yagnyawalkya. The texture of the dhoti, saree, and lungi fabrics, manufactured in Britain and sent to India, is not that required by the people, nor what they are accustomed to. It is in general too close, too minute like calico, in fact, which of course makes the garment hot, heavy in wear, and difficult to wash. Again, the surface becomes rough, and, as it is generally called, fuzzy in use, while the native fabric remains free. Comparatively few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But all classes wear coloured cloths—black, red, blue, occasionally orange and green, violet and grey. All through Western, Central, and Southern India, sarees are striped and checked in an infinite variety of patterns. Narainpet, Dhanwar, and Mukti, in the Nizam's territories; Gudik and Bottigerry in Dharwar, Kolhapur, Nasik, Yeola, and many other manufacturing towns in the Dekhan, Arme in the south, and elsewhere, send out articles of excellent texture, with beautifully-arranged colours and patterns, both in stripes and checks.

**DHOWA.** Hind. A whisth-coloured wood, close-grained and hard. Plentiful in the Santal jungles and hills from Ranibail to Haadha. Used for cart-wheels, beams, and door-posts by the natives, also for mallets and tent pegs.—Calcutta Engineers' Journal, July 1860.

**DHIRANGADRA,** a native state in Kattywar. Its chiefs are of the Jhala family, and of great antiquity.—*Jap, Gaz.*

**DHIRI SYAMNA,** brother of Draupadi, and commander-in-chief of the Pandaya in their war with the Kaurava. He killed Drona, and was in turn killed by Asawathanan, son of Drona.—*Drona.*

**DHIRI RASHTRA,** elder son of Krishna Dwiyanaya by the widow of Vichitra Vrya, king of Hastinapura. He was brother of Pandu, but was blind, and on that account was set aside from the throne; but he succeeded to it on Pandu's retirement. He married Gandhari, and his sons, Duhussana and Duryodhana, were named Kaurava. He had abdicated in favour of Duryodhana, at whose suggestion he banished the Pandavaprinces, his own nephews, from his kingdom. It was his sons and those of his brother Pandu who fought for supremacy at Kurukshetra. The chief of his sons were Duryodhana, Duhussana, Vikarna, and Chitrasena. His sons fell in the eighteenth days battle of Kurukshetra. Gandhari, after the battle of Kurukshetra, retired with Dhiratashstra and his mother Kunti to the jungle on the Ganges, where the maharajas died, or was burned in a forest fire.

**DHRUVA,** generally the pole of a great circle of the sphere, particularly the celestial poles. Uttara Dhruba, the North Pole, also the Polar Star; Dhakshina Dhruba, the South Pole. This term is also used to signify a constant arc, referring to the distance of a planet from the beginning of the sidereal zodiac. Dhruba means more commonly an epoch to which a computation is referred. Lastly, it is the name of the Yoga Star of the 12th Nakshatra, supposed to be the same as θ Leonis.—*Warren's Kal Norman.*

**DHUA.** In Bikainir, the six items of the revenue are.—Khalis, or fiscal revenue; Dhun; Angah; town and transit duties; Fussel or plough-tax; and Malah.—*Rajasthan, ii* p. 206.

**DHUDOOS,** a rod of iron about a foot long, with a knob at one end and a sharp point at the other, having from fifty to a hundred hollow rings, which, when shaken, rattle against one another; used by fakirs, who wield it about, striking their abdomen of a sudden with the sharp point.

**DHUB-KALA,** the Indian hot season. According to the Shastras, the seasons are six in number, each comprising two months. A more definite division is Choumasa or Burkha, the four months of the rainy season; Seela, Jara, or Mohasa, the cold season; and Dhub-Kala or K'hursa, the hot season.—*Eliot.*

**DHUDKI,** a wood of Nepal, also called bechia cori, sutha, and Isurinhoodi. Its branches are used in Nepal as torches; the fragrant turpentime which it yields is employed in sacrifices and in medicated salves, and its wood is converted into rafters for houses.—*Smith's Five Years,* p. 67.

**DUL,** Hind. A grass; grows in the marshes (juli) of Cachar; and the grasses of the jungle are the khak, eckur, and tara.

**DULBHUOM,** called also Ghatsallah, a large pargana east of the Kolehan, attached to the Singbhum district, first colonized by the Bhunjia.—*Dalton,* p. 156.

**DULIL,** a civil and military station in Kandesh.

**DULIL-BATTA,** of Coorg. Literally, sweeping of the threshing-floor; a cess levied on land holdings.—*Glossary.*

**DHUMKAR,** Kuli. A woman's shawl or wrapper.

**DHUMKURA,** among the non-Aryan tribes a half for bachelors.

**DUN,** Hind. Any low valley at the foot of a mountain; or the valley intervening between the true Himalaya and the Siwalik or outer hills is the Dehra-dun, Jaswan-dun, etc. The fixed gradations of true Himalaya, viz, dhan or valleys, sandstone or Siwalik range, 'bhaier' or forest tracts, and lowest of all the Terai, which consists of arid tracts or else swamps at the foot of the mountains, which are so constant and marked in the central Himalaya, are not observable in all the Punjab.

**DHUNA.** Hind. Small cups made out of leaves by the Dossai.

**DHUNA or Jhoona,** a resinous gum obtained
from the Vatica robusta by making incisions in the stem of the tree, from which the resin exudes.

DHUNCHEE, the Dunica or Dhunchea of Bengal, is cultivated for its fibres, which are made into ropes and nets. It is the Sesbania aculeata, *Persoon.* For its culture, the soil is generally low and wet, and not requiring much preparation, as the plant is hardy, growing from six to ten feet, and rapid in growth. It is considered a mелиорating crop. The sowing is when the soil has been moistened by the first showers of April or May. About thirty pounds of seed are allowed to the acre, and less weeding is required than for jute. The crop is ready to cut in September and October, though the fibre does not suffer, if left standing till the seed is ripe, in November. The process of steeping and cleaning the fibre is similar to that required for jute, which is Crotalaria junee. The general produce of an acre is from one hundred to one thousand pounds of fibre, the current price somewhat less than that of jute, viz. Corchorus olitorius and C. capsularis. The expense of cultivation, including land rent, is about nine rupees. The fibres are long (six to seven feet), but coarser and more harsh than those of hemp, unless cut at a very early period. From its great strength, it is well calculated for the manufacture of cordage and cables. In Bengal, the fishermen make drag-ropes to their nets of this fibre, on account of its strength, and durability in water. Indeed, by the Bengalis it is considered more durable in water than either jute or hemp. It is really a very excellent fibre for common cord and twine purposes, and certainly very much superior in strength and durability to jute. It is also a much harder plant than jute; the latter, indeed, being rather an uncertain crop for the production of the fine long silky fibre so much called for in England. Though rather wiry, it is strong, and remarkable for its contraction when wetted,—so much so, that it would even carry away the mainmast of a ship by mere contraction. Mr. Deene, a Belgian farmer employed in India, presented samples of the Bengal hemp, called dhunchea, to the Agricultural and Horticultural Society in London, in November, 1850, and alleged that they had been dressed after the Belgian mode. A bigha, he says, will yield 173 lbs. of cleaned fibre, and 92 lbs. of seed. A woman can dress about 4 lbs. a day. In April 1851, Captain Thonon presented a dressed sample of the fibre of the dhunchea of Bengal, and a piece of rope made of it. This rope, he stated, had been used in various ways for nearly two years, and, from various reports upon it, he thought it likely to come into extensive use. In the arsenal of Fort William, a three and a half inch rope of dhunchee broke with not less than 75 cwt., though the Government proof required for such rope was only 49 cwt. The price of the dhunchee in the interior has long been about Rs. 18 per munding. Dr. Royce thought it would probably fetch from £25 to £30 a ton, and, after being introduced, known, perhaps £5 more. It was also valued by others at £35 in 1858.—*Royce, Feb. IV.* p. 298.

DHUND. *Hindi.* A monumental mound. Boesil-Deo, a contemporary of Jeryal, the Tanur king of Delhi, lived about A.D. 1082-1096. He seems to have become a convert to Mahomedanism. But, for his subsequent expiation of this crime, he is represented in the garb of a penitent; and the mound (dhund) where he took up his abode still exists at Kalik Johaur, and is called after him, Boesil-ka-dhund.—*Bajranath,* ii. p. 454.

DHUNDHIJAMA, a king of Oudh of the Solbur line, properly called Kuvlayasa, but termed Dhundhunnar, from slaying a demon named Dhundhu, who annoyed the saint Uttakau.

DHUNDI. *Hindi.* An agricultural tribe of Mahomedans in the Multan division, on the banks of the Sutlej.

DHUNIA, the lowest caste in the Hinduja, who employ themselves as gold-washers, cotto-carders.

DHUNJEBHOY FRAMJEE, a learned Parsee of Bombay, author of a Zend and English and Zand and Gujarati dictionary. At the commencement of the work is a comparative table of the Zend alphabet according to the different systems of sixteen Asiatic and European orientalists. Preliminary Discourse on the Origin and Authorship of the Zend Language and Zendavesta. The Pehlevi Alphabets, published with observations on the Lapidary, Cursive, and Numismatic Pehlevi Writings, Tablets, Manuscripts, and Coins.

DHU NUWAZ was the surname of Yusuf, a king of Yemen, who, having, like some of his predecessors, embraced Judaism, terribly persecuted all who would not do so likewise. He put them to death by various tortures, the most common of which was throwing them into a glowing pit of fire, whence he had the opprobrious appellation of the 'Lord of the Pit.' This persecution is mentioned in the Koran, chapter 65. Dhu Nuwaz reigned till about 70 years before Mahomed, and was defeated by a force sent from Abyssinia, and slain.

DHUP or Dhupri. *Hindi.* Junipera excelsa, incense. J. communis, Chalei ke dhup; J. excelsa, Jari dhup, Dhupe. The word is also applied to many fragrant things used for burning, as incense offered to the gods, kindling the lamps of the festival, to juniper, or to benzoin, to Junipera excelsa, J. arborea, pencil cedar.

DHURGONTEE. In the time of Akbar, Dhurgontee, queen of Gulara Mundula, ruled over the Sargor and Nerbalada territories, and the greater part of Berar. She was a daughter of the reigning Chandul prince of Mahoba. He gave his daughter only on condition that the Gond prince who demanded her should, to save his character, come with an army of 50,000 men to take her. He did so, and, nothing looth, Dhurgontee departed to reign over a country where her name is now more revered than that of any other sovereign it has ever had. She was killed about the end of the 16th century, about 12 miles from Jubbulpur, while gallantly leading on her troops in their third and last attempt to stem the torrent of Mahomedan invasion. Her tomb is still to be seen where she fell, in a narrow defile between two hills, and a pair of large rounded stones which stand near are, according to popular belief, her royal drums turned into stone, which in the dead of the night are still heard resounding through the woods, and calling the spirits of her warriors from their thousand graves around her. The travellers who pass this solitary spot respect-
fully place upon the tomb the prettiest specimen they can find of the crystals which abound in the neighbourhood.—Sleeman's Rambles, p. 254; Jeggo, As. Soc. of Bengal, p. 213.

DIUJATI, a title of Siva or Mahadeva. The term means, He who weareth his hair bound about his head in the form of a tiara, in which style it is worn by the Jogi or Sanyasi devotees and other adherents of Siva.

DHUS, HIND., was an expedient to hasten the compliance of a demand from a dependent. A party of horse proceeds to the township, and are commanded to receive so much per day till the exaction is complied with. If the dhus is refused, it is considered tantamount to an appeal to arms.

DHUSAR, a tribe in Benares who came originally from Dehli. They cultivate a peculiar strain or measure of music, in which they are unsurpassed. The Dhusar rigidly maintain the purity of their order, and the performance of Hindu ceremonies and duties, and neither eat meat nor drink any kind of spirit.—Sherring's Tribes.

DIYA. HIND. In the Central Provinces the squatter cuts down and burns the trees, and sows seed among the ashes, usually abandoning the place after three crops, and repeating the process at another place. It is the Kumri cultivation of the south of the Peninsula.

DIYANA. SINGH. From Dhivi, to think. Religious meditation, mental abstraction, a Buddhist and Hindu practice. Ward says, in this act of devotion the worshipper of Siva, for instance, closes his eyes, places his arms before him, and, repeating the names of the god, ruminates thus:—His colour is like a mountain of silver, etc. Dhyan or Anupapadaka are celestial Buddha saints. Dhyan Bodhisattva, authors of creation.—Ward's Hindus, i. p. 67.

DIYE. HIND. Sour milk, the Yacoot of the Turk races, and Sauer Milch of the Germans. It is used in all Asiatic and European countries, except in England. Every native of India, Hindu and Mahomedan, eats dhye, plain with rice or bread, and in all sorts of cookery, both vegetarian and otherwise. It is made of several degrees of sourness, to suit the taste of customers. Boiling milk is poured into a porous earthenware vessel, the inside of which has been rubbed with a portion of the previous day's sour milk. It sets immediately. It much resembles butter milk.

DÌ, Doi, Ti, Thi, Tui, in several of the ancient tongues of India, mean water, as in the rivers Rapti, Iapti, Kampiti, Yang-tse-kiang, Goomtì, Dì, in Assamese and in Cachar; water; hence the name of the rivers, Dihong, Dihing, Dihong. Da in Damodar has the same meaning; and the Brahmaputra is called Doma, the river mother. The Dihong is generally regarded as the continuation of the Tsu Pu, and with the two Dihing rivers, makes the Brahmaputra river. These two are called the Na Dihing and the Buri Dihing. The Dihong is supposed to pierce through the Abor hills.—Dalton, Ethnology of Bengal, p. 87.

DIACOPE, a genus of fishes belonging to the section Acanthopterygii and family Percide. Many large and beautiful species inhabit the Indian seas. D. octolenta, a very beautiful species, caught off the coast of the Mauritius, is of a brilliant reddish-yellow colour, shaded into white on the belly, and is adorned with four longitudinal blue stripes on each side of the body; these stripes are margined with black. It is about 10 inches in length. Some of the species attain the length of 3 feet and upwards.—Eng. Cyc. p. 328.

DIALIUM OVOIDEUM. The. Gal-seyembala, SINGH. A valuable timber tree of Ceylon, north of Kandy. The wood is strong and handsome, and well adapted for ornamental furniture; the fruit has an agreeable acid flavour, and is sold in the bazaars.—Beddome, Fl. Sylv.

DIAMACHUS, an ambassador from the Greeks of Babylon to Mitragupta, son of Chandragupta. Mitragupta was known to the Greeks by the name of Alettero Chilias. Diamachus was the next Greek ambassador after Megasthenes.—Cal. Rev. 1686.

DIAMAND. Peak, or Nanga Parbat, in lat. 35° 14' 4" N., and long. 74° 34' 5" E., in Hasora. Top of the peak is 26,620 feet above the sea. This peak, the highest in Hasora, is situated to the north of the remarkable bend made by the Indus.

DIAMOND. Almas, Ar., Pers., Rus. Kamala, Kamula, Malay. Kin-kang-shì, Uhin. Intan, Jahlalom, H. Mass., Pers. Hira, Guj. Hind. Virum vachira kallu, Tam. The diamond is a crystallized mineral. On account of its lustre and hardness, it is reckoned the most valuable of all precious stones. The form is cubical, frequently in twin crystals, cleavage highly perfect, rarely massive. The bulk of the forms are those of the octahedron, an octahedron having six planes on the edges, or a dodecahedron with rhombic faces. Lustre brilliant adamantine. Colour white or colourless, occasionally with tints of blue, yellow, red, orange, green, brown, or black. Transparent to translucent when dark-coloured. Fracture conchoideal. H. 10. sp. gr. 3.5295 to 3.535. Exhibits vitreous electricity when rubbed. Index of refraction, 2.439. Becomes phosphorescent on exposure to light, and smaller diamonds become phosphorescent by a much shorter exposure than required for those of a larger size. The diamond is carbon in its purest form, and its combustibility was ascertained by the Tuscan philosophers. About 30 per cent. of diamonds are under half a carat, and one in a thousand may be above 24 carats. Diamonds have been obtained in India, from very ancient times. Ptolomy's Geography, said to have been composed sixty years after the time of Pliny, mentions the diamonds found on the banks of the Sumbulpore river; also speaks of Areata (the capital of the Sore or Sora-mandalam, from whence come the Coromandel), Melodia (the district which contains Masulpatam), and the river Canvery under the name of Chalari, Renell supposes Punna in Bundelkhand to be the Panassa of Ptolomy, and quotes the Ayin-Akbari as naming Biragur on the west of Bond near the Mahanadi river, adding that there is indeed a mine of more modern date in the vicinity of Sambulpore. Ptolomy's Adamas river answers perfectly to the Mahanadi; and the district of Sabare, on its banks, is said by him to abound in diamonds. Tavernier visited the Ralœonda diamond mines at the confluence of the Kistna and Bhima rivers, which were also noticed by Cesar Frederick; and both Tavernier
and Rennell notice the diamond mines of the Pennar river, and near Gudalcottah, also those of Colore (Kulur?) on the south bank of the Kistna, not far from Condavir.

The diamond mines of the Peninsula of India and Central India lie between lat. 13° and 25° N. They occur in irregular arid patches, sometimes basin-shaped, in hilly districts on the great elevated plains bordering the more considerable rivers that have an easterly and southerly course to the Bay of Bengal. Diamonds of considerable size are not rarely found in the sands of these streams and of their tributaries; but their geostratic situation must be referred to the sandstone and sandstone conglomerates at Ovalumpilly; Condappettah, in the Chinnor taluk on the banks of the Pennar, about 6 miles from Cuddapah; at Lamdur and Panchatgapadu; at Banaganapilly on the Kurnool frontier; at Ramulucottah and other places in Kurnool, and at Munimagadoo, north of Ghooty.

Further to the north and east diamonds are found on the ranges of the Kistna, in the vicinity of Condappily, in a plain formed by the alluvium of the river. Still further north, in the bed and alluvium of the Mahanadi river, especially at Sumbulpore, and about the mouths of the Hebe, Khelu, and Maund streams. Diamonds are also found in the bed of the Godavery about Badrachellum.

To the north-west of the districts here noticed, are the diamond mines of Punnah in Bundelkhand. They occur in a table-land covered by a reddish soil, which lies over a bed of rolled pebbles of the sandstone formation, in which the diamonds are found.

The Kurnool geological formation of the modern geologists occupies all the low ground of the Khundur valley, in the middle of the basin, and another large space in the Palnad. It consists of shales, limestones, quartizes, and, lowest of all, sandstones.

The Banaganapilly sandstone of the Kurnool formation is 10 to 20 feet thick, and is the only rock of that region in which the diamond is known to be found. Diggings are carried on in many parts of the country on or near the Kurnool formation, but mostly in the superficial gravels. At Banaganapilly, however, there have been extensive workings in the bottom sandstone. Shallow pits, not more than 15 feet deep, are sunk in the sandstone, and short galleries driven in the diamond layer, which must be at the very base of the group, or close to the bottom bed. In this locality the workings of the diamond miners are crowded over particular spots, whilst large areas adjoining, of the very same deposits, are left untouched. If this irregular working be only due to some delusion of the diamond seekers, a large field still awaits exploration. The Cuddapah geological formation has four great groups, called the Krishna, Nallamally, Cheynar, and Pampungi groups. These consist of shales and quartizes. The Cuddapah basin is about 210 miles long, and of a crescent shape. Its N.E. horn is the Palnad, and reaches to Juggiapet, a few miles N. of the Krishna river, an area of 13,500 square miles. More than a third of the area is taken up by the overlying Kurnool formation.

The Banaganapilly district is about 30 miles long from N. to S., and 26 in breadth from E. to W., lying between lat. 15° and 16° N. in the centre of the Ceded Districts. Its E. and S. part consists of a fertile plain of the regur or cotton soil, bounded on its N. and S. aspects by detached ridges of hillside clay and sandstone, which run from Kurnool towards Ghooty, Cuddapah, and Tripati, and terminate at Naggeri, N.W. of Madras. The Banaganapilly diamond mines are situated in and near a low range of hills about half a mile from the town. The diamond mines near Cuddapah are about 7 miles N.E. from the town, on both banks of the Pennar river, where this washes the foot of a range of hills. The mines at Cuddapah have, it is said, been worked for several hundred years with various success. In the Chinnur taluk, in which Cuddapah is the largest town, there are two places, called Condaetta and Ovalumpilly, where diamonds occur. In the next taluk, on the west side of this, diamonds are dug at Lamdur and Panchatgapadu. Several mines exist near Ghooty.

The Ovalumpilly mines are on the west side of the river, about 6 miles from Cuddapah, and 3 miles south of the Kistna. They are situated on a gentle ascent, about half a mile from the Pennar, in a well-cultivated country, and within a very short distance of three villages. They are chiefly on ground belonging to Ovalumpilly.

In the mines at Cuddapah, the uppermost stratum consists of sand or gravel, mixed with a small proportion of loam. Its thickness scarcely exceeds a foot and a half. Immediately under it is a bed of stiff bluish or black mud, similar to what is seen in places that have been inundated. It is about 4 feet thick, and contains no stones. The diamond bed comes next, and is easily distinguished from the incumbent bed, by the great number of large rounded stones which it contains. It is about 2 or 2½ feet thick, and is composed of large round stones, pebbles, and gravel, cemented together by clay; in the dry seasons, it is as dry as the bed which lies immediately above.

At Ramulucottah, about 20 miles from Kurnool, are many diamond pits in small ferruginous gravel. Iron ore, red hematite, occurs in all the hills in the neighbourhood of Ramulucottah. There are also diamond mines at Munimagadu, and Wudjar Karur near Ghooty; and during the Mahomedan rule diamonds were dug in the Sidhont Hills, a continuation of the Nallamally range, and also near the village of Durjipilly. Diamond mines occur at Naikenabad Mullaran, near Timmercottah, and in the bed of the Kistna river near Nagajureecondah.

Sandstone conglomerate extends eastwards from Banaganapilly to Condappilly and Mallavelly, in all which localities diamonds are found.

Mallavelly, a village 16 miles W.S.W. of Ellore, is one of seven villages near which diamond mines exist. The names of the other six villages in which diamonds are found are: Gani Partala or Partal, Atkur, Buthennyfada, Pertalla, Wustapilly, and Kodavetty Kallu. At Mallavelly, the hollow that where the diamond pits are excavated is a low swampy plain. Being surrounded by a bank or rising of the soil in a circular manner, it has the appearance of having been once a lake. The banks are formed of the red ferruginous sandy soil prevailing all round this place. The diamond pits are in general
excavated at the north end of the bank that surrounds the hollow. The deepest could not be more than 12 feet, and they never came to a hard mass of rock.

Partial is about 50 miles from Masulipatam, but the diamonds were of small size, and the searchers did not earn 4 or 5 rupees a month. In the northern diamond mines, particularly those of Partial, Dr. Heynes found in the diamond bed a great number of fine chalcedony and cornelian pebbles and garnets. The larger stones formed the greatest part of the diamond bed.

The district of the diamond mines of Golconda was ceded to the Nizam by the British under a special treaty, but is enclosed by British territory. Diamond mines not far from Coundaply are constantly worked. There are none found at Golconda, or in the Golconda district, but they were formerly cut and polished there.

The diamond washings of the Mahanadi, a little above Sambalpore, are exclusively from alluvial diggings; but the fact that they occur just outside and below the great lower Vindhyan basin, has suggested the conjecture that the gems are derived from those rocks, on the ground that those are the equivalents of the diamond-bearing beds of Southern India. The Joora, which are fishermen by caste, are the diamond searchers of the Mahanadi, at a place called Heeracode, near Chanderpore, adjacent to the place where the river Maid joins the Mahanadi. The river here makes a sudden turn to the left, where, amongst the smaller streams, which they dam up for a time, the diamonds are searched for during the hot season, generally commencing at the termination of the monsoon. The men throw the sand on the bank, and the women wash and expose it to the sun and select the diamonds.

In the main Vindhyan basin, diamonds are only known to occur in the Upper Vindhyan. Here, as everywhere, the great majority of the diggings are alluvial, but the principal workings are in a bed at the very base of the Rewa shales. Notwithstanding the immense range of this group, it is only known to be productive within a small area of the Panna State, on the borders of the Bundelkhand gneiss, and the surface diggings are confined to the same neighbourhood. Here, as in the Banaganapilly mines, the diamond-layer is conglomeratic.

A notice of the Pannya mines is in Dalrymple's Indian Repertory (v. p. 471), and there described as on a range of hills situated about 42 miles S.S.W. of Kalpi. The hills are called by the natives Band Achit; they extend about 12 miles in length and about 2 or 3 in breadth, and are divided into 21 districts, of which only the following nineteen names are given:—Pirnah, Gurria, Anwont Pokomnu, Channa, Birdu, Kallianpur, Pullu, Rajpur, Ellaw, Maharanpur, Rajpur, Kimmerah, Gadhaisia, Ranpur, Cheriapuri, Attunpurah, Merah, Singupurah, and Mityugah. Diamonds are found in all these districts, but those of Maharajpur, Rajpur, Kimmerah, and Gadhaisia are the largest and best.

In the Bundelkhand area, a cherty contact rock contains the gneiss under the Kaimur sandstone; and in the Chattarkot hill the contact rock occurs under the limestone, holding its position as a true bottom rock. It has been conjectured that this peculiar contact rock may possibly be an original nidus of the diamond. A common form of it is a semi-vitreous sandstone. Large pebbles of it are very abundant in the conglomeratic diamond bed of the Rewa shales at the Pannya mines, and are said to be broken up in the search for diamonds. The search for diamonds in Pannya is not, however, confined to positions in which the gems could be derived from any existing outcrop of the Rewa shales. There are numerous pits of surface diggings in the gorges and on the slope of the Upper Rewa sandstone, south of Pannya.

The Chinese Shan-tung diamonds are mostly very minute, varying in size from a millet seed to a pin's head, though occasionally larger ones are met with. Men with thick straw shoes on, walk about in the sands of the valleys and streams of the diamond mountains of Chin-kang-ling, some 15 miles S.E. of Yi-chow-foo. The shoes are burnt, the diamonds being searched for in the ashes. As in the case with amethysts and rock-crystal in the Lao-shan, the priests in the temples in the Chin-kang-ling and the prince deal in them. The Chinese diamonds are in general of poor quality, and are held in value by the Chinese themselves, being bought by the dealers at the large fairs held every year at Chou-chow, Lai-chow-foo, and Hwang-hien.

The diamond has been found in Borneo, in the district of Landak, in the territory of Pontianak, in long. 109° E., about 40 miles N. of the equator, and they occur from thence as far as Banjarasmun, between long. 114° and 115° E. The mines are worked by the Dyak, Malay, and Chinese. The gems are found in a yellow-coloured rubble or gravel, which occurs at various depths, the greatest to which a shaft has been known to be sunk being between 50 and 60 feet. Six different alluvial strata occur before reaching the diamond-yielding one, which the Malays call the areng. These strata are, a black mound, a yellow sandy clay, a red clay, a blue clay, a blue clay intermixed with gravel, called by the Malays ampir, or near at hand, and lastly a yellow clay, in which the diamonds are embedded. The prince of Matan has a rough diamond of 867 carats, but its genuineness has been suspected. It was found in 1787 at Landak.

The first South African diamond was found in 1867. A little girl was playing with it on the floor of a house in Albany, Griqualand West. Soon afterwards the Star of South Africa, weighing 38 carats, was found. The Port-Rhodes diamond was found in the Kimberley mine, 12th February 1880. It weighed 150 carats uncut, and £60,000 had been offered for it. Kimberley mine is the richest there. It has an area of about 7 acres, and its first owner sold it for £600; but in 1880 it was yielding £20,000 to £25,000 in rents, for about 400 claims.

After the Star of the South Africa, a diamond was found in 1872 which weighed 286½ carats. In 1880 the gross weight of diamonds passed through the Kimberley post office was 1440 lbs. 12 oz. avoirdupois, the estimated value being £386,897. At the end of the year, 22,000 blacks and 1700 white men were employed in the Kimberley division mines.

The Du Toit diamond was found in 1875 at Du Toit's pan. It has been cut and weighed 244 carats. It is the largest cut diamond.

Large diamonds are usually heirlooms in great families, and almost every royal house in Europe has one or more celebrated gems.
The Court of Holland has one of a conical shape, valued at £10,368.

The buttons of the silk stole of King Joseph 1. of Portugal were each a fine brilliant worth about £6000, or, in the aggregate of twenty, £100,000.

George IV. of Britain purchased a magnificent brilliant of a blue colour, which formed the chief ornament of the crown at his coronation. It cost £20,000.

The Pigot Diamond, brought to England by Earl Pigot, on his return from the Governor-Generalship of India, was disposed of in 1801 by lottery for £30,000. It afterwards passed into the hands of one of the Portuguese princes. It weighs 49 carats, and is valued at £40,000.

In the Crown Jewels of France there was a rich brilliant of a sky-blue colour. It weighs 67 carats and 2-16ths, and is valued at £40,000.

The Maximilian Diamond of the Austrian royal family is of a yellow colour, and rose-cut. It has been rated at 1894 carats, and valued at £155,682.

The Sanci Diamond originally belonged to an Eastern merchant, from whose hands it passed into those of Charles the Bold of Burgundy. Charles wore it in his cap at the battle of Nancy in 1475, where he was killed. A Swiss mercenary found the gem, and sold it to a priest for a florin, about twenty pence of British money. The priest sold it again at a very high rate. After this it came into the hands of Anselm Orloff, who pledged it to a gentleman named De Sanci for 40,000 francs, and afterwards, being unable to redeem it, he sold it to the same gentleman for 100,000 francs. A descendant of this gentleman, having occasion to deposit the family jewel with the Federal Government of Switzerland, entrusted it to the care of a faithful servant for that purpose. The servant disappeared for a long time, but so confident was De Sanci of his honesty, that he caused search to be made in his track, and found him at last murdered and half buried. In his stomach was found the brilliant, he having swallowed it to preserve it for his master!

The Russian Diamond is in the crown of Russia. Some Indian had placed it in the socket of an idol's eye. An Irish soldier gouged out the optic. After going through many adventures, it was sold by Count Orloff to the Empress Catharine in 1775 for £20,000 in present money, an annuity of £4000, and a patent of nobility. It is of the size of a pigeon's egg, and of a flat oval form. It weighs 179 carats, or 716 grains, and is without a flaw. Besides this stone, there is a stone among the Russian crown jewels valued at £869,800.

The Pitt Diamond.—Mr. Pitt, the father of the Right Hon. William Pitt, when Governor of Madras, purchased a diamond from a native for £12,500. When re-cut it was worth twelve times the money, and weighs 1863 carats. The small lamine, shreds, and cuttings from it were valued at £8000. It was purchased in 1717 by the Duke of Orleans for £135,000, and in the negotiations £5000 were expended. In 1791 a commission of jewellers valued the stone at twelve millions of francs, or nearly £500,000 sterling. Its original weight was 410 carats.

The Persian Court possesses the Sea of Glory and the Mountain of Light, the one valued at £145,000, and the other at £34,848.

The Nizam or Hyderabad Diamond belongs to the Nawab of Hyderabadd. It measures 2-16 inches in length by 1-35 inches in breadth, and 4ths of an inch in thickness, in the rough state. The gem was found in the mud wall of a native house, and was purchased for the Nizam. A child was playing with it as a stone, and on eight annas being offered for it, its value was ascertained. A small portion of the gem had been broken off one end before it was offered for sale. It weighs 1108 grains, nearly 277 carats (another authority says 340 carats).

The Moghul Diamond was described by Tavernier. He says: 'The water (of it) is perfection, and it weighs 319½ ratis, which are equal to 280 of our carats, the ratio being seven-eighths of a carat. When Miringola, who betrayed the king of Goeldona, his master, made a gift of this stone to Shah Jahan, from whom it descended, it was uncut, and weighed 900 ratis, which are equal to 787½ carats, and it had many flaws. If this stone had been in Europe, it would have been differently treated, for some good pieces would have been taken from it, and the stone left much larger; as it is, it has been almost polished away. It was a Venetian (Hortensio Borgio) who cut it, for which he was badly paid. They reproached him for having spoilt the stone, which ought to have remained heavier, and instead of paying him, the emperor made him pay a fine of Rs.10,000, and would have taken still further rewards possessed it. If the Venetian had known his work better, he might have taken some good pieces off, without doing injury to the king, and without having expended so much trouble in polishing it, but he was not a very accomplished diamond-cutter.' That Moghul diamond cannot now be traced. Many believe that the Orloff diamond and a stone now in Persia were cleaved from the Great Moghul.

The Koh-i-Nur Diamond belongs to Queen Victoria, Empress of India. When Shah Shuja was driven from Kabul, he became the nominal guest and actual prisoner of Ranjit Singh, who spared no means to obtain possession of this precious gem. In this he succeeded in 1813. After the death of Ranjit, it was occasionally worn by Kurruck Singh and Sher Singh. After the murder of the latter, it remained in the Lahore treasury until the supersession of Dhubil Singh and the annexation of the Panjab by the British. Upon the annexation of the Panjab, it was stipulated that the Koh-i-Nur should be surrendered to the Queen of Great Britain. It arrived in London on the 30th June 1850, and on the 3d July was presented to the Queen. It then weighed 186 carats, and looked like a very precious gem. It was cut by M. Voorsanger of Amsterdam, at a cost of £8000. It was placed on the mill by the Duke of Wellington on July 16th, 1852, to be cut, and was completely finished on September 7th, having taken thirty-eight days to cut, working for twelve hours per day without cessation. It was reduced to 106½ carats, and is valued at £100,000. It is a greyish stone, and, as jewellers say, too much spread, and was so very difficult to manage as to require to be twice cut. It has been suggested to be the Moghul diamond, but Tavernier states the weight of that at 280 carats, and the Koh-i-Nur had only 186 before cutting.

The Brazil Diamond, called also the Great Bra- ganza, the largest diamond known, belongs to the house of Braganza. When Don John of Portugal (afterwards John vi.) arrived at the Brazil in
DIAMOND.

1808, a negro conveyed a letter to him, in which he professed an ardent desire to present, in person, a large diamond which he had found. The regent granted him an escort, and the negro arrived and presented the stone. It is like a darkish-yellow pebble, kidney-shaped and oblong, about the size of a pallet's egg. Its weight is over 11 ounces, or 1680 carats. The Brazilian jewelers (Romé de Lisle) value it at three thousand millions of cruces, or £500,000,000! but it is believed to be a white topaz.

The Star of the South of America, a stone of singular beauty, was found by a negroess in Brazil in 1853. It weighed 254 carats, but has been cut down to 125. It was sold for £3000, but £80,000 were since realized for it from the Gaekwar of Baroda.

The diamonds of India are classed by native jewelers as white, yellow, red, green, and black; the coloured ones are extremely rare, but they are occasionally found of a white colour spotted with red, which are rejected as bad. They are classed by the northern native jewelers into three kinds, —Hira-la-rung-i-nausadir, greysish, or the colour of salt-ammoniac; Hira maktunt, of pale colour; and Almas-i-haiduli. Hindus distinguish four kinds of diamond, differing from each other in beauty and value, called, 1. Brahma, 2. Khatriya, 3. Vaisyia, and 4. Sudra, —names derived from the castes in which the Hindus are arranged. The Brahma diamond is described as of the colour of clear milk; the Khatriya, of clear honey; the Vaisyia, of cream; and the Sudra, of a smoky greyish white.

Diamonds in the rough are unattractive pebbles. Even with those who profess to be acquainted with precious stones, the white sapphire and topaz occasionally pass for the diamond. Some of the Ceylon diamonds which the Singhalese offer for sale are made of rock-crystal. The art of cutting diamonds is practised to some extent in India. A knowledge of this art, however, is not very common, as may be concluded when we mention that all Europe only possesses, in Amsterdam, one great diamond -cutting establishment, filled by workmen of the Jewish race, and in London another. The diamonds seen in such abundance amongst the wealthy natives of India are almost all cut in Europe.

Diamond-cutting is effected by a horizontal iron plate of about ten inches in diameter, called a schiff or mill, which revolves from 2000 to 3000 times per minute. The diamond is fixed in a ball of pewter, at the end of an arm, resting upon the table in which the plate revolves; the other end, at which the ball containing the diamond is fixed, is pressed upon the wheel by iron weights at the discretion of the workman. The diamond is cut by taking advantage of its cleavage, and also by abrasion with its own powder, and by friction with another diamond. It is a process of great labour, and many hours are spent in producing a single facet. They are cut into various forms, called the brilliant, the rose, and the table. The brilliant (brilliolette or briollette) form shows the gem to the best advantage, and is always set with the table upwards. In the rose the entire surface is covered with equilateral triangles, terminating in a sharp point at the summit. This form is used when the spread of surface is too great for its depth, and it could not be cut into the brilliant form without great loss. The table is applied to such diamonds as may be regarded as plates, lamine, or slabs of small depth compared to their superficial extent. The brilliant and the rose lose in cutting and polishing somewhat less than half the weight. In the formation of either a brilliant or rose diamond, so much is cut away that the weight of the diamond gets not less than half that of the rough crystal out of which it was formed. They were usually cut in the rose pattern till the middle of the 18th century; but roses are, in general, only now used where the space in the setting prohibits the introduction of the brilliant form, brilliants being at present universally worn. The double cut brilliant is at present the common form. Diamonds were first cut in Europe in 1456 by Louis Berquin, a citizen of Bruges.

According to Jaffries, the value of diamonds is in the duplicate ratio of their weights. Thus, if an uncut diamond of one carat be worth £2, that of one cut and polished would be valued at £8 sterling in the brilliant. A carat weighs four nominal grains, or 3·166 grains Troy. At this rate a cut diamond of two carats would be £2×8×32; one of three, 3×8×3×72; one of four, 4×8×4=128; and one of five, 5×8×5=200.

The rose diamond is of inferior value, but has been rated at £4 the carat when polished. For the purpose of estimating diamonds of inconsiderable size, the jeweller employs a gauge, in the handle of which are embedded small crystals of various relative sizes, from 1/24th to 1/4th of a carat, and a comparison is therewith made when there are numbers of various minute sizes. The rough diamond is called bort; and points are those small fragments with naturally acute angles which are set in glaziers’ cutting diamonds, and sell at £10 the carat.

Most precious stones will scratch, but diamonds alone cut glass. It is also employed for the lenses of microscopes. It has but little chromatic aberration, but the frequent irregularity of its structure is a drawback to its employment for this purpose. There seems to have always been a considerable traffic in this precious stone, carried on by the mercantile body on the east coast of peninsular India. In Madras, up to about the year 1840, what may be called the country transactions with England were conducted through European firms. The diamonds exported by them consisted of the small uncut stones, which were sent to London in packets called bulses; and the mercantile character of the Messrs. de Fries of Madras stood so high in the London market, that their packets or bulses were sold there by weight without examination. Latterly, however, the export trade fell into the hands of the native community, amongst whom there is a considerable tendency to speculate on prices. The course of trade has thus been somewhat changed. Prices have risen at least 20 per cent.; and if Europeans do now engage in the business, it is chiefly in importing from London.

—Tavernier’s Travs., pp. 135—149; Sir S. Raffles’ Hist. of Java; Low’s Sarawak; Remiell’s Memoir, pp. 233—290; Pennant’s Hindustan; Heyne’s Tracts; Captain Cullen; Lt. Newbold; Dalrymple’s Repository; Voysey’s Journal; Dana, Manual of Mineralogy; Catalogue of Great Exhibition of 1851 (Class xxiii.); Eng. Cyc. p. 325; Ainslie’s Materia Medica; Mason’s Tesserae;
DIAMOND CANING.

Powell's Handbook; Tomlinson, p. 309; Mr. Tennant in Illustrated London News, 31st January 1852; Crawford's Dict. p. 129; Medlicott, Blanford, and Ball, Geology of India.

DIAMOND CANING, a mode of using coloured rattans for caning the bottoms of chairs, etc., by boring the holes and putting on a first layer of rattan stripes, and a cross layer to form the diamond figures, ornamented with colours, and gilded. The colours are used, in powder, mixed with copal varnish, and the gold leaf is applied over a coat of gold size. It has a splendid effect, and is very durable.

DIANA of the Ephesians is the counterpart of the Hindu Kali. Diana of the Greeks is represented in Hindu mythology by Atavi Devi.

DIANTHUS, a genus of flowering plants cultivated in gardens. D. carphophyllus, or clove pink, clove flower, and D. Chinensis are called Kaempfi; the latter is of various colours. Dianthus carphophyllus, Ten-chun-ló, Chín.; its long dried stalks are made into brooms. Dianthus Fischeri, Ku-meh, and Shih-shuh, Chín., grows all over China.

A fine flowered linen, used for tablecloths and napkins, manufactured in the north of Ireland, Germany, and Scotland. Diapers are also made of cotton, in imitation of the linen goods bearing the same name. The shot diaper of Malaspitam, so made that it is difficult to ascertain whether it be not shot with silk, is a cotton fabric, excellent in quality and colour.—M. Ec. Jur. Reports.

DIARBAKAR, of Hazara, Cedrus deodara, Loud.

DIARBAKAR, a pashalik of Asiatice Turkey, between lat. 37° 28' and 39° 30' N., and long. 38° 30' and 43° 10' E. Its people occupy 2702 villages and towns, and many dwell in tents. They are Arabs, Kurds, 858,540; Christians, 123,056; Yezidi, 8804; and Kazzibashlı, 15,606. The Christians are of the Armenian, Catholic, and Greek Churches. Diarbakar town is on the banks of the river Tigris. In its prosperity it contained 40,000 houses, with numerous cotton looms constantly at work. The Diarbakar branch of the Tigris passes by Rodwan and Hasan Keif, before it joins the Tigris proper. The Mahallemi Kurds live in caverns hereabouts, cut in the cliffs of the Tigris. There is a prodigious number of these caves, which are said to be very ancient, and cut into different apartments. Altoon Soo, the river Caprus of antiquity, is called the Lesser Zab by Abulfeda. It joins the Tigris below Diarbakar, but it is an error to call the river Altoon, which is an epithet only belonging to the bridge, from what it cost, Altoon meaning gold or money.—MacleGregor; Ricâ's Kurdistan, i. p. 379, ii. p. 63.

DIATOMACEE, the Hazani- Yusuf of the Panjab, is a minute silicious shell of a triangular form, one of the Diatomacae found floating on lakes and ponds in the hills of Kashmir, whence it is skimmed off and dried. It was erroneously described by Honigberger and others as a seed.—Powell, i. p. 384.

DIAZ. Bartholomew Diaz, in the reign of John II., king of Portugal, proceeded with three vessels to ascertain the southern boundary of the African continent, and, driven from the land near the south cape, he ultimately regained the African shores east of the cape, at a bay which they called the Bay of Cows. The men seeing the land trend easterly here, began to murmur, and compelled Diaz to return. As they shaped their course homeward, they rounded that famous point in August 1486, to which Diaz gave the name of 'Cabo Tormentoso,' the Cape of Tempesta, but which John, with more foresight as to the future importance of the discovery, changed to that of the Cape of Good Hope. Diaz was the first who, in recent times, doubted the Cape of Good Hope. He landed at Calient about the beginning of the 16th century, soon after the discovery of America by Columbus. He was afterwards drowned in one of four ships lost by Cabral, in his voyage from Brazil to Calient.—Tennant's Ceylon. See Albuquerque; Cabral; Deulit; Vinco da Gama.

DIBARADANE or Dipartanai, or offering of fire, from Dipa, a lamp, and Aradana, to sacrifice, is a daily ceremony in honour of the Hindu gods, and makes the last part of the worship. The Brahman who officiates holds a little bell, which he sounds, and in the other a copper lamp full of ghi; he makes it pass and re-pass round the statue of the god he worships. During this time the dancing girls dance and sing his praises, after which the assistants, in contemplation, with hands joined, address their vows to the idol; the Brahman then breaks the garland with which the idol is adorned, distributes the fragments to the people, and receives from them the offerings they have brought to the divinity. The dance before the gods during divine service, and on festival days, was a ceremony much used by the ancients. The priests of Mars, called Sati, were held in great esteem by the Romans. They danced at Delos during divine service. This dance was performed in a very singular manner among the Greeks and the Romans: they moved from the left side of the altar to the right, meaning to intimate the course of the heavens, which moves from the east to the west; they then returned from the right side to the left side, which represented the motion of the planets. King David danced before the ark when brought back from the Philistines. We find in Exodus that the Jews danced before the golden calf; but there never has been a people like the Hindus, who choose girls of no virtue to dance before their idols.—Somervat's Voyage, pp. 157-59.

DIB-GRASS, the Anglo-Hindi name of several plants. In the Punjav it is the Cydonod dactylon, and there called Khabbal; on the banks of the Ravi it is the Typha angustifolia, and mats are made of it; in Sind it is the T. elephantina; in Hindustan it is the Pofy cosmucuroides. The Harial, Cydonod dactylon, is the creeping grass which is collected for horses by the grasscutters.

DIBROGARI, a district in the east end of the Assam valley, which produces coal.

DIBYA or Divya, Sansk. Divination; in Hindu law, the ordeal.

DIC, in Hindu astronomy, the four cardinal points of the compass. Asta dic, the eight principal points, including the cardinal ones. The Asta dic are called the eight corners of the world over each of which a divinity is supposed to preside.—Warren's Kata Sakhita. See Diepala.
DICE.

DUT. Buwah pari; D'adie, Malay.
FR. Kosti, Rus.
GER. Dades, Sp.
HIND. Tawaari, Tur.
IR. 

Those used in Europe are cubical pieces of ivory, bone, or ebony, marked with dots on each of their sides, from 1 to 6, according to the number of the face, and used for playing games of chance. Those used by the Hindus are oblong pieces of bone or ivory. The story of Draupadi being staked and lost by Yudishtra, the eldest of the Pandava, to Duraydhana, is equaled by one in Ainsworth's Old St. Paul's, and others in the History of England.—Faulkner.

DICTIT or Dikshit, a vernacular corruption for Dikshita, a name given to Brahmanis, and the title of one of the sixteen branches of the Kanotia Brahmanis; it is also borne by some families of Mahratta Brahmanis; and in Gauzipur and adjacent provinces by a tribe of Raijputs.—Wilson.

DICHOSTACHYS CINEREA. W. and A. 
Mimosa cinerea, Linn. 
Desmanthus cinereus, 
Wildie. 
Vurtuli, 
Andara-gass, 
Vata-tan, 
A small scruffy tree or large shrub, abundant in the hot and drier parts of Ceylon, Coimbatore, and waste places of the inland country in the Bombay Presidency, Archipelago, and North Australia. Flowers showy. The wood is very hard, strong, and good for pegs.—Drs. Wight, Gibson; Flor. Audh.; Thw. Zeyl.; Roxb.

DICKSONIA BILLARDIERII, P. von Mueller. 
A tree-fern abundant in the humid forests of Tasmania, S.E. Australia, and New Zealand, attaining a height of 30 to 50 feet. It is one of the tallest of all the fern trees of the globe, and certainly also the most hardy, the vitality being fully retained for several months. This species occasionally occurs with a divided trunk. Round the circumference of its top no fewer than nineteen crowns have been counted, and within the circumference there must be half as many more. D. squarrosa is the most southern tree-fern in the world, native of New Zealand.— Von Mueller; W. Archer.

DICLIPtera ROXBURGHII. N. ab E. 
Sonn. of . BEAR. Lakshmana of . Panjab. 

A medicinal plant; grows up to 6500 feet in the Western Himalaya.—Dr. J. L. Stewart.

DICPALA, eight guardians of holy places worshipped in India. See Dic.

DICRANOCEPHALUS ADAMSI. Pascoe. 
A beetle of Corea, a double-helmented coleoptera. It occurs also on the Himalayas.

DICRURIDE, a family of birds, comprising the genera Chibia, Chaptia, Bhiranga, Edolius, Dicurus. One of the genus Dicurus is the drongo shrike of the Peninsula of India. Other species: D. coromence, D. leucopygia, and D. eclectofornis. See Birds.

DID or Deed. Pess. A Sufi Mahomedan rite; the viewing or holding of the deity, pointed out by the moordsh or teacher.

DI-DITSII, N'guon, Moi, Ro-moi, and Ke-moi, rude tribes occupying the mountain ranges between Tonkin and Cochlin-China, and between Cochlin-China and Kambogia.—Latham's Ethnol.

DIDYMOCARPUS, a genus of plants. Dr. Wight gives as species, D. Humboldtiana, liruata, ovalifolia, Rotelliana, and tonentosa. D. aromatica is stated by Dr. Wallich to be used as a perfume and the aromatic drug, called by the natives Kumkuma and Rani Govindi.—Roxb., p. 204; O'Sha.

DIEG. At this place a battle was fought and won by Lord Lake. See Battles.

DIEGO GARCIA, one of the Chagos Islands, is about 14 miles long, and extends from lat. 7° 13' to 7° 27' S. It is low, and generally only 8 or 10 feet above high-water tides.—Horsburgh.

DIEN-NEUNG. Bumb. In Amherst, a timber used for rice-pounders; it is a close-grained, compact, brown, hard wood.

DIGA, a form of marriage amongst the polyandrist Kandyans in Ceylon, in which the wife dwells in her husband's house.

DIGAMBARA, or sky-clad, also called Nirgranth, without a bond, and Nagnata, naked. These are gymnosophist mendicants, who live absolutely separated from society, and from all family connections. Their name is commonly understood as sky-clad, and is derived from Dic, a quarter of the globe, and Ambar, apparel, and indicates one who has the world or universe for his covering. The Digambara is a division of the Jains, the members of which either go naked, or wear coloured clothes, in opposition to the Swetambara, or those who wear white. These ascetics have ceased to appear in public since the early part of the 19th century.—Wilson; Skerring.

DIGAMBARA, one of the six athecistical systems of philosophy current amongst the eastern Aryan race in India. The other five are the Charvaka, Yogachara, Siddhanta, Wai-boshika, and Madhyamika, all full of indeterminate phrases, and containing a jumble of atheism and ethics. The derivation of Charvaka is from Charu, insinuating, and Vaka, a word.

DIGITALIS PURPUREA. Linn., is the Mau-ti-hwng of the Chinese and the foxglove of the English.—Smith.

DIGITIGRADA, a tribe of mammals belonging to the order Carnivora. See Carnivora.

DIG-IJAYAY or SANS. From Dic, the quarters of the earth, and Vijaya, conquest. The Dig-Ijaya is a part of the Mahabharatas, relating the conquests of the four younger Pandya. It is also the name of a work by Sankaracharya, in support of the Vedanta philosophy.

DIHANG or Dihong, a river in the Lakhimpur district of Assam, one of the three which contribute to make up the Brahmaputra. The Dihang is supposed to be the connecting link between the Sang-pu (Tsang-pu) of Tibet and the Brahmaputra of Assam.—Imp. Gaz.

DIHING is the name of two rivers in Lakhimpur district, Assam, which contribute to make up the waters of the Brahmaputra.—(1) the Noa Dihing, rising in the Singpho hills; (2) the Buri Dihing, rising in the Patkoi hills.—Imp. Gaz.

DIF MAJORES and Dif Minores. See Hindus. Dif Patres of the Romans, the Pitrivedya of the Hindus. See Dehwar.

DIJLAH, a name of the Tigris. The designation applied to it in the Scriptures is Hiddelked. Dijlah is the name which it bears at the present day among a large portion of the people living
nearly its banks. The western branch rises at a spot which is about 20 miles westward of Argani Maden, and near 10 miles southward of the centre of the Ghuilkj lake; its course is north-eastward along the deep valley at the foot of the elevated ground of Kizan (4568 feet above the Black Sea), and, after having continued in the same direction towards the heart of Kurdistan, when a little more than 25 miles from the spring, it makes a sweep so as to take the direction of Argani Maden, or nearly south.

DIKAMALLEE, Hind., is the fragrant gum-resin of Gardenia incisa, Roxburgh. It exudes in amber-coloured transparent drops at the ends of young shoots. It is most useful in preventing vermin breeding in wounds, and in keeping away flies from sores, by its strong aroma, and is an article in the materia medica of the villagefarrier. It deserves more attention.—M. E. J. B.; Spry.

DIKHIT, a tribe of Rajputs inhabiting the parganas of Kooten, Futtupur, Ekdulla, Mootour, and Ghazipur, in the Futtupur district, also from Oudh to Bundelkhand.—Elliot, Supp. Gloss.

DIKO. Kol. A foreigner.

DIKOKAMENNI, a Kirghiz horde, divided into two wings, 'On' and 'Sol,' or right and left, corresponding to the Mongolian 'Borongar' and 'Zungar.' The right wing consists of two divisions, 'Adgen' and 'Tagai.' The left wing is formed of three tribes, who frequent the Talas. Their chiefs are related to the Khan of Kokan, who are on the female side of Kirghiz extraction.—Tal-kuhoof and M. Vinuukof, Russians, p. 103.

DIK PALAKA, in Hindu mythology, a regent of a quarter of the heavens. They are eight in number,—

Indra, E. | Kuvera, X. | Isani, N.E. | Yavu, N.W.
Varuna, W. | Yama, S. | Niruta, S.W. | Agni, S.E.

DIKSHA. SANSK. In Hinduism, sacrifical worship; initiation into sacred rites. Among Hindus of Malabar, the ceremony of abstaining from shaving for one year after the death of a relative.

Dikshamiga, a sacrifical act, explained in the beginning of the Aitareya Brahmana, meant to represent, by simple and natural emblems, the new birth (Matriculation), through which a man on his first admission to the sacrifice was believed to enter a new life.

Dikshaniya Ishti. SANSK. A curious sacrifical ceremony.

Diksha Visarjane. SANSK. A religious ceremony among Brahmans, who for six months after marriage allow their hair to grow, and then go to their father-in-law's house to have the head shaved.—Max Muller.

DILAZAK, a tribe in the Peshawur division, now few in number; were possessors of the Peshawur valley, till they were driven out by the Yusufzai. They are Mahomedans.

DILEM, a powerful tribe of Arabs, with about 1600 tents, in the province of Bagdad, chiefly on the E. bank of the Euphrates, from west of Bagdad to the north as far as the town of Hit. Their territory is rich, with 340 irrigating wells. They are agricultural and pastoral. The district yields sulphur and bitumen, also salt, from thermal springs.—MacGregor.

DILVARI ILICIFOLIA. Juss.

Acanthus ilicifolius, Linn., Roeb., Rhede.

Hakoreh, BENG. Paina shuh, MALAK.
Kaya, BURM. Koll mortal cheddar, TAM.
Harakat, HIND. Ails, Et chilhas, TEL.
Harcku kanta, ...

Grows in marine lagous, canals, and deltas in south of India. It resembles the holy; its leaves and root are used medicinally.—Roxb. ; Voigt.

DILKA, or swarming with oil, is in general use by the natives of the Soudan every evening by those who can afford it, before retiring to rest; to its use they ascribe the entire absence of cutaneous diseases, and also their being able to resist the cold and cutting winds of winter, with no other protection than a slight calico scarf or shirt.—Egypt, by J. Petherick.

DILLIET. HIND. A summons-server, apeon.

DILLENIACEE. D. C. A natural order of handsome trees, shrubs or under shrubs, rarely herbs; above 100 species, belonging to the East Indies and New Caledonia. The Indian forms are ranged under Tetracera, Wormia, Acrocomia, Dil- lenia. Several Dillenia yield useful and valuable timbers, in Ceylon, in the two Peninsulas, and in the Northern Provinces of India. Some are not yet species determined. The young fleshy edible of D. seabra and D. speciosa have a pleasant taste, and are used in curries by the inhabitants of Chittagong and Bengal. Dillenia augusta, Zim-byun, BURM., also D. seabra, Byew, BURM., and D. speciosa, Thab yew, BURM., occur in the Pegu forests; all three have a light-brown wood, and afford large and good timber for house buildings. In March and April the forests are dazzling from the bright yellow flowers which are crowded on their leafless branches. A species, always found on the borders of streams of Burma, produces a large green fruit, which is a favourite vegetable with the natives. Gamble mentions nine species.—Captain R. Benson ; Hooker, Hum. Jour. p. 395; Mason ; Royle, Hum. Bot.; Voigt ; Mc'Clendan, Cal. Cat. Ez. 1862.

DILLENIA AUREA. Sm. Zim-byun, BURM. Abundant in the plains and hills and in the forests of British Burma, but more scarce to the north of it, and found only on the banks of the Godra by General Hardwik. Wood of a light-brown colour, occasionally used in house-building, but mostly for firewood. Breaking weight, 198 lbs.

—Dr. Brandis, Cal. Cat. Ez. of 1862.

DILLENIA ORNATA. Wall. Zim-byun, BURM. Grows plentiful and of large girth in Pegu and Moulmein, and furnishes a strong, good timber, useful for general purposes in house and ship building. It has large gaudy yellow flowers.—Dr. Mason; Captain Benson.

DILLENS PENTAGYNA. Roeb.

D. augusta, Roeb. | Colubertia Coronamid, D.C.
D. pilosa, Roeb. | Wormia ...

Yeenga, Bjooben, BURM. | R. Pai, Nite-tek, TAM.
Kanaagalee, Machil, CAN. | Kaniga, China, TEL.

This is a very large tree, abundant throughout South and Northern India and Burma. It flowers towards the end of January, or as late as March or April, when the tree is destitute of leaves. The wood is close-grained, strong, tough, fibrous, and durable even under ground, of a reddish-brown colour. It is not easily worked, and is subject to warp and crack. A cubic foot unseasoned weighs 85 to 90 lbs., and 70 lbs. when seasoned; its specific gravity is 1.20; it is used in house and ship building, and is adapted for
DILLENIA PILOSA.

Cabinet purposes.—Drs. Roxb. ii. p. 652, Wight, Cleghorn, Gibson, Brandis, Voigt, p. 18; Captain Bennett; Cal. Cat. Ex. of 1862; Useful Plants.

DILLENIA PILOSA. Roxb. Grows in Assam near Goalpara, on the banks of the Megna, and furnishes a hard, tough wood, much used for canoes. —Roxb. ii. p. 652; Voigt; Mendis.

DILLENIA RETUSA. Thumb.

A moderate-sized tree, growing in Ceylon to an elevation of 2000 feet, but not abundant; used for roofs of houses.—Thur. p. 5.

DILLENIA SCABRELLA. Roxb. ii. p. 653.

D. scabra, Brandis.

Zen-bywon, . . . BURM. | Kulgal, . . . CAN.

Kyet-sen-bywon,. . . | Kurmul, . . . MAHR.

A stately timber tree; grows in Chittagong, also in Canara and Sunda, where it is most common below the ghat. Grows large, long, and straight. Its acid calyx leaves used in curries. Wood seems to be used for boat planks in Canara, but it is not reckoned a choice wood in the Bombay Presidency. It is plentiful in the Pegu province, but becomes scarce to the north of it, and it is there of large girth; furnishes a large, good timber, and is useful for general purposes, as house and ship building.—Drs. Roxb. ii. p. 653, Gibson, and M'Cleland; Captain Benson.

DILLENIA SPECIOSA. Thumb., Roxb., Bedd.

D. elliptica, Thumb. | D. Indica, Linn.

Kaboomoo, . . . BURM. | Mota kurmal, . . . MAHR.

Hondaparas, . . . CRYL. | Uva, . . . TEL.

Chalta, . . . HIND. | Pedda kalinga, . . . TEL.

This is a good-sized tree, one of the handsomest in India, and is much cultivated in particular parts by natives, about temples. It is found in dense forests at no great elevation in Malabar, the Northern Circars, Orissa, the Godavery forests, in various parts of Northern India, Bombay, Ceylon, Burma, and in the Malay Peninsula. The wood is hard and tough, and used to make gunstocks and in boat-building, and is said to be very durable under water. The timber weighs 44 lbs. the cubic foot when seasoned, and 55 to 60 when unseasoned, and its specific gravity is 704. Ovalkai is the Tamil name of the fruit, and is used by the natives in their curries, having an agreeable acid flavour; and also in chutnis. —Drs. Turvillae, Roxb. ii. p. 650, Voigt, Jeffrey, Brandis, M'Cleland, Riddell, and Irvine; Captains Beedome and Mason; Gen. Med. Top. p. 199.

DILLI, D'dy, or Yennala mountain, in lat. 12° 2' N., and long. 75° 14' E., in Malabar, near the sea-coast, rises 804 feet above the sea. Dilli was the first Indian land seen by Vasco da Gama. In Sonnerat's time the coast as far as Mount Dilli was inhabited by the Molandi, who lived merely by piracy, as the sea-robbers mentioned by Pliny, Arrian, Toleomy, and other ancient authors. They united themselves to other pirates who resided on the Angedib islands, near Goa, and captured all the small vessels which sailed from Goa to Cochín. The huts in which their wives and children lived were on the eastern side of Mount Dilli.—Voyage to the East Indies; Grand Tri. Surv.

DILLI-AL, or Dhilli wal, in J.M. 614, the ordinary coin of the country about Dhilli. The original currency, it is supposed, corresponded with the billion money of Prithi-raj and others, which was

initiatively adopted by the Mahomedans in the early days of their occupation of Hindustan.

DILLON, Captain, sailed from Port Jackson on the 4th June 1827, and at Mannickola discovered property that had belonged to La Perouse. The King of the French created him a Knight of the Legion of Honour.

DILL SEED, seed of Anethum sowa.

Buz ul shatat, Shubil, Afg. | Seleya, . . . SANSE.

Sowa, . . . GUJ. | Sattu-copa, . . . SINGH.

Mungai, . . . JAV. | Sadacappe, . . . TAM.

Adan-mansai, . . . MALAS. | Sadap, . . . TEL.

Mireyo, Sittu, . . . SANSE.

Flattened elliptical seeds, with brown and slightly convex backs, and pale membranous margin. Both the frrt-ibib and the plant are much used in the East Indies as condiments and articles of diet. The carapels have a bitter aromatic taste, making them useful as carminatives, and supposed to be used in the manufacture of gin. The seeds are procurable in all Indian bazaars. The Indian species is the Anethum sowa. Dill leaves are used to flavour pickles.—Paulkner; Jaffrey.

DILWARA, at Mount Abu, has been famed since a remote antiquity, and pilgrims seem to have been attracted to its temples since a.d. 1034. Hindu temples seem to have existed here in remote ages, dedicated to Siva and Vishnu, but all traces of them have disappeared; and on it now stand famous Jain temples, built by Bimul Sih, a rich Jain merchant, and others. In Jain estimation, Abu is the holiest spot on earth.

DILZAK are the predecessors of the Pathan tribes in the Koshwah valley. They seem to have been a considerable Pathan blood, and are supposed by some to be earlier Afghans.—Campbell, p. 96.

DIMAL, a tribe smaller than the Mechi, but somewhat similar in appearance, with a language that in some degree differs. The Kachari, Nage, Abar, and some other tribes bordering on Assam, are supposed to be of the same race as the Mechi. The Mechi form the chief population of the forests and N.E. Doars at the foot of the Sikkim and Bhutan hills, and a few have recently settled on the extreme eastern portion of the Nepal Terai. They are supposed to be the same as the Bodo, whom Mr. B. Hodgson described. Their features are described as Mongolia or Indo-Chinese; they are fairer than the Hindus around them, and of a yellow tinge; they are taller and larger than the Nepalese cultivators, are addicted to spirits and to smoking opium. They are proof against malaria, and make small temporary clearances in the forest; they are inferior to the Tharu in industrial habits.

DIMITY. Basin, Fr.; Dobletto, It.; Dimite, Sp. The name is supposed to be from Danietta. Dimity is a stout cotton cloth, white, ornamented either with raised stripes or figures, and employed for bed and bedroom furniture.—Tomp. ; M'Cullock.

DIMIYA. Singh. The great red ant of Ceylon; Formica smaragdina; it bites severely.

DIMRAUT. Hind. One of the twelve pal or tribes of the Mewati.

DIN or Deen, with Millat and Mazhab, are three Arabic words used by Mahomedan writers for religion. Din means as it stands in relation to God, Din-Allah, the religion of God; Millat as it stands in relation to a prophet or lawgiver, as Millat-i-Ibrahim, the religion of Abraham; and Mazhab as it stands in relation to the commentators of Islam, as Mazhab-i-Hanafi. Din is, however,
of general application. Mahomedans sometimes call their own religion, Din-i-Islam, the Faith of Salvation. Mazhab relates to the sectarian part of the Din. Thus a Mahomedan is of the Din-i-Islam, but may be of the Shiah or Sunni Mazhab. Din is everywhere used as the Mahomedan war-cry: Din! Din! For the faith! For the faith! The principles of the Koran generally, but in particular the text in chapters 8 and 47 which incites war against non-Mahomedans, and death in the contest as the surest passport to heaven, have established amongst Mahomedans an intimate connection between the spiritual aspiration and political convictions. Hami-i-Din, Defender of the Faith. Din-pana, Protector of the Faith.

DIN or Dina, Hind., a day, considered in a great variety of ways and durations, of which the following are the principal:

1st, a Savana or Bhumi savana dina, a natural day, being the time between two sunrises.

2d, a Saura dina. Of these there are two kinds; and the similarity of the name tends greatly to confuse the beginners in the study of Hindu astronomy. First, the absolute sense of Saura being sidereal, the Saura dina is the time between the same point of the ecliptic rising twice; or, more precisely, the time between the equinoctial points rising twice. Second, the other Saura dina is the time which the sun takes to describe one degree of the ecliptic. It follows, therefore, that, strictly speaking, neither of these kinds of days are equal throughout the year, yet the former (which is also called Nacshatra dina) are supposed to be so in the first steps of several operations. Such is also the case with the latter, but this only happens when calculating the mean elements of the planets by the Vayam process.

3d, Diva dina is equal to a sidereal revolution of the sun.

4th, Pityra dina, to a synodical revolution of the moon.

5th, Brahma dina is equal to a calpa, or 4,320,000,000 years, his nights being equal to his day.

6th, Yuga dina is another word for Ahargana, meaning the number of days expired from the commencement of a yug. Yuga dina also means the anniversary day of that on which a yug began, which is always noticed in the calendar. —Warren's Kala Sankito.

DINAPUR, a town which gives its name to a district in the west of the Rajshahi, Kuch-Bihar division of Bengal. In 1872 the population of the town was 13,042, and of the district 1,501,924. The most numerous caste is the Kebartta (38,651); the fishing castes are also strongly represented, especially the Tier, with 17,364, and the Jahees, with 10,296 members. There are 16,710 Vaishnav mendicants; many of the Fuli tribe are said to belong to this sect.—Imp. Gaz.

DINA-KARA. SANSK. The day-maker; a usual title of the sun.

DINAPUR, a large military cantonment which gives its name to a subdivision of the Patna district. The town is on the right or southern bank of the Ganges, 8 miles west of Patna, in lat. 25° 38' 19" N., and long. 85° 5' 0" E., with 42,084 inhabitants in 1872. The Dinapur district had 141,337. During the mutiny of 1857, the native soldiers of three regiments here joined the rebels.

DINAR. Denarius, LAT.; Dinara, SANSK. The Roman Denarius was of silver of the unit of 60 grains. The Denara of the Sanskrit was 32 rati, or 64 grains. Though sometimes applied by Ibn Battuta to an Indian gold coin, Dinar is the only name he uses for the standard Indian silver coin. Sometimes the term used by him is Dinar Diraham, which Defremery in some instances renders 'Dinars of silver,' and in others, 'Dinars in Dirhems.' Sometimes the term used is Dinair fizzat. The Dinar in Akbar's time was a gold coin weighing 1 miskal, i.e. 1/9 dirham, 1 miskal = 6 danga, 1 danga = 4 tassui.—Müller; Yule, Cathay.

DIND and Khooch-hali, though etymologically the antipodes of each other, the first meaning a compulsory contribution, the other a benevolence or voluntary, have a similar interpretation in Rajputana. Dind is coeval with Hindu legislation. The bard Chaud describes it; and the chronicleer of the life of the great Sidraj of Anhal-wara, 'who expelled the seven dilda or 'great evils' whose initial letter was d, enumerates dind as one of them, and places it with the Sirdar and Shakru, the slayers of the royal minister Zalim Shishoo. The reign of Koten was in 1817, abolished the dind, and commanded a stone to be raised in the chief town of every district of his country, on which was inscribed the edict of perpetual abolition of dind, with the denunciation of eternal vengeance on whosoever should revoke it. The effigies of the sun, the moon, also of the cow and the hog, animals reverenced or execrated by all classes, were carved in relief to attest the imprecation.—Toti's Rajasthan, ii. pp. 508-570.

DINDIGUL, a town in the south of the Peninsula, with 13,000 inhabitants, in a beautiful and fertile valley in Madura, extending along the foot of the ghats. It is in lat. 10° 21' 39" N., and long. 78° 0' 17" E., 800 feet above the sea. It is 270 miles S.W. from Madras. The principal rivers are the Kodavar, Mangerry, Vagachay, Kul, and Ellur. The Kodavar is a stream of considerable magnitude. A rock on the W. side of the town is fortified, the Dindu-kal, the rock of Dindo, an asura or demon.

DINDUGA TREE. ANGLO-CAN. Bayla-Nava maram, TAM. According to Dr. Roxburgh, a species of Andersonia. A large and valuable tree of the Wynaad.—Ains. Mat. Med. p. 213.

DINGO, a species of dog in Australia, Canis Australasiacus.

DINNER. To send a dinner to another person is a common compliment among Mahomedans. In Persia, when requesting permission to do this, the party begs leave to send a little Noon-i-jow, barley bread, which humble phrase (nain-i-jau) may include every delicacy of the season. In India the phrase is Dal khoosha, split peas and rice.

DIOCLESIAN ERA, or Martyrs' era, dates from A.D. 284, the year of that emperor's accession.

DIDON, a globe fish of the fam. Gymno- dontide. There are 6 Diodon, Tetrodons, Triodons, in Asiatic Seas. The Diodons have but one large tooth above and below, and are usually protected by large, strong spines. Tetrodons and Diodons have the power of inflating, with wind, a membrane which extends along the under side of the abdomen, which causes them to float on the surface of the water, without the power, it is said, of directing their course; the membrane, when inflated, gives to the fish an almost spherical

DION.
DIOMEDEA, a genus of birds of the family Procellariidae, comprising the genera Diomea, Procellaria, Prion, Pelecanoides, Puffinus, Thalassarche. The birds are familiar as the albatross to all travellers in the southern seas, the common albatross of the D. exulans, Linn., being very abundant. D. fuliginosa, Lath., and D. chlororhynchos, Lath., also met with. Mariners distinguish them by other names,—for instance, D. exulans is the wandering albatross, D. spadicea is the green-bill or Nelly, D. chlororhynchos their molly-mauux or yellow-bill, and D. fuliginosa the sooty albatross; D. canta, Gould, the cautious albatross; D. brevichyrax, Gould, the short-tailed albatross; D. culminata, Gould, the culminated albatross; D. melanophris, Gould, is the black-browed albatross, and other species, D. gibbosa, D. nigripes, and D. olivaceorhyncha.

D. exulans, Linn., Monton du Cap, Fr., is abundant and equally numerous in all parts of the ocean between lat. 30° and 60° S.; but it ranges much farther south, and is to within the Antarctic Circle. The measurable feet across.

D. melanophris, Penn., is the most abundant species in every part between lat. 30° and 60° S.

D. canta, Gould, was procured by Mr. Gould off the south coast of the Van Diemen's Land.

D. chlororhynchos, Lath., occurs between lat. 30° and 60° S., in both the Atlantic and Pacific Oceans.

D. culminata, Gould, is rather abundant both in the Pacific and Atlantic Oceans, between lat. 30° and 50° S.

D. fuliginosa, Gmel., occurs in all parts of the ocean, between lat. 30° and 60° S.

D. brevichyrax, Penn., found in the North Pacific.

D. gibbosa, Gould, an inhabitant of the North Pacific.

D. olivaceorhyncha, Gould, China Seas (2).

DIONECA MUSCIPULA, Venus' flytrap, is remarkable for the irritability of the lobes of the round and fringed blade of the leaf. These lobes close upon each other the instant any one of the six minute bristles upon their upper surface is touched, and in this way secure insects which alight upon the leaf, enveloped in a fluid of mucilaginous consistence, which seems to act as a solvent, the insects being more or less consumed in it.

DIONYSOPOLIS of Ptolemy, the modern Jalalabad.

DIONYUS, a name of Bacchus, said to be Rama son of Cush, who invaded India; also supposed to be the same with Deva Nahuaha, but also has been traced to Parasurama.

DIOPSIS, a genus of dipterous insects of the family Sepaide. The head is small, and appears as if it were furnished with two long horns, each having a knob at its apex. These horn-like processes are prolongations of the sides of the head, the knob at the apex of each being the eye of the insect. D. Sykesii of Gray is one of the largest species of the genus, and possesses the longest antennae. In this insect are of a pitchy red colour, and the body is of the same tint. The head and thorax are black, and the wings are coloured with brown. Colonel Sykes collected great numbers of this species near the hill fort of Hurrecoholmghur, in the western Ghats of the Dekhan, at an elevation of 3900 feet above the level of the sea, lat. 19° 23' N., and long. 70° 40' E. —Eng. Cyc. ii. p. 354.

DIOSCOREA, a genus of plants of the order Dioscoreaceae, which furnish the tropical esculents called yams. It is the type of the natural order Dioscoreaceae. The following Eastern species are generally recognised:—

-uncula.  
-uncula.  
alata.  
anguina.  
strepurpea.  
heterophylla.  
belophylla.  
nummularia.  
bispinosa.  
pentaphylla.  
crispa.

The yam plants are cultivated in India, also among all the tribes in the Archipelago, and generally most so where rice is least abundant; but they nowhere form the chief bread of the people, as rice, maize, or sago do. The Malay and Javanese names rubi or uwi extend to the languages of all the Malay and Philippine Islands, to those of the Pacific, and to Madagascar. In the Tonga it is ufi, in the Tahiti eul, in New Zealand uwi, in New Ireland u, and in Madagascar vi. In Madagascar a wild yam is called uvi-alu, which, is without doubt, the uwi-alu—the wild or forest yam of the Javanese, with the elision of the final consonant, conformably to the genius of Malagasy pronunciation. The word ufi, besides being applied specifically to the yam, is used as a generic for farmaceous roots. Thus the batata, or Convolvulus batatas, is called by the Malays uvi-java, or the Javanese yam, to distinguish it from the Dioscorea. While many species are nutritious in this genus, some are highly dangerous. D. demonum and D. triphylla, both terebra-leaved species, have very nauseous and dangerous tubers. In Otaheite, the D. bispinosa, which bears small fleshy angular tubers along the stem in the axils of the leaves, is the favourite species. The elephant-foot yam, with a tuber about the size and shape of an elephant's foot, is white, and often as light and agreeable as a potato. It abounds in Karen gardens, but is rarely seen among the Burmese, or in the market. In Bengal, yam species most esteemed is D. globosa; after it D. alata, and lastly the D. purpurea.

D. Crispa.  
Zoological Museum.  
Dioscorea.  
Ko-ori, Burm.  
A yam of Bengal.

D. Demonum.  
Zoob.  
Ubium sylvestris, Rumph.  
Ko-we, Burm.  
Grows in Gorakpur and the Moluccas.  
It is remarkable for its large terebra leaves, of which the leaflets are sometimes nearly a foot long and six inches wide.

Dioscorea Japonica.  
Thunb.  
A hardy yam of Japan and N.E. Australia.

D. Nummularia.  
Linn.  
The Tivoli yam of continental and insular India and South Sea Islands; roots exceedingly good.

Dioscorea oppositifolia.  
Linn.  
Of India and China; an edible yam.—Eng. Cyc.; Cruiseard, Dict.; Mason; V. Mueller.

DIOSCOREA ACULEATA.  
Linn.

Ma-alu, Beng., Hind.  
Ka-awi of.  
Pacific.

Chota pindalu.  
Dukh.  
Kaku-kukulalu, Singh.  
Potato.  
Eng.  
Suru-va-kalu, Thai.  
Prickly-stemmed yam, Kanta-kalangu, Thai.  
Kata-kalangu, Malay.  
Kummara baadan, Tel.  
Pudde-kalangu, Dampa.

This is a very valuable and delicate small yam, somewhat resembling the sweet potato in appearance; tubers of an oval form, and very white.
DIOSCOREA ALATA. *Linn., Roxb.*

This very large yam grows wild in both the Konkans, and is cultivated on the coast of Coromandel; and in Bengal it is esteemed next best to *D. globosa.* It has many varieties.—*Ainslie; Roxb.; Voigt; Mueller.*

**DIOSCOREA ATROPURPUREA. Roxb.**

Myouk nee, *Burm. Dark purple yam, Eng.*

This, with a dark purple root, is one of the best yams. It is extensively cultivated both by Karens and Burmeese, and at Malaccas; tubers are large and irregular, and grow so near the surface of the ground as to appear in dry weather through the cracks that make in the soil by upraising the earth.—*Mason; Eng. Cyc.*

**DIOSCOREA BULBIFERA. *Linn.*

A native of New Holland, and is cultivated on the western coast of India, and both the Konkans. The root is edible, and is applied externally to ulcers. The leaves are used as greens.—*Voigt.*

**DIOSCOREA DELTOIDEA. Wall.**

Dioscorea bulbifera, *L.?*

There is doubt as to whether all these vernacular names mean the same plant; but if so, it grows abundantly in many parts of the Panjab Himalaya, from as low as 2000 up to 9200 feet, and is found in the Khyber ranges. The root is used in Kashmir for washing sheep wool for shawls, and both there and on the Chenab and Sutlej for washing woollen cloth. The root of this, or a variety (?), which grows to several pounds weight, after steeping in ashes and water to remove acidity, is largely eaten cooked by various classes in parts of the Siwalik and outer hills, but in other places is not used; and Dr. Stewart was once told that the tongue would rot from eating it. Honigberger says that it is used medicinally.—*Dr. J. L. Stewart, Panjab Plants, p. 229; Porell, i p. 378.*

**DIOSCOREA FASCICULATA. Roxb.**

This small yam of Bengal is not much larger than a kidney potato, which it much resembles both in appearance and taste. It is cultivated extensively by the Karens race, and, being more like a potato than a yam, has acquired the names of the Karen potato and the Tavoy potato. It is the best vegetable the Karens have, but unfortunately it can be obtained during a few months only in the year; is largely cultivated in Bengal for food, and to make starch.—*Mason; Voigt; Roxb. iii. 801.*

**DIOSCOREA GLABRA. Roxb.; D. batatas, D. C. Chinese yam; introduced into Europe about the year 1849, having been sent from Shang-hai by M. de Montigny, the French consul. It is everywhere cultivated in China, and bears the names of Chou-yu, Tou-tehaw, Chan-chou, Chan-yo, and Chan-yun, which signify the 'Arum of the Mountain.' At Nankin it is very large and of excellent flavor; that of the Chou district is still better, but for medicinal purposes the Chinese prefer that of the Hoai-king district, where the Chou-yu root is laxative and sweet. It is particularly worthy of a place in the kitchen garden, as well as in field culture, on account of its perfectly succulent flavour, and the absence of any after-taste of sweeteness, acidity, or spiciness, such as is often found in other plants, as also on account of the case with which it may be cultivated, and the facility of preserving it from decay.—*Agricultural Rep. to Commissioners of Patents to House of Assembly for 1854.*

**DIOSCOREA GLOBOSA. Roxb., W. lc.**

Chupi alu, *Beng., Hind. Gunu pendalum, Tel.*

Is the most esteemed of all the Indian yams. Its flowers are highly fragrant; the tubers are white internally; it has arrow-headed cordate leaves.—*Roxb. iii. p. 797; Mason; Voigt.*

**DIOSCOREA PENTAPHYLLA. *Linn.*

This yam grows wild over all the East Indies and throughout the Archipelago, the flowers are used as greens, and the tubers as an esculent. In some parts of Southern India is called Kaat vulli kalang, or wild yam. It appears to be the Nooren kalang of the Hortus Malabaricus, and the Onu of the Malay.—*Ainslie, p. 249; Roxb. iii. p. 806.*

**DIOSCOREA PURPUREA. Roxb.**

This holds the third rank amongst the yams, and is cultivated throughout India, being boiled and eaten like a potato. The tubers are permanently stained purple throughout, immediately below the cuticle, and are sometimes three feet long. Its flowers are fragrant.—*Roxb. iii. p. 799.*

**DIOSCOREA SATIVA. W.**

This is eaten all over the E. Indies by Europeans and natives.—*Ainslie, p. 251.*

**DIOSCOREA TOMENTOSA. Spr. Subdampa, Tel. Grows in the Peninsula of India, at Travancore, and at Ginge.-Voigt.*

**DIOSCOREA TRIPHYLLA. *Linn.*

A yam of the Konkans and Moluccas; said to be used to render the coconuts tree too markedly intoxicating.

**DIOSCURI, the Greek analogue of the Aswini. DIOSPIRYACE.E, a natural order of plants, called by Ventenat and Lindley the Ebenaceae, or ebony tribe. They consist of trees and shrubs, and include two East Indian genera, Diospyros and Maha. The species of Diospyros form large trees, with alternate thick and often leathery leaves, remarkable for the hardness and the blackness of the wood of some species, and for the edible fruits of others, the woods being the ebones and ironwoods of commerce. The fruits are noted for
their extreme acerbity before arriving at maturity, but they are sometimes brought from China as a preserve. Diospyros kaki is common to Nepal, China, and Japan; D. melanoxyylon and D. chloroxylon, of the mountains of the Peninsula. D. embryopteris, found with them, extends from Sylhet and Bengal near to the Dhehra Doon along the foot of the mountains, and D. montana to the borders of the Raenka lake near Nahm. D. cordifolia seems to be common in every part of India, and D. tomentosa, first described by Dr. Roxburgh, from the northern parts of Bengail, extends to the Kheelee jungle, and the foot of the lower hills; the same species appears also to exist in the central range. D. Roylei, Wall. Cat. N. §. 4134, is a nearly-allied species, growing in abundance near Ajyghur and the Bierumganji Ghat. Wight, in Icones, gives 15 species, and Mr. Gamble notices 41. Besides those noticed here, authors mention D. bracteata, Roxb., D. clarkii, D. cerasifolia, D. Don, Nepal, D. frutescens, Bl., and D. macrophylla, Bl., of Java, and D. serrata, Buch., of Nepal. D. Candolleana, W. C.; Homedereya-gass, Singh.; in Ceylon, a middle-sized tree, in the Saffragam district and Hindoone Corle.

D. acuta, Thw., and D. attenuata, Thw., are middle-sized trees of Passoon Corle, in Ceylon. D. affinis, Thw., a middle-sized tree growing at Ooma, Oya, on the lowest land from Kandy to Badulla, in Ceylon; it grows sub-glabrous; timber is suitable for building purposes.

D. calycina, Bedd. This good-sized tree, everywhere glabrous, leaves dark shining green, has only been observed in the Tinnevelly district and southern portions of Madura, where, however, it is very abundant in the ghat forests from the foot up to 3000 feet elevation. It yields a valuable light-coloured wood, which is much in use in the Tinnevelly district.—Theuaites, Zeyl. p. 181; Roxb.; Eng. Cyc.; Dr. Mason; Royle, Ill. Jnn. Bot. p. 202; Wight, Icones; Bedd.

Diospyros cananica, Bedd. A good-sized tree, glabrous; leaves oblong to obovato-oblong. South Canara plains, near the foot of the ghat, called Karah-mara, allied to D. Arnottiana.—Miq. in Bedd. 1c. Plant.

Grows to a large tree on the Cercar mountains, and gives a very hard, useful wood; whereas it is generally a shrub about the Godavery forests. The fruit is edible.—Roxb. ii. p. 538; Voigt; Beddome.

Diospyros cordifolia, Roxb. Diospyros montana, Wight!! Ban-gab, BENG. Nalla ulinera, TEL. Guinathan, MARH. Kaka ulinera, "

Vukcan maram, TAM. Nalla urinida, "

Grows in Ceylon near Jaffna, in the Peninsula of India, in Coimbatore, and in Bengal. It yields a hard, Bengal, strong wood, of a dark-brown colour, and difficult to work. Not uncommon in the Bombay side of India, but more in ravines and waste places than in forests; and Dr. Gibson had never seen a tree that would turn out a log 4 inches square. The wood is strong and durable.—Roxb. ii. 538; Wight; Gibson; Theuaites; Voigt.

Diospyros crummentata. Thw. A very large tree of the central province of Ceylon; branches glabrous; leaves glabrous, oblong, abruptly and obtusely acuminate; growing at an elevation of 2000 to 4000 feet.—Thw.; Bedd. 1c.

Diospyros ebenum. Linn. Ebony.

Diospyros ebenaster, Retz. | Hebester, Rumph.

Kara maa, CAN. Kado beriya? "
Steinholz, GER. Kaka-tati; Atchem, TAM.
Don., SCI. Thabi maram, "
Habemen, HEI. Tuki, "
Tendu, Tendua (the white wood), HIND. Kendhoo, "

The timber of this great tree yields the best kind of ebony wood. In Exodus xxvii. 15, it is mentioned as brought with ivory by the men of Dedan. It seems to have been then brought both from Ethiopia and India, though Virgil appears to have been unaware of this, for he says (Georg. ii. p. 115).—

'Sola India nigrum
Fert ebenum.'

It was highly esteemed by the ancients. In Ceylon it is found not uncommon up to an elevation of 5000 feet, in great abundance in the north of the island, and to some extent in the Kandyman country. The great weight of the timber renders its transport very costly, unless where water conveyance can be obtained, which is seldom the case, but during the rainy months; and though immense forests of this wood still exist in the island, they are to a great extent too far from a port of shipment to be available. The exports of ebony have varied much of late years from 15,000 to 5000 cwt.

This valuable tree is not uncommon in the mountain forests on both sides of the Madras Presidency, and in Ceylon, and is well known in the Kurnool and Cuddapah forests, where it yields the best kind of ebony, generally jet black, but sometimes highly streaked with yellow or brown. It is very heavy, close, and even-grained, and takes a high polish; un seasoned, it weighs 90 to 100 lbs. the cubic foot, 81 lbs. when seasoned, and has a specific gravity of 1.296. It is used for inlaying and ornamental turnery, and sometimes for furniture. The sap-wood is white, hard, close-grained and strong, but not durable, but is used by the natives for various purposes.—Roxb.; Theuaites; Tredgold; Holtzapfel.

Tumika, BENG. Timbiri, SANJ. SINGH, Gab, BENG., HIND. Tumbikai, TAM.
Yendaik, TAM. Tumiki, Tinduki, TEL.
Timburi, DEK. Tumiki, "

Grows in the south of Ceylon, in damp forests, also in the Peninsula of India, in the Cercars, all along the foot of the Himalaya to Sylhet and Assam. It is a common tree on the western coast of the Peninsula, particularly near marine lagoons, and is also grown in the forests of Bengal, Mysore, and Bombay. The timber is only of average quality, but is used in Ceylon for the masts and yards of country vessels and for building purposes; and the fruit rusty-coloured, abundant in a viscid glutinous astrigent juice, obnoxious to insects, and used by bookbinders, also for paying boats' bottoms, and also in infusion for
soaking fishing nets, as it contains much tannin. Thwaites describes three varieties:—

Var. β. Atatra; folis membranaceis, gemmis, pedunculis calycico nigro-pilosis.

Var. γ. Nervoria; folis brevioribus, coriaceis, utrique valde prominentem senenis, basi, rotundatia; gemmis, pedunculis calycico nigropilosis; lobis calycis fructiferi ciliatis.

Var. α. is very abundant in the hotter parts of the island. Var. β. Less common, but generally distributed. Var. γ. In damp forests towards the south of the island. Wood indifferent, and not much used.—Roxb. ii. p. 553; Rohde’s MSS.; Voigt; Thee. En. Pl. Zeylii. ii. p. 178; Beddome.

Diospyros Exsculpta. Ham., D. C.

Diospyros tomentosa, Roxz. Tumki, Tel.

Diospyros Erecta. Ham.

This is a valuable tree, not uncommon in the Cuddapah, Salem, and Kurnool forests, and probably elsewhere in the Madras Presidency, and is found in Bengal and Bombay. It grows to a considerable size, and yields a valuable jet-black ebony, so very similar to that of D. ebenum, that Colonel Beddome doubts if the two woods could be easily differentiated. The tree sheds all its leaves in the cold season, and they appear again with the flowers in the beginning of the hot weather.—Beddome, Fl. Sylte. p. 66.

Diospyros Hisutsa. Linn. fisc.

Calamander maram, Tam.

A medium-sized tree in the Saffragam and Galle forests of Ceylon. It furnishes one of the calamander woods of commerce. The figure is between that of a rosewood and zebra-wood; the colour of the ground is usually of a red olive brown, described also as chocolate brown, with black stripes and marks. Veneer saws cut it without difficulty, and it turns well. A cubic foot weighs 57 lbs. It is a scarce though beautiful wood, close-grained, and the most valuable for ornamental purposes in Ceylon. It is exceedingly hard, and finely veined, with different shades of black and brown.—Ains.; Tredgold; Holtzapfelt; Mr. Faulkner; Thee. En. Pl. Zeyli. p. 181.

A very large tree of the damp forests of Ceylon, growing up to an elevation of 2000 feet; also in the dense forests of the Animalays; young branches slightly pilose.—Thue. p. 180.

Diospyros Kaki. Linn.

D. Chinnais, Bl.

Embryopteris kaki, G. Don.

Tee-tee, Tee-tea, Bum. Persimmon of China.

Sz. Tze. Chin.

Keg fig of Japan.

Chinese date., Eng. Chinese fig.

Date plum of China.

A tree of Nepal, Burma, Cochín-China, and celebrated in China and Japan, where it is common. The fruit in Japan and China attains the size of an orange, and is frequently sent to Europe in a dried state. Preserved in sugar, it is a large, thin-skinned, juicy fruit of an orange-yellow colour, with a sweet taste. The tree is occasionally cultivated by the Burmese, but it bears fruit very sparsingly, and is by no means equal to a good apple.—Roxb. ii. 557; Masou; Eng. Cyc.; Smith.

Diospyros lotus. Linn.

This is the true lotus of the LoduPeople. It is common in Kaghahan, in the hills and gardens of Murri and Hazaar and N. China. In parts of Hazaar the male plant is called Gwaldhar, and the female Amlok. Timber good. In Hazaar it is valued chiefly for its fruit, which is purple in colour, and about the size of a cherry or a pigeon’s egg; it is eaten either fresh or dried. The tree is not uncommon in the western part of the Jhelum basin from 2500 to 6000 feet, and appears to be common in some parts of the northern Trans-Judas hills; and one or two specimens were grown at Peshawur. It is a handsome little tree, growing generally to 3 or 4 feet in girth, the largest seen being one of 6 feet girth and 35 feet high at Jareed in Kaghahan, and another about the same size on the Kishenganga. There are three trees (probably introduced by fakirs) at Jugatsakh (6000 feet) in Kullu, and there called Bissahripala, the largest of 12 feet girth. Griffith remarks that the fruit is not worthy of any notice; but when fresh or even carefully dried, it is sweet and pleasant enough, and the Afghans, etc., prize it, large quantities being brought to the Peshawur bazar from Swat, etc. Bellew mentions that it is eaten plain or with rice, or is used in sherbets. It has the appearance of a dried cherry, but darker in colour. Irvine states that, in the Panjab, spirits are distilled from the fruit.—Dr. Irvine, J. L. Stewart, Ceylon; V. Mueller; Smith.

Diospyros Mabola. Roxb.

D. discolor, Wild.; Cavemilla Philippensis, Embryopteris disc, G. Don.; Devors.

Often called Mangosteen, under which name it is cultivated extensively in gardens at Vizagapatam. It is a small tree, native of the Philippine Islands; wood black, very compact. The fruit, called Mabola, is brown, with a pink-coloured fleshy rind about the size of a quince; its flavour is said to be agreeable.—G. Don; Madras Ez. Ju. R.

Diospyros Melanoxylon. Roxb.

Kendu, Kiu, Bong. Tumbali maram, Tam.

Ouk-chin-ya, Burm. Tamma chettu, Tel.

Wu-ma, Wu-pi, Chin.

It is the ebony tree of the Coromandel coast, and is found on the mountains of that coast, as well as on those of Malabar and Ceylon. The fruit is eaten by the poor. The leaves are deciduous in the cold season, the new ones appearing with the flowers in April and May. As in other species, it is only the centre of the large trees that is black and valuable, and this varies in quantity according to the age of the tree. The outside wood, which is white and soft, time and insects soon destroy, leaving the black untouched. The ripe fruit is eaten by the natives, though rather astringent, as is also the bark. It grows in Coimbatore, North Canara, in Malabar, and Otrisa, near the Godavery. It is a very large tree in Coimbatore. Its white wood is used for common purposes. It is found sparingly in North Canara, as below the Woolwa Ghat, and near Meerajan island. Accord-
ing to Dr. M'Clelland, it occurs plentifully in the southern forests of Pegu, from 15 to 18 inches in diameter and 50 to 70 feet in length, and might afford spars for naval purposes; but Dr. Brandis does not mention this as a Pegu tree.—*Drs. Ainslie, Roxb. ii. 599; Beddome.*

**Diospyros Microphylla.** *Bedd.* A lofty tree of the Animallasy dense forests up to 3000 feet elevation; very common in South Cunara, forests of the ghats and plains (Sooleya), Wynad; trunk very straight, young branches verticillate; it has the habit of Leucoxylon buxiiform.-*Maj.*

**Diospyros mollis?** *Ma-kleu, Bum.* One of the black-dye plants. The blossoms of the black-dye plant are used by the Chinese to dye leather black. The juice of the cashew tree gives a black to linen, and the fruit of the melastoma affords a black dye. The celebrated vegetable Shan black dye is made from the fruit of this species of ebony, which is said to grow on the mountains that separate the province of Tavoy from the Siamese territories. Isolated plants may be seen in the gardens of Tavoy and Moulmein.—*Mason.*

**Diospyros Montana.** *Rozb.*

*Diospyros Cordifolia, Rozb., W. i.e.*

Kendu of Beas and Doab. *Hilek, Pasenda,* *Panj.*

Teeboorni, *Tumiki.*

A middle-sized, handsome tree of the Circar mountains, in the hills eastward from Fanwell, extending northwards to Ruenka lake, near Nahn; very common in the larger Bombay jungles, both near the coast and elsewhere, and it would be one of the most prominent of their mountain trees if allowed to grow; but it is generally cut off for burning material, or such like worthless purposes.

It is not uncommon along the Sivalki tract up to near the Ravi, and occasionally out in the plains westward from Dehi to near Sirsa. Wood dark and strong, fitted for agricultural implements, indoor work, etc.; does not bear exposure, and could not be cresoted. Dr. Roxburgh says it is hard and durable, and is variegated with dark and white coloured veins. Dr. Stewart says it ordinarily grows to about 3 feet girth, but he had seen two trees of 7 feet. The wood is used for native roofs, etc. The fruit is not eaten, and he had heard it called poisonous. In some places it is applied to the hands for the boils to which the Bhisti are subject.—*Drs. Rozb.* ii. p. 598, *Ainslie, Voiyf, Gibson, Stewart.*

**Diospyros Moonii.** *Thee.* A middle-sized Ceylon tree near Cultura and Pasloon Corle. Branches terete, slightly pilose when young, but soon glabrous.—*Thee. Zeyl.*

**Diospyros Nicriganos.** *Dalt.* A tree of the Bombay Ghats, arboreous, glabrous, turning very black in drying; leaves membranaceous, glabrous.—*Bedd. Ic. Plant.*

**Diospyros Oocarpa.** *Thee.* Kalooka-dooambirheyga-gass, *Singh.* A middling-sized Ceylon tree of the Kornegalle district, and at Haragam, near Kandy, at no great elevation. It furnishes one of the camander woods.—*Thee. Zeyl.*

**Diospyros Oppositifolia.** *Thee.* Ka-loo midereya-gass, *Singh.* A middle-sized tree of Ceylon at Hindoon Corle, up to an elevation of 1000 feet; leaves opposite, slightly pilose when young. The timber much resembles the true camander wood.—*Thee. Zeyl.; Bedd. Ic. Plant.*

**Diospyros Ovarifolia.** *W. i.e. t. 1227.* A middle-sized Ceylon tree at Jaffna, in the central province, at Haweatherine and below Hapootelle, at an elevation of 2000 to 4000 feet.—*Thee. En.*

**Diospyros Paniculata.** *Dalt.* A middling-sized tree; branches glabrous; leaves glabrous, lanceolate; grows in Bombay Ghats and in the Cearoo Ghat, Wynad, at 2000 to 3000 feet elevation.—*Bedd. Ic. Plante.*

**Diospyros Pruniens.** *Dalt.* A small or middling-sized tree; young branches densely hisurate, with long yellow hairs; very common throughout the Wynad up to 3000 feet elevation; also in the Animallasy, the South Canara Ghats and plains, Tinnevelly and Bombay Ghats, also found in Ceylon.—*Bedd. Ic. Plant.*

**Diospyros Quesita.** *Thee.* Kaloo midereya-gass, *Singh.* A great tree of Ceylon; at Singherajah and other forests between Ratnapura and Gale. This species produces the most valuable of the timber known as camander wood, so much esteemed for ornamental cabinet work. Its branches are glabrous, leaves glabrous, prominently reticulated. *D. quesita* is nearly allied to *D. crumenata,* but its larger leaves and fruit, and its pentameros flowers, well distinguish it.—*Thee.*

**Diospyros Sylvatica.** *Rozb.*

Sandoon kadoombhirheyga-gass,—*Tella-goda,* *Tel.*

-Sinor.*

A middling-sized tree common in the Peninsula; in many of the western coast forests up to about 3000 feet, also in the forests of the Northern Division and in Ceylon, in the damp forests in the Hantani district and near Ratnapura, up to an elevation of 4000 feet.—*Rozb.* ii. 537; *Thee. Zeyl.*

**Diospyros Thwaitesii.** *Bedd.* A middling-sized tree; branchlets, young leaves, and inflorescence rufo-tomentose; grows in Ceylon at no great elevation; allied to, but quite distinct from, *D. Candolleana of Wight.—Bedd. Ic. Plant.*

**Diospyros Tomentosa.** *Rozb.*

*D. lotus,* *Linn.*

This tall, elegant tree grows in the northern part of Bengal, in the Panjab, in Kullu and Kangra, and is common in the Sivalki tract, westward near to the Ravi, and extending to the Khera jungle. It attains full size in 60 years. Length of trunk to first branch, 8 or 10 feet, and girth 4 feet. The wood of young trees is white, but that of old trees is black, and is termed Abmus; sap-wood soft; when the heart-wood becomes black, it is fine, extremely hard, but somewhat brittle, and is used by agriculturists for ploughs, and for the woodwork of their houses. It carves well, and insects are said not to touch it. In and near the Rohilkhand Sivalki tract, handsome workboxes, etc., are made from the wood; combs are made from it in the Ambala district. In Kangra, etc., it is used for ploughs, in house-building, and for small boxes. The fruit, which is said to ripen in June with the mango, is eaten being sweetish and astrigent, and not unpleasant. Resappings of the wood, called Burad-i-abrus, are
DIPSYROS TOPOSIA.

official, being given as an alternative.—Roeb. i. 532; L. Col. L.; C.; Koll.; Steuart.

DIPSYROS TOPOSIA. Him. D. racemosa; Roeb.; Encyclopædia racemosa, G. Don. Kaka-kaala, S. Ling. Tovaray, TAM.

A middling-sized tree of Ceylon, of the Tinnevelly Hills, and of Sylhet; glabrous, leaves coriaceous, not uncommon in damp forests up to an elevation of 4000 feet.—Th. Zeyl. iii. p. 179.

DIPSYROS WIGHTIANA. Wall., D. C. Tenda, ... Hind; Tum, Tuml, TAM, Tel.

This tree is common in most of the dry forests of S. India, and quite answers to the description of D. Wightiana, as given in De Candolle's Prodromus. Its heart-wood yields a jet black ebony like D. ebenum and D. exsulcatra, but the trees are always small and stunted in the trunk; and Colonel Beddome says all ebony in log comes from D. ebenum and D. exsulcatra. It sheds its leaves in the cold season, and they appear again with the flowers yearly in the hot season.—Bedd. Fl. Sylc. part vi. p. 67.

DIPA DUNI, a ruined city between the ancient city of D'Bharikotah and the more modern town of Amaravati, in the Guntur district of the Madras Presidency. It contains the ruins of one of the most magnificent dagobas ever constructed. Many of the sculptures obtained from it were sent to Great Britain by the Editor, from the Government Central Museum, Madras, and are lodged in the British Museum.

DIPA MALA, a Sikh festival on the 14th of the dark half of Kartik. It means a garland of lights; a pillar in front of a temple, on which lights are put. The Dimpal pedestal is an essential part of every large Hindu temple. It is often of great height, and furnished with niches or brackets, each of which holds a lamp on festivals, especially on that of the Dewali, the feast of lamps, celebrated in the autumn in honour of the Hindu goddess Bahwani or Kali.

The Dipawali, Dipali, or Diwali, is a Hindu festival in honour of the Hindu god Kartikaya, held on the new moon of the month Kartik, in September or October, when lamps are lighted by every one, after a procession to commemorate the killing of Narasakura by Krishna.—Wilson.

DIPDAN or Deepdan. Hind. In E. Oudh and Benares, is land assigned to Brahmins on the banks of rivers, to deprecate river encroachment. The word is derived from Deep, an island, and Dan, a gift.—Eliot.

DIP-DAN. Hind. A Hindu ceremony of suspending dipa, a lamp, to a pidal or other tree for ten days, after the death of a relative, in order to light the spirit on its way to Yamapuri, the city of Yama, the judge of the dead. Yamapuri is declared in the Hindu sacred books to be the general rendezvous of the departed from all parts of the world, from which they proceed in a body with a proper guard, composed of the servants of Yama (Plato) to Draymapuri. Also, presenting a lamp to the Ganges, setting it afloat on the river lighted, and watching for its extinction, as ominous of future good or ill luck.

Dip-Dan, or lamp-post pillars, are very common in the south of India near Jaina buildings, standing either singly or in pairs, in front of the gopuras. All the Hindu temples are provided with them. They generally consist of a single block of granite, square at base, changing to an octagon, and again to a figure of sixteen sides, with a capital of very elegant shape; some, however, are circular.—Ferguson; As. Res. x. p. 145; Elliot.

DIPLOCUS and Minimus. Monkey flower.

DIPLOSPORA APIOCARPA Ducl. This large tree grows on the Cominatore Hills (Mati-kolam, 4500 feet elevation), on the Simpara Ghats (Neelgherries), and in the Wynad (2800 feet elevation); and Mr. Dalzell found it on the Bombay Ghats. It flowers in the rains, and ripens its fruit in January; timber not known.—Beddome, Fl. Sylc. part xix. p. 223.

Dipsas cynodon? Schlegel. Scutae, 240; setella, 110; rows of scales, 21. Only found in forests on the west coast.

Dipsas trigonata, Tati kattaday, Tel.; Peri surutay, T. Scutae, 235; setella, 83. Common in the Kannatic.

DIPSAS, a genus of lepidopterous insects, the larvae of which have several curious modes of working. Those of D. isocrates occupy the interior of a pomegranate, which they enclose in a web, to prevent it falling.

DIPTERA, an order of insects, gnats, flies, etc., sec. Athericorum, fam. Muscidae, comprising,—

Dipsia Westwoodii, De Haan, Java.
D. sub-notata, West., Philippines.
D. sphyryncephala, West., Nieuw, India.
D. schia, Makl., Java.
D. colax variegatus, West., Java.

Midas rudeficoris occurs in Tranquebar. About fifty species occur in Ceylon, the most troublesome of the mosquitoes being Culex anaguer, on the coast. The genera Sciara, Cecidomyia, and Simillium have each one species there. The Peepsa, a troublesome dipterous insect, very small and black, floats like a speck before the eye. The bite of this leaves a small spot of extravasated blood under the cuticle, very irritating if not opened.—Journ. As. Soc. Bengal, No. xxix. p. 426. See Insects.

DIPTERIS HOISFIELDII and Matonia pectinata are two ferns of Mount Ophir in Malacca. They bear large spreading pinnate fronds, on slender stems six or eight feet high.—Wallace, p. 31.

DIPTERIX ODOHATA. Tonkin bean; Camarouma odorata. A native of the woods of China, used as a perfume for snuff.—O'Sh. p. 304.

DIPTEROCARPACEAE, the caupary tree tribe, a natural order of plants, generally large trees, which grow in the East Indies and Java, viz. Dippterocarpus, Doona, Hopea, Shorea, Vatica, and Vateria, with about 35 species. More than two-thirds of the species inhabit mountainous or hilly parts of the two Peninsulas. In Madras they are all natives of the hilly tracts of
the Balaghut. In Sylhet, Chittagong, and Pegu, where they abound, they, however, occupy the plains. In Java, one species, the Dipterocarpus littoralis, is found on the sea-shore. A Hopea and the Vateria Indica also approach the coast in Malabar, but the latter, or perhaps a distinct species, is also plentiful in Mysore. Two or three species are found in Gunsurn, forming extensive forests. Almost every species abounds in a balassic resinous juice. That from the genera Vateria and Vateria hinders on exposure, and is called dammer, but the exudations from the Dipterocarpi retain their fluidity, and are the wood-oils of the bazaars. Some of the species produce a fragrant gum-resin, which is used as incense in the temples. Dammer is used in India for most of the purposes to which pitch and resin are applied in Europe. Wood-oil alone, or thickened with dammer, supplies a useful varnish for wood, possessing the valuable property of repelling for a long time the attacks of white ants, as well as of resisting the influence of the climate. The species abound in Sumatra, Java, and Borneo, and are the chief sources of the dammer of commerce. Borneo tallow is said to be obtained from the seeds of a Dipterocarpus tree, and is generally run, whilst melted, into joints of bamboo. It has a pale greenish tint, is very hard, and approximates nearly to a vegetable wax.

Several trees of the genus Dipterocarpus produce a nut, that, when compressed, yields a fatty oil, which, having been recently sent to England, has been used extensively under the names of vegetable tallow and vegetable wax. Three species of this genus are common in Sarawak, under the name of Mencabang. One of them, Mencabang piang, is valued for its close-grained timber; the others do not grow so large in size, but have larger leaves and fruit. The one most valued for producing the oil is a fine tree growing on the banks of the Sarawak river; it attains the height of forty feet. The leaves being large, and the branches drooping towards the water, give it a very beautiful appearance; its fruit is produced in the greatest profusion about December and January, being as large as a walnut, with two long wings to the seed. These nuts are collected by the natives, and yield a very large proportion of oil, which, on being allowed to cool, takes the consistence of sperm, and in appearance very much resembles that substance. The native uses this as a cooking oil. In England it has proved to be the best lubricating substance for steam machinery, for surpassing even olive oil; and it has been used in Mauritius in the manufacture of candles, and found to answer admirably. It will doubtless be applied to many other purposes. From the quickness of its growth, and the great profusion with which it bears its fruit, it will, should the demand for it continue, become a profitable object for cultivation, by which the quality and quantity would most likely be improved and increased. It is also found in Java and Sumatra; and a similar substance has been lately sent from China. In Borneo the oil is called by the natives indifferently, Minik menebang, or Minik tankawan. The wood-oils dissolved in water, and have medicinal properties similar to copalina. D. levis, D. turbinatus, and D. alatus are useful for planking when not exposed to wet; extensively used in the Straits for this purpose in house-building. They are magnificent forest trees, growing straight to the height of 250 feet and more.—Wight; Voigt, p. 124; Crawford, Dictionary, p. 116; Loue's Sarawak; London Ex. 1862; Royle, Ill. Him. Bot.; M'Clelland.

DIPTEROCARPS ALATUS. Roxb.

Batee al, . . . BENG. Aing . . . . BURM. Ka-nyin, . . . . BURM. Wood-oil tree, . . . EGO. A magnificent forest tree of Pegu and the Mascal Islands, rising 250 feet in height. It is found chiefly to grow on laterite in the Townghoo and Prome districts. Its wood is of a light-brown colour. A cubic foot weighs 38 lbs. In a full-grown tree on good soil, the average length of the trunk to the first branch is 100 feet, and average girth measured at 6 feet from the ground, is 25 feet. It sells at 4 annas per cubic foot. This timber is excellent for every purpose of house-building, especially for posts. It is useful for planking when not exposed to wet, and is extensively used in the Straits for house-building; when exposed to wet, however, it rapidly decays, and canoes made of it do not last over three or four years.—Dr. Roxb. ii. p. 6, M'Clelland, Brandis.

DIPTEROCARPS ANGUSTIFOLIUS. Roxb.

D. costatus, Roxb. [Tilla garjan. . . . RAKH. A large tree of Chittagong, furnishing a wood-oil in the largest quantity.—Roxb. ii. p. 613.]

DIPTEROCARPS GLANDULOSUS. Thw.

Dorana, Singh. A large Ceylon tree, growing in the Saffraham and Ambaganowa districts, at no great elevation.—Thw.

DIPTEROCARPS GRANDIFLORA. Wall. Eng, En, Ain tha, BURM. [Kanne phin, . . . BURM. An immense tree of Burma, Pegu, and Tavoy, which grows on the sandy plains near the seashore, and on a similar soil in the interior. This tree, in company with a few other kinds, forms an extensive forest, which covers upwards of 200 square miles in the province of Pegu. The wood is somewhat more durable than that of D. alatus, and is used for canoes, house-posts, planking, etc. A cubic foot weighs 55 pounds. In a full-grown tree on good soil the average length of the trunk to the first branch is 60 feet, and the average girth measured at 6 feet from the ground is 10 feet. It sells at 8 annas per cubic foot.—Dr. Wallis, Brandis, and Mason; Col. Frith.

DIPTEROCARPS HISPIDUS. Thwaieta.

Boohora gass. SINGIL. A large tree of Ceylon, growing in the Saffraham district at no great elevation.—Thwaieta.

DIPTEROCARPS INCANUS, a tree of Chittagong. All the tender parts hairy.—Roxb.

DIPTEROCARPS INDICUS. Bedd. Common in all the ghats of the Peninsula, from Cape Comorin to Cape Cromali, and very abundant in S. Canara, where it is called guga. Its timber is very open in the grain, and not durable, but is occasionally used for various purposes; the tree yields a wood-oil, but it is never extracted. The liquid balsam, like copaiba, sold in Travenuond, and the produce of a tree from those glats, is not from this tree, but is extracted from the Hardwickii pinnata.—Beddome, Fl. Sylv. p. 94.

DIPTEROCARPS INSIGNIS. Thw. An immense tree of the Saffraham district, in Ceylon.—Thwaieta.

DIPTEROCARPS LEVIS. Buch.

D. turbinatus, Roxb.

Tills gurjan, . . . BENG. Ka nypeen phyu, . . . BURM. Ka nypeen tha? . . . BURM. Wood-oil tree, . . . EGO. Ka nypeen ney, . . . HERT. SINGIL.
DIPTEROCARPUS OBLONGIFOLIUS.

This majestic tree grows to a height of 250 feet. It is met with in Assam, Tiperah, Chittagong, Burma, and Pegu, and is very abundant all over the provinces of Anherst, Tavoy, and Mergui, where its wood is used similarly to D. alatus. Dr. Mason says it is a very useful timber, which is sawn into boards at Tavoy and Mergui, and used in house-building. Where not exposed to the wet, they answer as well as teak, and are sold at half the price; they are, however, not impervious to white ants. Captain Dance, who tells us that it is used for rafters and planks, adds that it is an inferior wood, by no means durable, as it rots as soon as it is exposed to water, and shrinks readily.

He says that Dr. M'Clelland speaks of this wood more favourably, but thinks he must mean some other wood, as this is decidedly bad, very porous, and when kept the oil oozes out and stands in globsules over it. It warps to a great extent, and, though used for cases, does not last for more than about two years. In the cold weather the tree is largely notched near the ground, and the wound charred. After this the oil or balsam begins to ooze out, sometimes forty gallons daily,—a balsam that compares favourably with balsam of copaiba. Maximum girth, 6 cubic; maximum length, 70 feet. When seasoned, floats in water.—Roeb. ii. p. 612; Drs. Mason, Voigt; Captains Dance and Benson; Dr. M'Clelland's Report, No. 81, p. 135.

DIPTEROCARPUS OBLONGIFOLIUS, Thw., and D. scabridus, Thw., are great trees near Tatanpur, in Ceylon.—Theaeetes.

DIPTEROCARPUS TUBERCULATUS, Roeb., of Chittagong; D. pilosus of the Mascal Island, are also known.—Roeb. ii. 614.

DIPTEROCARPUS TUBINATUS. Roeb. Shweta-garan., Burs.; Hora-gaha, SINGH. Kw-yin, BURM. A native of Chittagong, Tiperah, Pegu, etc., to the eastward of Bengal, where it grows to be an immense tree, and is famous all over the eastern parts of India and the Malay Islands, on account of its thin liquid balsam or wood-oil. To procure this balsam, a large notch is cut into the trunk of the tree about 30 inches from the ground, where a fire is kept up until the wood is charred, soon after which the liquid begins to ooze out. A small gutter is cut in the wood to conduct the liquid into a vessel placed to receive it. The average produce of the best trees during the season is said to be sometimes forty gallons. It is found necessary every week to cut off the old charred surfaces and burn it afresh. In large healthy trees, abounding in balsam, they even cut a second notch in some other part of the tree, and clear it in the same manner during the months of November to February. Should any of the trees appear sickly the following season, one or more years' respite is given them.

This is the most superb tree to be met with in the Indian forests. It is conspicuous for its gigantic size, and for the straightness and graceful form of its tall unbranched pale-grey trunk, and small symmetrical crown. Many individuals are upwards of 200 feet high, and 15 in girth. Its leaves are broad, glossy, and beautiful; the flowers are not conspicuous; the wood is light-brown, hard, close-grained, and durable, and fit for any purpose for which sal is employed, and is chiefly employed for canoe and boat build-

ing.—Roeburgh, ii. p. 612; Rokale's MSS.; Hooker, Fl. Jour. ii. p. 348; M'Clelland.

DIPTEROCARPUS UINER. Blume. A tree of Java; yields a resin which is substituted for copaiba, like wood-oil.

DIPTEROCARPUS ZEYLANTICUS. Thw. Hora-gass, SINGH. A great tree in Ceylon, abundant up to an elevation of 3000 feet. A cubic foot weighs 45 pounds; and its timber, which is used for the roofs of common buildings, lasts fifteen years.—Theaeetes; Mendis.

DIRHAM. Pers. Money. A silver coin; 20 or 25 equal one dinar. The dinar is equal to a ducat or sequin, about 9s. Also name of a weight.

Tataria dirhams are mentioned by Idrisi as current at Mansura and in the Malay Archipelago about a.d. 900. Mr. Thomas supposes them to be coins of the Tahir dynasty then ruling in Khorasan. According to Ibn Khordadhbeh, who died about a.d. 912, the Taturia dirhams were current in the country of Hazara; and, according to Ibn Haukul, who wrote about a.d. 977, these dirhams were also current in the kingdom of Gandhara, which at that time included the Punjab. The dirham and the dinar, even in Akbar's time, were considered old coins. The dirham was silver of 6 or 8 darg;—1 darg = 2 qirat; 1 qirat = 2 tassuj; 1 tassuj = 2 habbas.—Cumingham, Ancient Geo. of India, p. 313; Gloss.

DIHT-BIRD, also Scavenger Bird, Neophron percnopterus, Linn.; also called Dung-kite and Pharaoh's chicken.

DIRZI. Hind. A tailor, whether Hindu or Mahomedan. In Hindustan, the Hindu tailors are in clans,—Sri-bastak, Nam-deo, Tanchara, Dharana, Panjabi, Gaar, Kantak.

DISC. Auroole, or Glory, encircling the heads of gods and saints, signifies perfection. It was originally intended, in the Saivite worship, to represent the solar orb; but in the course of time the symbol was multiplied added to, and its meanings similarly increased, and in its changes it has represented the sun, the moon, and the whole planetary system. It has been an emblem of monothelitism, tritheism, and polytheism, of particular local divinities, as well as of those with universal dominion. It is put round Vishnu's head.

In Egypt, the Delta, δ, was originally the type of Haal, afterwards of Siva; and when placed with its apex upwards, δ, was used to denote fire, the element consecrated to the first-named god. When placed with its apex downwards, ν, it typified Vishnuz or water; and there were many other meanings attached to it, some of them very gross. Discs of six to nine inches in diameter, and about an inch of breadth of rim, were carried by all Sikh soldiers. The edges are ground very sharp, and, after having gained velocity by being rotated on the forefinger of the right hand, they are projected to a distance of 50 or 80 yards with considerable force, therefore, but with such want of dexterity or impossibility of regulating their flight, that the bystanders are more in danger than the object of the aim. The Chakra, the discus of the god Vishnuz, resembling a wheel or quoit, is whirled round the middle finger. The Chakra is mythologically described as a circular mass of fire, darting flames in all directions, which, thrown by the gods, slays the wicked, and then returns to the hand from which

957
it issued. The Sikh Akali usually had several of them on their conical caps. They are cheap, and are almost useless weapons.

DISCOBOLI, a family of fishes. First group, Cyclopterina; second group, Liparidina. DISCOGLOSSIDÆ, a family of reptiles, comprising the genera Megalophrys, Xenophrys, Cyclopterus.

DISCOGNATHUS NASUTUS, hill-trout. DISEASE. Hindi sages suppose that diseases are either produced by sins committed in a former state of existence, by derangements of the humours, or by the combination of these two causes. The former are removed by sacrifices, prayers, penance, and gifts; the latter by remedies, regimen, medicine, or surgery. There are also accidental diseases. Simple medicines may be arranged according as they cure deranged air, bile, or phlegm.

DISHA, an Arabian astronomer who flourished in India. DISMAS and Jesmas, according to Mahomedan tradition, the penitent and impenitent thieves of the gospel.

DISTILLERIES. The principal matters distilled from in India are palm wines, dates, sugar, rice, mahwa flowers, bark, corncobs, and substances yielding perfumes. Under native rule, the akbari, or government excise system, was an item in the revenue arrangements of the proprietor of every estate, and he made his own arrangements with the distillers resident thereon. There were one or more small distilleries in almost every village, consisting of an oven, chilas, and reservoir (garh). In the latter were placed earthen vessels (kunda), into which was placed the material to be distilled, and the product was designated nari, or fourth quality, which sold at 33 annas a garha; tharra or third quality, at 64 annas; phul or second quality, at 12 annas; and tapka, or first quality, at 12 annas. A garha was equal to eight bottles.

The British Indian Government early suppressed these small stills, and introduced the system of distilleries at the chief stations, which are farming out to the highest bidder; and the spirits are called once-distilled (ekbara) or double-distilled (do-atas), according as they have passed once or twice through the still. The mahwa flower of the Bassia latifolia ferments in from five to nine days, and gur from eight to fifteen days, according to the heat of the weather. A maund or man of mahwa flowers yields four gallons in summer and five gallons in winter of a spirit between 25° and 30°. In the same way, a maund of gur will yield four and three gallons, according to the season.

The Bombay toddy or arrack still consists of a large earthen jar, of the shape of that used by water carriers, but many times more capacious. The receiver is of the same form and material as the still, but somewhat smaller in size,—the former being two and a half, the latter one and a half, feet in diameter. The still mouth is plugged up with a piece of wood luted with clay; a hole is cut in the side of the still near the top, and into this is fastened a wooden spout, which conveys the spirituous vapour to the cooler. This last stands on a trellis or frame of wood, placed over a pit for holding water, and cooling is effected by a man lifting successive fills of water from the well in a cocoanut ladle and pouring it on the top of the cooler. A vessel of water with a small spout or drip is occasionally resorted to.

A cocoanut tree will yield about 4 seers of toddy or sap a day. Seventy-five seers of toddy, or the produce for one day of 18 cocoanut trees, furnish a charge for a still; yield 25 seers of liquor on a first distillation; on the second it affords 36 seers of liquor, considerably under proof. The process of distillation just described is nearly as unskilful as can be; and a third, if half, might be added to the returns were a little more care and attention bestowed on the matter. Date and palmyra trees yield toddy as well as cocoanuts.

A strong alcoholic liquor, called mayah, is in popular repute amongst the natives in Western India. The following process is employed in making it at Surat. The berries of the mayah are about the size and form of marbles. They are first steeped or mashed in casks. So soon as they get into a state of active fermentation, the fermented liquor is drawn off and carried to the still, and more water poured over the berries, successive charges being added as long as the worts are strong enough to ferment. A sufficient number of casks, or mash tuns, as they may be called, are employed in the work, so as to permit a charge of the still to be supplied on each drawing off from the fermenting tuns, as it takes a couple of days to complete the process of fermentation; but worts already drawn off would sour were this to be waited for before the first run was run off. The still consists of a wooden tub, with a copper bottom, built over a surface of brickwork; over the mouth of this is placed a huge copper saucer, the centre of the bottom terminating in a nipple. This is placed over the mouth of the tub which contains the liquor, and is fitted tight after the still has been charged; it is then filled with cold water, a fresh supply of which is poured into it from time to time as the original fill gets heated. A bamboo spout passes through the side of the tub just above the level of the liquor inside; it terminates in a flat shovel or ladle-shaped dish under the nipple. Into this the spirit condensed in the under side of the saucer trickles down; it is run off and resolved into a suitable receptacle outside. A second or third distillation is resorted to when the liquor is required to be made very strong.

The Portuguese in India, for the purpose of rectification, use a very neat and serviceable variety of still, by them called an alembic. It consists of a common cooking pot as a boiler, with a cylindrical head of the same diameter, and generally about the same depth as the boiler. The bottom of this is a cone closed in at the apex, the mouth of which covers that of the boiler. Around its inner edge is a slight turned-up ledging or flange, from which a pipe or worm leads off the spirit. The cylindrical portion of the top being filled with cold water, the spirituous vapour is condensed by it in theinside of the cone, and, trickling down, is caught by the flange and carried off by the pipe. This is a convenient and serviceable implement, and may be so used to give very excellent results.

In the Panjab, the first spirit that passes over is called phul and ek-atas, or once-distilled. This is collected in vessels and distilled again in another still; when the spirit passes over, it
is called do-atasha, or double-distilled. This is of two qualities, according to strength. In the Panjab the spices and flavourings, or mesali, used in distilling, are the following:—Sak, or bark of the kikar, which is often erroneously supposed itself to yield a spirit on distillation, but is only added to promote and accelerate the fermentation of the molasses, etc.; triphala, the three myrobalans, mixed together as an astrigent; rose-leaves; cardamom pods (Cissampelia); gosabha (Cacalia Kleinitii); violets; anise seed (badyan); limes and lemon peel (sangtara); saffron; sandalwood, red and white; mututi buti (sphaeranthus); cashmuz (coriander); adak (ginger); ilachi (cardamoms); musli; darchini (cassia or cinnamon); gajar (carrots dry and fresh); motya (jessamine); seb (apples); naspati (pears); shir (milk); raughan, ghi; meat (?); misri (sugar); tulam patr (aromatic leaves); taj (aromatic flavouring leaves); bed-musk (willow flowers); kasturi (musk); ambar (ambergris); khaw (Anatherium arenarium); khas, root of the latter; chob-chini (Simulax chinu); salep misri,—are all distilled from.

Distilled waters contain a little of the volatile principles of plants, and may be distilled either off the plants, or by distilling some essential oil with water.—Powell; O'Shaughnessy; Cavenney.

DITA, a tree of Mindoro. Its sap, mixed with an infusion of the alyah, or rind of the fruit of the Sago palm (Cabo negro), is used by the wild tribes of Mindoro to poison their arrows.

DITHWAN, the Ekadasi, or 11th of the bright half of the moon Kartik, is a day also known to the Hindus of Northern India, by the name of Bodini. On this day a ceremony with music and singing is observed in celebration of Vishnu's return from his slumber of four months, during which he is represented to have been with Raja Bulating Patala, or the infernal regions. The Mudra Rakshasha, a Sanskrit play, says:

May Vishnu's shining glance
Yield peace and joy, as, waking from his trance,
His opening eyes are dazzled by the rays
From lamps dispincing that blaze:
Those eyes that, with long slumber red,
Ambrosial tear-drops shed,
As, pilowed on his snake-couch 'midst the deep,
He breaks reluctant from his fated sleep.'

It is the close of the rainy season. No marriages, and but few festive ceremonies, have taken place in the meantime, and the Dithwan is the signal for their commencement. Houses are cleaned, and smeared afresh with cow-dung. The fruit of the sing'hara, ber, and chunakasag, and other dainties of the season, may be lawfully enjoyed (Elliot's Suppl. Gloss.), and the sugar-cane is commenced to be cut, the cultivators bringing home a small quantity of it from a corner of the field, and spreading it out for the reception of the salagram, an ammonite regarded as a type of Vishnu, afterwards eat it at a fortunate hour.

DITI. Sansk. A Kala, or part of the Mula Prakriti.

DITI, the wife of Daksha; also one of the two wives of Kasyapa (Lamech), mother of the Asura or Daitya, who were destroyed by the flood.

DITTANY. Lung-tan-tau, Chin. The root of a species of Dictamnus.—Smith.

DIU, a small barren island, 04 miles long and 1 broad, on the S. coast of Kattyawar. It forms part of the Portuguese possessions in India. A fort was built on it in a.d. 1513. It is separated from the mainland by a shallow strait only navigable by boats at high water. Diu is in lat. 20° 43' 20" N., long. 71° 2' 30" E., at the entrance of the Gulf of Cambay, near the southern extremity of the peninsula of Gujerat; population, 10,765. The town has been repeatedly besieged by rulers of Gujerat and the Dekhan, but it continues in the power of the Portuguese. The convent of St. Francis is used as a mint, and the monument of St. John of God as a place of burial, that of St. Dominic is in ruins.—Jor. Gusz.; Postels' Western India, i. p. 112; Horsheburg; Findlay.

DIV. SANSK. From Div, the sky, hence the Latin Deus. Divas Pati, lord of heaven, from Div, heaven, Pati, lord.

DIVAKARA. Sansk. From Diva, day, and Kara, from Kree, to do, a name of the sun, under which it was worshipped in Sakadwipi.

DIVE PARRE. Singh. A wood of the western province of Ceylon, used in common house buildings. A cubic foot weighs 41 lbs., and the timber lasts 20 years.—Mr. Mendis.

DIVI-DIVI, Dibi-dibi, or Libi-libi, are the seed-pods of Cassipina coriaria, a plant of South American origin, belonging to the natural order Cassipinieae, naturalized in India, and now grown at several places in the Madras and Bengal Presidencies. The seed-pods have been extensively used for tanning leathers, and for that purpose are considered superior to all the Indian astringents. Leather tanned in this way is considered equal to that of the best of European manufacture. The average produce of pods from a full-grown tree has been estimated at 100 lbs. weight, one-fourth of which consists of seeds or refuse, leaving about 75 lbs. of marketable matter. Divi-divi pods are of a dark-brown colour externally when ripe, transversely wrinkled and curled, from 1 to 3 inches long, and 2 of an inch wide, and contain 2 to 4 seeds. The outer skin of the pods is very thin, and peels off easily if the pods are ripe. Underneath it, and separated from the seeds by a layer of woody fibre, is a considerable thickness of astringent matter of a light yellow colour, almost pure tannin, as met with in commerce. At an interval of 6 feet apart, an acre of ground will contain 1210 trees, yielding an average of 810 cwt., and 30 lbs. of divi-divi, or above 200 tons of marketable matter, worth, at only 55 per ton, £200. Its tannin differs materially from that of nutgalls. The quantity of mucilage it contains precludes it from the use of dyers, but it is largely used by curriers. One part of the divi-divi is sufficient for tanning as much leather as four parts of bark, and the process occupies only one-third of the time. The selling price ranges from £8 to £13 per ton. The imports into the United Kingdom from 1844 to 1850 ranged from 10 tons to 3800 tons.—Var. Rep. Med. Ec. 1855; Indian Annals, vii. p. 120; Simmonds' Comm. Prod.

DIVI LADNER, the forbidden fruit of the Ceylonese, is the produce of a species of Tabernamontana.—Eng. Cyc. ii. p. 365.

DIVINATION.

In all ages there have been seers, prophets, miracle-workers, exorcists, as there are now Shiamans amongst the Mongols, Payang amongst
DIVINATION.

the Malays, who are resorted to on all occasions of importance,—as for instance the fixing on a pro-
pitious day to commence a journey or any under-
taking. The commonest system is analogous to the
Roman 'sortes.' With Mahomedana a Koran is
used for this purpose. They have also books filled with
sentences and words. The Malay consulting
them turn in with a kris, and the sentence marked
by the kris point is interpreted to suit the wants
and wishes of all parties. In the Allo ordeal of
the Hindus of Gujarat, a cloth or a raw hide is
dedicated to one of the forms of Durga. The
claimant of a disputed boundary puts it over his
shoulders and walks over the contested limits.
In Sind, the Son or Sugum is a kind of divi-
nation by means of the position of birds and
beasts,—their cry, the direction of their flight, and
other such particulars. The divination by lots,
anguries, and omens by flights of birds, as prac-
tised by the Getic nations, and described by
Herodotus, and amongst the Germans by Tacitus,
are to be found amongst the Rajputs. Their
books on the subject could supply the whole of
the augurs and arcanae, German or Roman.
The Mahomedana in India often cast lots; and in
Sind is a practice similar to that of the moun-
taineers of Scotland, called sleinanchad, or ' read-
ing the speal-bone,' or the blade-bone of a shoulder
of mutton. One very common mode of divination
in Persia is called the Him-i-shooma, or ' science of
the shoulder-blade,' and practised by cutting out
the blade-bone of a sheep newly killed, and
examining the lines and marks upon it. This
was common in England in old times, and in
Scotland till the 18th century. Pennant gives an
account of a Highlander in the Isle of Skye for-
telling the event of the battle of Culloden by this
means. Confucius gave rules for this species of
sorcery. The poet Drayton alludes to the practice
of this amongst the 'Dutch-made English,' settled
about Pembroke-shire, in his Polybasion, song 5.
Confucius noted the same practice in China.

The ordeal of taking a piece of gold out of a
pot of hot oil, Karahi lena, is common in India.
If the accused do so without being scalded, he is
deemed innocent. The ordeal amongst the Hindus
called Dibya or Dieya, is from a Sanskrit word
meaning Divine. In the Tola, or weighing ordeal,
the accused is weighed; then certain ceremonies
are performed, and he is again weighed, and if
found lighter, he is guilty. In Agni, or fire
ordeal, the accused touches fire or heated metal,
and if burned, he is guilty. In Jala, or water
ordeal, the accused is dipped under water, whilst
an arrow is shot, and a person runs and brings it.
If the accused be still alive, he is innocent. Or the
accused is sewed up in a sack, which is let down into
water about three feet deep. If the person in the
sack can get his head above water, he is a witch. In
the poison or Visha ordeal, if the accused swallows
it with impunity, he is innocent. Others are the
Kosha, or drinking holy water, the Tandula, or
chewing grains of rice, the Tupta—nashia or
taking a nashia weight of gold out of a jar of hot
oil or butter. In the Dharmarcha or Dharma-
tharma ordeal, drawings of Dharma and Adharma,
virtue and vice, are covered with cow-dung, and
put in a covered vessel, from which the accused
draws one. In the Tulasi, the leaves of the tulsi
and water are swallowed after an oath, the tulsi
being sacred to Vishnu. In the Kacha ghaora, or
unhked pot, such a pot is filled with water and
carried to some distance without spilling. Bal-
bhundia is swearing by the leaves of the bel,
which is sacred to Siva. Gauagajala, swearing
on the Ganges water, Devata or Devolaya,
swearing in a temple, before an image. Gato, a
cow, swearing while holding a cow's tail. Brah-
man, swearing while touching the feet of a
Brahman. Sinwa or Sinhah, the ceremony, after
religious rites, of pointing out a boundary. In
Hinduism nine ordeals were recognised. In trivial
cases, a few grains of rice that have been weiged
with the Salagrama are put into the mouth of
the suspected or accused person, who chews them
and spits them out on a pipal leaf. If the person
be innocent, the grains appear as if stained with
blood; if guilty, the rice is dry. In the trial by
Kosha, or image water, the accused person drinks
some of the water with which an idol has been
washed, and if the accused survive free from
calamity through the next fortnight, he is inno-
cent. The Tola, or ordeal of the balance, is
applied to women, children, the aged, blind, lame,
and sick men, and to Brahmans. After a fast of
four hours, both of the accused and the priest,
the accused batters in holy water, prayers are offered
up, and oblalions are presented to fire. The
beam of the balance is then adjusted, the cord
fixed, and the accuracy of the scales ascertained.
The accused then sits in the scale, and, while being
weighed, the priests prostrate themselves, repeat
certain incantations and, after an interval of six
minutes, the accusation paper with the written
accusation is bound around the head of the
accused, who invokes the balance thus: 'Thou, O
balance, art the mansion of truth; thou wast
anciently contrived by the deities: declare the
truth, therefore, O giver of success, and clear
me from all suspicion. If I am guilty, oh!
venerable as my own mother, then sink me down;
but if innocent, then raise me aloft.' The accused
is then re-weighed; if he then weigh heavier, he is
found guilty, but if lighter, he goes free. In the
Agni, trial by fire, the accused, in India, walks
barefoot into a mass of burning pilap leaves
(Ficus religiosa); in Siam, over a pit filled
with burning charcoal. In the ordeal by boiling oil,
the accused has to thrust the hand into the scald-
ing fluid. In the hot iron ordeal, nine circles are
drawn, each 16 fingers in diameter, and each the
same distance of 16 fingers apart. The hands of
the accused are rubbed with unhked rice (paddy),
and all marks on them carefully noted; seven
pilap leaves are then bound with seven threads
on each hand, and the priest gives him a red-hot
ball to carry as he steps from circle to circle,
keeping his feet within each, until he reaches the
eighth, when he throws the ball on a heap of
dried grass inside the circle. If his hands, which
are then examined, be not burned, he is pro-
nounced innocent. In Japan, a reputed thief
bears on his hand a piece of thin paper having the
figures of three deities. On this a piece of red-
hot iron is placed, and if his hand escape, he is
pronounced free. The Hejaz Arab licks red-hot
iron as an ordeal. In other forms, the Jala or water
ordeal is in vogue in India, in Burma, and in Borneo.
In India, the accused stands in water nearly up
to his waist, attended by a Brahman, staff in hand.
A person near shoots three arrows from a bamboo
bow, and a man hurries to pick up the further—
—

960
most shaft. As he takes it from the ground, another person runs towards him from the water's edge; at the same moment the accused grasps the Brahman's staff and dives beneath the water. If he remain there till the two arrow-fetchers return, he is innocent; but if any part of his body appear, he is guilty. In Burma, a stake is driven into the water; the accuser and accused take hold and together plunge beneath the water, and he who remains longer submerged is declared to have truth on his side. In Bustrin, the Leaf-ordeal is followed by sewing up the accused in a sack, and letting him down into water waist-deep; if he manage in his struggles for life to raise his head above water, he is finally adjudged to be guilty. Then comes the punishment of extracting the teeth. This is said in Bustrin to be effected with the idea of preventing the witch from muttering charms, but in Kamaon the object of the operation is rather to prevent her from doing mischief under the form of a tigress, which is the Indian equivalent of the lapon-garon of Europe. In the Poison ordeal, white arsenic and butter in a mixture is administered. In the snake ordeal, a cobra and a ring are placed in an earthen pot, and the accused has to withdraw the ring. In the ideal ordeal, two images, representing Karma, or Justice, the other Jahamara, or Injustice, are placed in a tank; the ring is put into a place, and to withdraw it is allowed to draw. If the dharma image be withdrawn, he is innocent. The Borneo Dyaks place two pieces of Salt in the water, to represent the accuser and accused, and the owner of the piece dissolving first loses the cause. Also, two shells are placed on a plate and lime-juice squeezed over them, and he whose shell moves first is pronounced guilty or innocent, as may have been resolved on. But the more common mode amongst the Dyaks is for the accuser and the accused to plunge their heads beneath the water, and he who remains longer is free. The Binjari people use the branch of a nain tree, the Azadarcha Indica. A husband throws it on the ground, and, turning to his wife, says, 'If thou be a true woman to me, lift that nain branch.' Arrows are sometimes used in North-Western India as tests of innocence. The opposite ends of the arrows are held by a rattron laid upon the hands by two persons placed opposite to each other: they are parallel to and just sufficiently apart to allow of the suspected person's hand being held between them. The ends of the arrows merely rest upon the fingers. The arrows are supposed to move towards and close upon the guilty hand. 

Amulets (totka, tawiz; hirz; ta'tit, jantar, nadi) are worn by almost all Eastern nations. They are especially prized by Mahomedans, both young and old of whom wear them. They are usually put on the young to ward off disease, and to guard from the evil eye, and consist of figures with numbers on pieces of paper, or Arabic words, often extracts from the Koran, engraved on potstone or silver or gold, and worn from the neck. They are also put over the door-porch or on the house-wall. Amongst the Malays of Java, Mustika means amulet, which is always some very scarce substance, but usually being worn about the person, they are supposed to act as a talisman, and ward off evil. The mustika kerbo, or buffalo amulet, is quite white, and round like a marble, nearly an inch in diameter, and semi-transparent; it is stated to be found at Panggul. The mustika waringin, a calcareous concretion, is found at Ngadi Rejo. It is quite black, and a little smaller than the mustika kerbo. 

Arrat, Taz, is a Hindu ceremony for warding off the evil eye. The Romans had peculiar modes of divination,—their dies fasti, nefasti, their auguries, etc. Tacitus informs us that among the ancient Germans, who were originally Scythians, the prototype of rhabdomancy was engraved on rods. The Chinese had also rods with similar inscriptions. The Arabs, before the birth of Mahomed, divided by bundles of arrows in the Kaba. Mahomed destroyed this practice.

The practice of astrology at the present day in Ceylon, and the preparation of the ephemerides predicting the weather and other particulars of the forthcoming year, appear to have undergone little or no change since this custom of the inhabitants of India was described by Arrian and Strabo. But in later times the Brahmins and the Buddhists have superadded to that occupation the casting of nativities and the composition of horoscopes for individuals, from which the Sophiste described by Arrian abstained. It is practised alike by the highest and most illustrious castes of Singhalese and Buddhists, from the Veddas or agricultural aristocracy, to the beaters of tom-toms, who have thus acquired the title of Nakatya or astrologers. The attendance on particular ceremonies, however, called Bali, which are connected with divination, belongs exclusively to the latter class. The Mahomedans of British India keep their calendar (Jantri), and the Hindu Joshi calculates the ephemeris. The Hindus also have their calendar or Panjangan, but they all practise divination from books, for which the Chintami Pastakam is in use in the south of India. Wilson's Glossary; Burton's Seinde; Tod's Rajasthan; Tennant's Christianity in Ceylon; Jour. Ind. Archi. 1863, 1857; Miller's Seven Churches of Asia, p. 127; Rasamala, Hindu Annals, ii. p. 463; Ouseley's Travels, i. p. 227; Skinner's Overland Journ. ii. p. 70; Ward's Hindoos, ii. p. 71; Herdicks; Burton's Mecca, iii. p. 255; Lyell's Studies.

DIVO DASA, the titular appellation of several kings and illustrious persons, viz. a king named in the Rig Veda; a Brahman, twin brother of Ahalya; also a king of Kasi, who, with all his family, was slain by a king named Vita-hanya. His son Pratardana avenged the slaughter of his relatives.—Dowson.

DIVORCE.

Ehescheidung... GER. | Divorzio,... | IT. Talaj,... | HINDI | Divorcio,... | SP.

The Hindu law does not admit of divorce. The Buddhist Burmese laws allow every facility for divorce. An appeal case heard by the privy council illustrates the Mahomedan law of divorce. A moonish wished to divorce his wife, without which a second wife would not have him, but he wished at the same time to avoid paying the first wife's dowry, amounting to Rs. 26,000. He had two modes of proceeding: either by his own declaration and repudiation of his wife, in which case he must restore the dowry, or to divorce the woman with her own consent (khola), in which case he may keep the dowry, or make any arrangement regarding it. After a divorce, the
woman must remain some months in seclusion, and be maintained by her late husband, till all chance of children has passed away. In a recent case, the husband, by ill-usage of his wife, induced her mother to give up the marriage settlement, and so proceeded by the kolta method, keeping the dowry; but the subordinate and appellate courts decreed the restoration of the dowry, on the ground of force being used. Mahomedans in India follow the Koran and Shara, and marry to four wives, though some take into their households a far greater number of women, under different designations. Mrs. Mir Hussian Ali had heard of princes in Hindustan marrying seven or more wives. On a native trip, Tippu Sultan had less than nine hundred women. In Madras, some of these are known as the Harm, which term is there applied to purchased women associating with their lord, but in Hindustan such are termed Doolie wives. These are not the Kameez, or slave girls, who are servants. There are three forms of Talaq, repudiation or divorce, amongst Mahomedans in India. 1st. Talaq-i-byn, which consists in the husband only once saying to his wife, 'I have divorced you'; 2d. Talaq-i-rijzae, in repeating the same twice; and 3d. Talaq-i-mootulnaa, in three similar repetitions. Mahomedan lawyers say there are 16 various kinds:—Talaq-i-absu, T.-i-rujai, T.-i-sumna, T.-i-bidat, T. kinat, T. minajal, T. sarh, Aila, Istena, Khala, Lan, Mubarat, Yamin, Zifar, Tawiz-ul-talah. In China, divorces are frequent; the divorced wife is sometimes provided for, or is rewarded. Chinese divorces are granted for seven reasons, unchastity, striking the husband's parents.

DIWALLI. thin plates of gold and silver prepared for the gold-beater.

DIWALLI.
Dipali. . . . HIND. | Dipali. . . . HIND. Deuli, . . . , D. Dewaligiecha, | KARN.

The Diwali is a popular Hindu festival on the two last days of the dark half of the month Aswin, and the new moon and four following days of Kartik (September—October). Appropriate ceremonies are performed on each day, but on the last the night is to be spent in merry-making and festivity, and illuminations are to be made in honour of deceased ancestors. The goddess Lakshmi is also to be worshipped in the night of the festival, and games of chance played in her honour. Amongst the Maharrattas, it is the commencement of the commercial year, over which Lakshmi, especially presides, and accounts are opened by bankers and merchants for the smallest sums—a few rupees—as tokens of success. Bankruptcies are also declared at this season.

DIWAN. In Persian poetry, a complete series of odes or other poems, the rhymes terminating from alif to ye in each letter of the alphabet. The Diwan-i-Haft and that of Jami are celebrated.—Gloss.

DIWAN. ARAB., HIND., PEERS. A royal court, a chief officer of state. The title of Diwan or office of Diwani was conferred upon the East India Company by Shah Alam in 1765, giving the right to collect the whole revenues of Bengal, Behar, and Orissa.

Diwan Khanah, amongst Mahomedans, the common hall or place of reception. It has a line of flat cottages ranged round the room, either placed upon the ground, or, on wooden benches, or on a step of mosaic, varying in height, according to the fashion of the day. When such foundation is used, it should be about a yard in breadth, and slope very gently from the outer edge towards the wall, for the greater convenience of reclining. Cotton-stuffed pillows, covered with chintz for summer, and silk for winter, are placed against the wall, and can be moved to make a luxurious heap; their covers are generally all of the same colour, except those at the end. The sent of honour is denoted by a small square cotton-stuffed silk coverlet, placed on one of the covers, which the position of the windings determines.

DIWHYN, Colonel, CHARLES GEORGE, an officer of the Bengal artillery, which he joined on the 14th August 1813. He served throughout the Nepa| war in 1814, 1815, and 1816; was present at the siege and bombardment of Hatras in 1817; was Quartermaster to the artillery and pioneers with the right division of the Grand Army during the Pindari campaign of 1817-18. In 1820-21, was present with the force which subjugated Mhairwara. In May 1835 he was appointed to its civil charge, and in January 1836, Commandant of the Mhairwara Battalion. In March 1839, the Mhair corps, in conjunction with the Jodhpur Legion, completely routed a large body of outlaws at Kot in Mhairwara, and killed their chiefs, with one hundred followers. In February 1842, the jurisdiction of Ajmir was added to that of Mhairwara, and he was appointed Commissioner of Ajmir in March 1835. The Mhair tribes were the bravest, and were amongst the most predatory, of the non-Aryan races in India. Colonel Dixon built a new town, and encouraged shopkeepers to settle in it. Gradually the whole population became attached to industrial pursuits. Up to A.D. 1838, the district was wholly dependent on supplies brought in (chiefly by plunder) from a distance. But by 1850 the population had much increased, and the sounds of honourable industry were heard on the face of those long-troubled hills in some of its most benignant forms. He wrote a Sketch of Mhairwara, 1850; also Ajmir and Mhairwara Revenue Settlement, 1855.

DIYAR BAKR, on the Tigris, in its prosperity contained 40,000 houses, with numerous cotton looms constantly at work, and it enjoyed an active trade in gall-nuts, not only with Kurdistan, but also with India on one side, through Baghdad, and with Europe, through Aleppo, on the other; and at present there are scarcely 8000 houses, 1500 Armenians and 6300 Turks, and its commerce is almost annihilated. Below Diyar Bakr, the Tigris contains several islands. Its banks are thinly peopled, and the country about them is only partially cultivated; but the pasture grounds are rich, and well suited for the visits of the nomadic tribes which come occasionally to the river from the neighbouring countries. The windings of the Diyak Bakr river thus far have a length of rather more than 150 miles, whilst those of the tributary by Myafarekin are less than 100 miles.

DIZABULUS, a Mongol ruler of the 13th or 14th century, who is described as seated on a couch that was all of gold, and in the middle of the pavilion were drinking vessels and flags and great jars of the same metal. At the entrance
of the tent there was a bench with cosmos (kunia, or fermented mare's milk), and great goblets of gold and silver set with precious stones. Shah Rukh's description in the 15th century of the constant drinking there corresponds exactly to the account of the habits of the Mongol court in Planco Carpini and Rubruquis (a.d. 1253). The former, on the occasion of Kuyuk Khan's formal enthroning, says that after the homage had been done they began to drink, and, as their way is, continued drinking till hour of vespers (p. 738). Rubruquis's account of his residence at the court of Mangu Khan is quite redolent of drink; from which one sees how Sultan Baban came by his propensity to strong drink.—Shah Rukh's Embassy to Cathay, i, p. 104.

DIZFUL, an important stream in Khuzistan. The bed of an occasional torrent in ancient Susiana, called Ab-i-Bald, which falls into the Dizful, is covered with a peculiar kind of pebble, which, being filled with little fossil shells resembling grains of rice, is called Sang-i-birjin, or rice stone. These stones are also found in the river at Shuster. They are in much request throughout Persia for the head of the nargel pipe, which is almost invariably composed of this material, set in silver. See Khuzistan; Luristan; Sassanian.

Dj, with the nations of continental Europe, are used to obtain the sound of the English j; thus Djalal, a camel, Djalal, a mountain. Similarly, tech is used for the English ch.

DOAB. Hind, Pers. From Do, two, and Ab, arid. A country lying between two rivers, a mesopotamia. In British India, people speak of the Doabs of the Ganges and Jumna, of the Godavery and Kistna, of the Tumbirda and Kistna, the Raichore Doab, etc. The five Doabs of the Panjab are fertile as far as the river influence extends, but have in the centre a high arid tract called Bar. The names of the Doabs of the Panjab are in all instances, excepting the first or Jalandhar Doab, the result of a rough attempt to join the names of the rivers on each side into one word. Thus the Panjab is traversed by six rivers, which, running in a south-western course to their places of junction, partition the country into five Doabs. The Jalandhar Doab is between the Sutlej and the Beas. The other four Doabs are still popularly known by those names which were given them in the days of Moghul ascendancy. The Bari lies between the Beas and the Ravi, the Rechna between the Ravi and the Chenab, the Chuj between the Chenab and the Jhelum; the fourth, enclosed by the Jhelum and the Indus, takes its title from the latter, and is styled the Sind Sangur, or Ocean of the Indus. Of these the Bari Doab carries off the palm, as containing the central Manja, or home of the Sikh nation, and the three greatest cities, Lahore, Amritsar, and Multan.

DOAB. Hind, Pers. From Do, two, and Ab, arid. A country lying between two rivers, a mesopotamia. In British India, people speak of the Doabs of the Ganges and Jumna, of the Godavery and Kistna, of the Tumbirda and Kistna, the Raichore Doab, etc. The five Doabs of the Panjab are fertile as far as the river influence extends, but have in the centre a high arid tract called Bar. The names of the Doabs of the Panjab are in all instances, excepting the first or Jalandhar Doab, the result of a rough attempt to join the names of the rivers on each side into one word. Thus the Panjab is traversed by six rivers, which, running in a south-western course to their places of junction, partition the country into five Doabs. The Jalandhar Doab is between the Sutlej and the Beas. The other four Doabs are still popularly known by those names which were given them in the days of Moghul ascendancy. The Bari lies between the Beas and the Ravi, the Rechna between the Ravi and the Chenab, the Chuj between the Chenab and the Jhelum; the fourth, enclosed by the Jhelum and the Indus, takes its title from the latter, and is styled the Sind Sangur, or Ocean of the Indus. Of these the Bari Doab carries off the palm, as containing the central Manja, or home of the Sikh nation, and the three greatest cities, Lahore, Amritsar, and Multan.

It is by far the most populous, as well as the most important, whether in a political, commercial, or an agricultural point of view. It has also the sanatorium of Dalhousie near the Kalatop forest, and the district of Montgomery to the south of Lahore. This Doab has two features, viz., a flat alluvial tract, called Dhaya, several miles broad, running along either river, and producing tamarisk and jhund. Also an elevated dorsal plateau in the Manja or middle part, and called Ganji-bar, or bald country. Its soil is intensely arid, often saline, and produces only some salso- acinos plants and a few bushes of jhund. The Bari Doab (sometimes called Manja, whence the Sikhs resident here are called Manja Singh), between the Ravi and Beas, is the narrowest of the Doabs.

The district lying between the Indus and the Jhelum, called the Sind Sangur Doab, is 147 miles broad in the widest part, and whilst it is the largest, is the most sterile and least inhabited, abounding with undulating bare eminences and rugged declivities.

The Rechna Doab, between the Chenab and the Ravi, is seventy-six miles in its widest part, and consists of an arid plain.

The Jalandhar Doab, the smallest, is in a better condition than the other intra-fluvian tracts.

The Gangangetic Doab, the Antervey of the ancient Hindus, is the Doab or Mesopotamia of the Jumna and Ganges. From the narrow point in which it terminates, the valley broadens as it stretches away towards the west, embracing a greater and greater area between the Ganges and Jumna. The whole of its immense superficies forms a vast, populous, and busy hive, enriched by human industry, and embellished by human taste. On the map no country is so thickly dotted with great townships and cities, and under the sun no country makes up such a highly interesting prospect of green fields, orchards, and gardens, in a continuous succession. In this fair savannah man has had his abode from a remote antiquity, to reap rich harvests, and live amidst plenty. Here were the cradle cities of the pre-Vedic Draya races. Here rose the first cities of the Aryan race. In the plains of the Doab, the rajas of Hastinapur, of Indraprastha, and of Kanouj exhibited the highest power and splendour of Hindu sovereignty. The rich districts watered by the Ganges and Jumna have always tempted the avarice of the foreign conqueror. Here was the residence of the most famous Hindu sages. From this birthplace of arts and civilization wisdom travelled to the West. This Doab is the battle-ground of the Pandu against the Kurus, of the Gihzivide and Ghorian against the Hindu, of the Moghul against the Patah, the Mahratta against the Moghul, and of the British against the Mahratta, where many a spot is hallowed by tradition, and many a ruin is consecrated by history. In this Doab almost every inch of land is under the plough. Here the rural population is more intelligent and spirited than the camp follower of Bengal. The humblest Doabi lives upon better food, and covers his body with more abundant clothing, than the humbler Bengali. The cattle here are various. Camels, buffaloes, horses, donkeys, and oxen are all made to assist man in his labours. The fondness of the Doabi women for coloured millinery evinces a more refined female taste, and to them may remotely be traced the impetus which is given to the various dye-manufactures of the country. The agricultural women of the Doab use ornaments of brass and bell-metal. The same class in Bengal
is in the habit of wearing shell ornaments, and a pair of Dooa shell-bracelets may sometimes cost the sum of two hundred and fifty rupees. One particular ornament in general use amongst the Doabi women of both the upper and the lower classes, is the tikia, which is in the shape of a tiny crescent made of gold, silver, or tinsel, according as the wearer is circumstance. It is fixed with an adhesive substance on the forehead, just between the eyebrows. These tikas are not a little prized and coveted by the Hindustani young men. They train the boys to execute little commissions of gallantry. On a given signal, the birds go, seize and carries off the tikia from the forehead of a woman, as precious booty, to her planning lover. This Doab, like Bengal, is flat and alluvial. The vast plain is uninterrupted by a single eminence; but the soil and climate differ. The tall and robust figure, the firm step, the stern eye, and the erect bearing of the manly Hindustani are everywhere to be seen. In Bengal the oxen alone form beasts of burden. A Hindustani coolie takes the load over the waist, and not upon the head. The Calcutta Baboo do not know what it is to ride. In Hindustan, rural women perform journeys on horseback, and princesses discuss the merits of horsemanship. The people of the Doab have for the most part well-formed features.

In India, the country between the Ganges and Jumna (Jamuna) is especially known as the Doab. It includes the whole wedge of land enclosed between the confluent streams of the Ganges and the Jumna, comprising the districts of Saharanpur, Muzaffarnagar, Meerut, Agra, Mainpuri, Etah, Farrukhabad, Etawa, Cawnpur, Fatehpur, and part of Allahabad. The irregular horn-shaped tongue of country thus enclosed runs in a sweeping south-eastward curve, following the general direction of the Ganges watershed from the Siwaliks to Allahabad. On either side the great rivers flow through low-lying valleys, fertilized by their overflow or percolation, while a high bank leads up to the central upland, which consists of the older deposits. This central plateau, though naturally dry and unproductive, except when irrigated by wells, has been transformed into an almost unbroken sheet of cultivation by three great systems of irrigation works,—the Ganges, the Lower Ganges, and the Eastern Jumna canals. The East Indian, the Sind, Panjab and Dehli, and the Oudh and Rohilkund Railways also pass through the Doab in several directions, and afford an outlet for its surplus agricultural produce. This Doab was ceded to the British by Shah Rukh-Din Ghazni in A.D. 1194, and it continued in the power of the Dehli emperors until overrun by the Mahrattas in 1736, and occupied by the British in 1754-5, after the battle of Buxar and Kora, and in 1801 the whole lower Doab was ceded to the British by the Nawab Wazir.

Doaba, a moist rich tract of land between the Sutlej and Kabul rivers.—Tod's Rajasthan; History of the Panjab; Tr. of Hind.

DO-BEH. HIND. A Brahman who has studied, or who teaches, two of the four Vedas, hence the term Do, two, and Veda. The caste of Brahmans so formed are generally ignorant and low persons, and by profession boxers and wrestlers.—Wilson.

DO-BHASHA. HIND. Two languages. Do-bash or Do-bhashi, one who speaks two languages; a broker or interpreter.—Wilson.

DOBSONNOOR, or the Salt Lake, is celebrated over all the west of Mongolia. It furnishes salt, not only to the neighbouring Tartars, but to several provinces of the Chinese empire. The Dobson-Noor is less a lake than a vast reservoir of mineral salt, mixed with nitrous efflorescence. The latter is of a faint white, and friable between the fingers; and is easily distinguishable from the salt, which is of a greyish tint, and with a shining and crystalline fracture. The lake is nearly ten miles in circumference, and here and there yours inhabited by the Mongols, who are occupied with the salt trade; they have also Chinese partners, for Chinese take part in every kind of trade or industry. The manipulation to which the salt is subjected requires little labour or science. It consists of nothing more than picking up the pieces, laying them in heaps, and covering them with potter's clay, and the salt sufficiently purifies itself.—Huc's Journey.

DOCKET. This term, in trade, is often applied to a short certificate, summary, or memorandum. In Government correspondence it means the summary or précis on the back of a letter. In English law it signifies a brief in writing.

DOCKS. Along the greater part of the eastern coast of the Peninsula of India, wherever the rivers can be entered by coasting craft, docks are formed by digging a channel from the river sufficiently large to allow the vessel to be floated into it at high water. A dam is thrown across the channel, and the earth being thrown into the dock thus formed, the vessel is floated up above the water mark. By draining off the water, the vessel is left high and dry embedded in earth. This is removed to allow of access to the bottom of the vessel, which is propped up by stones. It is usual also to place logs under the keel. A dry dock is thus formed about the vessel at a small expense. The repairs having been executed, it becomes necessary to lower the vessel down to that point when, the dam being removed and the water let in, she can be floated out. For this purpose cables are coiled under her, and these coiled fillet in with earth, the earth under the vessel and logs which were placed under her keel removed, the dock is dug out to its former depth, the vessel is left suspended resting on the coals; by uncoiling the cables gradually the vessel is let down, and is then floated out.

Ships of 400 tons are thus docked at Coringa. This mode of docking ships is followed on the Indus, and is called Calcutta and Bombay. Ships are docked in Calcutta and in Bombay extensive wet docks for receiving ships.—Robbe.

DOCTOR FISH, a name given to a species of Chaetodon, also to the small-spined Acanthurus subarmatus, Bennettii.

DOCUMENT-BILL, an Indian bill of exchange drawn on London, having as collateral security the bill of lading and policy of insurance on the goods; against a part of the estimated value of these the bill is drawn.—Simmond's Dictionary.

DODABETTA, the highest peak on the Nilgiri mountains in Southern India, in lat. 11° 25' N., long. 76° 40' E., its height being 7670 feet. It was made the site of an observatory, under the astronomer at Madras. A record of the meteorological observations was published at 964.
DODAH.

Madras in 1848; the Toda name is Petmartz, the name means big mountain.—Sykes; Schlagent.

DODAH. Hind. The unopened cotton pod; any round seed-vessel, as poppy head.

DODA MARRI. See Baluchistan; Kahan; Kist.

DODDERS, species of Cuscuta; in the Sone valley they cover even tall trees with a golden web.—Hooker, Hist. Jour. p. 38.

DODITAK, a forehead jewel ornament, worn by Hazara women.

DODO, an extinct bird of the Mauritius. This and the Aphanapteryx of the Mauritius, the Dinornis, Philip Island parrot of New Zealand and Philip Island, and the Erythromachus of Rodriguez, have become extinct. Their large size made them conspicuous objects, and, being occupants of very limited areas, they were easily destroyed.—G. Bennett, Gatherings, p. 243.

DODOH. In Java, a posture of humility which inferiors assume when approaching superiors. It is similar to the custom in Burma, where the superior sits on his legs.

DODONEA BURMANNIANA. D. C. Angustifolia, Roxb.

Mendru, . . BRAS. | Gharaske, . . . | TR. INDES.
Sanatta, Aliar, . . . | HIND. | Veravena, . . .
Ban men du . . . | KAVI. | Shumashad, . .

A handsome small evergreen shrub, well suited for hedges, for which it is often used, and generally called bog myrtle.—Roxb.; Stewart.

DODONEA VIScosa. Linn. Common on the Neighberries and Panjab; wood elastic, and useful for tool handles.—Feyer; Von Mueller.

DODUGA. Tel.? A wood of the Northern Circars.

DOFLA, a tribe occupying the hills forming the northern boundary of Assam. In one of their districts, that of the Char Dwor, Four Marches, no less than 180 petty chiefs are said to hold authority in the Dolla villages. The tribes on the northern Assam frontier are found in the following order along the hills, viz. Aka, Abor, Dofla, Miri, and Mishmi; next to them is the Buteah. The Dofla country extends from the hill course of the Sunndri river to the Bhoroli river, comprising the hills to the north of Chedwar in the Lakhimipur, and of Naodwar in the Tezpur district.

Bangri, the term in their language to signify a man, is the only designation they give themselves. During the latter days of the declining Abom sovereignty, several of these were made to check the Dofla aggrandizies; and on one occasion, raja Gourinath Singh is said to have marched an army into their hills for the express purpose of chastising them, and several thousands Doflas were taken prisoners and brought down to the plains. The raja obliged them to dig a canal, with the view of draining off the large and unwholesome morasses that still exist in mahal Kollongpur; but the greater portion of them are said to have perished, and the task assigned to them remained unaccomplished. They are in communication with the Tibetans, and possess many articles of Tibetan or Chinese manufacture. They have a Mongolian type of physiognomy; but from their intercourse with the people of the plains, and the number of Assamese slaves which they have acquired, it is much modified and softened, and Colonel Dalton had sometimes seen Dolla girls with pleasing and regular features. Their complexion varies much from olive with a ruddy tinge, to dark brown. Marriages and marital rights are the same with the Dofla as with the hill Miri. Those who can afford it are polygamists; but polyandry is far more common amongst the Dolla than amongst the eastern tribes.—Dalton, Ethn. of Bengal; Beng. As. Soc. Jour., No. 2051.

DOG.

The various kinds of dogs are commonly believed to have been derived from one extinct species. On the monuments of Egypt, of date B.C. 3400 to 2100, several varieties of dogs are represented, and on one Assyrian monument, of date B.C. 640, an enormous mastiff is figured,—evidences of the fact the long existence of many varieties. A predilection for the society of man seems almost inherent in the dog; and when we trace back its history, as far as the refuse heaps of Denmark and the pile folks of the Swiss lakes, or, what is still more suggestive, the representations on the Egyptian temples and tombs, the great fact is irresistible, that man and the dog have shared each other's company for possibly a longer period than any other creatures; and whether the attachment at first was gradual or not, it has now, at least as far as the brute is concerned, become instinctive. Moreover, when we think of the vast periods embraced by the Egyptian monuments of antiquity, and the time it must have taken to develop even one variety from the feral stock, and note the foxhound or the turnspit of 4500 to 5000 years ago, it may well be conceded that the dog, of all four-footed beasts, has a claim to man's kindness and protection. The dog is mentioned forty times in the Hebrew Scriptures, but always in terms of aversion. In the present day, Bedouins prefer their dogs. Except at Medina, they are met with everywhere in Arabia and Syria, of the fierce Turkoman breed, the shepherd dog, the bazar dog, and the Macedonian greyhound, and are almost as much cherished by Europeans; and, whether a wretched mongrel, or belonging to one of the pure breeds, a dog is the fierce companion of the wandering Turkoman, with its long ears and winter coat of long soft hair. The shepherd dog is not inferior to that of Europe in any respect. There is also the town or bazar dog, besides crosses of the dog and wolf and the dog and fox. They are generally the only sentinels of every Bedouin encampment; and the Macedonian greyhound, with the usual addition of a hawk perched near the entrance of the tent, forms part of the suite of a sheikh or other chief throughout most parts of Arabia. This animal is about the height of a full-sized English greyhound, but rather shorter; he is deep-chested, has long smooth hair of a red colour, and a tail nearly as much feathered as that of an Irish setter. His speed does not quite equal that of the highest bred dogs of Great Britain,
but he keeps it up so much longer, that he is tolerably certain of running down the fleetest gazelle.

The wild dog is the Cunor rutulans of naturalists. They are to be found in packs throughout Ceylon, British India, and Malayanna, the Himalaya and Tibet, and each of the races has a name for it, mostly meaning wild dog. Wild dogs do not bark,—they only whine, howl, and growl. The Himalayan wild dog, when taken young, is easily tamed: and this rule would seem to hold good with the wild races of other countries; indeed, although not generally acknowledged, the wolf, jackal, and hyena get much attached to man, if carefully reared and treated with kindness. The semi-domesticated dogs, in common with the wild species, have erect ears, and this would seem to become more pronounced the nearer they assimilate to the latter. This circumstance has been noted in respect to domesticated sheep, goats, etc., when left more or less to shift for themselves, as is apparent on the Himalayas and Alps.

In the Nepal hills, the dhole or wild dog are found in packs, varying from 50 to 200, and the havoc committed by them among the flocks of sheep and hill cattle is incredible. Their destruction of deer also is immense, and their mode of hunting may be worth of mention. In size the wild dog is little larger than the common jackal of India, but longer in the body, and possessing much greater power, with a very formidable set of jaws. Colour, a rich reddish-brown, with scenting qualities of the highest order. Soon after nightfall the pack assemble at a given cry, when they disperse in threes and fours in search of game. The first party that hits off the trail, open, when the whole pack rush to them, and when all are assembled, fasten to the trail and off they go. The deer soon become alarmed and double, when the pack immediately fell off in parties, each one rushing to the different passes for which deer are known to make; and on the deer attempting to pass either, it is immediately seized by the party, who utter a simultaneous cry, and the whole pack then rush in, and the deer is at once devoured. Fresh game is next sought, and in the same way destroyed; and this species of hunting is continued according to the size of the pack, till all their appetites are appeased, when they retire to their almost inaccessable fastnesses in the rocks, and remain for three or four days, until hunger again drives them forth on another excursion. From their destructive qualities, the wild dogs hardly ever remain longer than a month in the same locality, having in that time effectually scattered the deer they have been depending on. Captain Smith never knew them to attack man, and even when severely wounded, they will only snap after the manner of a wounded jackal. When deer are not procurable, they will attack even bears. Wild dogs differ slightly in appearance. They are 'the most determined enemies of the tiger, hunting him whenever they meet with him.' 'I have been assured,' remarks Lieutenant Rice, 'by Bhils, that they have sometimes seen a tiger kept prisoner up a large tree, with a pack of these dogs hanging around him, when on no other occasion would a tiger attempt to save himself by climbing trees. On the approach of the men the wild dogs dispersed, when the tiger jumped down and gladly made his escape. This I firmly believe to be a fact, for the story arose out of a casual remark which one Bhil made to another in my hearing, as we were passing a certain large tree (with a straight stump about five yards high before the branches began, up which a tiger had jumped). Perhaps these dogs hunt the tiger for poaching on their deer; or it may be only the old antipathy between cat and dog on a large scale.'

Mr. Arthur Grote, C.S., sent to the Bengal Asiatic Society from Chibbars, Central India, the skins and skeletons of a mature female and male half-grown, of the ordinary wild dog, so called, of British India. These animals are specifically identical with a particularly fine living adult male sent down from Upper Assam; and this appears to be the ordinary specimen of the Himalaya and of Central and S. India, Canis Dukhunniensis, Sykes, and C. primaeus, Hodgson; and a Malayan specimen in that museum, which was supposed to be C. Sumatrensis, Hardwicke, differed only in the considerably deeper tint of its rufous colouring.

The Vakhan Dog is a breed from Chitral. It bears a strong resemblance to the Scotoh collie. They have long ears, a bushy tail, and a body more calculated for swiftness than strength. The colours are black, reddish-brown, or mottled.

The Hill Dogs are covered with black wool, which forms an article of traffic. They are large, and ferocious to strangers, but are useful as sheep-dogs, and are provided with an iron collar to secure the dog from a leopard's teeth.

The Tibetan Mastiff is large, strong, with a shaggy coat. It is very fierce, well adapted to defend flocks against robbers or beasts of prey; it is subject to hydrophobia. It has a tan-coloured super-orbital stripe.

The Shikari Dog of Kamaon is very like the pariah dog of the plains.

The Dogs of Kanawar are of a large ferocious breed, resembling wild beasts in their nature; they are covered with black wool, and are very averse to strangers, whom they often bite and tear in a most shocking manner; they are generally chased during the day, otherwise it would be dangerous to approach a village. The fleece, especially of the young ones, is almost equal to shawl wool.

The breed of Bisur, in the Himalaya, is noted for its size and hardihood. The finest dogs of this breed bear a considerable resemblance to a mastiff, but retain a good deal of the ear. Their colour in general is black and white, with a little red occasionally; their hair is long and thick, and the tail long and bushy, curling up behind; their head is long and narrow, and somewhat like the common shepherd's dog. They are often very fierce, and sometimes attain a considerable size, but are seldom so large as a full-sized mastiff. These animals are furnished with a down under their long shaggy hair, which is as fine and soft as shawl wool; this comes off easily in warm weather, and is regularly shed with the hair. Every animal is similarly furnished in this cold country. The natives use these as sheep-dogs, in the same way as those of other countries, and also for hunting all sorts of game, even birds, which they tire out in flying; and some were valued at a very high price.

From a genealogical table in the Encyclopaedia Britannica, it appears that the common Turkish dog is the parent stock of most others known in Europe.
DOKHMA.

The Greyhound of Babylon is fleet. It has long shaggy hair on the legs and body. The Persian greyhound has a fringe of soft silky hair on the ears.

The dog which is known in Bengal by the name of the Nepalese dog, is, properly speaking, a native of the Upper and Lower Tribes, whence it is usually brought to Nepal. It is a fierce and surly creature, about the size of an English Newfoundland, and covered with thick long hair. It is reckoned to be a good watch-dog, and never to sleep at night.

Amongst the Hindus of India and the Indian Mahomedans, the dog is regarded as an unclean animal. With the Ceylonese, the dog was supposed to be the most acceptable sacrifice to the offended deities, five dogs being the common number for a propitiatory offering. The unclaimed dogs of Bombay, Egypt, Mecca, and Constantinople are a sad nuisance, and even in Bombay, being protected and fed, but not housed, by the Parsee inhabitants, as well as by Hindus. An expiring Parsee requires the presence of a dog, in furtherance of his departing soul, and, after the Sag-did or dog-look, the exposed body is speedily consigned to the Tower of Silence. In Rangoon, pariah dogs infest the town. The greatest number of dogs are found near the Kyongs.

Dogs are eaten in China, at Zanzibar, in Australia, and the Pacific. In China there are restaurants both for dogs' and cats' flesh.

Dog-skin is thin, but tough, and makes good leather. Of late years house leathers take its place for thin dress shoes. Most of the dog-skin gloves are really made of lamb-skin.

Dogs in the Pacific Islands are fed on cocoanuts.—MacGregor; Darwin's Variation of Animals and Plants; Jordan's Mammalia; Smith's Nepal; Journ. As. Soc. of Ben., November 1856; Gerard's Kauacac; Fraser's Himalaya Mts. p. 364; Robinson's Travels, ii. p. 356; Gray, ii. pp. 75, 76. See Canis.

DOGAR, also Dogra, a predatory and pastoral race scattered over various tracts of the N.W. of Hindustan. There are a few in Hansi, Sonam, and Firozpur, which latter place, together with a considerable tract along the bank of the Sutlej, they held for a long time during the 18th century in almost undisputed sovereignty. Their occupation was divided between pasture and plough. They are Mahomedans, and state that they were originally Chauhan Rajputs; but the Kalim Khani and other converted Chauhans of those parts will not acknowledged their fraternity, asserting that Dogra was nothing but Jats and Gujars. Dogars are held in no consideration by their neighbours, but in former times they were much dreaded on account of their predatory habits, which a civilised neighbourhood and a strong government compel them now unwillingly to relinquish. Their personal appearance is in their favour: they are a tall and muscular race, and are generally remarkable for having large aquiline noses. Members of the Dogar race attained distinction first as feudatories of Ranjit Singh, and later as allies of the British. The raja of Jamu and Kashmir is a Dogar. They use as a written character a modification of the Nagari, to which the term Dogri has been given.—Elliot's Surr. Gloss.; Cust.

DOBANES, the Apocynaceae, or dogbane tribe of plants, are trees and shrubs, of which the oleander is a conspicuous example. Some are herbaceous, as in the case of the vine or periwinkle, a climbing plant with trailing twigs. The Nerium pascical of Roxburgh is common in the Khasiya or Sylhet mountains, and there called echalat. It is an extensive perennial climber. Its bark contains a large quantity of fibre, which the natives use for the same purposes as hemp. Dr. Roxburgh, in speeeing some of the young shoots in a fish-pond, in order to facilitate the removal of the bark, and to clean the fibres, found that many, if not all the fish, were killed. Hence the specific name which he applied. Dr. Wight formed the plant into a new genus, Echaltum.—Fl. Ind., i. p. 7.

DOG-FLY, the zimb of Abyssinia.

DOG'S TONGUE; FISH is shaped like the sole. It attaches itself to the bottoms of boats, and makes a sonorous noise, which is more musical when several are stuck to the same plank and act in concert.—Boer's Stiemen, i. p. 11.

DOH, a name in Java for the horsehair-like fibre of the eje or gomuti palm, the Arenga saccharifera, Labill.—Simmonds.

DOHADA. HIND. A term which usually signifies the desire or longing of a pregnant woman, to which the Hindus attach as much importance as do the nations of Europe.

DOHAGUN. Amongst the Hindus, Sohagun is a woman who becomes sati previous to her lord's death; Dohagun, one who follows him after death.

DO-HARTA. HIND. A well with two wheels. DOING NAK, a hill race in Arakan, on the upper waters of the Mayu river. They are Buddhists; their language is a corrupt Bengali, and they call themselves Khein banago. They are a branch of the Chukma, and appear also to have been endogamous. Captain Lewin mentions that they abandoned the parent stem during the chiefship of Janbakhsh Khan, about 1782. The reason of this split was a disagreement on the subject of marriages. The chief passed an order that the Doing Nak should intermarry with the tribe in general. This was contrary to ancient custom, and caused discontent, and eventually a break in the tribe. —Lewin's Hill Tracts of Chittagong, p. 65; Raffles' History of Java, i. p. 328; Lubbock, Orig. of Civil. p. 103.

DOI-PHORYA. MAH. The name of a class of importunate Hindu mendicants, who knock their heads against stones to enforce compliance with their demands; hence any importunate petitioner.

DOJA. THET. An ingot of silver, stamped, current on the hills for 20 rupees.

DOKA. HIND. A tree of Chutia Nagpur, with a hard red timber.—Cal. Cutt. Ex.

DOKAD-DAR, a pattern in a Kashmir shawl. Dokh, a Central Asian cotton fabric.

DOKH. HIND. A cut-and-thrust sword of Hindustan.

DOKHMA or Dokhma, or Tower of Silence, the place for depositing the dead of the Parsee race. The dokhma has a deep well, surrounded by a platform with channels converging to the well. The body is laid on a partition of the platform, and the fluids resulting from its decomposition flow along the channels into the well; but after a time the remains of bones are also swept into that excavation. The word is also said to be
DOLICHOS UNIFLORUS.

A valuable pulse, prized in India; it is cultivated in Portugal. D. Sinensis has six varieties, distinguished by their white, brown, and black seeds, —leucosemperus, phaeosemperus, and melanosemperus. Ainslie, p. 237; Roxb. iii. 308. See D. Sinensis.

DOLICHOS FALCATUS. Klein.

Its cube tige, . . . Tel. Verri ulva, . . . Tel. Common in hedgerows, thickets, etc., where the soil is rich and moist. Flowers during the cold season. The tuberous roots are cut by the natives into the form of beads, and strung and worn round the neck to cure purging in children.—Roxb. iii. 311.

DOLICHOS GLUTINOSUS. Roxb.

Glycine viscosa, Roth. = Rhynchosia visciosa, D.C. (see entry above, p. 311). Shim-batraje, . . . BENG. Karu kanuli, . . . Tel. Naga chikakku, . . . Tel. Karu chikakku, . . . Tel. Grows all over India, and has largish yellow flowers; differs but little from D. tomentosus.

DOLICHOS PILOSUM. Roxb.

Tao bai, . . . BURM. Takuri kulay, . . . HIND. Grows over all India. Cattle eat the straw.—Roxb. iii. 312.

DOLICHOS SINENSIS. Linn.

1. ecremocarpus. as leucosemperus. phaeosemperus. melanosemperus. Burtati, . . . BENG. Chota harwan, . . . PANJ. Chowa, . . . DUKH. Chovan, . . . DUKH. Lobat, . . . OAS. Chanaan, . . . SHAH. Lob, . . . HIND. PERS. Karmani, Bobbaru, TAM. Rooghi, . . . MALAEL. Paru, . . . Ala-cheshala; Alasanda, . . . DOL.

The varieties of this commonly-cultivated species have white, brown, and black seeds. The section ecremocarpus is D. Sinensis, D.C., the D. sosiquepadas of Linn. The orthocarpus is the D. Tranquebariensis of Jacquemont, D. catjang of Roxburgh. This bean is sown at the commencement of the rains; it has a very long and slender pod, and eaten as French beans. The bean itself is small, and those with white seeds are esteemed the best.

Moisture, . . . 12-44 Fatty or oily matter, 1-41 Nitrogenous matter, 24-01 Mineral constituents 59-62 (ash), . . . 3-13

DOLICHOS TRANQUEBARIENSIS. Jacq.

D. Sinensis, var. orthocarpus. Lobor ke phalli, . . . DUKH. Poy-an-kal, . . . TAM. Rajamasha, . . . SANSK. Pesola-kai, . . . TAM.

This is a long, slender, pleasant-tasted legume, not unlike the French bean both in appearance and natural qualities. There is a larger variety of it, called in Tamil, Perum pyttum-kai; in Dukhiani, Saffaud lobor ke phalli; in Telugu, Dantoo pesola-kai, and in Sanskrit, Svetra raja-jamasha.—Ainslie, p. 244.

DOLICHOS UNIFLORUS. Lam.

D. biflorus, Roxb.

Roong ; Rawan, . . . BEAS. Barat ; Botang, . . . PANJ. Kulthu kule, . . . Kulti, . . . BEN. Kulture ; Cuhula, . . . SANSK. Huru ; Kalat, . . . CAN. Kult ; Kolt, RAVI. SUTLEJ. Kalat ; Kulate, . . . CHER. Mudra, . . . GRAM, ENG. Gaddi, . . . TAM. Horse gram, . . . TAM. Kolti, . . . HIND, MAHR. Muthera ; Maeliri, . . . MAL.

It is used in S. India for cattle, and is the common food for horses in the southern part of the Peninsula. It is a very pleasant-tasted pulse, and is used by the poorer classes as an article of diet in curries. It is grown in fields after the seasons.
DOLPHIN.  

Arthur's quoit or cœtan, near Criccieth, Lanyon quoit and Chûn quoit and others in Cornwall, Stanton Drew quoit in Somersetshire, the Kite-koty or quoit near Maidstone, and the Coity-y-encro in Guernsey, all of them circles of upright stones. Professor Sven Nilsson (On the Stone Age, p. 159) defines the English cromlechs as synonymous to the French dolmens, the Scandinavian döös, and the dyss of Denmark, consisting of one large block of stone, supported by some three to five stones arranged in a ring, and intended to contain one corpse only, several of these dösser being sometimes enclosed in circles of raised stones. Following, however, the nomenclature given by the late Dr. Lukis, we cannot fail to agree in assigning the word to an architectural megalithic structure of one or more chambers, in which category the passage graves may be included. The dolmen (Dol, a table, Moen, a stone) is, as its name implies, of different structure. The cromlechs of Jersey and the adjacent islands partake of the character of the French grottes aux féces, the fairy's grotto, as well as the Gang-rifer, the gallery tombs of the Swedes, the jetestoner or chambered tumuli of the Danes, and the German Hunnenbetafen. In China, the chambered tumuli associated with megalithic avenues have attained their greatest development. The great tomb (the Ling or resting-place of Yung Lo of the Ming dynasty), 30 miles from Pekin, consists of an enormous mound or earth barrow covered with trees, and surrounded by a wall a mile in circumference. In the centre of the mound is a stone chamber containing the sarcophagus, in which is the corpse. This chamber or vault is accessible by an arched tunnel, the entrance to which is bricked up. This entrance is approached by a paved causeway, passing through numerous arches, galleries, courts, and halls of sacrifice, and through a long avenue of colossal marble figures, sixteen pairs of wolves, kelinis, lions, horses, cemals, elephants, and twelve pairs of warriors, priests, and civil officers.

There was a fine called dolmen formerly existing near Nidi-mund, on the Neighgheries, and throughout the Belgaum and Kaladgi collectorates are scattered groups of dolmens, formed of large rough slabs set on edge, with a huge cap-stone laid over them. Many of these are to be seen to the S.W. of Konur, in the Belgaum collectorate. A dolmen was discovered in Gujarat. Barrows occur in Zorapur. Upright monumental stones or menhirs also occur.—Ind. Ant.

DOLMELA MACROCEPHALIA.  

Dupa, Diopa, Panch, Gagal, Gagal, Pakar, Pakar, Pakar, Pakar, Pakar.  

A plant not uncommon from the Sutlej up to the Indus, at from 10,500 to 13,000 feet, often growing on the crests of ridges. The odorous root is locally used as incense offered at shrines and to rajias, and the flowers also are placed in temples on the Sutlej.—Dr. J. L. Stewart.

DOLOMITE. Hwah-ju-shih, CHIN. The Chinese make vessels out of their dolomites. It is also used medicinally internally. Dolomite is a magnesian limestone, used for building and for lithographic stones.—Smith.

DOLPHIN. This name is applied by southern-going sailors both to the brilliant Coryphaena hippurus, Linn., the Dorado or Dolphin proper, of a brilliant blue or purple, and to the Delphinus or
Porpess. The Coryphaena hippurus are caught in the Gulf of Arabia (Bennett, i. p. 8). When swimming about it is of a brilliant blue or purple, gleaming with a metallic lustre on every change of reflected light, and varying in intensity according to the degree of illumination and shade. On being captured, the changes of its tints are most lovely: the bright purple and golden yellow hues change to a brilliant silvery tint, varying back again into the original colours of purple and gold. This play of colours continues for some time, and then settles to a dull leader hue. The Delphinus Perouisi is very rare, and confined to the confines of the Antarctic Ocean. S. of Cape Horn.—G. Bennett, i. pp. 8, 29.

DO-LUNGI of Jalandhr, a fine double lungi or scarf.

DOM or Halī. In the great belt of forest land intervening between the mountains and the plains, are several tribes. One of these, the Dom of the N.W. Provinces, is generally regarded as a remnant of the original stock which the invading Aryans displaced. The huts of the Dom or Halī are on a low range, and the Dom are hereditary bondsman to the Rajputs. They are supposed to be the same as the Dom of the Santal hills, and the Duni, still a well-defined tribe in sub-Himalayan Nepal. Besides the Dom of Garhwal, in the N.W. Provinces, there are wandering and wild tribes, named Bhur, Damak, Kanjar, Kumbh, Nat, Saussi, Gond, the Tharu in the Terai, and the Pasī in Oudh. In Oudh the Dom is a sweeper, carries away the dead, is often a musician, and his wife the Domini, an actress who performs in the private apartments of women. In Kamaon in N.W. India, the Dom is engaged in basket-making and wicker-work. They have dark, almost black skins, and crisp curly hair. The Dom is now dwelling amongst the general population in the north of India, under the Himalayas, and in the Kamaon hills. The Dom were once a considerable tribe, and are still a numerous helot section of the population, being in fact the only inferior class, and ordinary labourer as well as artisan, and, with the Ghasi, in the labour market of Northern India take the place of the Mang, Mhar, Dher, and Parīsh of the south of India, and are rope, fan, basket, and mat makers. Tradition fixes the country of the Dom to the north of the Gogra, touching the Bhur on the east, in the vicinity of the Kanī. So many old forts testify to their former importance, and still retain the names of their founders, as for instance Domdiah and Dommangur. Ramghur and Shumkote on the Rohini are also Dom forts. Buchanan considers that the Dom are the same as the Dom Kutur (Donatikar); also that the Dom expelled the Tharu, and were afterwards expelled by the Bhur. There are several Dom or Domra tribes scattered over the western districts of Oudh, and in Bundelkhand and Sangor. The Mirasi Dom are Mahomedans descended from Bhat, and are perhaps more generally known by the name of Mirusi and Pakhawaj. The name of Mirasi is abbreviated into Mir; and thus the Mir of the Kul Naubāt, after whom Mirapur is called, having assumed this distinguished title, are frequently able to conceal the truth of their being really descended from the Mirasi Soorkh. Domnang, a low caste men in Kanauj, the same as the Dom of Kamaon.—Wilson; Latham; Campbell, pp. 16-125; Buchanan, Eastern India; Elliot; Dalton, Eth.

DO-MALA. HIND. A large well, furnished with a double 'barth' or Persian wheel.

DO-MAT. HIND. Soil, part clay and part sand, hence the name 'two-earths,' Do-mat.

DOMBA, Dombar, or Domar, an athlete, rope-dancer, or gymnast, known in the south of India as the Kollati or Kheilti. The young women are models of physical strength; they are not restrained from intercourse for money. They are in small claims in the centre and south of the Peninsula of India.

DOMBA GASS. SINGH. Calophyllum inophyllum, L. Donba-keena is C. Mooni, W. Domba oil, a fragrant fixed oil obtained from the seeds of the Alexandrian laurel, C. inophyllum. It is used for burning and for medicinal purposes. C. inophyllum has a soft, coarse, open-grained, light wood, bearing a strong resemblance to inferior Honduras mahogany, takes a good polish, and presents a pretty curied pattern; perhaps not a very durable wood, at all events in its native country.—Ex. 1851.

DOMBEYA, a genus of plants belonging to the natural order Sterculiaceae, inhabiting the East Indies, and the Isles of France, Bourbon, and Madagascar. The bark of D. spectabilis is made into ropes in Madagascar. D. angulata, Cac., is the D. tiliefolia, Roeb. It is a shrub, native of Bourbon, with rose-coloured flowers like those of the common censer, leaves coriace; flowers in corymbs, of a pretty rose colour. D. palmata, Cac., a shrub; leaves palmate, resembling the common censer-oil plant. Flowers, in large terminal corymbs, rose-coloured, appear in September and October. D. tomentosa is a small tree with rose-coloured flowers.—Eng. Cac.; Riddell; Roeb.

DOM, in architecture, is generally in use for tombs of the Indian Mahomedans. The ceilings and domes of Hindu and Jain temples are sometimes of singular excellence of execution. In the western side of India, the cupped arch and the dome characterize the Mahomedan style of architecture, but that of Ahmadabad and that of the Bijapur buildings present points of difference. Perforated stonework occurs in old Hindustani buildings, but specimens remarkable for the variety of beautiful design are chiefly to be found in the Mahomedan works of the 16th and following centuries at Ahmadabad and Aurangabad.

DOMETT, a thin kind of flannel, of which the weft is of wool, the warp of cotton.—Paulnier.

DON, D., a botanist, author of the Prodromus and Flora Nepalesins.

DON. HIND. A cloot-crusher drawn by two bullocks; the driver stands on the implement when working it. The kulu is used after the cloot-crusher for levelling the ground, and, with the scart remover, it is used for covering the seed after it is drilled in. The kuri is a drill used in rice cultivation.

DONA. HIND. A leaf folded up as a cup.

DONABEW, a town in Pegu, taken by the British 20 April 1825.

DONDRA HEAD, the most southern point in Ceylon, is in lat. 5° 55' N., long. 80° 33' 40'' E. It is low and projecting, and covered with coca-nut trees. Extensive ruins are still on it of an ancient and once celebrated temple, which was sacked and destroyed by the Portuguese in 1587.
DONDU.

DONDU. Hand. Tubes of the corolla of the Nyctanthes arbor-tristis.

DONG. Buot. The wild yak of Tibet, the fiercest of all known ruminants. It will rarely allow a man to escape alive if it can come up with him. It is generally hunted on horseback, the great aim being to detach one from the herd. It affects open grassy places, and goes in large herds. Its favourite pasturages being ascertainment, in the midst of these the hunters, who are on foot, throw up circular enclosures of stone a few yards apart, the hunter taking up a position in one of them. When a dong is within shot, the hunter, having fired at him, instantly quits his enclosure for another; for as soon as the animal hears the shot, whether he has been hit or not, he, guided by the smoke of the discharge, rushes furiously on the enclosure, and commences knocking it to pieces. When the hunter gets another shot at him, he retires again from his shelter to a fresh enclosure, and so on till he has killed his game.

The ordinary size of the dong is four times that of the domestic yak; it is black all over, having occasionally a white streak in the forehead. The horns of a full-grown bull are said to be three feet long, and the circumference must be immense.

The common mode of describing it is to throw out the elbow, bring the fingers to the ribs, and point to the circle thus formed as the size of the base. It is used by the grandees of Tibet at marriages and other feasts, when it is filled with strong drink, and handed round to the company. Nothing more commendatory of the host's joviality can be said, than that he regaled his guest out of the dong's horn. The horns so used are finely polished, and mounted with silver or gold and precious stones. It is common in a Tibetan gompa (lamaserai) to see a stuffed dong standing in front of the image of Maha Kali, at whose shrine the animal is thus figuratively sacrificed; axes and other instruments of sacrifice are ranged around the image. Strange that Buddhists should preserve this feature of Hinduism in their places of worship; not more so, however, than, as Hirs describes, that a llama should nearly go into fits on seeing a louse from his tunic imbedded in the fur of his coat. If, in the whole of his countrymen and co-religionists are among the greatest sufferers and consumers of animal food in the world.

DONGAR. MAHR. A hill, high ground. Dongar-Koli. MAHR. A lawless tribe inhabiting the hilly country. Dongargaon, on the plateau of Chhattisgarh, has a great grain market.

DONGI - DONGI of Maccasar, Echenhama spinosa; Plocaria candida, Nees; the agar-agar of commerce.

DONI of the Coromandel coast is a huge vessel of the ark-like form, about seventy feet long, twenty feet broad, and twelve feet deep, with a flat bottom or keel part, which at the broadest place is seven feet; and at the fore and after parts of the vessel it breaks into ten inches, which is the siding of the stem and stern post. The fore and after bodies are similar in form amidships. Their light draught of water is about four feet, and when loaded, about nine feet. These rude unhappily vessels trade from Madras and the coast to the island of Ceylon; and many of them to the Gulf of Mannar, as the water is shoal between Ceylon and the southern part of the continent. They have only one mast, with a long sail, and are navigated from land to land, and coastwise, in the fine season only.

DONJONG-MA, a goddess of the Guaro.

DONKEY, the ass, the Gaddha of the Urdu-speaking races of India. Gaddha-ka-hal, Hind., literally a donkey's plough. Before the British domination in India, it was not uncommon to yoke donkeys in a plough and drive them over the ruins of a captured fort, as a mode of showing supreme contempt for the vanquished enemy. The furrows thus raised were levelled by the hohe-kimye, or iron harrow. Horace says (Carm. i. 16):

"Exitio graviter
Stravere, et alia urbibus ultime
Stetere cause, cur perirunt
Funditus, imprimenterque muris
Hostile aratrum exercitus insolens;"

indicating this mode of wreaking vengeance.

It has been in especial favour with Eastern nations, and was practised by Chengiz Khan and Timur with unremitting severity. Hence the common expression, 'I shall saw barley where you now stand,' as in the vault of the bandit minister Kurrug II., at p. 185 of Popular Poetry of Persia. Gaddha-karanchar, literally to seat upon a jacksass, is a punishment formerly known by the Arabic word Tash'hir, publication, celebration, which is rendered by Golius, 'Per urben duo jussit sotonem in exemplum; fere asino aut cameloo impositum.' In India delinquents are never placed on camels, but often paraded on donkeys. — Elliott's Supp. Gloss.

DONKIA, a pass in N. Sikkim, in lat. 27° 56' N., and long. 88° 48' E. The crest is 18,466 feet above the sea. Tibet is visible from its summit. Dr. (Sir) J. D. Hooker described the grand but most desolate panorama beheld by him from the summit of this pass.

DONWAR, a clan or tribe of the Bhunhaar, found in considerable numbers in the districts of Mirzapur, Azimgarh, and Jaunpur; a few also reside in Gorakhpur. Some of them are called Rajputs, and others Bhunihars. The Donwar clan of Rajputs was once in possession of the Doab pargana, in the Ghazipur district. This tract has passed in the course of the wealthy and influential raja of Donon, but they continue to inhabit the soil in large numbers. — Skerrington.

DOOLEY, a litter with wooden framework and canvas; a coarsely made palanquin, light and airy, generally used for carrying the sick.

DOOM or Donum, the gingerbread palm-tree, exclusively inhabiting Upper Egypt, especially the neighbourhood of Thebes, whence it is named Cucifera Thebica. Its stem forks two or three times, thus assuming the appearance of a Pandanus. The fruit is about the size of an orange, angular, irregularly formed, of a reddish colour, and has a spongy, tasteless, but nutritious rind. The albumen of the seed is hard and semi-transparent, and is turned into beads and other little ornaments. Gertner, described it under the name of Hyphaene coriacea. It is known in Egypt as the gingerbread tree, because of the resemblance of its brown mealy rind to that cake. — Eng. Cyc.

DOONA. (Lobelia amabilis.) A genus of great trees of Ceylon. D. affinis occurs between Ratnapura and Galle, at no great elevation; D. congestiflora, Tinneya-gass, Stign., at Hikkaduwa and Pasdooen Corles; D. cordifolia, at no great elevation
DOONA TRAPEZIFOLIA.

DORDONIA

by

D. an it but when who Persia, a stranger as all flowers, rich and this creamy colour of the doors, open the former colour may be, for the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing; but the dyers and securers of India have a process by which the former colour may be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The do-pattas of Pytum, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Dekhan, not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares. Scarfs are in use by every one,—plain muslins, or muslins with figured fields and borders without colour, plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called sehla in India, are in everyday use among millions of Hindus and Mahomedans, men and women. They are always open-textured muslins, and the quality ranges from very ordinary yarn to that of the finest Dacca fibres. No attire is so becoming to the brighter form of woman as the Hindu-stani garments in silver and do-patta. A woman in European attire gives the idea of a German manikin; an Asiatic in her flowing drapery recalls the statue of antiquity. These scarfs are manufactured at various places, and of different qualities and colours. Those brought from Benares, always with gold and plain lace borders of different sorts, are sold at from 25 to 350 rupees each. Those of Aurnce, in the collectorate of Chingleput, with borders of yellow cotton, are priced at from 2 to 7 rupees each, and those of Oopada in Rajamundry are woven with white borders, and are sold at from 1 to 3 rupees each.—Dr. Watson; Tr. of Hind. ii. p. 37.

DOH, a tribe of Rajputs, some of whom, mostly converted to Mahomedanism, are settled in the Alligur district, also about Banda and Sungur. Time has destroyed all knowledge of the history of this branch, but they must have been of importance in the time of the last Hindu sovereign of Tanjore, Prithi-raj, as he commemorated a victory over them by a tablet. Before the emigration of the Bir Gjur race, they were the chief proprietors of Aligur, and a remnant of them now exists in Dubhace, Atrowlee, Coel, Shikarpur, and Burun.—Elliot; Tod; Wilson.

DOH. HIND. Land ploughed twice; from Do, two. When ploughed three times, it is called Toor; when four, Chawur.

DOH, the modern village Atbeia, the first place towards Jaffa; it is the Castel Pelegroino of the crusaders, and the Dor of the Hebrews. Its columns and butresses are a confused mass, stretching into the waves, over which the surf breaks. Dor is the celebrated city of Cesarea.—Skinner’s Journey, i. p. 96.

DOR, with the Tamil and Telugu races, is equivalent to the Mangal words, Sir, Master, and to the Arabic Sahib. Both in its singular and plural forms, Doravdru, Doraguru, Dorawaru, it is a title of the Konda Dora, the chieftains in the mountains of Gunmur. Dorasani is a lady.

DORADINA, a group of fishes of the family Siluride stenobranchi.

DORADO, one of the dolphins.

DORAN, woolen cloth of Kulu.

DOEDONIA ORIENTALIS, hop wood of Nor-
DORYANTHES AMMONIACUM.

Folk Island, does not attain to more than a foot in diameter, and is principally used for veneering and in turning ornaments.—Keppel's Ind. Arch.

DORYANTHES AMMONIACUM. Don.

Ferula orientalis. | Ferula ammoniaca, Vec.
Fesbuk, | Arab. | Simugh teratees, | Pers.
Ooshak, | Pers. | Simugh buss-shirin, |

A glaucoous green plant belonging to the natural order Umbellifera, with a perennial root, and large leaves two feet long. It is a native of Persia, in the plains of Yezdeghast and Kunnishna, in the province of Irak, and near the town of Jezud Khat, in very dry plains and gravelly soil, exposed to an ardent sun. It is one of the plants which yield gum ammoniacum, but it is probable that several plants yield this, as well as the other gum-resins of the order Umbellifera. This gum-resin is imported into Bombay from the Persian Gulf, and re-exported to different countries. It is obtained by incisions in the plant, and occurs in two forms,—first, in voluminous masses of yellowish colour, enclosing white almond-like tears, the whole being of plastic consistency, and very impure; secondly, in tears of irregular form, white or yellowish, opaque, rather solid, agglutinated or distinct, compact, brittle, of glassy fracture, and free from impurities. Its odour is faint and peculiar, taste sweetish and then bitter. It is partially soluble in water, ether, alcohol, alkaline solutions, and acetic acid. Its medical effects are similar to, but less powerful than, asafoetida. It is principally employed as an expectorant in the chronic catarrh and asthmata of old persons. It is also applied externally as a warm and stimulating plaster.—Linley, Pl. Med.; Eng. Cyc. p. 395; Todd, in Phil. Mag., 71, p. 384; Powell, p. 354. See Asafoetida; Ferula Persica.

DORÉ or Dori, a village in New Guinea, in which the houses are built on posts in the water, and are reached by long rude bridges. The houses are low, in the form of a boat bottom upwards. In Dori the Papuans are called Myfore. They are about 5 feet 3 inches high; few attain 5 feet 6 inches. They wear their crisped hair its full length, and generally uncurled for, which gives them a wild, scared appearance. The men, not the women, wear a comb. The beard is crisp. The forehead is high and narrow; eyes large, dark brown, or black; nose flat and broad; mouth large, lips thick, and teeth good; few have regular features, and most are apathetic. Theordinary men wear a waist-cloth made of the bark of a tree, called Mar, which is wrapped round the waist and passed between the legs. Women wear a short sarong to the knee, generally of blue cloth. Men and women tattoo their bodies by pricking them with sharp bone, rubbing in lime, black. The Dori people are seafarers, fishers, and traders, and are expert swimmers and divers. Their palms have outriggers, and are excavated from the trunk of a single tree. Their food consists of millet, obi, maize, a little rice, fish, and logs' flesh, and fruits; sago is imported in small quantities. Theft is considered a grave offence. The people resemble the Ke and Aru islanders. Their colour is a deep brown, often approaching closely to black. On a pole near the stem of the boat, they place, chiefly for ornament, a thin, finely-carved red-and-white striped plank, sometimes furnished with the image of a Papuan's head, with out-sticking hair, made from gomuti fibres or cassowary feathers. Respect for the aged, love of their children, fidelity to their wives, are traits which reflect honour on their disposition. Chastity is held in high regard, and is a virtue which is seldom transgressed by them. A man can only have one wife, and is bound to her for life. Concubinage is not permitted. Adultery is unknown amongst them. They are generally very fond of strong drink. They do not make any fermented liquor, not even sugoweer or tuak. Kidnapping is general in these countries. The hillmen, or Arfak, of the interior are generally black, but some are brown. Their hair, though always more or less frizzly, is sometimes short and matted. The Arfak mountains are about ten thousand feet high, and inhabited by savage tribes. Birds of paradise are brought to Dori for sale from Amberbaki, about a hundred miles west.—Wallace, ii. p. 184; Earl, p. 71; Journal of the Ind. Arch., June 1852, pp. 312 to 317.

DORI. HIND. An iron straining ladle to separate the curd for cheese-making.

DORI. HIND. A kind of edging or narrow braid in gold and silk. Dorihar, a pellor selling laces and thread; also a Sivai mendicant living partly by the sale of thread. Dori means a small twine or thread, or cording edge, used for the edges of clothing, similarly to nakki, gota, kinari, patti, mandil, and zarzi.

DORIA. HIND. A cotton fabric coloured with fine stripes, one of the piece goods of India.

DORIA. HIND. A leash, consisting of a bunch of silk thread fastened at the ends; they are often worn to suspend charms or amulets, etc., round the neck.

DORIAN, the fruit of the Duroio zibetinum, it is pleasant-tasted, but of most offensive persistent odour, though the natives of Amherst and Malacea are very fond of it. They cost three rupees each at Moulmein.

DORID.E, the sea-lemon family of molluscs. Doris Barnardi, Keluwart, has rich colours. D. exanthemata, Keluwart, of Formosa, Labuan, and Borneo, is nearly eight inches long, of an olive green colour, and is the largest known nudibranch. Its bosses and tuberules render it an unpleasant object.—Cooli.

DOR-KHAIR. HIND.? A tree of Chutia Nagpur, with hard, yellowish-red timber.—Cat. Cat.

DORO. SIND. Unripe fruit of Capparis aphylla, Roxb.

DORVILLE and Grueber, two Romish missionaries who travelled in Tibet in the middle of the 17th century. They crossed China from Pekin by Sin-gan-foo to Teshing, reached the Koko-nor and thence passed into Tibet, and thence the sources of the Hoang-ho, and, crossing those of the Yang-tze-kiang river, they came on from thence to India, through the valley of Nepal by Khatmandu and Hetounda to Patna on the Ganges, where Dorville died.—Prinsep, Tibet, p. 14.

DORYANTHES EXCELSA. A lofty tree Amaryllis, the gigantic lily of the sea-coasts of Australia between Sydney and Botany Bay. It is a magnificent plant, with a lofty flowering spike. The height of the flowering stem is from 10 to 20 feet, bearing a terminal cluster, 12 to 14 inches in diameter, of crimson flowers. In the beautiful Ilhawara district it is found in the greatest perfection, and attains its full magnitude and beauty about the mountain ranges. It is supposed that

973
a useful flux could be made from the fibres of its leaves. It should be introduced into India.—G. Bennett, p. 340.  

**DORYMA BERDMOREI.** Blyth. A genus of the Geckokidæ found in Mergui.  

**DO-SUTI.** Hodyson's soil.  

**DO-SAD.** In Bengal, a low caste employed as executioners, to remove dead bodies, as village watchmen and messengers. In Bengal and Behar, the work of labourers is done by Bhuï, Rajjwar, and other aboriginal tribes, but Chandal, Dosad, Hari, Bhumali, are names of other low-caste races; the Bhimnal, in Bengal, being the lowest or swearer class. The Dosad of Behar used to make frequent predatory excursions into Lower Bengal. The Dosad men are of strong build, and as tall as the average Hindu; have coarse features, but with nothing of the Chinese or Negro about them. They have adopted the worship of the demon Rahu, who is supposed to cause eclipses by his periodic attacks on the sun and moon, in revenge for having had his head cut off by Vishnû. The Dosads not only adore him, but claim to be his descendents, from their upper class from Rahu and his wife, and their second class from Rahu and his wife's maid-servant. In their mode of worshipping their founder, the faithful ascendants formed of sword-blades, so placed as to bring the sharp edge in contact with the foot as they ascend. The Dosads aspire to higher employment than the Ghissi and Dom. They serve as village watchmen, and sometimes as police and as court runners. They live freely.—Wilson; Dalton, Ethnol. of Bengal, p. 326; Campbell, p. 129.  

**DO-SALI.** A caste who make leaf cups and leaf platters in India.  

**DO-SHAHI.** Hind. A soil part clay and part sand; soil of two kinds mingled, hence its name, Do-mat, or two earths. See Do.  

**DO-SHAH.** Hind., Pers. Double shawl, shawls being always worn double by the natives of India. The ordinary do-shah is a pair of shawls, made with the 'kinara' or border at different sides, so that one may be worn over the other for thickness as well as appearance, for then both sides show as right sides. See Do.  

**DO-SHAM.** See Polyandry.  

**DO-SHA.** Hind. A kind of coarse white cotton cloth. The words mean double thread. Dosa-shí, Sina-shí, Celut-shí, literally, two-thread, three-thread, four-thread; kinds of cotton cloths. Káde and Púrum are other kinds.  

**DO-SUTI.** A kind of coarse white cotton cloth. The words mean double thread. Dosa-suti, Ins-suti, Char-suti, literally, two-thread, three-thread, four-thread; kinds of cotton cloths. Káde and Púrum are other kinds.  

**DOSALI,** a cotton fabric with broad stripe in blue and orange.  

**DOSS,** from Dasa, Sansk. A slave; a surname of many Hindu races in India, as Jangdamba Doss. It has the same reference to the Hindu gods as the Abd or Ghulam of the present Arabs, slave to the Almighty, as Abd-ul-Kadar, Abd-Allah, slave of the Almighty, slave of God. This name among Hindus is borne chiefly by men of the Banya caste, by Byragi fakirs, and occasionally by Kayasthas and Brahmanas. It is usually coupled with the name of some deity, as Esvara Doss, Shib Doss, Narayan Doss, etc., to imply subject of some religious tutelary god.  

**DOST ALLI** in 1732 became nawab of the Karnatic, in succession to his uncle, Saadat Allah. He gave one daughter to Chanda Sahib, and one to Murtuza Ali, and he appointed Chanda Sahib to be his diwan. His succession had been disputed by Nizam-ul-Mulk, who in 1730 incited the Mahrattas to invade Areqot, and Dost Ali met them at Ambur on the 20th May 1740, and fell in battle.  

**DOST MAHAOED KHAN** was one of the youngest sons of Sirfaraz Khan, a Barakazi sirîr, slain by order of Shâh Zaman at Kundahar in 1709. The mother of Dost Mahomed Khan was a Junsirir family. He succeeded Shah Shuja as ruler in Afghanistan. After a youth and early manhood passed in strife with his brothers and the Sadkozi family, in 1826 he became supreme at Kâbul. His youth had been neglected; but he now reformed, made a public acknowledgment of his past errors, taught himself to read and write, studied the Koran, abandoned the use of strong liquors, became serulously abstemious, plain in his attire, assiduous in his attention to business, urbane and courteous to all. He was a just ruler, and was supreme at Kâbul until political difficulties induced the Indian Government, at the close of 1838, to resolve on displacing him and replacing the deposed king, Shah Shuja-ul-Mulk. This was done on 7th August 1839, after a series of successes and severe reverses, in one of which an entire brigade of British was destroyed by climate and the sword. It was the greatest disaster that ever befell the army of India. He was driven from his throne by the British in 1839, was taken prisoner to Calcutta, but was ultimately restored. He brought Kâbul and Kundahar under his rule; when close on eighty years of age, he wrested Herat from Persian influence, and on the 9th June 1863 he died, twelve days after which he had taken the city by storm. He left sixteen sons, who continued for many years a civil war of succession.—Musson's Journey, iii. p. 17.
DOW.

DOW.

A dealer in cloth, a pedlar of the Banya tribe.

DOWA, a province of Nepal bordering on Kamaon. Dung is one of its subdivisions, and the Dung people are called Dimul.

DOUBLE-HEADED SNAKE of Ceylon, Uropelia grandis.

DOUBLETS, in jewellery, a thin slice of a pure gem cemented over a paste of same colour; or a face of faceted crystal cemented over a pure gem.

DOUL, Hind. The ridge or small embankment dividing irrigated fields. Doula or Doula, a boundary. In many English games, as in barley-break, and occasionally in football, the limits are the doula, and the football is said to be douled.

DOUR, surrounded by the Waziri hills, and adjoining the western border of Bunnu, is the small valley of Dour, inhabited by a distinct race, and containing about 8000 inhabitants. This valley originally belonged to the Dourani kingdom. It was, together with other outlying tracts, formally ceded to Ranjit Singh by the tripartite treaty of 1858; but afterwards, in 1847, the British relinquished all claim to it on behalf of the Sikhs. The people of Dour more than once expressed a wish to come under British jurisdiction, but the offer was not accepted. During the treaty negotiations of 1855, the amir's representative urged that the valley once formed an integral portion of the Dourani empire, and that his highness now wished to take it, provided that the British did not claim any title. The Government replied that the British did not desire to assert any claim, nor to interfere with the amir, if he chose to reannex it to his kingdom.

DOUR or Dour, Hind., in military life in India, is a sudden expedition against an enemy.

DOURABA. — A village watchman.

DOURANI, a name of the Abdali tribe, given to them by Ahmad Shah, Saddozai, on his ascending the throne in A.D. 1747, he designating them Dar-i-Dauran, Pearl of the World. They are also called Sulimani, from a district of which, the Tobeh Maruf, they formerly came. The Dourani are an agricultural, but chiefly a pastoral race, who term their summer and winter ground Ailak and Kishlak, dwelling in their coarse black camlet tents, called Kishli, the same with the Kora-uli of the Turks, and Sah-ch deficient of the Persians. The Dourani country is about 400 miles long, and, except in the north-west, the general breadth is from 120 to 140 miles. It is bounded on the north by the Paropamisus mountains, inhabited by the Aimak and Hazara; on the west it has a sandy desert of various breadth, beyond which, on the south-west, it has Scistan, and a desert which separates it from Baluchistan; its southern boundary is formed by Shorawak and the hills of Khajah Amran, which separate it from the Tarin and Kak; and on the east it has no natural boundary, but joins to the lands of the Ghilzai, into which the valley of Urgheasan, part of the Dourani territory, runs for a considerable extent. The number of Dourani tribes are nine, — Mak, Khugian, Barakzai, Popalzai, Alikuzai, Achakzai, Nurzai, Alizai, and Ishakzai. The Popalzai are the largest. In person, the Dourani are stout and well-natured, many of them being above the standard of the Indo-Germanic races of Europe. Some have round and plump faces. With others the countenance is strongly marked, and with most the cheek-bones are prominent. When a family is by itself, the men and women eat together; few restraints are put upon the female, and her influence is considerable. The Dourani tribes, all but the Achakzai, are religiously given, but not intolerant. They are of the Sunni sect. Their national dance, called Attan, is danced almost every evening, with songs and tales to accompany it. Their language is a mingling of tales, and fond of the chase. The Dourani, especially the men of Kandahar, have a powerful love of country; the Dourani is rarely a merchant or adventurer. They are hospitable and brave, and are the most important of the Afghan tribes.

DOW, ALEXANDER, translated and published Ferishta's History of the Mahomedans of Asia.

DOW, a vessel employed in the trade between the Red Sea, the Arabian coast, the Gulf of Persia, and the W. coasts of India, in Cutch, Gujerat, and Malabar. They were also used in the Persian Gulf for the purpose of war and piracy. They are always manned by Arabs. The Arab dow is of about 150 to 250 tons burden by measurement; grab-built, with 10 or 12 ports; about 85 feet long from stem to stern, 203 feet broad, and 11½ feet deep. These vessels have a great rise of floor, are calculated for sailing with small cargoes, and are fully prepared, by internal equipment, for fighting, with decks, forecastles, ports, poop-deck, etc., like a vessel of war; many of them are sheathed, on 2½ inch plank bottoms, with one-inch board, and a preparation of chumam and oil, which is called galgal, put between the planks and sheathing-board, causing the vessel to be very dry and durable, and preventing the worm from attacking the bottom. The worm is one of the greatest enemies in India to timber in the water, while the white ant is as much so out of it. On the outside of the sheathing-board there is a coat of whitewash, made from the same articles as that between the sheathing and planks; which coat is renewed every season they put to sea. These vessels have generally one mast, and a lateen sail; the yard is the length of the vessel aloft, and the mast raking forward, for the purpose of keeping this ponderous weight clear in raising and lowering. The tack of the sail is brought to the stern-head, and sheets aft in the usual way; the halliards lead to the taffrail, having a pendant and treble purchase - block which becomes the backstay, to support the mast when the sail is set; this, with three pairs of shrouds, completes the rigging, which is very simple, the whole being of coir rope. Several of these vessels were fitted as brigs after their arrival in Arabia, and armed by the Arabs for cruising in the Red Sea and Arabian Gulf, as piratical vessels; they are also the class of vessels of which Tipu Sultan's fleet of 1100 consisted. When armed, they were too powerful for the Bombay marine brigs, when weak and unsupported. The large dows make generally one voyage in the season to the southward of Arabia, taking advantage of the N.E. monsoon, and the S.W. to return with an exchange cargo. They generally bring dates, fruit, preserves, Shiraz wine, and horses, and take back rice, coir, canvas, coconuts, oil, timber, daumer, etc., various articles of
cloth of the country manufacture; and from Bombay, European articles of every description. The trade of the western coast of India is very great in those vessels; extending from Allippee, the southernmost port on the coast of Malabar, up to Bombay; but all the trade to Bengal is carried on by ships which are called country traders, from the Gulf of Persia and Arabia. The Arabs usually navigate their ships to Bengal in perfect safety, and with great skill.—Edge ; Malcolm.

DOWLASHWARAM, a small town in the Rajamundry taluk of the Godavery district, in lat. 9° 38' N., long. 81° 43' 55" E., and 7252 inhabitants.

DOWLAT, Ar. Wealth, prosperity. Umr - dowlat ziadah, May your days and your prosperity be prolonged. Dowlah, a state, a kingdom. The fifth title amongst Indian Mahomedans, as Suraj - ud - Dowlah, Rashid - ud - Dowlah. In Southern Arabia, a dowlah is a governor of a province, equivalent to the Turkish title of Pasha. Doulat - ul - Aliyah - al - Usmaniyyah, the Ottoman Government.

DOWLATABAD, in lat. 19° 57' N., long. 75° 14' E., in the Dehkan, 9 miles N.W. of Aurangabad. Mean height of the village, 1721 feet. Its fortress, which was first known as Deoghour or Deogori, consists of a conical greenstone rock, the base of which is scarped to a height of 120 feet from the ground. The upper conical part is reached by means of an opening at the base of the scarp, which gives admission into a low narrow passage, hewn out of the solid stone, and opening into a large chamber or vault that has been excavated in the interior of the hill. From this vault a vapp or gallery, gradually sloping upwards, and also excavated in the solid rock, winds round the interior. It has a height and breadth of 12 feet, and terminates above in a recess on the top of the rock about 20 feet square. At the base of the rock is a ditch, which is crossed only at one place, and by a causeway on which only two men abreast can walk, and defended on the side next the rock by a battlemented building. Outside the ditch is a minaret 100 feet high. Its position is commanding, and it has from the most ancient times been a stronghold of the rulers in that part of India. It was the capital of Ram Deo, a prince of so great power that the Mahomedans looked on him as king of the Dehkan. Ala - ud - Din, nephew and general of the emperor Firoz, in 1294 swept across the Nerbadda with an army of 8000 men, and presented himself before Deoghour, which he captured. He entered into negotiations with the raja, and, besides money and jewels, obtained the cession of Ellichpur and its dependencies, and the raja was further to pay tribute annually. On his return, he was met by his uncle Firoz, whom he assassinated, as he was being patted by him on the cheek. Kamala Devi was the wife of the raja of Gujerat, and was celebrated as the flower of India. On the fall of Nerwalla, the capital of Gujerat, her husband became a fugitive, and Kamala Devi was taken prisoner and carried to Ala - ud - Din's harem, and, attracted by her beauty, wit, and accomplishments, he made her his queen. Her fascinations soothed that savage Pathan in his moodiest hours, and influenced him to a lenity hitherto unknown to him. Her daughter, Dewala Devi, had escaped with her father. Her reputation for beauty equalled that of her mother, and the son of Ram - deo, the raja of Deogori (Dowlatabad), had long sued for her, but her father, proud of his Rajput origin, would not accept a Maharrat, even though a prince. Kamala Devi, however, having expressed to Ala - ud - Din a wish to be joined by her daughter, Ala - ud - Din sent a strong army, under a general, to bring Dewala Devi to Dehli. In this extremity her father accepted the Maharrat prince, and sent off his daughter to Deogori under an escort, but the escort was overtaken, the fair maiden seized and carried to Dehli; when Khizr Khan, the son of Ala - ud - Din, married her. Their union was very happy, and the poet Khusru praised them. In five years from the death of Ala - ud - Din, the throne of Dehli was filled by Kafur, a converted Hindu, who filled the capital with Hindu troops, put out Khizr Khan's eyes, put to death all the survivors of Ala - ud - Din's family, and transferred Dewala Devi to his own zenana.—Wilson; Bridges, The Nizam.

DOWRY, the mahr, dota, and jahaz of the Mahomedans. According to the law of Moses, Exodus xxii. 16, Deuteronomy xxii. 29, 1 Samuel xviii. 25, Hosea iii. 2, the dowry of Hebrew women was from thirty to fifty shekels. In Arabia and in Egypt, the mahr of the Mahomedan woman is a sum commensurate with the bridegroom and bride's condition in life. In India it is usually an ideal amount, fabulously large, the object being to prevent divorce, which in India is almost unknown. The dowry of the Mahomedans is the gift of the bridegroom to the bride agreed to during the marriage ceremony. It is her own money, and must be paid unless she waive her claim to it. This the Mahomedan wife often does, sometimes at the point of death, in order to prevent her children claiming it from their father.

With Hindus, the practice as to money gifts at marriage varies. With some races the bridegroom pays money or cattle for his bride; others receive a dowry with the bride. Menu (Institutes, ii. 51, and ix. 93) mentions both customs. In the N.W. Provinces, among the agricultural races, the bride's father gives a dowry with his daughter. It is the poverty originating from this which led the Rajputs to murder their infant daughters.—Elliot.

DOWSON, JOHN, M.R.A.S., author of a classical dictionary of Hindu mythology; editor of the posthumous papers of Sir Henry M. Elliot, K.C.B., which the latter had begun under the title of The History of India as told by its own Historians. It reached eight volumes, and occupied eleven years—1867 to 1877.

DOWYAT. BURM. A timber tree; maximum girth 3 cubits, maximum length 18 feet. Found abundant, but always inland, all over the country, at Amherst, Tavoy, and Mergui. When seasoned, floats in water. It has a soft, bad wood, useless except for elephant bells.

DO-ZANOBYTHINA. HIND. To kneel on both knees.

DOZUK. HIND. Hell; the seven hells.

DRACENA, a genus of plants belonging to the Liliaceae, known as the dragon trees. Several species, mostly shrubs, grow in the East Indies, China, Madagascar, the Archipelago, Bourbon, the coast of Africa, and Canary Islands. One mentioned by Sir G. Stawton had a diameter of 12 feet at 10 feet from the ground. The singular
red - leaved Chinese iron - wood, a species of *Dracaena*, is chiefly noticeable for its long red leaves. D. draco is the indigenous dragon tree of Orotava in Tenerife. It affords a similar secretion to that of Calamus dracon. The tree at Tenerife measured 17 feet in diameter. It was known to be a very ancient tree in 1406, and was destroyed by a gale in 1867. - *Roxb.*: "Williams’ *Med. Kingd.* p. 279; *O’Sh.*

**DRACAENA ATRO-PURPURA**. *Roxb.*

Kwon len nat, . . BURM. | Kwon len phyo, . . BURM.

Two or more species of the dragon tree, resembling small areca palms, are seen in Burmese compounds, but the most prominent is this one, with dark purple leaves. — *Mason.*

**DRACAENA TERMINALIS.** *Wild.* A native of China, the Eastern Archipelago, and Pacific, whose root is called Ti; is considered valuable in dysentery and diarrhoea. The plant is a signal of truth and of peace in the Eastern Archipelago.

A sweetish juice is expressed from its roots, and afterwards reduced by evaporation to a sugar.

M. Gauchard mentions that in the Sandwich Islands generally an intoxicating drink is prepared from this root, to which the name *Ava* is often applied, as well as to that made with the roots of *Piper mysticking*. The root is employed in cooking in the Fiji Islands; it weighs from 10 to 40 pounds.

**DRACO,** a genus of reptiles of the family Agamidae: —

*Devi. teniopierus*, *Genth*, Tenasserim.
*Devi. volaria*, *Linn.*, Singapore.
*Devi. macrostigma*, *Genth*, Malacca, Tenasserim.
*Devi. Dussuniere*, *D.*, and *B.* Madras.

**DRACOCEPHALUM CANAIRENSE,** the balm of Gilead, has pretty blue flowers. The scent only lies in the leaves, and the plant seldom exceeds 18 inches in height. Other species have large splendid blue flowers. D. Royceannum yields Tukhm-Balungu of Bombay, and is largely cultivated for medicinal purposes. — *Riddell.*

**DRACONTIUM POLYPHYLLUM.** L.

Grows in the Konkans, on the western coast of India, at Bombay, and in Japan. Its root, after having undergone certain preparations to subdue its acrimony, is supposed to possess antispasmodic qualities, and is considered valuable in asthmatic affections; given to the quantity of 12 or 15 grains in the course of the day. It is also in native use in hemorrhoids. In the dry condition in which it occurs in the bazaars, it has, though faint, a smell not unlike that of musk. — *Ains. Nat. Med.* p. 73.

**DRAGOMAN.** *Turk.* An interpreter; a dialectal change of the Arabic word, *Tarjumman*, a translator.

Since the 7th century B.C., from the time of *Psammeticus* I, this as a distinct class has existed in Egypt, and is mentioned by Herodotus.

**DRAGON.** Dragons are supposed by the Chinese to inhabit the four oceans, Tonquin Gulf, China Sea, Eastern Sea, and Yellow Sea; and in A.D. 1725, the emperor *Yung Ching*, in the second year of his reign, conferred titles and other honours upon the four dragons, *Hsin Yuen*, *Ching Hung*, *Shang Tai*, and *Telu Ming*.

**DRAGON BOATS** of China are long and narrow, capable of holding forty to eighty men. They are employed by the Chinese in their boat races and rowing matches, in the festival of the fifth day of the fifth month, usually falling in June, and seemingly relating to the summer solstice. During this festival, three - cornered dumplinges of glutinous rice are eaten. They are wrapped up in the large, long leaves of the phragmites reeds.

**DRAGON CANE,** a kind of rattan, strong, springy, and much valued. They occur both light and dark coloured. A variety with a soft bark is called Manila dragon cane. — *See man.*

**DRAGON FLY** of Ceylon, *Euplaca splendens,* See Insects.

**DRAGON RIVER,** or Kew-lang-keang, takes its rise in *Yu-nam*, on the frontiers of *Se-fan*, lat. 27° 29' N. It is at first named *Lam-tsan*; but towards the south, and before it enters the Laos country, it is called *Kew-lang-keang*, or Nine Dragon River. In Chinese territory it runs a long distance through a magnificent valley. In lat. 16° N. it bends more to the west, and enters Cambodia, having previously been augmented by a large tributary. It then drains the whole length of that country, and falls by three embouchures into the sea, in about lat. 9° 34' N. In many places the river is very deep; at others there are rocks, sandbanks, and shallows, which obstruct navigation. The river runs through *Yu-nam*, and there are cities upon it. In Laos villages adorn its banks, and in Cambodia the principal population is near it. It traverses eighteen degrees of latitude; it forms at its mouth an alluvial deposit second only to the *Yang-tssiang* or *Hoang-ho.* — *Roxb.*

**DRAGON'S BLOOD.**

*Sang-dragon,* . . *Fr.* | *Kandamuraga rattan,* *Tan.*
*Drachenbluth,* . . *Ger.* | *Khadga-mrugam netru,* *Tel.*

The dragon's blood gum-resins of commerce are obtained from several plants. The fourth Chinese name means dragon's spittle gum-resin. As sold in China, it is the product of two plants, probably the *Pterocarpus dracon*, the other the *Calamus dracon*. Pterocarpus dracon wood when first cut presents no marks of redness, but in a little time red drops begin to exude from the wood. In about ten minutes these become hard and clear, and are collected. All the dragon's blood obtained, now, in the market is said to be from several species of Calamus, *C. petræus* (Lour.), *C. rudentum* (Lour.), *C. verus* (Lour.), and *C. dracon* (Willd.), natives of Hindustan, Cochim-China, the Moluccas, Borneo, and Sumatra; but Linnaeus reckoned the last three mere varieties of the *C. rotang* (Linn.). Its ripe fruits are covered with a reddish-brown dry resinous granular matter, which is obtained by beating or threshing the fruit in little baskets. Within the Archipelago, the principal place of production is Jambi, on the N.E. side of Sumatra. The plant is not cultivated. The collectors are the wild *Kubu*, who dispose of it to the Malays at a price not much exceeding a shilling a pound. The best kind imported into Europe in recent years is manipulated by the Chinese. The causes of the male plant used in former times to be exported to Batavia, and very probably formed the 'true Jambes,' con-
memorated in The Spectator as the most fashionable walking-sticks in the reign of Queen Anne. The secretion of the fruit constitutes the best of jur-nang, or dragon's blood. A second and rather inferior kind is produced by heat, and by bruising the fruit, from which the natural secretion has been removed. The third, and most inferior, seems to be the refuse of the last process. It is perhaps doubtful whether it is ever procured from the plant by incisions. Quantities of this drug are annually sent from Banjer Mising in Borneo to Singapore and Batavia, and thence to China, where it is much prized. In Europe it is a constituent of some tooth-powders and tinctures, but is chiefly used for colouring spirit and turpentine varnishes. It is found in the market either in oval drops, or in large and impure masses composed of several tears. That which is good is of a bright crimson when powdered, and if held up to the light in masses, is semi-transparent. It is often adulterated with other gums. It is sent to the Chinese market in reeds, at 15 to 35 dollars per pukul, principally in native vessels. The price in China varies from 80 to 100 dollars a pukul, after purifying and refining.—Paullker; Morrison; Marsden's Sumatra, p. 159; Crawford; Seaman on Palma.

DRAGON'S BONES, the Lung-kh of the Chinese, is fossil ivory. Dragon's teeth are the Lung-chi of the Chinese. Dragon's teeth and dragon's bones, in use in Chinese medicine, are the fossil teeth and bones of various extinct mammalia of the tertiary series of rocks, such as those of the Rhinoceros trichorhinus, also those of a mastodon, an elephant, a horse, two species of hippotherium, a species of stag, and the teeth of a large carnivorous animal. The fossil teeth of the Stegoton Sinensis, Ocen, are likewise so called; as are also the horns of the Chalicotherium Sinense, Soinhoe, the teeth of Hyla Sinensis, the molars of mastodons, elephants, sheep, stages, and teeth of two species of hippotherium.

DRAMA. Mahomedan countries have never cultivated the drama, if we except the passion play of Hasan and Hussain in Persia and Bombay, which is rather a religious commemoration than a drama proper. The older Semitic literature contains no dramatic pieces at all. With Hindu, and with the Buddhists of Burma and China, the drama has formed a branch of literature, and the performances have been an amusement to the people from the most ancient times. In 1877, 102 dramas were published in India; and there were 196 works of fiction and 697 works of poetry. The dramas of the Hindus intermingle various dialects, as also prose and verse.

The dramatic performances in South India possess many interesting features which would be creditable to the actors of any nation. The histrionic art is extensively practised, but so seldom receives substantial encouragement from the purses of its admirers, it is matter for astonishment that it should have made any progress at all. The graceful modulations of voice, expression of emotion, propriety of gesture,—not to speak of the grotesque dress, and the peculiar music of the performers,—rivet a stranger's attention.

Like every other trade or profession in India, acting is confined to one particular caste, though it sometimes happens that outsiders join a dramatic corps, which has no settled abode, but strolls from place to place in quest of employment. Tanjore has the largest number of these itinerant actors, and their performances are reputed to be the best in South India. Female performers are rarely to be met with in districts farther south; but their places are easily supplied by young men of effeminate appearance, who have been trained from infancy to speak in a high-pitched, melodious tone of voice. The actresses of Tanjore have their headquarters at Ammapet, in the same district. They frequently play a heroic part on the stage, by personating kings, rajas, and heros, especially in a popular historical play called Markandian's Nadjagam. Both men and women sometimes assume strange and objectless characters, to the infinite gratification of their patrons. About the year 1870, in Madras and Bombay, dramas were largely acted, and attracted crowds.

In the Tamil drama, anything like the scientific divisions of tragedy and comedy, and the nice classifications which obtain among more advanced nations, is nowhere to be seen. Nor have the Hindus been more careful in dividing a play into acts and scenes, or in portioning out a piece among different actors.

The best of the ancient Sanskrit dramas have been translated into Tamil and other languages. Portions of these are sometimes acted at weddings. When a nautch is given, a drama is occasionally performed. Generally, however, in the south of India, the drama is humble as to its attendants, owing, perhaps, to the extraordinary fondness of the people for the splendid processions, and night festivals of temples, and their ceremonies. The Toy Cart was written in Sanskrit about the commencement of the Christian era. In it the king is dethroned for tyranny, by a cowherd. In the Uttara Rama Charitaya, the great monarch Rama is compelled by the clamours of his people to banish his beloved queen. The Pui of the Burmese is their favourite dramatic display, and no festival is deemed complete without a performance of this kind; the entire race are passionately fond of them. The puppet-shows or marionettes, however, is their legitimate high art drama. The figures are 2 to 3 feet high, and they are cleverly moved on a bamboo platform, animals, ships, supernatural beings; and the dialogue is in polished language.—Forbes, p. 152; Imj. Gaz. ; Ward, iv.

DRAPER, COLONEL, a British officer, who entered into a literary contest with Junius. He conquered Manilla, and in 1758 joined Colonel Lawrence in the Kurnak, and gave able assistance at the battle of Wandiwash.

DRAPER, MRS. ELIZABETH, the Eliza of Sterne, was born at Anjengo. She was married to Mr. Draper, one of the E. I. Company's Council at Surat. Her monument of marble is in a Bristol church.

DRAS, a district of Ladakh. Kargil, a little fort, is situate near the junction of the Zakut and Kartse, which flow into the Dras a short way to the north of Kargil. In the upper part of its valley, the sites are marked by descending glaciers and beds of snow. The Dras people in general are very ugly; their dress consists of a round pork-pie cap of black material, fitting close to the head, a thick woolen gown reaching midway beyond their knees, with their legs wrapped in bandages of cloth; and boots,
reaching above the ankles, of the same material, with under-surfaces covered with leather. The females muffle up in piles of clothing; and both sexes frequently clothe themselves in sheep and goat skins, with the woolly side inwards.

DRAUPAD. MAJN. SANSK. Evil eye.

DRAUPADI was the daughter of Drupada, king of Panchala. She was put forward by her father as the lady of the swayamvara, or tournament. Famed for her beauty, many rajas and chieftains attended her swayamvara, where she promised to accept the competitor who should on the first attempt shoot an arrow through the revolving chariot, and hit the eye of the golden fish beyond. Karnata wished to try, but Draupadi declared she would not wed with a charioteer's son. Sisupala, raja of Chedi, and Jarnaadhara, raja of Magadha, both tried the bow, and failed; but Arjuna, one of the Pandava princes, bent the bow, and hit the mark, and Draupadi threw the garland around his neck, and accepted the five brothers as her husbands. Yudhishtra was a gambler, and staked and lost the throne of Indra to Durvodyana; to recover it, he hazarded the beautiful Draupadi. By the loaded dice of his foe, she became the goli of the Kaurava chief, and underwent great hardships till the destruction of the Kaurava. Duhssana, one of the Kaurava princes, dragged her by the hair into the public court; Bhima vowed to kill him for the insult, and drink his blood, and he fulfilled his vow. Draupadi, as the polyandric wife of the Pandava princes, is the heroine of the Mahabharata. Yudhishtra and Draupadi have been defied, and their feast is named the procession of fire, because in Hindu legend she is fabled to have passed every year from one of her five husbands to another, after a solemn purification by that element. In the Bhasha language, her name is written Dropti. In the drama of the Enchanted Fruit, when Draupadi and her five husbands entered the garden, Arjuna, with an arrow, brought down the fruits.

'Light-pinioned gales, to charm the sense,
Their odorif'rous breath dispense:
From Bela's pearl'd or pointed bloom,
And Malty rich, they steal perfume.
There, honey-scented Singarlar,
And Jyly like a rising star,
Strong Cheampa, darted by Caudew,
And Mulsery of paler hue,
Cayora which the Ranies wear
In tangles of their silken hair,
Round Hubal flow'rs, and Gul-cchein,
Dye'd like the shell of Beauty's Queen,
Sweet Mindly pressed for crimson stains,
And sacred Tulus, pride of plains.
With Seowy, and embalming rose,
Their odours mix, their tints disclose,
And, as a gemmed tiara bright,
Paint the fresh branches with delight.'

Wb. H. of 1; Sir W. Jones, xiii. p. 217.

DRAVEE. The Bombay group consists of fifteen or twenty islands in all, viz. the island of Bassein, about 30 miles to the northward of that which gives the cluster its name; Dravce and Versova, just off the shore of Salsette; Salsette, by much the largest of them all; Trombay, conspicuous for the mountain called Neat's Tongue, which attains the altitude of 1000 feet; Bombay itself, united on the northward to Trombay and Salsette, as these are united to each other by bridges and embankments, and to the southward, Old Woman's Island; Colaba; and Henery and Kenery; with little rocks and islets of lesser note and name.

DRAVIDA, a class of the Brahmanical tribes called the five Dravir, comprehending all those of the Peninsula, or Dravira, Karna, Telinga, Gujerata, and Maharatta.

DRAVIDIAN, a term which Dr. Caldwell applied to the peoples and to the vernacular tongues of the great majority of the inhabitants of Southern India. Dravida is used in Sanskrit Brahmanical writings as an ethnological and philological term. Menu mentions the inhabitants, the Dravida, as out-castes and barbarians, i.e. not in communion with Brahmans. In the Brihat Sanshita of Varaha Mihira, A.D. 404, Dravida is described as divided into Chola, Pandya, Kerala, Kannatuka, Kalinga, and Andhra. Philologists identify the words Arava, Dravida, and Tamil, and identify these with the Penterigian tables, and the Limyrics of Ptolemy. The eastern and southern parts of the Peninsula of India, from the Vindhy mountains and the river Nabadda to Cape Comorin, appear to have been peopled from the earliest period by different branches of one and the same race, speaking different dialects of one and the same language; and scattered offshoots from the same stem are to be traced still further to the north and to the west, as far as the Rajmahal hills and the mountain fastnesses of Baluchistan. Their line of route to their present sites, and the time of their advent, are alike unknown. They are generally supposed to have streamed through the passes of the Himalaya, and also from the west side of the Indus. Ferguson, however (Ind. and E. Arch. p. 12), says if they came into India in historical times, it was not from Central Asia, but from Babylonia, or some such southern region of the Asiatic continent. Mr. Logan is of opinion that a Negroid race once occupied S. India; and Professor Huxley has expressed the opinion (J. Eth. Soc. 1869) that the Dravidian, Tamil, and the Australian are the same race.

Researches into the families of language to which the spoken dialects belong, and the existing physical peculiarities of the several races, permit the belief that India and the island parts of South-Eastern Asia were peopled long prior to historic times, and that a succession of races, or of branches of the same human family, have entered India, and in some instances become amalgamated with or been dispersed amongst the prior occupants, or have pushed them further in into less peopled or less fertile districts, or amid forest and mountain tracts. In India proper, from the Himalaya to Cape Comorin, even yet, every village and every hamlet have small bodies of predial slaves, who, though possessing certain minor agricultural and civil rights, are not allowed to purchase lands, are compelled to reside outside the village walls, and are prevented quitting the locality, for they furnish the only free labour available for the work of the field. On this point Chevalier Bunsen mentions (Iepport, Brit. Association, 1847) that throughout Asia, the two great nations, who once centred the one in the Altai and the pasture land towards the Himalaya, the other having its centre in the Ural mountains, appear in Asia as the subdued or primary element, as the subdued substratum
of Iranian civilisation, and that the aboriginal languages of India, which attained their full development in the Dekhan dialects, belong to that stock.

Professor Rask of Copenhagen, and Dr. Caldwell, have given the opinion that the Dravidian languages are to be affiliated to the Scythian, Turanian, and Baltic group of tongues. The Turkish, Finnish, Hungarian, and Japanese languages, though in many particulars distinctly Turanian, have become still more inferential than the Dravidian.

A general name for all these peoples has not been fixed upon. In India they have been called the Mongolid, pre-Aryan, non-Aryan, Tamulian, Turanian, and Scythian. Several of them in India are highly civilized, with cultivated languages; others, though without a literature, and even predatory, form large nationalities; while there are many broken tribes, dispersed, homeless wanderers, or dwelling in forests. In Southern India the Mongolid races are in two great branches, the Dravidian and the Kolarian; and their number has been estimated at 45,670,000, of whom the interior Mahrattas, Kolt, Bhil, Santal, and Gond constitute 12,000,000. The Dravidian section speak the Tamil, Telugu, Canarese, Kodaga, Malealum, Tulu, which are cultivated tongues, and the other branches in the south speaking uncivilized Dravidian languages are the Kurumbars, Badaga, Irular, Toda, Kota, Male-Arisar, Ramusi, Gond, Khand, Khond, or Khu; while the branches in the Central Provinces, Chutia Nagpur, and Bengal, are the Oraon, Gadaba, Rajmahali, Bhumia, Bhumiar, Binjia or Binjhar, Kaur or Kaurava or Kaurani or Raj Kaur, the Kochh, Rottia, Sabar or Savara, and Yerkala. Of these uncivilized branches, the Kurumbar and Irular speak Tamil, the Badaga, Kota, and Toda have dialects of Canarese, the Male-Arisar use Malealum, and the Ramusi Yerkala have a Khu.

The people of the coasts of Ceylon are Dravidian of the Tamil stock. Those of Kandy, with their habits of polyandry, would seem to be allied to the people of Coorg, and Ceylon has a few wild races, the Galaveya, Rhodia, and Vedda, in the forests and unfrequented parts.

In the Peninsula of India, where the Tamil is spoken in the extreme south-east by about ten millions of souls, the Tamil-speaking people are, generally speaking, a dark-coloured and short-statured race, energetic, fiery, quarrelsome, but not vindictive. Most of them have embraced Brahmanism, but largely mixed with a devil and hero worship, and the worship of the local deities called Amman. Where the Telugu is spoken by about 15 millions of people, on the eastern side of the Peninsula, the people are a taller and fairer race than the Tamil, many of the more northern of them being equal in stature to the Aryan Hindus of the north. They are more Brahmanical than the Tamilians, and are as energetic as the latter, though less restless. The people who speak Canarese are about five millions in number, chiefly in the centre of the Peninsula; they are a tall and singularly graceful, dark, almost black race, with whom something akin to polyandry is very prevalent. The Malealum language in the south-west of the Peninsula is spoken by about 2½ millions, and the Tulu, on the seacoast somewhat to the north, by about 150,000. The people of Coorg and Mysore speak a Canarese dialect; and on the Neighherry Hills are the Kota, the Toda, the Badaga, the Irular, and other small tribes. In the interior of the Peninsula are Kod tribes, and the Khand, Kru, also Dravidian, who are estimated at half a million of souls, and the Bhils are of Kanesh and the Nerbadda, and Rajputas.

Dravidian aborigines deal in demonology, fetishism, frantic dances, bloody and even human sacrifices. They are, however, superior to the Aryan Hindus in freedom from disqualifying prejudices. but inferior to them in learning, and all its train of appliances.

Of the broken tribes, the Mhar, Dher, Madera, Hariar, Holaru, Toty, and Pariah are labourers and village servants; the Mang, Chakili, and Madaga are leather-workers; the homeless Korawa, Yerkah, Bhatu, Domar, are mat-makers, fowlers, and athletes; the hillmen, Kotah, Toda, Irular, Kurnurbar, Kadar, Chenchewal, Male-Arisar, Saora, Khand, Gond, Juanga, are in the mountains and forests and hilly country from the Peninsular Bengal to Central India, Behar, and Benares, to Cape Comorin, and from the Western Ghats inland to the Bay of Bengal.

Of all the Dravidian tongues, no two are so nearly related to each other as to be mutually intelligible to the people who speak them, except in the simplest and most direct manner. In the cultivated Dravidian tongues, Sanskrit words are not at all, or but very rarely, employed. Tamil was the earliest developed of all the Dravidian idoms, is the most copious, and contains the largest portion of indubitably ancient forms. It includes two dialects, the classical and colloquial, the ancient and the modern, called respectively the Shen Tamil and the Kodum Tamil, which so widely differ, that they may almost be regarded as different languages. The Tamil race is the least scrupulous or superstitious, and the most enterprising and persevering of Hindus. They swear wherever money is to be made, or wherever a more apathetic or a more aristocratic people is waiting to be pushed aside. The majority of the Hindus found in Pegu, Penang, Singapore, and other places in the east, where they are known as Klings, are Tamilar. All throughout Ceylon, the coolies in the coffee plantations are Tamilar; the majority of the money-making classes even in Colombo are Tamillars; and ere long the Tamilians will have excluded the Sinhalese from almost every office of profit and trust in their own island. The majority of the domestic servants and of the camp followers in the Madras Presidency are Tamillars; and the coolies who emigrate to the Mauritius and the West Indies Islands were largely Tamil. Includ- ing the Tamil people who are residing in the military cantonments and distant colonies, and those in Mysore, south Travancore, northern Ceylon, and excluding all Mahommedan, Telings, and Brahman residents of the Tamil country, who amount to at least ten per cent. of the whole population, the people who speak the Tamil language were estimated by Dr. Caldwell at about 10 millions.

Tamil was the language of three ancient dynasties of whom we have record,—the Chola of Tanjore and Combaconum, who were settled...
on or near the Cauvery and Coleroon rivers, and who, as some suppose, gave their names to the Coromandel or Cholamandal coast; the Pandya, whose capital is now occupied by the inhabitants of Madura; and the Chera, who ruled at Kerala on the Malabar coast.

Tamil is now spoken throughout the vast plain of the Karnatic, or country below the Ghats. From Cape Comorin to Pulicat, 30 miles north of Madras, and inland from the Bay of Bengal to the Eastern Ghats, it skirts Mysore on all its eastern frontier, is also spoken in the Bara Mahal, Salem, and Combaconum, meeting with the Malaalam at the great gap of Palghat. It is spoken also on the western side of the Ghats from Cape Comorin to the neighbourhood of Trivandrum; also in the northern and north-western parts of Ceylon, where it is the turned settlements prior to the Christian era, and from whence they have gradually throut out the Singhalese. Mr. Taylor is of opinion that Tamil was cultivated in its purity in the ancient Pandiya kingdom.

Teling is the Andhra of Sanskrit writers, a name mentioned by the Greek geographers as that of a nation dwelling on or near the Ganges. Until lately, Europeans termed the people and their language Gentoo, from a Portuguese word signifying heathens or gentiles. In respect to antiquity of culture and glossarial copiousness, it ranks next to the Tamil in the list of Dravidian idioms, but it surpasses all of them in euphonic sweetness. Telugu extends from Chanda, where it meets the Mahratta, and from Ganjam and Chitacole, where it intermixes with Urya, along the coast to Pulicat on the marine lagoon 30 miles north of Madras, where it meets the Tamil. At Vizagapatam, which is 120 miles south of Gauja, Telugu is the sole language spoken. On this line of coast two monarchies formerly existed, the Andhra and Kalinga; both, apparently, were enterprise races with a seafaring people, and it is doubtless from the name of the latter dynasty that the Burmese and Malayas derive the appellation of King, by which they distinguish all people from India; and the Tagi of the Delta of the Irawadi are supposed to have been Teling. The Kalinga dynasty appear to have gained great possessions to the westward, as, at the time of the Mahomedan conquest, Warangal, seventy miles N.E. from Hyderabad, was considered by them the capital of Telingana, including then the eastern part of the nawab of Hyderabad’s dominions, all the modern districts of Ganjam, Nellere, and Cuddapah, and much of the lands north. The most westerly spot at which Telugu is spoken is the small town of Murkundah, about 30 miles west of Beiler, and it reaches its western limit running from north of Madras, as far as the eastern boundary of Mysore, which it follows up to that of the Canarese country, thus including in its extent the Ceded Districts, Kurnool, the greater part of the Hyderabad Dominions, and portions of the Nagpur country and Goundwana. In ancient times it seems to have been spoken as far north as the months of the Ganges. This appears both from the geographical limits which the Greeks have assigned to the territory of the Andhra or northern Telugu dynasty, and from many of the names and places mentioned by Ptolemy tip to that delta being found to be Telugu. The Telugu people are undoubtedly the most numerous branch of the Dravidian race, although the Tamil surpass them in enterprise and in that self-reliance which supports them in their emigrations. Including the Naik or Naidoo (Nayaka), Reddi, and other Telugu tribes settled in the Tamil country, who are chiefly the descendants of those soldiers of fortune by whom the Pandiya and Chola kingdoms were subverted, and who number not less than a million of souls, and including also the Telugu settlers in Mysore, and the Telugu inhabitants of the Nizam’s territory and other Native States, the people who speak the Telugu language may be estimated to amount to at least fourteen millions. Tamil and Telugu roots are in the great majority the same; but peculiarities in inflection and dialectic changes have so modified the modern tongues, that they differ from each other as much as Portuguese from Spanish, Irish from Welsh, Hebrew from Aramaic, and Hindi from Bengali.

Canarese, properly the Kannada or Karnataka tongue, is bordered by the Tamil and the Telugu on the east. It is spoken throughout the plateau of Mysore, and in the south-western districts of the Hyderabad territory as far north as the village of Murkundah, about 30 miles west of Beder. Also it is much spoken in the ancient Tulava country on the Malabar coast, now long designated as Canara, a name which it acquired from having been subjected for centuries to the rule of Canarese princes. But, in Canara, the Malealam, the Konkani, and the Tulava are also spoken, though less extensively than the Canarese. The Canarese writing characters differ slightly from the Telugu, from which it has been borrowed, but the characters used for Tamil, Malealam, and Telugu are quite distinct from each other. The ancient Canarese character, however, entirely differs from that of the modern Telugu, and the Canarese language differs even more widely from the Telugu than it does from the Tamil. There is an ancient dialect of the Canarese language current, as well as modern, the latter differing from the former by the use of different inflexional terminations. The ancient Canarese dialect, however, has no connection with the Sanskrit character to which that name has been given, in which, viz. the Hala Kannada, many very ancient inscriptions in the Mahratta country as well as Mysore are found. The Imperial Gazetteer gives nine millions as the number speaking Canarese, but this number seems to be excessive. In the Hyderabad country, Canarese, Maharati, and Telugu are spoken. The Urdu or Hinulustani language used there is merely known as a linga fravara by the Mahomedans, to the Hindus and kayasthis from Northern India, and to the resident population. The Coorgy or Konkana language is spoken in the small principality of this name, lying on the Western Ghats, and has hitherto been regarded as Canarese, modified by the Tulu. But Mr. Moegling states that it is more nearly allied to the Tamil and Malealam than to the Canarese.

Malealam or Malearnma is spoken along the Malabar coast on the western side of the Ghats or Malealam mountains, from Cape Comorin to the Chandagiri river, or, more strictly, perhaps to Nileshwar (Nileswaras), where a Nair raja, conquered by Hyder, formerly ruled; from the vicinity of Mangalore, where it supersedes the Canarese and the Tulu, to Trivandrum, where it begins to be
superseded by the Tamil. The people speaking it in the states of Travancore and Cochin, and in the provinces of Malabar and Canara, were estimated by Dr. Caldwell at two and a half millions. The language, however, on the Malabar coast is rapidly being driven out by the Tamil. The people who speak it are, of all the Dravidian races, the most exclusive and superstitious, and shrink with most sensitiveness from contact with foreigners, though their coast, more than any part of India, has been in all ages visited by the traders of other lands,—by Phenicians, Greeks, Jews, Syrian Christians, and Arabs, and the three last even formed permanent settlements amongst them. They shrink even from their own people, retreating from the great roads, cities, and bazaars as eagerly as the Tamil flocks to them; and the Malealaman-speaking race are to be found isolated with their families in their high-walled parambams, even in parts where the lines and centres of communication are entirely occupied by the more enterprising Tamil people, whose language, too, seems gradually pushing the Maleala aside. Their reticent character has led to the less scrupulous and more adroit Tamil occupying all the lines of communication, and monopolizing the greater part of the public business and commerce of the Malabar states. In a short time, perhaps, the Maleala will only be known in the hilly tracts or jungle fastnesses. Maleala was separated from the Tamil before the latter was cultivated and refined, and from Brahmanical influence has since had an infusion of Sanskrit words more than in any other Dravidian language, the fewest of such being in the Tamil.

Tulu or Tuluva is the last of the cultivated Dravidian tongues. It is an idiom which holds a position midway between the Canarese and the Maleala, but more nearly resembling the Canarese. Though once generally prevalent in the district of Canara, it is now spoken only in a small tract of country in the vicinity of Mangalore, by not more than 100,000 or 150,000 souls. It has been encroached upon by many languages, and is likely soon to disappear. The Tuluva has a strong resemblance to Maleala, though the Tuluva-speaking races are unable to understand their Maleala neighbours.

The Toda, properly the Tudo or Touda, language is that spoken by the Tudadam, a primitive tribe on the Nilgerry Hills, believed to be the aboriginal inhabitants. They do not at present number more than from 300 to 500 souls. It is supposed that they never could have exceeded a few thousands; but they have diminished through opium-eating and polyandry, and at a former period the prevalence among them of female infanticide. The Toda is the oldest indigenous speech on the hills.

The Kota is the language of the Kotar, a small tribe of hill-craftsmen inhabiting the Nilgerry Hills, and numbering about 1000 souls. It is a very old and rude dialect of Canarese, and their ancestors on the hills are supposed by Dr. Caldwell to have been at some ancient time a low-caste tribe who had fled thither to escape persecution. They are exceedingly filthy in their habits, are addicted beyond all other low-caste tribes to the eating of carrion, and have been generally shunned by Europeans.

Budoga or Budagar speak an ancient but organized dialect of the Canarese. They are immigrants from the north, and are the most numerous class of the inhabitants of the Nilgerry Hills.

The Irular, people of 'ignorance or darkness,' speak a rude Tamil.

The Curb, or Cernubar, or Kurnumbar, are nomade shepherds, who occupy the denser, deeper jungle, where they are occasionally stumbled upon by adventurous sportsmen, and the smoke of whose fires may occasionally be seen rising from the lower gorges of the hills.

The Gond is the language of the indigenous inhabitants of the northern parts of the extensive hilly country of Gondwana, of the northern portion of Berar, and which includes the greater part of the Central Provinces. Mr. Dribeg compiled a very complete grammar and vocabulary of the Mahadeo dialect of the Gond language; and the dialect of the Stonee Gonds was noticed in a paper by Mr. Manger. The Urunon and the Male or Rajahamul dialects are close to the Gond and Sinhalese.

Khard is the language of a primitive race, who are supposed to be allied to the Gond. They inhabit the upper parts of Gondwana, Gumsar, and the hilly ranges of Orissa, and their horrid rites of offering young people in sacrifice (see Meriah) is generally known. The two people by whom the Gond and Ku languages are spoken are supposed to amount to 500,000 souls. 30,000,000 of Dravidians are British subjects, and the remainder are under the Native States of Mysore, Hyderabad, Travancore, and Cochin, and in this enumeration there has not been included the idioms of the Ramusi, the Yerkaul, the Korawa, the Birijar, the Beder, the Male-Arisar, and other wandering, predatory, or forest tribes. The Birijaram speak a dialect of the Hindi; the Ramusi, and the majority of the Korawa, a patois of the Telugam. The tribes inhabiting the hills and forests of the Gonds, on the contrary, have the most pure and uncorrupted dialects of the language of the contiguous plains. The Male-Arisar, hill kings, the hill tribes inhabiting the Southern Ghats, speak corrupt Maleala in the northern part of the range, where the Maleala is the prevailing language, and corrupt Tamil in the southern, in the vicinity of Tamil-speaking districts.

Kol and Saora dwell towards the north of the Gond and Khard, in Central India; their languages contain Dravidian words, but they belong to a totally different family of languages.

Uronon, the language of the Ura people, is an uncultivated idiom, and contains many roots and forms belonging to the Kol dialects, but so many Dravidian roots of primary importance, that it is considered by Dr. Caldwell as having originally been a member of the Dravidian family of languages.

The Mal, Paharia, or Rajamhal, contains so many Dravidian roots of primary importance, though it also contains a large admixture of roots and forms belonging to the Kol dialects, that Dr. Caldwell considers it also had originally belonged to the Dravidian family of languages. It is spoken by the Malei, or inhabitants of the hills. A brief vocabulary of the words of the tribe inhabiting the Rajamhal Hills, in Central India, as contained in vol. v. of the Asiatic Researches, and Mr. Hodgson’s more complete collections, prove the idiom of this tribe to be in the main Dravidian.
DREAMS.

The Brahu language, spoken by the mountain-dwelling women in the kingdom of Kelat in Baluchistan, contains some Dravidian words, and a considerable infusion of unquestionable Dravidian forms and idioms. Considered as a whole, this language is supposed to be derived from the same source as the Panjabi and Sindi; but it unquestionably contains a Dravidian element, derived from a remnant of the ancient Dravidian race having been incorporated with the Brahu. The discovery of this element beyond the Indus has been thought to prove that some of the Dravidians, like the Aryans, the Greek—Scythians, and the Turkic—Mongolians, entered India by the north-west route. The Brahu language extends from Shawl in the north to Jaisalmar in the south, and from Kohak in the west to Harand in the east.—Professor Huxley in Jo. Etnu. So.; Bunsen in Rep. Brit. Assoc.; The Rev. Dr. Caldwell's Comparative Grammar; Sir Erastus Perry's Bird's-eye View.

DREAMS.

Song, Révé... Fr. Sogno... It. Terra... G. Sogno... Sr. Khab, Nazr, Manam, Parmash, Bogh, Dush... Turk.

Dreams are to a great extent still trusted to in Eastern countries. Their earliest remarkable dreams related were those to Abraham, of the captivity, and at Bethel, of the ladder (Genesis xxvii. 12). Subsequently were Joseph's dreams and those of Pharaoh (Genesis xi. 5, xii. 1), Gideon, and Saul (1 Samuel xxviii. 6). Belief in dreams is intimately associated with the lower forms of religion. To the savage they have a reality and an importance which we can scarcely appreciate. During sleep the spirit seems to desert the body; and as in dreams we visit other localities and even other worlds, living as it were a separate and different life, the two phenomena are not unnaturally regarded as the complements of one another. In Madagascar the people pay a religious regard to dreams, and imagine that their good demons or inferior deities tell them in their dreams what ought to be done, or warn them of what ought to be avoided.

Throughout the Christian world and in Great Britain, as elsewhere, it was customary for young women on St. Agnes' eve to endeavour to divine who should be their husbands. This was called fasting St. Agnes' fast. They took a row of pins, pulling one out after another, saying a paternoster, and sticking one pin in the sleeve. Then, going to rest without food, their dreams were supposed to present the image of their future husbands. In Kent's poem, entitled The Eve of St. Agnes, the custom is thus alluded to:—

'They told her, how, upon St. Agnes' eve,
Young virgins might have visions of delight,
And soft adorings from their loves receive,
Upon the honeyed middle of the night,
If ceremonies due they did aright,—
As, supperless to bed they must retire,
And couch supine their beauties lilly-white,
Nor soft adorings from their loves receive,
Of Heaven with upward eyes for all that they desire.'

DREDGING. In this process, note the numbers of species, the kinds usually found associated together, the number of living specimens of each, the number of dead, the average age of the specimens, whether young or adult. The general state of the animals, and particularly as to the maturity of the eggs, or if they have been recently shed. The kind of ground. The depth; the distance from land. The zone, whether the littoral zone, the space between high and low water marks; the laminarian zone, or that in which the large tangles or sea-weeds flourish, and extends from low-water mark to a depth of about 15 fathoms; the coralline zone extends from the depth of 15 to 50 fathoms; sea-weeds are scarce, but corallines abound in this region; the coral zone is that in which deep-sea corals are found, and where the depth is beyond 50 fathoms. Any particular currents. What are the molluscs found between tide-marks on the neighbouring coast? Is mud present, and if present, of what kind? Are any dead shells common, of which no living examples occur? What sea-weeds are found? Do the different specimens of the same species vary much in size, form, or colour?—Ed. N. Phil. Journ. pp. 206, 207, July 1806.

DREN. Hind. An inflated buffalo skin, used by swimmers in torrents.

DREPANA. Several caterpillars, the Aloe lactines, the Orgyia Ceylanica, Euprocotis virgincula, the Trichia exigua, the Narosa conspersa, the Lambadas graciosus, and a species of Drepana, are found on the coffee trees, but they do not cause much injury. Another caterpillar, however, though fortunately not abundant, the Zeneza coffee, destroys many trees, both young and old, by eating out the heart. It resembles the caterpillar of the goat-moth of England, and is as thick as a goose quill. It generally enters the tree 6 or 12 inches from the ground, eating upwards. The sickly drooping of the tree marks its presence.

DREPANOGLATHUS SALTATOR, Jordon. An ant which moves by jumps of several inches.

DRESHUK. In front of the Gurchani and Lishari hills, and between Harand and Mithunkote, are plains inhabited by the Dreshuk.

DRILL. In Bundelkhand the drill-sowing is called bob, jaya in Dehli, and water in Rohilkhand and the Deccan. In some parts of N. India the drill is attached to the plough, in other districts it is a detached instrument. Bansa or orna, Hind., is the channel down which the seed descends. The mouth into which the seed is cast is called daura or mal, also weira in N. India. The drill of Cuddapah is of bamboo. It is a small wooden hopper, perforated with holes, which communicate with bamboo tubes below, into which the seed is fed by the hand. The seed, passing down through the bamboo tubes which radiate from the hopper, is deposited in the soil by a number of similar perpendicular tubes which are fixed in a beam of wood which receives the lower ends of the bamboo, which communicate with the hopper. The whole is very effective.

DROGUE AMERE. Fr. A compound of mastice, fruckincense, myrrh, aloes, and kreat.

DROK or Brog are Bhot occupants of the central part of Northern Tibet. Mr. Hodgson supposes them a mixed race, joined together for predatory purposes.

DROMAIUS. A genus of birds belonging to the order Cursores or runners, fam. Casuaricidae, Casauri galactus, and C. Bennetti, Dromius Novae Hollandiae, and fam. Struthionidae, Struthio camedus.
Casuarius Bennettii, Gould, is the cassowary of the island of New Britain, near to New Guinea, where it was called Mooruk. The height of the bird is 3 feet to the top of the back, and 5 feet when standing erect. Its colour is rufous mixed with black on the back and hinder portions of the body, and raven black about the neck and breast. The loose wavy skin of the neck is beautifully coloured with iridescent tints of bluish purple, pink, and an occasional shady green, quite different from the red and purple caruncles of the Casuarius galeatus. The feet and legs, which are very large and strong, are of a pale ash colour. This bird also differs from the C. galeatus in having a horned plate instead of a helmet-like protuberance on the top of the head; which callous plate has the character of and resembles mother-of-pearl darkened with black lead. The form of the bill differs considerably from that of the emu, Dromaius Nova Hollandiae, being narrower, larger, and more curved, and in having a black or leathery case at the base. Behind the plate of the head is a small tuft of black hair-like feathers, which are continued in greater or lesser abundance over most parts of the neck. The egg is about the same size as that of the emu, and is of a dirty pale yellowish-green colour. It utters a peculiar chirping, whistling sound, but also a loud one resembling that of the wood Moork. Casuarius galeatus, the helmeted cassowary of Ceram only, is so called from the horny helmet which surmounts the head. Its rudimentary wings consist of five long bristles like blunt porcupine quills. It runs swiftly with a bounding motion. It feeds on fruits, birds' eggs, insects, crustaceans, and tender herbage. It is a small bird strong, standing 5 or 6 feet high, and is covered with long, coarse black hair-like feathers. The head has a large horny casque or helmet, with bright blue and red colours on the bare skin of the neck. These birds wander about in the vast mountain forests that cover the island of Ceram. The female lays three to five large and beautifully shagreened green eggs, on a bed of leaves. The male and female sit alternately on the eggs for about a month.

The Dromaius Nova Hollandiae rises to a height of 7 feet. It lives on fruits, eggs, and small animals.—Crawford's Dictionary, p. 84; London Athenæum, No. 1512, 12th Dec. 1857, p. 1551; Wallace, ii.; Dr. Bennett in a Letter, dated Sydney, 10th Sept. 1857.

DROMEDARY, Camelus dromedarius, Linnaeus.

DRONA, son of the rishi Bharadwaja. He was a Brahman, but he had been taught military science by Parasurama. His offers of service were unceremoniously rejected by raja Drupada, on which he visited Hastinapura, where he was appointed teacher of the five Pandu princes. He instructed them to rein the steed, to guide the elephant, to drive the chariot, launch the javelin, hurl the dart, wield the battle-axe, and whirl the lance. He took an active share in the battle of Kuru Kshetra; on the death of Bhishma, he took the command of the Kuru forces; on the fourth day he killed Virata and king Drupada, but was subsequently unfairly slain by Dhrishta-Jyumna, who had sworn to revenge his father's death. The son of Drona is a celebrated hero in the Mahabharata, named Asvatthama.—Garrett.

DROSERA, a genus of the natural family Drosenaceae, or sun-dew tribe of plants. D. Burmanni, Yahl, Mo-dwen-tha of the Burmese, grows in Ceylon, the Peninsula, Bengal, Sylhet, and Burma. There are two different species at Tavoy. D. peltata (Drosera Junata, Ham.) grows in the Neillgherry and Baba Booden Hills. The leaves stain paper red. They are applied as a blister to the skin. They close upon flies which light upon them.—Masson; Voigt; Roxb. ii. 113.

DROUGHTS are frequent in tropical Asia. They are alluded to in Genesis xxxi. 40, 'In the day the drought consumed me, and the frost by night, and my sleep departed from my eyes.' The following droughts are generally known:—

B.C. 136, The whole world.
A.D. 767, Asia.
1291, the Baroda. N.W. London 1412-3, 1682-3,
1877, Madras, Mysore, and parts of Bombay.

DRUG is a hill fort, or any hill, and is a vernacular change from the Sanskrit word Durga. Chittle-drug in Mysore, Raman-drug in the Bellary district, Chinthergooty-drug in lat. 14° 27' N.

DRUGS. Dawa of the Arabs, and Marandu of the Dravidian races. Amongst the physicians of the east and south of Asia, as in Europe until recent times, almost every substance possessing any peculiarity of colour, shape, smell, or taste, is believed to have some medicinal virtue. Much reliance is placed by them on the doctrine of the signatures, i.e. the belief that a substance which has some of the physical characters of an organ, or of the symptoms of a disease, will have power over what it resembles. Some substances (chiefly animal, however) are considered to have medicinal virtues merely from their oddity,—for example, pikhal müs, rat's drug, the gall-bladder of the brown bear, the hairs of a tiger's whisker, etc. Difficulty of acquisition would also appear to add virtue. Thus it frequently happens that of two kinds of a drug, the one which is more rare is considered much the more powerful,—in some cases, indeed, when neither would appear to have any special virtue. The bākīmn of India has curious beliefs as to the plants which produce some of the foreign vegetable drugs, and still more curious theories are held as to the source of some of those of mineral origin. Thus Zahr-mohra, which comprises several mineral substances given medicinally, is believed by them to be formed by the spittle of the Mar-khor (Capra megaceros) falling on stones in the Kohistan, west of the Indus. The great number of substances to which, by natives and in their books on medicine, aphrodisiac virtues are attributed, is remarkable, some in connection with the doctrine of signatures, but most of them probably quite destitute of the qualities assigned to them. Drugs of Cachar and Tibet hold a high reputation in Northern India.—Powell's Handbook.

DRUHYU, in Hindu legend, one of the sons of Yagati, one of the old fathers of mankind. Ann
was the founder of one of the five great Turanian tribes, the Yadu, Turvasa, Druhu, and Ann.

**DRUIDICAL REMAINS.** The cromlech or trilithic altar in the centre of all Druidic monuments, is supposed by Tod to be a torus or triumphal arch, sacred to the sun-god Belenus. There are numerous Indo-Sctthic remains in the Nizam's territory and near Bustar. See Cairn; Cromlech; Dolmen; Menhir.

The drum is used by Asiatic nations as a musical instrument in war, and in lieu of a bell. The institution of the drum was adopted by a late king of Siam, according to Paleloogix, but the pages who had to answer it succeeded in extinguishing the practice. A curious Chinese drawing engraved in Chine ancienne ('L'Univers Pittorique'), pl. 3, represents this institution of the drum. A drum was suspended at the gate of the emperor of China, to announce the entrance of strangers. The custom is a genuine Chinese one, and the summons seems to have been by a drum rather than by a bell. Thus in the romance of The Fortunate Union, the hero Teichun-gyu exclaims, 'My lord, you are mistaken. The emperor himself suspends the drum at his palace gate, and admits all to state their hardships without reserve.'—Yule, Cathay, i. vi.; Davis's Chinese Miscellanies, p. 109.

**DRUM-FISH,** a sea-fish near the Pearl River at Macao. Every evening they assemble around a ship, and continue their musical humming till about midnight. The noise rises and falls, or suddenly ceases at times, as they quit the ship in search of food. The drumming of fish or molluscs is said to be heard also in the seas near Bombay, also in the Carolina seas.—Adams, p. 63.

**DRUMMOND, Lieut.-Col.,** an officer of the Bengal army who wrote on the mines and mineral resources of Northern Afghanistan, on the copper mines of Kannon, on the natural resources of Almroth, which form the subject of Extracts from Public Papers, N.W. Provinces, Bombay Telegraph and Courier, Oct. 24 and Nov. 19, 1849, and Mufussilite, Nov. 10, 1849.—Dr. Boyd's Catalogue.

**DRUN,** also Pau. Th. The Tibetan name of the red marmot of the western mid-Himalayas; Arctonyx hemachalans, Hodgson. It is confined to certain situations at high altitudes, and prefers fertile and secluded valleys, where vegetation returns rapidly and is luxuriant. There it spends the summer months, until again forced to its burrow by the cold and snow of winter. Their excavations are formed on gentle slopes or under stones and rocks, where they delight to sit erect and scream. Often the burrows are scattered over the valley, where loud wailing cries may be heard for miles along the mountain-sides. It is seldom they wander for any distance from their habitations, and usually take up a position close to the entrances, darting thence on the approach of danger. They frequently leap during progression, at times using their tails to assist them. The hibernation lasts from four to five months, or even longer when the snow lies for any lengthened period.—Adams.

**DRUNKENNESS.**

**Drus.**

In India the inebriating substances used are opium, preparations of hemp, distilled spirits, and the fermented juices of the palm trees. In modern times these substances are beneficial, and all nations use them, though the mode of their action on the human frame is not understood; but most of them must be regarded as valuable in wearing mental or bodily exertions,—they evidently supply some want in the system. In some individuals drunkenness is a hereditary disease equivalent to a mania, and these cases are generally given up by the medical faculty in despair.

Although Hindus and Mahomedans and Buddhists are by their religions or by social usage prohibited the use of alcoholic fluids, they do use them largely, either stealthily or openly, the fermented palm wines, or the distilled arracks or spirits, being in great demand. In ancient times the conquering Aryans seem to have largely used some alcoholic fluid, because the excitement described from drinking their sacred beverage must have resulted from its use. Out of 500,000 persons who took the pledge in America, 350,000 broke it, proving that a moderate use of alcohol is proper for man; the experience of the hydrophatic establishments shows an enormous increase in the use of food. If we only drink water, our consumption of farinaceous and animal food must be very largely extended. The effect of alcohol is to arrest the destruction of the tissues, and to utilize the constituents of life; and therefore, under the present conditions of modern life, where the nervous system is liable to so much waste, alcoholic substances, as the most portable form of accessory diet, are more than ever necessary. If, as is the case in infancy, the only purpose of life were to live, the complementary diets of animal, farinaceous, and leguminous food would be sufficient to sustain life; but so soon as man begins to work and think, alcohol, as preventing and arresting the destruction of tissues, is the cheapest food and most bountiful on the table, to a man having a skill in spending on food, he will do a better day's work on nine pennytroy of bread and meat and three pennytroy of beer, than on six pennytroy of bread, six pennytroy of meat, and sufficiency of water. Another important fact is, that total abstinence from stimulating drink actually predisposes to certain diseases.

**DRUPADA,** king of the Pandula, was son of Prishata and father of Draupadi. Defeated by Drona, his kingdom was restricted to the boundary of the Chantal and the Ganges. He took part with the Pandava in the battle of Kurja Kshetra, but was killed by Drona on the fourth day of the engagement. He was schoolfellow of Drona, and father of Dirghoth-dynama and of Draupadi.—Garrett.

**DRURY, BEVER,** an officer of the Madras army, author of Useful Plants of India, London 1873, a work of much value; also of Handbook of the Indian Flora.

**DRUSE.** A race occupying the range of hills which extend parallel to the coast from the neighbourhood of Beyrut to the heights above Sidon. They are brave, honest, and hospitable. They number 70,000. Min kadim (ab origine) is the general answer given to all inquiries as to their settling there; they are likewise spread over the Haaran to the S.E. of Damascus. Zaleh, seven hours from Balbe, belongs to their territory. Half an hour from Zaleh, on the south side of the
village of Kerak, is shown the tomb of Noah. They trace their cult to Al Hakim, a khaliq of Egypt. They believe in the transmigration of souls, and that the prophets recorded in the Old Testament were only a succession of identical spirits. The names of David, Abraham, Ishmael, and Pythagoras occur in their sacred code, but without any adherence to ascertained chronology. Hamsa, their God and sovereign, they consider to have been the true Christ; and Jesus, son of Joseph, a travelling impostor, and therefore deservedly crucified. They seem equally opposed to Mahomedans and Christians, but not the Koran to deceive their Turkish masters. They consider the four evangelists to have been so many powers or parts of religion, and Hamsa to have appeared about 400 years after Mahomed, when he flourished eight years upon earth, and afterwards appeared seven times in all from the time of Adam, finally and formidably to reappear when the Christians shall be more powerful than the Turks; he will then spread the religion of the Druses by divine authority. Their creed requires implicit obedience, and rejects fasting, prayers, tithe, and killing of animals. In mode of life, form of government, language, and customs, they resemble the Maronites. Druse women wear the tautour, a conical tube, about 18 inches long, of silver or plated copper, and ornamented with a variety of patterns. It is fixed upon a cushion fastened to the top of the forehead, and inclines slightly forward, like a horn. Over this a piece of white mullin is thrown, which falls down to the hips, and serves to envelope their faces at pleasure when they go abroad. In some parts of the mountain it is worn on the side of the head. Their religion seems a remnant of some Mahomedan heresy. They arrange themselves as the Akal or intelligent, and that of the Jahil or ignorant. The Akal, in number about ten thousand, form the sacred order, and are distinguishable by their white turbans. The Akal are not permitted to smoke tobacco; they never swear, and are very reserved in their manners and conversation, but are allowed to marry. The chief of the order resides in a village called El-Matna. The Jahil, or uninitiated, perform no religious rite whatever, unless, to assume the appearance of Mahomedans, they enter the mosques and recite their prayers with Turks. Schools are very frequent among the Druses. The Akal are generally the masters, and are paid by their pupils. They teach reading and writing. — Robinson's Travels, ii. pp. 9 to 322; Cataphago.

DRYADS. See Fountains; Rivers; Springs.

DRYANDRA CORDIFOLIA, Thou., the Wootherg-shoo or Tung-ct of the Chinese, is a plant valuable on account of its oil-seeds, much in use in China. It is one of the favourite trees of the Chinese, prized for its beauty and the hard wood it furnishes.—Williams' Middle Kingdom, p. 281; Fortune's Tea Districts, p. 119.

DRYOPHID.E, the white snake family of reptiles, containing—

Tropidococex perroteti, D. and B., North Canara.

Trigops prasinus, Rein., Eastern India.

T. diaper, Gthr., Animalley mountains.

T. fronticinctus, Gthr.

Passerita mystizarians, L., Ceylon, Peninsula of India.

P. purparascens, Gthr., Ceylon.

SHOREA CAMPHORIFERA, Roxb., is a very large tree, a native of Borneo and Sumatra, where it sometimes attains 6 to 8 feet in diameter, and 120 feet high. In the cavities of the trunk there occur collections of solid camphor, and of a light fluid called camphor oil. The solid camphor is highly prized by the Chinese and Japanese, and rarely finds its way to Europe. The tree is said to be common in Sumatra, in the country of the Battas, but not to be found to the south of the line. In Borneo it was found at first towards the north, was particularly abundant in the country of the Kayans, in the interior, on the Bintulu and Rejang rivers, and has since been discovered in Sarawak. In Labuan it is common, and is one of the noblest of the trees in that fine jungle. Not one in ten trees is found to produce camphor, and the camphor collectors cut notches in the trees, in order, before felling, to ascertain whether they are likely to find camphor. The younger and smaller trees are often quite as prolific as the older and larger trees. The camphor is found in a concrete state in the crevices of the wood, so that it can only be extracted by felling the tree, which is afterwards cut into blocks and split into wedges, and the camphor, which is white and transparent, is then taken out. The essential oil, found in hollows in the wood, the natives crystallize artificially, but the camphor thus obtained is not so much esteemed as that found naturally. The high price of the concrete camphor depends wholly on its scarcity, and the fancy of the Chinese and Japanese, who ascribe high medicinal virtues to it, which it probably possesses in no higher degree than the cheap article which they themselves obtain by the distillation of the wood of the Camphor officinalis, and which may be had in the same markets for about one-hundredth part of the price. After a stay in the woods, frequently of three months, during which they may fell a hundred trees, a party of 30 persons rarely bring away more than 15 or 20 pounds of solid camphor, worth from 200 to 250 dollars. The camphor of D. camphora is in white crystalline fragments; sp. gr. 1·009. Its odour is not of so diffusable a nature, otherwise it closely resembles the camphor from the Camphora officinalis. The wood of this camphor tree is good timber, suited for house and ship building. The liquid camphor of the same tree appears of the nature of camphagen. Dr. A. T. Thompson, by passing a current of oxygen gas through it, converted it into camphor.—As. Researches, xii. p. 585; Low's Sarawak, p. 44; Marsden's Sumatra, p. 150; Royle's Mal. Med., p. 586; Crawford's Dictionary, p. 81; Simmonds' Commercial Products; O'Sh. Bengal Disp.; Mason's Tenasserim; Tomlinson, p. 287; Indian Agriculturist.

DRY ROT is a disease affecting timber, produced by the attacks of fungi. The first sign of it consists in the appearance of small white points, from which a filamentous substance radiates parallel with the surface of the timber. This is the first stage of growth of the spores of the fungus, and the filamentous matter is their thallus or spawn. As the thallus gathers strength, it insinuates its filaments into any crevice of the wood, and they, being of excessive fineness, readily pass down and between the tubes from which the wood is organized, forcing them asunder, and completely destroying the cohesion

986
of the tissue. When the thalli of many fungi interface, the radiating appearance can no longer be remarked; but a thick, tough, leathery white stratum is formed wherever there is room for its development, and from this a fresh supply of the destructive filamentous thallus is emitted with such constantly increasing rapidity and force, that the total ruin of timber speedily ensues where circumstances are favourable for the growth of the fungi. Dry rot consists of the thallus of Merulius lacrymans, or Polyporus destructor, two highly-organized fungi; but any of the fungi that are commonly found upon decaying trees in woods are capable of producing dry rot, and the most rapidly-spreading and dangerous kinds is caused by the ravages of different species of Sphagotrichium. The latter throw up from their thallus whole forests of microscopic tubes headed with reproductive spores, of such excessive smallness that they may insinuate themselves into the most minute crevices or flaws even in the sides of the tubes of which timber consists, and they are infinitely more dangerous than merulii or polyposi, which seldom fructify. The circumstances that are most favourable to the development of the dry rot fungi are damp, unventilated situations, and a subacid state of the wood. The latter condition, especially in oak, is easily produced by a slight fermentation of the sap which remains in the timber, especially if the latter has not been well seasoned before being employed. It has been proved experimentally that fluids which, in their ordinary state, will not produce fungi, generate them abundantly if ever so slightly acidulated. Dutrochet found that distilled water, holding in solution a small quantity of the white of egg, will not generate fungi in a twelvemonth; but upon the addition of the minutest quantity of nitric sulphuric, muriatic, phosphoric, oxalic, or acetic acid, it generated them in eight days' time in abundance. Alkalescent infusions possess the same property. The only poisons which will prevent the appearance of fungi are the oxides or salts of mercury. A solution of fish-glue yields fungi rapidly and in great abundance; but a small quantity of red precipitate or corrosive sublimate destroys this power entirely. It is, moreover, an important fact that no other mineral preparation has any such properties. Dutrochet ascertained that other metallic oxides acted differently. Oxides of lead and tin hastened the development of fungi; those of iron, antimony, and zinc were inert; and oxides of copper, nickel, and cobalt, although they retarded the appearance of fungi, yet did not prevent their growth in the end. These facts are confirmed by the experiments of the use of Kyan's process for preparing timber, which consists in submitting the wood to the action of corrosive sublimate. Immersing the wood in chloride of zinc likewise prevents the attacks of fungi, and also submitting it to the action of the vapour of creosote. Dry rot also occurs in animals. Specimens of hymenopterous insects resembling wasps have been brought from the West Indies, with a fungus allied to Spharia militaris growing from between their anterior coxe, and it is positively asserted by travellers that the insects fly about while bedracked with the plant. Upon opening the bodies of the wasps, they are found filled with the thallus of the fungus up to the orbits of the eyes and the points of the
tarsi, the whole of the intestines being obliterated. In such cases it is to be supposed that the thallus of the spheira first kills the wasp by compressing and drying up the body, and then, continuing to grow, occupies the whole of the cavity of the shell of the insect. A more common instance of animal dry rot is the disease in silk-worms called La Mucadine. Silk-worms of all ages are occasionally liable to become sickly and to die, soon after death becoming stiff, and acquiring such a degree of firmness as to be readily broken. They then throw out from their surface a sort of white efflorescence, which is the fructification of the fungus called Botrytis bastiana, their inside being filled by the thallus of the same plant. If some healthy caterpillars are placed beneath a bell-glass, along with a small portion of worm killed by the botrytis, they soon catch the disease, exhibit the same symptoms as those already mentioned, and eventually perish, having no doubt been infected either by rubbing themselves against the dead worm, or, which is more probable, having received upon their skins the infinitely minute seeds dispersed by the botrytis. If healthy cysalids are inoculated by the introduction below their shell of a little of the botrytis matter upon the point of a needle, they also sicken and die. In these cases effects are produced upon insects similar to those upon timber; that is to say, vitality in the one case, and cohesion in the other, is destroyed by the growth of the thallus of certain fungi, which spread with great and irresistible rapidity, and fructify where occasion offers. Boletus destructor is also one of the dry rot fungi.—Eng. Cyc.; Todd.

DUBBER. DUBBER. DUBBER. DUBBER.
DUBBOYE, in Gujarat. Its chief is of the Bagela race. See Komarpal.

DUBDUBA, a Nepal tree abounding in the Terai. Wood is a powerful astrigent, and an article of trade.—Smith’s Five Years.

DUBHI. Hind. The grass Cyperus dactylon. Its dry, creeping rhizomes spread out, and take root at the nodes. It is commonly called khabal in the Panjab. This is the durba grass of Sanskrit authors, and in the Atharva Veda it is thus apostrophized: ‘May Durba which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth for a hundred years.’ The flower of this grass is a most beautiful object under the microscope. There are, however, three sorts of dubh recognised in the north of India. The best, called Pauma, is especially the same as Fioini; the second, called Khatia, is smaller, and grows on hard ground; the third is of two white sorts, called Ghur-dubh, for horse fodder, and Ban-dubh, a coarser kind.—Powell.

DUBLO. MAH. Dubaro, GZ. A clan of the Bhil in the inland tracts of Surat and Broach. They are addicted to the practice of idolatry, and are forbidden by the Hindus to wash their clothes.

DUBOIS, ARBE J.A., a French missionary in Mysore and in the south of India. He wrote an account of Hindu Ordeals in Mad. Lit. Trans., 1827; On the State of Christianity in India, Lond. 1823; also a Description of the Character, Manners, and Customs of the People of India, and their Institutions, Religious and Civil, Lond. 1817.

DUCK. 

Canard, ... Fr. Anitra, ... Fr. Ente, Schatzchen, Gér. Anade, ... Sp. Battah, ... Hind. Urde, ... Turk.

The domesticated duck is a descendant from the common wild duck, the Anas boschas. Its domestication has been accomplished in comparatively recent times, for it was unknown to the Egyptians, to the Jews of the Old Testament, or to the Greeks of the Homeric period. About eighteen centuries ago, Columella and Varro speak of the necessity of keeping ducks in netted enclosures, like other wild fowl, so, even then, there was danger of them flying away. The A. boschas is met with in all the northern parts of Asia, Europe, and America. The domestic duck is polygamous. Young ducks are injured by being allowed to swim in water. The domestic breeds are the Common duck, the Flat-billed, Call and Penguin duck, Arlesbury, Tufted, Hook-bill, and Labrador duck; but though breeding in remote southern latitudes, where the mallard is unknown, the domestic breed always shows parts of the wild. Certain ducks breed on cliffs or trees, and they must carry their young to the water, though this has not been observed. A large red duck is the emblem of fidelity with the Rajputs.

Tadorna vulpanser, the Common Shieldrake of Europe, Asia, N. Africa; is common in the Panjab, not rare in Lower Bengal.

T. tadornoides, Australian Shieldrake, S. Australia.

T. variegata, Paradise Shieldrake, New Zealand.

Aix galericulata, Mandarin Duck, China.

Cassares rutila, Ruddy Shieldrake, N. Africa and S. Asia.

Dendrocygna arcuata, Whistling Duck, Java.

Spatula cypraea, or Anas cypraea, the Shoveller, northern regions, N. Africa; tolerably common in India.

Anas strepera, the Gadwall, the northern regions and Barbary; tolerably common in India.

A. cajeta, the Pintail Duck, northern regions and Barbary, and is very common in India.

A. boscas, the Mallard, the northern regions and Barbary; in India, is confined to Sind, Panjab, and the Hindustan and its vicinity, replaced southward by A. pecatorrhyncha.

A. creca, Querquedula creca, Teal of Europe, Asia, Barbary; common in India.

A. penelope, Meara penelope, Widgeon of Europe, Asia, N. Africa; common in India.

A. pecatorrhyncha, the Spotted-billed Duck.

Aythya ferina, the Pochard of the northern regions and Barbary; common in India.

A. nyroca, White-eyed Duck of Europe, Asia, N. Africa; common in India.

Fuligula marila, Scap Pochard of the northern regions; occurs in Panjab, Sind, Nepal.

F. cristata, Tufted Duck of Europe, Asia, Barbary; common in India.

Ducks are sacred to the worshippers in China of a canonized being, Hon-yun—shuee. The ducks on the river at Canton are so trained, that, when feeding in the fields, on being summoned to return by the whistle of their owner, they all waddle hastily back. They are similarly trained on all China rivers. Flocks of ducks are huddled together in the village, and driven the ducks from place to place during the day, sending them home in the evening.—Montgomery, ii. p. 262; Frere; Antipodes, p. 248; Darwin; Blyth; Jordan.

DUCK—WEED, Lemma gibba and other species of Lennacea.

DUDAEN, of Genesis xxx. 14, is the Mandragora officinalis.

DUDHI. Hind. Milk. Hence Duddh ka Mahena, the tenth month, literally the milk month. Duddh-Pavra, sweetmeats.

DUDHI TUPPAS, forming the S.E. portion of the Mizrapore district, are in a hilly tract of considerable size, which, owing to a variety of circumstances, escaped assessment when the rest of the Benares province was regularly settled. The great bulk of the cultivators and village managers belong to a tribal or aboriginal tribe, and are a simple, ignorant people, easily overreached by astute and grasping money-lenders. The people in general are truthful, willing to labour, possess great physical courage, and exhibit much enterprise. The Suri, however, are addicted to theft; they coin false money, and live principally by jugglery. They procure wives for their young men by kidnapping girls. Their women wear a tartan dress, often have a horn projecting from the forehead as an ornament, and are fond of intoxicating drinks. The Bhuiya are daring mountaineers. Their courtships are managed by the father of a marriageable lad searching round the neighbouring villages for a daughter-in-law, not related within the prohibited degrees of consanguinity. Having at last chosen one, he returns home, and in a few days again visits the bride’s house with his son, and not less than five other kinsmen. Five rupees are then paid to the girl’s father, baskets of flowers and fruit are presented to the bride herself and her mother, and the proceedings are closed by the marriage ceremony, which is performed by the family priest or a barber. The inhabitants, as a body, shun society. Mr. Conybeare says their language will become extinct.

DUDRENEE. Chevalier Dudrene, a native of India.
DUKFAR. HIND. An officer of irregular cavalry: the head of a party of labourers.

DUGDAH, a tribe of inferior Brahmans on the borders of Futtehpur and Allahabad. They date their origin from the time of Jye-chand, who figures in many fabulous legends of those parts. The Pande, who wore Dugdha Brahman (i.e. of mixed blood), received 48 villages, of the greater part of which they are in possession to this day.—Elliot's Supp. Gloss.

DUGGY, in Madras, round timber from 20 to 40 feet long, 1 to 2½ feet square.

DUGLA or Dauri. HIND. A bamboo basket swung on double ropes, and worked by two men in irrigating land.

DUGONG. MALAY. The sea siren, merman, mermaid. Professor Owen denominated the dugong of the Archipelago, Halicore Indicus, in distinction from that of the northern coast of Australia, at a time when the former had not been ascertained to frequent (as a dugong of some kind is now known to do) the Malabar coast and Gulf of Calpentine in Ceylon.

Halicore Dugong.

Trichechus dugong, Gmel. | Dugongus Indicus, Ham. | Halicore Indicus, F. Cuvier.

Indian dugong, ENG. Mermaid, ENG. Sea siren, Merman, : Le dugong des Indes, Fr.

This inhabits the shallows of the Indian Ocean and about Ceylon, where the water is not more than two or three fathoms deep. It does not appear to frequent the land or the fresh water. Its flesh is delicate. The dugong was noticed as occurring in Ceylon by the early Arab sailors, by Megasthenes (Fragm. lix.) and Zelian, and subsequently by the Portuguese. It is this creature which has given rise to the tales about mermaids which have till the present day occupied the world, and doubtless had their origin in the tales of the Arab seamen. They are phytoplankous or plant-eaters. Numbers are attracted to the inlets from the Bay of Calpentine to Adam's Bridge, by the still water, and the abundance of marine algae in these parts of the gulf. One which was killed at Manaar in 1874 measured upwards of 7 feet in length, but specimens considerably larger have been taken at Calpentine; and their flesh is represented as closely resembling veal.

Halicore Australis, manate of Dampier, white-tailed manate of Pennant, is a native of the west coast of Australia, and is called also the sea-cow. About the month of January the dugong shows itself in Port Mount Bay, coming to feed upon a species of seaweed, which is also relished by the

DUKU. H. tabernaculum, Rup. | Dagungus marius, Tiede.

Dugong. . . . MALAY. | Pseudipinnus laurii, MALAY.

Under these synonyms Dr. Theodore Cantor unites all the above, which he says inhabits the Red Sea, the seas of the Malay Peninsula, Singapore, Sumatra, the Philippine islands, Moluccas, Sunda islands, and New Holland. It is supposed that the dugong can be easily domesticated. Doubtless the ancient Arab stories gave rise to the mermaid tales which have since then occupied the world, for it is this creature that has given rise to all the fables about the mermaid and the merman. Tennyson writes of

'A mermaid fair
Singing alone,
Combing her hair,
Under the sea,
In a golden curl,
With a comb of pearl,
On a throne.

At night I would wander away;
I would cling on each side my low-flowing locks,
And lightly vault from the throne, and play
With the swimmers in and out of the rocks;
We would run to and fro, and hide and seek,
On the broad sea walls in the crimson shells
Whose silvery spires are nearest the sea.'

DUH. SANSK. To milk. Hence Duhitar and Duhiti, a milker, a daughter.

DUHAI. HIND. Justice! An exclamation still made in Hindustan from an individual who considers himself injured. 'Duhai, Maharraj! Duhai, Company Bahadur!—Justice, justice, my lord! Justice, Company Bahadur!—' Yule, Cathay, ii. 436.

DU HALDE, J. B., author of Description of the Empire of China, Chinese Tartary, Corea, and Tibet.

DUHARU. BENG. A caste of fishermen and divers.

DUHET. ARAB. A cove or bay. Duhet Dilam, Hafah, Kabir, Kulaib, Kathemeh, Selwah, Shahrah, Shishal, are in the Persian Gulf, and Gwettur in Baluchistan.

DUSASANA and Duryodhama, sons of Dhrirat-rashtra. Dussasana behaved brutally to Draupadi, and he was afterwards killed by Bhima when fighting in the battle at Kurukshetra.—Dowson.

DUJA. ARAB. Blood-money, paid by a criminal to the relatives of a murdered person.

DUK or Duk. JAY. The hair-fibre of the Arenga saccharifera, Gooni, Malay.

DUKAI. MAHI. Hog; Sus scrofa. Dukkari-chahari. HIND., hog's head.

DUKSHIN-ACLARI. SANSK. From Dukshina, the right hand, and Aclain, acting.

DUKU, the Malay and Javanese name of a tree and fruit of the Lasiurus domesticum, and natural order Meliaceae of botanists. To the same genus belong the langsat, langsat, or langsab, for in all these forms the word is written, and also the ayyayar, L. aquen. The duku is the most esteemed of them, and to the European palate is the best of the native fruits of the Archipelago, after the mangostin. The natives class it after the durian and mangostin. It is of the size of a pigeon's egg, of globular form, and covered with a coriaceous
skin of the colour of parchment. The species seems to be indigenous in the western portion of the Archipelago, but has been introduced into the Philippines, where one variety of it, the langseh, is cultivated.—*Crawford's Dict.* p. 125.

DULCAMARA or Solanum dulcamara is the Shuh-yang-ta's-uen of the Chinese. Dulcamara contains an active narcotic alkalai, solanine, narcotic and diuretic. Solanum nigrum, Arrubsus-saleb, may possess similar virtues.—*Being. Disp.*

DULHA, ARAB. A bridgroom. Dulhan, a bride. For the Dulha-Deo of India the Greeks had Adonis, Ganynede, Hylas, and Thammuz.

DULLA, HIND. Carbonate of soda. A soda ash or natron from the waters of the lake of Luner; it is used in dyeing, in medicine, and in the arts.

DUM, in Afghanistan, a class of servants attached to families of rank, whose wives serve in the women's apartments, and are go-between in marriage negotiations.

DUMA, HIND, also written Duma, is the name of the leather case in which tea is imported from Tibet into Garhwal and Kumaon. It contains about three seers, and bears a price of six or seven rupees.

DUMAGUDEM, on the Upper Godavery, 120 miles from Sironcha, and same from Ellore. Coal occurs about 15 miles N. of Dumaguedem, near the junction of the Tal river near Lingalana.

DUMAI MURALLEE, in Cachar, the first crop of rice, sown in April.

DUMBA, HIND. A flat-tailed sheep of Pesah Warren Kabul, the Salt Range, and the Cape. Dumki marchi, the tailed pepper, cubebs. Dumki satari, a comet.

DUMB-BELLS. See Magdar.

DUMDUM, a subdivision of the 24 Parganas, in which, near Calcutta, there is a military station of same name, in lat. 22° 38' N., and long. 88° 30' E., and 44 miles from Calcutta.

DUM-I-GURG, or the wolf's tail, is the Persian name for the first brushes of grey light which appear as forerunners of dawn. Dum is a tail.

DUMKI, a brave and martial tribe of Baluchistan who inhabit Eastern Kachi; part of them were removed to Sind by Sir Charles Napier in 1845.—*MacGregor, N. W. F.* p. 502.

DUMOH, a district in the Jubbulpur division, lying between lat. 22° 10' and 23° 30' N., and long. 79° 5' and 80° E. It is situated on the table-land of the Vindhyian range of hills, and is 90 miles long from N. to S., and 50 broad, with an area of 3799 square miles, and 269,642 inhabitants, largely Goud, Kurku, Lodhi, and Kurni. See Damoh.

DUMUR. TEL. A name for the Bhatu Attakats. Dumbram, Tam., Dumbed war, Tel., and called also Khollati. See Bhatu. DUN. HIND. A valley; a term locally applied in the Sivalik Hills, under the Himalaya, as Pattie Dun, Dehra Dun. It seems to be the same word in the Celtic and Indo-European languages, as well as in the Arabic. In English, the adverb Down implies descent, and Down, the noun, a sloping hill, an elevated plain, or hillock of soil on the sea-shore. See Dunes.

DUN, BURMA. Of Arakan, a land measure 30,720 square yards, therefore equal to a little more than 64 English acres.

DUNAI or Doab, in Rajputana, is a portion of the dish of which the prince partakes, sent by his own hand to whomsoever he honours at the banquet. At the russora, or refectory, the chiefs who are admitted to dine in the presence of their sovereign, are seated according to their rank. The repast is one of those occasions when an easy familiarity is permitted, which, though unrestrained, never exceeds the bounds of etiquette, or the habitual reverence due to their father and prince. When he sends, by the steward of the kitchen, a portion of the dish before him, or a little from his own khansa or plate, all eyes are guided to the favoured mortal, whose good fortune is the subject of subsequent conversation. Though, with the diminished lustre of the Rajput house, the dunah may have lost its former estimation, it is yet received with reverence.—*Todd's Rajasathan*, i. p. 317.

DUND or Dhand. SINDI. Pools, ponds, or lakes on the line of the river Narra, from Sukkur to Omerkot, or about 100 miles. The Narra is only filled with water during the inundation of the Indus river, and even this not often; it never reaches the sea, but is lost in the sand near Omerkot. Betwixt this and Sukkur there are at least 360 dund, most of which contain water throughout the year. They are from 300 to 400 yards across, but often many miles in length. They all become brackish during the hot weather. They abound in fish.—*Captain Del Hoste in Bom. Geo. Trans.* ii.

DUNDA. DUN, or Dun, or Dungar, is in several dialects derived from the Sanskrit, a hill or mountain, as it was also in some of the old languages of Europe.—*As. Res. ix.* p. 98.

DUNDA. The best-known boats on the Indus are the Zoruk of the Upper Indus, the Dunda, which plies from Mithankote to the sea, and the Dugga, which is specially suited, from its strong build, to the navigation of the rapids between Attok and Kalabagh. The better kinds of wood used in their construction (sissoo and large babul) are procured with difficulty, and various species of timber are generally seen in one boat, such as babul, deodar, chir, kalm, and karil. Malabar teak is much prized in the Lower Indus, and fetches a large price. The ordinary ferry boats are constructed by the sides and bottom being prepared separately, and brought together to be secured by knees or crooked pieces nailed to the bottom and sides. The bottom is made of sissoo, the knees of mulberry or olive, and the side planks of deodar. The wedges and treenails are usually made of tut and kahn. Ropes for rafts and boats are prepared either from hemp (Cannabis indica), sirki (Sacharum spontaneum), Typha latifolia, dib, or other grasses, common on the river bank. Munj (Sacharum munja) is also largely employed by the native boatsmen. The great boat-building localities of the Panjab are Pind Dadun Khan, Wazirabad, and Jhelum, but there is a marked increase on the Indus, not only at Attok, but at Nowshera, Hashnagar, Mokhd, and Kalabagh.

DUNDGIRI. HIND. A very populous village, adjoining the esplanade of Bombay fort.

DUNDOO-MALE, GUM-resin of the Doona Zeylanica subsequent to 1868. DUNES occur in India near the sea, and to leeward of the beds of rivers, also on the Indian desert, and in the desert of Gobi, where the sand
waves are overwhelming cities. In the Indian desert are to be seen multitudes of the Tuba rising 400 or 500 feet high. Newbold describes dunes of the Hogri and Penmar rivers, and mentions the overflowing of Bodhurti, a village of Konigul, also of an old village near Jameulmadig, and the encroachments on the village of Honour, 204 miles S. from Bellary. In the Landes of Gascony, many dunes exceed 225 feet; some attain 391 feet elevation; and on the W. of Africa, near Cape Verde, they are no less than 800 feet high. See Down; Dun.

DUNG. BIOTT. An encampment of shepherds and herdsmen in the N.W. Himalayas.

DUNG. Tin. The wild yak of Darjiling.

DUNG of birds and bats is applied medicinally externally, and, given internally by the Chinese. That of the avadavat, Fringilla amandava; of the common house sparrow, Passer montanus (Kung-ma-tsho-fen, Chin.); of the magpie (Han-hau-echung, Chin., and WU-le-Chi, Chin.), is applied externally in leprosy; and the dung of the white pigeon, Tso-pwan-lung, Chin., left-coiling dragon, is an external veterinary medicine.—Smith.

DUNGA, a punt or broad boat of Kashmir.

DUNGANE, the great Onigoor horde in Eastern Turkestan. They are Turk, and became Mahomedans in a.d. 966. The Chinese call them Hoiheke, Ohior, and Hoai-Hoi. Towards the close of the 8th century, the emperors of the Tang dynasty deposed a million of Onigoor people from the neighbourhood of Kashgar, and settled them at Kau-su and Chen-si. About a.d. 966, these families embraced Mahomedanism, and under their chief Satook they conquered Transoxiana, and carried away captive an immense number of Turks of the Turgut tribe. In 972, the majority of these captives were allowed to return to their homes; but many remained, and these were called Targhanchi or Tanghani, signifying remnant, and corrupted into Dungen. They are all Mahomedans, but dress like Chinese. They are abstemious, religious, quarrelsome, using the knife; honest, and fond of trade. The Dungan or Turgen race, following Mahomedanism, in the N.W. of China, rose in rebellion against the Chinese in 1867. The Burmeese call them Tharat; their own name for themselves is Muslim. In 1881, the delegates of the inhabitants of Kulja chose the following districts for the colonization of the Dungan and the remaining Tarantehi, for whom there is no room on the Tchilik steppes,—for the Dungans, the district Tchink, between the rivers Soukoulouk, Aksu, and Tehoun; for the Tarantehi, a part of the same district, situate between the rivers Alarteha and Soukoulouk.

DUNGAREE, HIND. Datta, TAM. A coarse cotton cloth manufactured in various parts of India, and used by the poorer classes of natives. The stouter kinds are much employed in the making of sails for native sailing vessels and tents. Dungaree is woven with two or more threads together in the web and woof. It is generally used for sails of country ships, and would no doubt be advantageously employed for the occasional light sails for larger ships, being more easily handled than European canvas. Superior descriptions are made with the web and woof, or web only, twisted either wet or dry, but this becomes as expensive as the best English canvas. The prevailing price of the ordinary dungarees, 30 cubits,—that is, 15 yards long, and 2 feet wide,—is 1 rupee 12 annas; the piece at Masulipatam being brought from Ray- lunny, a village and tank to the northward, where a finer description, well adapted for tents, is made at 7 rupees the piece of 36 yards, 1 yard wide. About Vizagapatam, the ordinary dungaree is usually sold by weight. The best Bengal tents appear to be made of an open-textured dungaree, the threads of which are finer than is usual in dungarees. Like all other cotton goods, dungaree should not be exposed to the weather in tents, tents, etc., till the weavers’ dressing and flax has been thoroughly removed by washing and partial bleaching.—Frankner; Rohle, MSN. See Cloths.

DUNGAPUR, a native state in Rajputana, ruled over by a Maharawul in a town of that name, in lat. 23° 52′ N., and long. 73° 19′ E. The population of the state in 1878 was 175,000. Three-fourths of the inhabitants are Hindus, one-eighth Jains, and one-eighth Musalmans. The Bhils aggregate about 10,000 souls. The family is an offshoot of the house of Udaipur. On the fall of the Moghul empire, Dungapur, like other Rajput states, became tributary to the Marhattas. The tribute of Rs.35,000 levied from it was transferred to the British Government by the treaty of 1818, with Jeswunt Singh, in return for its protection.

—Imp. Gaz.

DUNG BIRD, Neophron perenpenturis.

DUNGING OF CLOTHS is a process resorted to by dyers, both in the East Indies and Europe, the object being to impregnate cotton cloths with animal matter, for which many dyes have a strong affinity.—Rohle, MSN.

DUNGTEEN, a bone or relic receptacle of the Buddhist religionists. The chayita is any sacred object worshipped by the Buddhists, as a tree, an altar, a temple, as well as any monument raised on the site of a funeral pile, as a mound or pillar, and is probably applicable both to the Buddhist chodtan, or offering to the deity, and the dungten, a bone or relic receptacle. The stupa or chayita of Indian Buddhism is supposed to have been erected subsequent to the cave temples and viharas or monasteries. The ancient stupas were originally meant as receptacles of either the Buddha or the Bodhisatwas and the kings who encouraged the propagation of the Buddhist faith. The chodtan or charter of Tibet are similar to the stupa. They consist of a cylindrical vase, and have a cupola over their head. The dungten, on the other hand, correspond to the dhagoba of the Sanskrit, is a bone or relic receptacle, built in honour of the mortal Buddha, and ought to contain some portion of their relics, real or supposed.

—Cunningham. See Buddha; Stupa; Topes.

DULIBAR or Danywalor, a mode of address among fakirs.

DUNORHUNG, a Penang wood of a brown colour, sp. gr. 1:253. Used by the Chinese for carving images.

DUPADA NUNA, Tel., is Dupada oil, or Piney tallow. Dupada resin exudes from the Vateria Indica, and constitutes the piney varnish. The resin is used as a fragrant incense in temples; the quantity procurable is very considerable.—M. E. J. R.

DUPERRY. Anquetil Duperron, without means, and in the face of great hardship, learned the Zend from some Parsee priests at Surat, and
DUPLEIX.

DUPLEIX, JOSEPH FRANCIS, an eminent French commander, who served in the Peninsula of India in the middle of the 18th century, and made great efforts to sustain French interests there, against the British. He opposed Anwar-ud-Din and his son Muhammad Ali, in opposition to Major Stringer Lawrence, who was contending against Chanda Sahib. Dupleix failed in an attack on Fort St. David, on the 19th December 1747. His efforts were directed to expel the British from the Peninsula, his chief British opponents being Lawrence and Clive. In that time, Madras, Fort St. David, Cuddalore, Arcot, St. Thomé, repeatedly changed hands. He was appointed chief of Chanderugur, and succeeded M. Dumas as governor of Pondicherry. He was of a bold, self-reliant, but haughty character, and was much thwarted by M. de la Bourdonnais. It was in his time that Madras was taken and held by the French, and again restored to the British. He twice failed to take Cuddalore. He negociated largely and formed alliances with native chiefs,—with Chanda Sahib, Muzaffar Jung, and Nisar Jung. In 1752 he was appointed by Salubut Jung, Subhadar of the Dekhan, Nawab of the Kaf-natic. For his services he was created a marquis; but misfortunes overtook him, and he was superseded by M. Goddeheu, and returned to France in September 1754. On his return, the French Government refused to pass the bills for the sums which he had ordered to be disbursed on his own responsibility, and he was reduced to extreme poverty. He was shamefully ill-treated, and three days before his death, in 1754, he wrote in his memoir, 'I have sacrificed my youth, my fortune, my life, to enrich my nation in Asia.' His great name shed a lustre on the struggles of his countrymen for empire in the East. —Orme; Malleson.

DURA. Daniel iii. 1 tells us that Nebuchad-zezzar the king made an image of gold, whose height was three score cubits, and the breadth thereof six cubits. He set it up in the plain of Dura, in the province of Babylon. This is the modern Imam Dour, on the left bank of the river.

Riek's Kurdistan, i. p. 148.

DURA. HIND, a whitish blanket of Basahir.

DURAND, SIR HENRY MARION, K.C.S.I. and C.B., entered the Bengal Engineers in June 1828, and promoted to Major-General in 1867. He served in the Afghan campaign; headed the explosion party, and fired the train at Ghazi; served also at Gwalior and in the Panjub campaign at Chillianwalla and Gujerat; was afterwards Agent to the Governor-General in Central India. He was for a brief time Commissioner of the Tenasserim Provinces. He was also Military Secretary to the Government of India. Invested with the Order of the Star of India in June 1867. He was a sagacious political officer. In 1857 he stood to his ground, and stemmed the flood of mutiny, and bursting into Hyderabad and recovering the Dekhan. In January 1871 he was killed on an elephant, entering a gateway on the Tank frontier. Wrote on Dadapir Fossils in Bl. As. Trans. v. 291; On the Barometer, ibid. 301; On Fossil Rhinoceros, ibid. 486; Carnivora, 579; Shells, 661; Quadrupeds, 730.—Howell Thurlow; Dr. Buist's Catalogue.

DURANTA ELLISIA, one of the Verbenaceae, a beautiful large shrub, with light blue pendulous scentless flowers. D. Plumieri is also a large shrub, with handsome drooping blue flowers having the scent of almonds; the clusters of seed-berris, which are numerous, when ripe, have a very pretty appearance from their dark orange colour; they do not appear to germinate readily. —Riddell.

DURBA CHAPALOO. Tel. A kind of mat made in Tannjam from the fibres of the Sansieveria Zeylanica.

DURDU, an old secluded pastoral race in Gilgait and Chulas, on the Indus river, on the north. The Afghans on the one side, and the Turkoman on the other, are pressing on them. See Dard.

DURGA, a form of Parvati, and wife of Siva. She corresponds with Juno of the Greeks and Romans, and the Isis of the Egyptians, as also with Ceres and Proserpine. Durga is also known as Bhawani, Kali, Devi, and Singhwani. As Durga, she is represented with ten arms. In one hand she holds a spear, with which she is piercing the giant Mahesha; in another, a sword; in a third, the hair of the giant, and the tail of a serpent is twined round him; and in others, the trident, the discus, the axe, the club, the arrow, and the shield. One of her knees presses on the body of the giant, and her right foot rests on the back of a lion, which is lacering his arm. On her head she has a crown richly gowned, and her dress is magnificently decorated with jewels. The giant is issuing from the body of the buffalo, into which he had transformed himself during his combat with the goddess. From this victory she took the names Durga and Singhwani, or Lion Rider.

Like the Ephesian Diana, Durga wears the crescent on the head. She is also 'the turreted Cybele,' the guardian goddess of all places of strength (durga), and like her she is drawn or carried by the lion. As Mata Janavi, the 'Mother of Births,' she is Juno Lucina; as Padma, 'whose throne is the lotus,' she is the fair Isis of the Nile; as Tripura, 'governing the three worlds,' and Atma-devi, 'the goddess of souls,' she is the deceased transformed of the Greeks. In short, her power is manifested under every form, from the birth through all the intermediate stages until death, whether Janavi, Gouri, or the terrific Kali, the Proserpine or Calligenia of the West.

As Parvati, Bhavani, Durga, or Devi, she is the sakti or personified energy of Siva. And the yoni, the symbol of female energy, is the emblem of this goddess, as the lingam is that of her husband.

In the different terrific forms of Siva and Durga, a necklace of skulls forms an invariable decoration, as does the crescent moon on her forehead; and the moon is considered to be the peculiar reservoir of Amrita, or the beverage of immortality. In Hind. Theatre, ii. p. 59, Aghora Ghanta, invoking Chamunda, says of Durga:

'The elephant hide that robs thee, to thy steps Swings to and fro; the whirling talons rend The crescent on thy brow; from the torn orb The trickling nectar falls; and every skull That gus thy necklace laughs with horrid life.'

She combines the characteristics of Minerva, Pallas, and Juno, and in her amiable character is often called Bhawani. Durga is worshipped in the form of a water-pot. It is called Ghata puja, also Ghatishtapana. A water-pot is placed, and, after certain ceremonies, Durga is supposed to enter it, and she is then worshipped. —Todd's Rajasthan, i. p. 576.
DURGA.

DURGA. Sansk. Durg or Doorg, hence Droog. A hill fort, a fort. Durga means difficult of access, from Door, prep., and Gami, to go.

DURGA PUJA is the festival of Durga, held in Bengal in the month of Aswin, about October, and on this occasion the images of her sons, Kartikeya and Ganesha, are usually placed on each side of her. In Calcutta this is the most splendid and expensive, as well as the most popular, of any of the Hindu festivals, and takes place in the month Aswina, the end of September or beginning of October. The preliminary ceremonies occupy several days previous to the three days of worship. During the whole of this period all business is suspended, and pleasure and festivity prevail. This festival is known among the Maharratins as the Dassera.

In the Durga puja, a sacred jar is an essential article in the celebration of the mysteries, and is marked with the combined triangles denoting the union of the two deities, Siva and Durga. The Satka sect, worshippers of the satki, or female principle, mark the jar with another triangle. The Vaishnava in their worship use also a mystical jar, which is also marked. These marks, Mr. Paterson says, are called tantra, and are hieroglyphic characters, of which there are a vast variety. He hence deduces the identity of the Durga puja with some Egyptian rites of a corresponding nature. In some parts of the country there are figures paraded of a coarsely licentious character, but these are being forbidden. The festival, with its boisterous and obscene merriment, its vigils of three successive nights, its monetary extravagance, its ludicrous sights, its licentious exhibitions, deteriorates the moral health of the community. On the fourth and last day no sacrifices are offered. After religious adorations, the officiating priest dismisses the goddess, and implores her to return the next year. The dismissing ceremony over, the females of the house lament the departure of so beneficial a deity. The goddess is presented with gifts, and the dust of her feet is rubbed on the foreheads of the votaries. The idol is paraded through the streets with great pomp. The streets resound with music and singing, and the acclamations of the worshippers. As it passes along the streets, the spectators join their hands in form of adoration. The parade over, the idol, with all its trappings and its tinsel ornaments, is cast into the waters, where the people vie with one another in rilling the goddess of her decorations.—Sir John Malcolm in Tr. Bombay Lit. Soc.; Cote, Myth. Hind, p. 51; Paterson, Essay on the Origin of the Hindu Religious Asiat. Researches, viii. p. 401.

DURGARASPTNAM, a seaport village on the Nellore coast of the Bay of Bengal, in lat. 15° 59′ N., and 55 miles N. of Madras. It was known to the British as Armegon, from the circumstance that when they settled there, and it was their first site on the Coromandel coast, the name of the Kurnam or village accountant was Armagam Mudiar.

DURGAVATI, pronounced Durgoti, was the daughter of the Chandaal king of Mahola, the ancient capital of Bundelkhand. With her father's consent, the Gond king of Gurhah, Mundla carried her off with an army of 50,000 men. After her husband's death, Asof Khan, a general of Akbar, in 1564 advanced to annex Gurhah Mundla, but, as her son was a minor, Durgavati assembled 1300 elephants, 8000 horse, and some foot, and, clothed in armour, met the Moghul forces and drove them back. Asof again advanced, and was again defeated, with a loss of 600 men. A third effort was successful, her son was wounded, and her troops fled; she herself was wounded, and she ended her life with a dagger. Her tomb is still to be seen in a narrow defile between two hills, and passers-by place crystals on her grave. Her name still rests in Gond story (As. Res. xv. p. 437). She was interred at the place where she fell (Ben. As. Soc. Journal, vi. 628), and to this day the passing stranger places a votive offering one of the fairest he can find of those beautiful specimens of white crystal in which the hills in this quarter abound. Two rocks lie by her side, which are supposed by the people to be her drums converted into stone; and strange stories are told of their being still occasionally heard to sound in the stillness of the night by the people of the nearest villages.

DURG BANSI. Hind. A tribe of Rajputs in Joupur and Azimgurh.

DURGI MURGI WALE of Kohlapur, are Hindu wanderers, who exhibit idols and beg. Their favourite objects of worship are Lakshmi and Hanuman.

DURIA MADDEE, also Korn maddee and Kornman. Tel. Briedelia spinosa. A tree of the Godavary; wood very strong and good. Cattle eat the leaves most voraciously.—Beddome.

DURIO. The name of this genus of plants has been derived from Durian, a well-known fruit of the Malay Archipelago. The specific name of zibethinus has been applied to the tree from its fruit smelling like the fœtid zibet (Vivera rouse, Hor.). The genus belongs to the order Sterculiaceae.

DURION, a tree of Sumatra; its trunk is hollowed out as a collin of the Batta rajas.

DURIO ZIBETHINUS. Linn. Du yeen, ... Birm. Doriain, ... Eng. Du yeen yaising, ... Turrien, ... Siam.

The durian is a large and lofty tree of the Malay Peninsula, the Eastern Archipelago, and the Moluccas. The flowers are arranged in clusters on the trunk and older branches, where is also borne the fruit, as in the jack tree. It is of the size of a melon, covered with sharp points; when ripe, the outer skin opens spontaneously, and the interior consists of five lobes of a creamy consistence and a whitish colour, in which are nuts more or less numerous. During May and June it is in season; but there is usually also a second crop in November. It is as remarkable for the delicacy, combined with richness, of its flavour, as for the intolerable offensiveness of its strong and persistent smell, which repels most Europeans, possessing an odour so powerful and diffusive as to taint the air of a whole town when it is in season, and steamers carrying the fruit stow them in the tops. It is sometimes compared to a rolled-up hedgehog; hence it has been called Echinus arboreus, in consequence of its hard and thick rind, which is yellow-coloured when ripe, being covered with firm and angular projections. The seed, with its edible enveloping pulp, is about the size of a hen's egg. The pulp is as white as milk, and as delicate in taste as the finest cream; but it should be eaten fresh, as it soon becomes discoloured, and undergoes decomposition. When
the fruit is ripe it falls of itself, and getting them as they fall, the smell is less overpowering. When the fruits begin to ripen, they fall daily, and almost hourly, and accidents not unfrequently happen to persons walking or working under the trees. The seeds are likewise eaten when roasted, and have something of the flavour of chestnuts. The wood of the tree is valued for many economical purposes, especially when protected from moisture. The rind, probably from containing potoah, is used in the preparation of some dyes. The natives of the countries yielding the durian prize it beyond all other fruits. In countries with a suitable climate, it flourishes without care or culture. It is most abundant in the western portion of the Archipelago, and extends east as far as the island of Mindano, the only one of the Philippine group in which it is known. It is abundant in Siam, and is found on the coast of Tenasserim about lat. 14°, which is the furthest distance from the equator to which it has been successfully propagated. All attempts to cultivate it in any part of Hindostan have failed; nor has it, like some other Asiatic fruits, been transferred to tropical America. A hot, moist, and equable climate would seem to be indispensable to the durian; but soil seems to be indifferent to it, for it thrives in the granite, in the sandstone, and in the calcareous soil of the Malay Peninsula and Sumatra, in the volcanic soil of Java, and in the rich alluvium of the valley of the Surabaya in Siam. The name is from Dari, Malay., a thorn or prickel, with reference to the sharp tubercles with which the rind is covered. In the interior of the Malay Peninsula, in several places in the forest are found durian trees, always in a body together, to the number of about ten or twelve trees. Such places are for the Jakuns an object of great attention, and matter of work. They cut with the great axe all the other trees which surround the durians, that these, by receiving more air, may grow up more easily, and give finer and a greater quantity of fruit. They build there a small house, and then return to their ordinary habitations, which are sometimes distant from such places one or two days' journey. Durian is seen to grow spontaneously in one of the small islands of the eastern coast of the Malay Peninsula, and which is nearly one entire forest down to the margin of the sea. On Pulo Tungi, the Orang Laut, or sea-gypsy, assemblé, attracted from the coast of the Peninsula, as well as from the islands of the Johore Archipelago. On one occasion, six boats from Moro, an island of that group, were found on their way to Pulo Tungi; they had travelled by sea a distance of 180 miles, to partake of the fascinating fruit.— Roxburgh, iii. p. 398; Madden's Hist. of Sumatra; Mason's Tenasserim; McClelland, Eng. Cyc.; Crawford, Dict. p. 126.

DURKHEE, Hind., also written Durkhi, an insect whose ravages are very destructive to indigo, when the plant is young.

DURKOTEE. This petty chieftainship pays allegiance to the British Government, and is exempted from all pecuniary liability. Revenue, 500 rupees; population, 612.—Alcheson, Treaties.

DURRAH, a derivative of Dwar, a barrier, pass, outlet, or portal. Mukund is one of the epithets of Krishna. Mukundurra and Dwariarath are synonymous, the pass and portal of the deity.—Rajasthan, ii. pp. 702, 703. See Door.

DURRAH, a Pindara brigade.

DURREE, Hind. A woolen cloth of Ambala and Bahawulpur.

DURUNG. Malay. In Bawean, a hall of audience or of reception, before the houses.

DURVA. Hind. Pea cynosorioides. Vishnu, as Rama, in his seventh incarnation, assumed the colour of this grass, which is therefore held sacred to that god, and used by the Vaishnavas in all religious ceremonies.

DURVASAS, in Hindu legend, a rishi of a choleric temperament, whose curse was of dreadful effect. He is described as the son of Atri and Anasuya. He cursed Sakuntala for keeping him waiting at the door; he foretold that Krishna would be killed, because Krishna did not wipe particles of food off his foot; but he blessed Kunti, so that she became a mother by the sun. He cursed Indra to lose his sovereignty over the three worlds, and Indra had recourse to Vishnu to be restored to health.

D'URVILLE. Admiral Dumont d'Urville, an eminent French navigator, who left France in 1857 with the Astrolabe and La Zélée corvettes, on a voyage of discovery in the Antarctic Ocean. He perished on the 8th May 1842, in the fire that destroyed the cars on the Paris and Versailles Railroad.—Am. Exemp, p. 278.

DURYODHANA was the eldest son of king Dhrita-ras'ka, and, being of the elder branch, retained his title as head of the Kuru, while the junior, Yudishtra, on the separation of authority, adopted his father's name, Pandu, as the pater-onymic of his new dynasty. He educated along with his own 100 children, the five sons of his brother Pandu; but he took a dislike to Bhima, and the Pandava princes went into exile, where his enmity followed them, and he failed in an attempt to burn them in their home. On their return from exile, he gambled with Yudishtra, eldest of the five Pandu princes, and won their entire possessions, even to the freedom of themselves, and even of their wife Draupadi, whom he ordered to sweep the room, and on her refusing, his brother Dushasana behaved rudely towards her. Yudishtra having lost his kingdom, his wife, and even his personal liberty and that of his brothers, for twelve years, became an exile from the plains of the Yamuna. The Kaurava and Pandava fought for dominion. The site of the great conflict, known as the Mahabharat, between these rival clans, is called Kuru Khotu, or Field of the Kurus. On the 18th day of the battle, Bhima fought with and wounded Duryodhana, so that he died of the injuries he received.—Dowson; Garrett.

DUSSUMIERIA ACUTA. C. and V. Tamba-bulat. Head above, back, and upper third of the sides, deep glossy blue, bordered by a longitudinal band of pale copper-red; the rest of the head and body shining silvery. Single individuals occur at Penang at all seasons, but numbers from June to September. It is highly valued for its delicate flavour, and passes commonly as a sardine. The latter denomination it shares, however, with Clupeonella perforata, with which it is also conjoined by the Malays under the common name of Ikan tamban. Both have been prepared as sardines à huile. See Clupeidae.

DUST and Dust-storms.

Dust, or cloud of minute particles, blown or transported by the wind, is a common phenomenon. It is well known that in deserts there is a daily dust-storm, the result of the gradual evaporation of the moisture in the soil. When this soil is fine and sandy, it is easily blown up into a cloud, and may be carried for many miles. Even in arctic regions the snow is blown up into the air, and sometimes covers the trees with a white snow-like deposit. In desert regions, where the heat is intense, it is well known that the fine dust is blown up into the air, and forms a cloud, and may be carried for many miles. Even in arctic regions the snow is blown up into the air, and sometimes covers the trees with a white snow-like deposit.
DUST.

Dust is carried along with winds to great distances. Sicere or African dust has been found by the microscope to consist of infusoria and organisms whose habitat is, not Africa but S. America, and carried in the track of the S.E. trade wind of S. America. In the dust of the Cape Verdes, Malta, Genoa, Lyons, and the Tyrol, Ehrenberg discovered separate forms. Dust is blown from Arabia and Africa far to seaward, causing a great haze. During four months of the year, a large quantity of dust is blown from the N.W. shores of Africa, and falls on the Atlantic over a space of 1600 miles in latitude, and for a distance of from 300 to 600 miles from the coast. But dust has been seen to fall at a distance of 1030 miles from the shores of Africa. Darwin mentions that in some of the dust 330 and 380 miles from Africa, falling in the sea near the Cape de Verde Islands, particles of stone occur 1000th of an inch square. Dust-storms are very frequent in India, and usually have a north to south course. One commenced at Allahabad about seven A.M., and continued till one P.M., retaining the same fury as when it began. On the evening of the 17th, Secunderabad had been visited with an unusually severe dust-storm. It came from the N.W. and was accompanied by lightning and thunder. The air to a considerable height was rendered almost opaque by dense clouds of red dust. The wind raged with great fury for upwards of half an hour, and on its abating was followed by a heavy shower. The dust-storm passed over Madras on Sunday the 19th, beginning at one P.M. It had passed over Kristnapatam, seventeen miles S.E. of Nellore, at half-past ten o’clock in the forenoon of that day, accompanied by a slight fall of rain. In the north of the district between Ongole and Ramapatam, there was a heavy fall of rain in the forenoon of Sunday, averaging from two to four inches. At Chingleput, thirty-six miles south of Madras, the storm was experienced in full force at that station at two P.M. the same day. It came from the N.W., and the wind was laden with vast quantities of reddish dust; no refreshing shower succeeded the storm.

A dust-storm occurred over 8800 square miles, from Ningpo to Shang-hai, on the 15th March 1846. It consisted of a congeries of light downy fibres or hairs, with silex adhering to them, and an admixture of an alkaline salt. In China, according to Richthofen, beds appearing like fine sediment, several inches deep, are found over an enormous area, owe their origin to dust blown from the high lands of Central Asia.

Whirling dust-storms are caused by spiral columns of the electric fluid passing from the atmosphere to the earth; they have an onward motion, a revolving motion, like revolving storms at sea, and a peculiar spiral motion from above downwards, like a cork-screw. It seems probable that in an extensive dust-storm there are many of these columns moving on together in the same direction, and during the continuance of the storm many sudden gusts take place at intervals, during which time the electric tension is at its maximum. These storms, in the Panjab, mostly commence from N.W. or W., and in the course of an hour, more or less, they have nearly completed the circle, and have passed onwards. Precisely the same phenomena, in kind, are observable in all cases of dust-storms; from the one of a few inches in diameter, to those that extend for fifty miles and upwards, the phenomena are identical. It is a curious fact that some of the smaller dust-storms occasionally seen in extensive and arid plains, both in the Panjab and in Afghanistan above the Bolan pass, called in familiar language devils, are either stationary for a long time, that is, upwards of an hour, or early so, and during the whole of this time the dust-storms revolving on the ground are kept whirling above into the air; in other cases, these small dust-storms are seen slowly advancing, and when numerous, usually proceed in the same direction. Birds, kites, and vultures are usually seen soaring high up just above these spots, apparently following the direction of the column. They may be looking for prey, or involved in and unable to fly out of, the invisible part of the electrified aerial column, of which the lower part only is visible to us by the dust raised. The phenomena connected with dust-storms seem to be identical with those present in waterspouts and white squalls at sea, and revolving storms and tornadoes of all kinds; and they apparently originate from the same cause, viz. moving columns of electricity. In 1847, at Lahore, an observer, being desirous of ascertaining the nature of dust-storms, projected into the air an insulated copper wire on a bamboo on the top of his house, and brought the wire into his room, and connected it with a gold-leaf electrometer and a detached wire communicating with the earth. A day or two after, during the passage of a small dust-storm, he had the pleasure of observing the electric fluid passing in vivid sparks from one wire to another, and of course strongly affecting the electrometer. Afterwards, by the same means, he observed at least sixty dust-storms of various sizes, all presenting the same phenomena in kind. Commonly, towards the close of a storm of this kind, a fall of rain suddenly takes place, and instantly the stream of electricity ceases, or is much diminished; and when it continues, it seems only on occasions when the storm is severe and continues for some time after. The barometer steadily rises throughout. In the Panjab plains, the fluctuation of the barometric column is very slight, seldom more than two or three tenths of an inch at a time. The average height at Lahore is 1180, corrected for temperature, indicating, it is supposed, above 1150 feet above the level of the sea, taking 30 inches as the standard. A large dust-storm is usually preceded by certain peculiarities in the dew-point, and the manner in which the particles of dew are deposited on the bulb of a thermometer. The mode of taking the dew-point is to plunge a common thermometer in a little ice, and let it run down 20° or 30°. The manner in which the electricity acts upon the dust and light bodies it meets with in its passage, is simple enough. The particles are similarly electrified and mutually repulsive, and then, together with the whirling motion communicated to them, are whisked into the air. The same takes place when the electricity moves over water. The surface of the water becomes exposed to the electric agency, and its particles, rendered mutually repulsive, are in the same way whirled into the air. At sea the waterspout is thus formed. First of all is seen the cloud descending, and beneath
DUTCH.

DUTCH. This name, in the English language, is given to the people of Holland, who call their own country Netherlands or Netherland. They have occupied parts of the East Indies since the middle of the 16th century. Ceylon was occupied by the Portuguese in 1596, but was taken possession of by the Dutch in 1658, and by the British in 1797. They had small possessions on the continent of India, chiefly near Cochinn. They had taken Malacca, Naming, and neighbouring sites, but some of these were taken by arms by the British, and others were obtained from them by negotiation under the treaty of 17th March 1824.

Asiatic nations have territories great established also in Asia. Houtman of the sultan, the then is comprised in the strait which is called the Malacca, in the Dutch, Dutch and the Dutch. The British at that time to war with his brother Mangkoe Boemi. The war lasted till 1755, and the Mataram territory was then appropriated to the brothers,—Surakarta to the Sultan, and Jokyokarta, with the title of sultan, to Mangkoe Boemi. These two principalities continue independent of each other to the present, although diminished in extent.

The Dutch possessions in Netherlands India comprise subject and feudatory states. The former is Netherlands India proper, and consists of Java and Madura, arranged into 23 civil districts. In the tributary states the old reigning families remain, but in every state a resident is appointed, and under his superintendence the native administration is carried on, much in the same way as is done under similar circumstances in India. Some states, which have not been subdued, are under treaty agreements.

The area of the principal islands of Netherlands India, according to Baron Melvillo Van Carnebo, 445,411 square English geographical miles. Population, 23 millions.

In the year 1880 the population of the two divisions of Netherlands India was as under:

The army of 30,000 men which Holland maintains in these dependencies is entirely distinct from that in Europe. It is under the Minister for the Colonies, and is commanded by a Lieut.-General, whose position is next to that of the Governor-General. The islands have military commands:—

Three divisions in Java, with their headquarters at Batavia, Semarang, and Sourabaya.
One division for Sumatra and its dependencies, headquarters at Padang. The districts of Lampung, Palembang, Banka, Kiow, and dependencies.
The W. division of Borneo, headquarters Pontinak.
The E. and S. division of Borneo, headquarters Tandjermas.
Colchus, headquarters Macassar.
The Molucca, headquarters Ambonva.

The regulars comprise in definite proportions, Europeans and natives. Enlistment is voluntary. The officers of all arms are furnished from the Military Academy at Breda, from non-commissioned officers of the army in Europe, who pass certain special examinations, and from the non-commissioned officers of the colonial army, who pass successfully through the schools. There are also a certain number of officers detached from their corps in Holland for five years, who are replaced during their absence by officers of the colonial army. Of the European rank and file, one half are Dutch, and the remainder French, Swiss, and Germans. In the island of Java are concentrated nearly all the military establishments, and the greater part of the troops.

The native soldiers comprise men from the coast of Guineas, from Congo, from Ambonva, Madura, and Java, and of these the best are said to be the Ambonva and Guineans men. The Schutterij are a sort of national guard, composed of Europeans and natives from sixteen to forty-five years of age; they can be mobilized for service, but not out of the islands to which they belong. The Pradocripts are small bodies of native soldierly, which serve as guards to the residents and Dutch authorities. They comprise about 2000 men, and cannot be sent on service beyond their own districts. Finally, there are the Dyayangescars, a sort of native gendarmerie, commanded by European officers.

The troops kept up by native princes can also be mobilized for service on the Governor-General's orders. These are called Barrisans, and are reported to be brave men. They comprise infantry, cavalry, and artillery, and are paid by the Malay princes.

In 1854, Amboyna, Ternate, Banda, and Kayeli were made free ports.—Dickmore, p. 147;

sessions in the Indian Archipelago; Straits Times;
Civil and Military Gazette; Regriyn's Almanac,
1882.

DUTT, from Datta, a gift, a frequently occur-
ing name amongst the Hindus of Calcutta, as Deo-dutt, Theodotus, God's gift. See Datta.

DWAJA. SANSK. A twice-born man; a man of any of the three first classes or castes of the Hindus, the Brahman, Kshatriya, and Vaisyia, after being initiated into their respective tribes by investiture with the sacred thread, which is called a second birth. Various ceremonies are attendant upon these caste Hindu boys between infancy and the age of eight years. After that age, and before a Brahman boy is fifteen, it is imperative upon him to receive the poita, zornar, janavi, or jhandiam, the sacred thread, which the Brahmanas, in their secret ceremonies, call Yadupavita. The investiture of a Brahman boy, after a variety of preliminary ceremonies, is thus performed. The priest first offers a burnt sacrifice, and worships the salagrama, repeating a number of prayers.

The boy's white garments are then taken off, and he is dressed in yellow or red, and a cloth is brought over his head, that no Sudra may see his face; after which he takes in his right hand a branch of the vilva tree, Agie marmolos, and a piece of cloth in the form of a pocket, and places the branch on his shoulder. A poita of three threads, made of the fibres of the anar, to which a piece of deer's skin is fastened, is suspended from the boy's left shoulder, falling under his right arm, during the reading of the invocations. The father of the boy then repeats certain formulas, and in a low voice pronounces three times, the gniirti O'm! Bhurubhuvani savahii, O'm! Tatsa vichh varennayam, B'hamge devasaya dhimahi dhyo yona Praho dayath. O'm! earth, air, and heaven, O'm! Let us meditate on the adorable light of the divine Sun (ruler), Savitri; may it guide our intellects. After this the suru poita is taken off, and the real poita, or sacred thread, put on. During this ceremony the father repeats certain formulas; the suru poita is fastened to the vilva staff; shoes are put on the boy's feet, an umbrella in his hand, as is prepared for a long journey. The receiving of the poita is considered as the second birth of a Hindu, who is from that time deno-
minated 'dwaaja,' or twice-born. A Brahman boy cannot be married until he has received the poita. The sacred thread must be made by a religious Brahman. It consists of three strings, each ninety-six hatli or cubits (forty-eight yards), which are twisted together; it is then folded into three, and again twisted; these a second time folded into the same number, and tied at each end in knots. It is worn over the left shoulder (next the skin), extending half-
way down the right thigh, by the Brahman, Ksha-
triya, and Vaisyia castes, and in Southern India by the artisans. The first are usually invested with it at eight years of age, the second at eleven, and the Vaisyia at twelve. The period may
DWARITA.

from especial causes, be deferred; but it is indispensable that it should be received, or the parties resisting it become out-castes. They do not consider an individual as fully a member of his class until he has assumed this emblem. It is, in its import, the counterpart of the confirmation of the Anglican Church. Of these zonas, a Brahman wears four, the other privileged tribes but three. Some writers call this the Brahmanical, or priestly or sacredaist, tribe, and it is not being confined to a Brahmin, priestly, but worn by three out of the four tribes of Hindus, and by all the five sections of the artisan class, the kansa of the Hindus, viz. the goldsmith, brazier, blacksmith, stonecutter, and carpenter. The number of three threads, each measuring ninety-six hands, for the sacrificial string, may have some mystical allusion to the ninety-six fixed annual sacrifices. The number three is mystical with almost all nations, and with the Hindus may refer to the same source as the three sacred fires, the three legs of Agni, the triad of divine powers, etc. Ninety-six does not, however, arise from any ordinary process of three, and seven, and two, the distinguishing numbers of Agni’s legs, arms, and faces. —Muir, p. 379; Cole, Myth. Ind., pp. 155, 245.

DWARITA, Adwaitya, and Vasisthadwaitya are three great schools of Brahmanical philosophy. Adwaitya is the doctrine of unity, distinguishing two principles in creation, spirit and matter. It is opposed to the Adwaitya or Monad doctrine, which acknowledges the reality of spiritual existence only. The followers of Madhavacharya, who are Vaisnava sectarians, adopt the Dwaitya or dual philosophy, and maintain that the soul of man is distinct from that of the deity.

DWAJASTAMBHA. Sansk. A flagstaff; a pillar bearing an ensign.

DWAFAKARA. Sansk. From Dwa, the second, and Para, after. The Dwaqara-yuga, in Hinduism, the third age of the world, the brazen age, extending to 864,000 years:

‘The Dwaraka yug! ah thou! —
Preposterous that one bipped vain
Should drag ten housewives in his train,
And stuff them in a gaudy cage,
Slaughters to weak lungs, or potent rage.
One beam dame might wed five men.
True history in sacred terms
This philosophic lore confirms;
For India once, as now cold Tibet,
A group unusual might exhibit,
Of several husbands, free from strife,
Linked fairly to a single wife!
But, lest my word should nought avail,
To fair, to no unholy tale
Attend;—Five thousand years ago,
As annals in Benares show,
When Pandu chiefs with Curus fought,
And each the throne imperial sought,
Five brothers of the royal line
Blazed high with qualities divine:
The first a prince without his peer,
Just, pious, liberal Yudhishthir;
Then Arjun, to the base a rod,
An he favored by a god;
Bhima, like mountain-leopard strong,
Unrivaled in the embattled throng;
Bold Naucul, fired by noble shame
To emulate fraternal fame;
And Scehdeo, flushed with manly grace,
Bright virtue dawning in his face;—
To these a dame devoid of care,
Bhitte Draupady, the debonair,
Renowned for beauty and for wit,
In wedlock’s pleasing chain was knit.’

DWARA. Hind. A gate or entrance. A term applied to the mountain passes leading from the plain at the foot of the Himalaya into Bhutan, also to the rich and fertile level tract itself. The Dwar are occupied by an Indian race. They are 18 in number. Their breadth varies from 10 to 20 miles, and their extreme length 220. They are in a narrow tract extending along the foot of the lower range of the Himalaya, and very unhealthy, and were inhabited by the Mech or Kachari and the Kochh or Rajbans, in all about 37,047. The Eastern Dwaras is a flat strip of country lying beneath the Bhutan mountains, intersected by numerous streams, and overgrown with wild vegetation. The West Dwaras include the tract of country at the base of the Bhutan hills from the Tista river to the Sunkos river on the east. It is about 25 miles broad, and terminates on the northern limits of Rungpore, Kochh Behar. The Bhutan government had been guilty of raids and of grossly insulting a British ambassador, and in 1863 to 1865 the Dwaras were seized and annexed. The Mech are cognate to the Kochh, Kachari, Garo, and Rabha. They are widely scattered over all N.E. Bengal, being able to support life in the malarious Terai that continuously fringes the first slopes of the Himalayas. The social condition of the Mech is very low. They are migratory, and their marriages are by abduction, but they are said to have adopted Rajaswini for its number, assumed by those Kochh who have adopted Hinduism.—Imp. Gaz.; Ann. Ind. Asia, xii. p. 87.

DWARA, a portal, a door, the Celtic Dooras. Amongst all nations of antiquity, the portal had its peculiar veneration. To pass it was a privilege regarded as a mark of honour. The Jew Haman, in the true oriental style, took post at the king’s gate as an inexpugnable position. Natives of India visiting prominent men, or attending court, alight at a distance from the portal. The most pompous court in Europe takes its title from its porte, the bab or door, where, as at Udaipur, all alight. The tripolia or triple portal, the entry to the magnificent terrace in front of the Udaipur rana’s palace, consists, like the Roman arcs of triumph, of three arches, still preserving the numeral sacred to the god of battle, one of whose titles is Tripart, which may be rendered Tripoli, or lord of the three pieces of abode, or cities, but applied in its extensive sense to the three worlds, heaven, earth, and hell. From the Sanskrit Pola, we have the Greek Polis, gate or pass; and in the guardian or Polish, or Dwara palata, the doorkeeper or porter; and the English language is indebted, not only for its portes and porters, but its doors (dwara). Pylas signified also a pass; so in Sanskrit these natural barriers are called Pala, and hence the poetical epithet applied to the aboriginal mountain tribes of Rajasthan, namely, Palipati and Pala-Indra, lords of the pass. Nathdwaras is the most celebrated of the fanes of Krishna, the Hindu Apollo. Its etymology is ‘the portal’ (dwara) ‘of the god’ (nat’h), of the same import as his more ancient shrine of Dwariaca or Dwarka. Nathdwaras is 22 miles N.N.E. of Udaipur, on the right bank of the Bunas. Although the principal resort of the followers of Vishnu, it has nothing very remarkable in its structure or situation. It owes its celebrity entirely to the image of Krishna, said to be the same that had been worshipped at
DWARA SAMUDRAM.

Mathura ever since his deification, between eleven and twelve hundred years before Christ. As containing the representative of the mildest of the gods of Hind, Nat humanoid is one of the most frequented places of pilgrimage, though it must want that attraction to the classical Hind where the caves of Gaya afford.—*Toö's Raja斯坦*, i. pp. 323-589.

DWARA SAMUDRAM, the modern Halibud, a town in Mysore. It was at one time held by the Bellala, a Yadava race.

DWARKA or Dwarka or Dwara Vati, the City of Gates, also called Abdhi-nagar, is at the W. extremity of the Gugera peninsula, in lat. 22° 14' 20" N., and long. 69° 5' E. The great temple, the most famous shrine of Krishna, is at the point of the Saurashtra peninsula called Jagugat Koont. In the time of Krishna it seems to have been a hotbed of drunkennes. The people suddenly fell on each other after a great drinking bont, and many were killed. A storm-wave overwhelmed the city, and destroyed more of them; but Krishna, his brother Arjuna, and a few others escaped. It is one of the seven sacred cities of the Hindus; population 4712. At Dwarka the god of thieves is called Bucha Trivernara, or of triple energy, the Hermes Triplex, or three-headed Mercury of the Egyptians. Dwarka, in Obkanra, was taken 26th November 1800.—*Toö's Raja斯坦*, i. p. 75; Wheeler's *Hist. of India*.

DWARKANATH TAGORE, an enlightened Hindu and religious reformer of Bengal, who travelled through Italy and France on his way to England. He returned once to his native country, but again revisited England and died. He took with him several medical pupils to be educated there. He adopted theical views, and his example originated the Hindu sects known as the Braho-Samaj and Vebo-Samaj.

DWIPA. SANSK. An island, from Dwi, two, and Ap, water; also an extensive region or continent. The cosmogony of the Agni Purana divides the world then known to the Hindus into seven dwipas or continents.—(1) Jambu-dwipa, (2) Alaksha, (3) Samnali, (4) Kusa, (5) Kranucha, (6) Saka, (7) Pushkara. Jambu-dwipa, according to the Hindus, the division of the world in which India lies, was so named because the jambu tree grows in it. Saka-dwipa, whose inhabitants descended from Bupha, are termed Saceswara, i.e. Saka lords. Bupha's offspring or descendents were Julud, Sookmar, Manichuk, Koorn, Ootures, Darbeeka, Drooma, each of whom gave his name to a Khand or division (qu. Sookmar Khand). The chief ranges of mountains were Julud, Krait, Sinanah, Indue, Amki, Rim, and Kesari. There were seven grand rivers, viz. Mug, Mugud, Arverna, etc. The inhabitants worship the sun. We must believe that this Saka-dwipa or Sacatai is the Sythian of the ancients; and the Saceswara (the Saca of Menu), the Sacc so well known in western history, the progenitors of the Parthians, whose first (ad) king was Arsaca. The sun-worship indicates the adorer of Mithras, the Mitra or Surya of the Hind; the Arverna recalls the Araxes applied to the Jaxartes; while Julud, the proper name of the son of the first king of Saka-dwipa, appears to be the JuludRemarks on the Tatar historian Aboulizi, who used the same term as does the Hind, to designate a range of mountains. Whence this identity between Prurane and Tatar cosmography?

DYES.

Dyeing is the art of imparting to wool, hair, silk, cotton, linen, leather, etc., colours which resist the operation of washing, and the wear to which they are subject, when made up into articles of furniture or clothing. The art was known at a very early period. Jacob made for Joseph a coat of many colours (Genesis xxxvii. 3); and in Exodus frequent mention is made of the ornaments for the tabernacle, as being composed of blue, purple, scarlet, and fine linen. About N.C. 1400, the Mahabharata describes the colours of garments worn by men and women, which could only have been produced by the indigo, which was known by the ancients to yield the blue dye. The term Dye, in the first use to designate the cloth, and in the present meaning of the word, i.e. to dye. The art of dyeing was found in India, the place which has been visited by Arab traders, and is the source of the wool, and the dyeing of the henna, turmeric, and indigo. The dyeing of the indigo is first worked up into an extract, and then into various colours, and finally into the proper article. The colours are made by mixing the extract with various substances, and are called *Dyeing*.

In the Bagh caves in Central India, which are nearly as old as those of Ajunta, Dr. Bhau
Dyes. in but and they played in that part of India, from B.C. 200 to A.D. 800 or 1000; and besides garments of many colours, they show coloured borders and ends to white clothes. Pliny mentions the flags of various colours displayed by the Indians; and the Egyptians may have learned the art from the Hindus, from whom they doubtless obtained the alum celebrated by the name of Egyptian alum, the manufacture of which is still carried on in Cutch.

We read also in 2 Chronicles ii. 14 of Solomon having sent to Tyre for coloured linens, and the king of that country sent him a man skilful to work in purple, in blue, and in fine linen, and in crimson. Still nearer the Christian era, Ezekiel (593 B.C.), in his prophecy against Tyre (xxvii. 7), speaks of "blue and purple from the isles of Elahish." The Tyrian dye is supposed to have been obtained from two molluscs, described by Pliny under the names phurna and buccinum. Their colour was durable, but very costly. Pliny states that a pound weight of the double-dipped Tyrian purple was sold in Rome in the time of Augustus for 100 crowns (equal to about £30 of our money). Citizens of Rome wore purple attire until the time of the emperors, when the use of purple was restricted to them; and the manufacture languished until the 11th century, and then became extinct. In the 17th century the art of dyeing purple was revived by Mr. Cole of Bristol, and in the 18th century by M. Reaumur of France; but by this time finer colours had been discovered, and cheaper processes invented. We learn from Pliny that the competitors in the circus were clothed in dresses of green, orange, grey, and white; but the art of dyeing was lost at Rome after the invasion of the northern barbarians in the 5th century. About the end of the 12th century, Florence became celebrated in the art, and in the early part of the 14th century numbered not less than 200 dyeing establishments. The discovery of America supplied Europe with a variety of new colouring matters, such as indigo, logwood, quercitron, Brazil-wood, cochineal, arnottio, etc. Before the introduction of indigo, wood was used in Europe for dyeing blue; and the cultivators of this plant endeavoured to prevent the use of indigo, which, by a decree of the German Diet in 1577, was declared to be "a pernicious, deceitful, eating, and corrosive dye." The introduction of logwood was opposed from similarly interested motives. Its use was prohibited by a statute of Elizabeth, under heavy penalties, and all of it found in the country was ordered to be destroyed. It was not until the reign of Charles II. that its use was permitted. The method of dyeing Turkey-red—one of the most durable of colours—early discovered in India, was afterwards practised in other parts of Asia and in Greece. About the middle of the 18th century, some Greek dyers established dyeworks for this colour in France, and in 1765 an account of the method of producing it was published, by order of the French Government. About the end of the 18th century, a Turkey-red dyehouse was established in Manchester by a Frenchman, who obtained a grant from the British Government for the disclosure of his process, which, however, was not very successful. A better process was introduced into Glasgow by a Frenchman named Papillon; but before this, Mr. Wilson of Ainsworth, near Manchester, had obtained a process from the Greeks of Smyrna, which he made public. Still more recently, in the middle of the 19th century, a discovery by Faraday, and, after him, by other chemists, of a series known as the aniline dyes, has lessened the value of the madders, cochineal, turmeric, and safflower.

India and China furnish all the raw materials for a great variety of colours; and as indigo undergoes a considerable degree of chemical change during its formation, as well as while applied to the dyeing of its blue colour, the people must have early known how to manufacture the several salts which have long been employed as mordants. Mr. Rotole does not think that any durable colours are communicated by natives of India to cotton cloth, except reds and blacks, and modifications of the one; the other; their deep blues, yellows, and other colours are lost to him very fugitive.

The success which the art attained in India is owing chiefly to the abundant supply of materials, whilst the simplest possible form of working these materials has been adopted. The forest products in many places are collected by the dyers or their families. The myrobalan is often left to rot on the ground. The dyers conduct their operations on some river bank, or close to a well with a plentiful supply of water. A fireplace of bricks, and mud utensils of simple make, a large cistern for the principal dye-beek, a hollowed stone for a mortar, and such-like, are enough for the dyer in India, and are what his fathers have used for ages. Yet with these simple means, the Indian dyer, without any great knowledge of chemistry, works with results which were once the admiration of the world, and are even still sufficiently creditable to him. In the west of India, for a time, the Khatri engrossed the art to themselves. But the trade was also taken up by Mahomedans, who are in India designated Rangrez. In the early days of European intercourse with India, the dyed cloths of Gujerat were received with great favour in the Portuguese market of Goa; and colonies of dyers were invited to settle under European protection at Din and Daman, where dyeing was for a time largely carried on. But the dyers of Western India have fallen behind their brethren in Hindustan, especially those in the Panjab, Kashmir, and Sind, the last country having always been famous for its pre-eminent in this respect.

The dyeing industry in the N.W. Provinces is conducted in two distinct branches, each of which is followed by a separate class of Mahomedans. These are the Rangrez, who dye in plain colours, and the Chippies, who are calico printers. The former generally dye cloths which customers send them; the Chipi purchase plain fabrics, which they print and sell. The Chipi sometimes also dye plain colours, such as the khara (coarse red) cloth of Man Ranipur, and the salu, which is a finer cloth, dyed red. The Rangrez also produce varieties of colours by combinations of different dyes.

In the calico printing of India, the apparatus consists of some patterned wooden blocks, and an earthen pot, on which a light convex bamboo
frame-work is fitted. Over this is placed a thick cloth, generally of wool. The cloth to be printed is stretched on a padded board, and the colour is hand-printed on the cloth with the dye, or a mordant only is printed, the colour being subsequently applied by boiling.

The carpet-weavers of Bangalore, in the most simple manner, obtain their various soft shades, from a light greyish-white through brown and dark grays to black, by sorting the natural fleece, and by their combination are produced the harmonious effects observed in the Bangalore carpets. The bags of wool, coming in just as they are clipped, are picked over by women and boys, and the different shades of wool separated, to be spun into different-coloured yarns. These dull colours forming the groundwork of the carpets, are relieved to a certain extent by indigo blues and tumeric yellows, and by a dull green when the two are combined. But the bright purples, reds, oranges, and greens, observable on all but the plainest carpets, are now aniline, and the juxtaposition of these fugitive colours with the absolutely fast shades of the natural fleece is very curious. The aniline colours are floating. In the bright light of India they go in a few months, or even days, if exposed to direct sunlight; but a little bright colour with no increase of prices tempts many purchasers.

Most of the colours used in dyeing are vegetable, a few are from the animal and mineral kingdom. The most vivid and brilliant vegetable colours, such as those of flowers and other parts of plants exposed to the light, are small in quantity, very fugitive, and difficult to separate. The colouring matters of plants capable of being isolated, are mostly yellow, brown, and red. Blue dyestuffs furnished by plants are indigo and litmus. No black vegetable dye has been isolated. Most vegetable colours are soluble in water, and those which are not so can be dissolved in alcohol, ether, or the fixed oils. Vegetable colours are permanent in dry air, but they gradually fade in moist air, especially under the influence of light. The blue of most flowers is converted into red by an acid, and into green by an alkali. The methods of dyeing vary with the nature of the dye-stuff, and also with that of the material to be dyed. Different methods are adopted for cotton, silk, and wool.

In India, the secrets of the mixtures of colours, the methods of extracting the dyes, of the use of mordants, and of producing every variety of tint that may be necessary, descend from father to son. The Indian dyers have no chemical processes, as known in Europe, but safflower, madder, tumeric, indigo, are used to produce the brightest and most delicate tints of scarlet, pink, rose colour, crimson, purple, yellow, orange, and green. The colours are for the most part very pure and beautiful, and the combinations of colours and tints are most ingenious. The people do not admire brilliant or gaudy colours for garments. The tints in these have almost a neutral effect. Sober greys, dull but rich madder and cochineal reds and crinumis, neutral grey, browns, greens, and purples, with dull but rich yellows, are arranged by the dyers so as to produce richness and variety of effect, with the utmost harmony of combination. Bright or gaudy colour is used only sparingly, and then only to produce the contrast which may be necessary.

Whatever may be the colour or tint or pattern used, whether in monotone, striped, or checked, perfect harmony exists, and the effect is never glaring or in bad taste. The dyes are either permanent or temporary. In the former are the yarns for weaving both silk and cotton cloths; in the latter are white cloths, such as muslin; turband, scarfs, and the silks are dyed in the piece, to suit the tastes of their customers. The latter are purposely kept unfixed, as a scarf or turband can be more easily and perfectly washed and retained than a permanently dyed cloth be cleansed from impurities. Goats' dung is largely employed. Women's garments are usually woven with yarns with fixed dyes, as they have to undergo almost daily washing and exposure to the sun in drying, yet the colour almost never fades, but seems to grow brighter and clearer from constant exposure. The strong satins, striped and plain, called mushroom and hemmoo, used for women's trousers and petticoats, as well as by men for trousers and other garments, must needs be of permanent colour, for repeated washing. In most parts of India, Mahomedan ladies wear nothing but this material for their nether garments, which are sent to the wash with as much confidence as if they were cotton, and with as little injury.

The natural patterns of the Panjib, Baluchistan, and Sind, are large and bold, but the colours are harmonious. The favourite artistic Coocandra rugs is one of the most pleasing of the Indian carpets. The short, even-piled carpets of Turkomania and Kerman have a glorious elaboration in colour and design.

The mode of printing in colours is by block printing and knot-dyeing. For the former process, the designs are usually cut out from teak-wood (Tectona grandis), the pattern standing out in high relief, and the hollows being cut very deep. Besides the numerous patterned blocks called bibin, the implements required by the calico printer are, the gadi, which is a wooden tray, in which three or four layers of country woollen cloth (dhabaddi) are laid, and which are kept soaked with the intended colours. Besides, there is a table on which are stretched three or four layers of thick cotton cloth, and on the top a woolen cloth, over which lies the cloth intended for printing. The printer usually squats with the table in front of him, on which he works from morning to night. The engraved surface is dipped in a preparation of the dye, to which a mixture of gum-arabic has given a consistency. When the cloth has to be printed in metallic leaf, the block is dipped in gum and impressed on it, and tin, silver, or gold leaf is then stuck on to the adhesive design. Another way of printing, called 'khah,' is to charge the blocks with putty, and cover the impression with tale.

The calico printed goods of Sind rank the highest, and next to them those of Dina and Baman, whence issue bed-sheets, saris, chotis, and children's cloths of divers kinds. There is often a wonderful combination of colours in the patterns of these goods.

Knot-tying is either done on a plain or coloured ground, according to the kind of pattern required. The lines are printed with an aqueous solution of Indian earth (red ochre), so as to be easily discharged during the dyeing process. The tye
keeps the following nails long, viz. of the forefinger and the thumb of the right, and of the thumb, the forefinger, and the middle finger of the left hand. To tie the cloth, he takes either a thin or thick cotton yarn, according as the design is in fine or large patterned spots. At the place where the spot is to be, the cloth is raised up into a fold by means of the pointed long nail of the middle finger, and the fold is now caught between the long nails of the forefinger and of the thumb of the left, and a knot tied by means of the yarn held between the long nails of the right hand, by passing the yarn quickly four or five times round and round, and finishing the motion with a knot, by which the yarn is secured to its place. This process is repeated on one spot after another with the same thread so quickly, that a practised hand goes over an area of cloth extending 3 feet square in the course of 13 hours. A close pattern is workable during the same time only to the extent of about 1 foot square. The daily earning of the tyer is estimated at 1 rupee a day. After the knot-tying is finished, the silk cloth is taken to the dyer. To produce a black ground, it is dyed red in cochineal. The steeping in the dye-beck is repeated twice, so that the red colour penetrates the thread and fixes itself into the white spots (kanda) covered by the thread. Once steeping fails to allow the penetration. For large spots (kanda) it is necessary to dye red three times. The cloth is now submitted to the indigo vat, then washed and dried. This process appears to have been first devised to overcome the difficulty met with in the production of white spots on a dark-dyed ground. It is largely practised in Gujerat, Cutch, Sind, and Bombay, and is scarcely met with in other parts of India. From this it appears that it had its origin in Gujerat, Cutch, and Sind. Knot-dyed goods, which are generally handkerchiefs, sarees (women's scarfs), bodicas, petticoats, trousers, borders, turbans, etc., and executed chiefly for consumption among the Gujerati and Parsees. They are manufactured either in cotton or silk, the latter kind being common among the Parsees. The patterns produced are either in dotted lines, or in single or grouped spots, the spots varying in size from that of a mustard seed to that of an almond. They are either round or square, according to the way of tying the knot.

Besides these, there is the putting printing, a laborious process, peculiarly Indian in its conception, consisting of designs in putty executed over a dark ground, without the use of the stamper. Then we come to printing in metallic leaf, by which process cloths are printed with gold, silver, copper, or tin leaf. The latter patterns are in Upper India. The process is similar.

Dyeing of silk is carried on in Bombay principally by Hindous, who are natives of Sind. The raw silk comes from China, Bengal, and Persia, the first being the most pure in colour, and is strong and lustrous. In the Panjab and Kashmir, woolen fabrics of beautiful colours are extensively manufactured. Dyeing in ivory is a branch of the art which is practised to only a small extent, in Bombay by Parsees, but in Surat and other places by Hindus chiefly. The process is not so complicated as in the other branches of cotton, silk, or wool, and the colours produced are few, only red, deep green, parrot green, yellow, and black being the colours obtained, but fancy colours may be produced by the application of wax as a resist on the same principle as is done in calico printing.

Europe can no doubt work by cheaper processes. For instance, in the early part of the 10th century, the bandana (bándhna, to tie) handkerchief of India were in great demand, and were there dyed by the knot process. The demand stimulated competition and improved processes in Europe, and presses adapted for them, which could generate a pressure several times greater than 300 tons, so as even to bend the iron sides, which were 6 inches thick. A press cost £1000. They completely superseded the Indian plan of knotting to prevent the colouring matter having access to the cloth.

The following mineral and vegetable dyes are in general use in India and Southern and Eastern Asia:—

Dyes.

DYES.

L. argentea.
L. cinerea.
L. caerulea.
L. dispera.

Thespesia populnea.
V. acalyclus.
V. myilung of Akyab.
Wrightia tinctoria.
Toddisia aculeata.
Xanthochoria.

Acacia Arabica, the babli tree; its bark is used for tanning, barking sails, nets, and fishing lines. With sulphate of iron it yields a black colour, and with alum a brown colour, both on cotton and wool.

Of Burmes green dye-plants, the turmeric and the leaves of the soap-acacia, Acacia rugata, afford a beautiful green dye.

Acids obtained from the leaves, flowers, and fruits of the tamarind, mango, the lime and citron, are much employed to assist in fixing the dye on the cloth; safflower is almost always used with an acid of some sort.

Adenanthera pavonina wood dyes red.
Adhatoda vasica leaves in decoration dye yellow.
10 lbs. are bruised, soaked, and boiled in 16 lbs. of water, till half of it evaporate. Alum, lime, and citron juice are the mordants, and the cloth is three times dipped into it. It yields a dark blue with indigo.

Egle mammelus, the brbal, is a cultivated tree; the rind of its fruit is used with myrobalan by calico printers. The rind and the leaves produce bright yellow dyes.

Albizza odorotissima bark is boiled, in Assam, with the leaves of the dagal tree (Tarecholmays pulcherrima), and gives a brownish dye.

Alpinia galanga, the Kulinjan. A decoction of its wood is used along with myrobalan.

Alum is largely used as a mordant with the colours yielded by turmeric and madder. Alumina earth, called chaun in Mysore, is largely used in dyeing cotton cloth in permanent colours.

It is a clay impregnated with alum or soda, or both. Alumina, in combination with a vegetable dye, constitutes the lake class of fast dyes, rendering the original colours more vivid and durable.

Anchusa tinctoria root is the alkanet or dyer's bugloss. In the Panjash, a root to which the name of alkanet is given. It is probably the root of Onosma emoli, Wall., as other species of Onosma, also Echium rubrum and Lithospermum tinctorium are in Europe and elsewhere substituted for alkanet.

Aniline dyes. Faraday's discovery of benzol in 1825 led to the knowledge of the aniline dyes. By the action of nitric acid, benzol is converted into a dense yellow oil, called nitro-benzol; and by the action of nascent hydrogen, this new compound is transformed into aniline. The names of Unverdorben (1826), Runge (1855), W. H. Perkins (1855), Grebe and Liebmann (1868), and Baeyer (1878), are all honourably connected with the subsequent discoveries of multitudinous colours, with a great increase in the beauty and tintorial effect of the dyes obtained, and with a diminished cost of their manufacture. At the present time (1883), every colour, and all tints and shades of colours, are produced from aniline. The processes employed and the combinations formed are very numerous, and the commercial names given to the new dyestuffs may be said to be endless. The aniline dyes are cheaper than those obtained from cochineal, madder, safflower, and
turmeric, and are more easily worked. The aniline
dye is even finer than that of the safflower,
and gives a greater variety of shades. The aniline is,
in Europe, displacing the turmeric, as it furnishes
a great variety of the shades of yellow. In Europe,
the dye from the madder and manjith roots has
been largely displaced. In the year 1877, 69,166
cwt. of these two imported, went into Great Britain,
but in 1881 only 12,892 cwt. Even cochineal
is being displaced, as aniline scarlet is much
cheaper and quite as fine. The imports of aniline
dye into India for the years ending 31st March were—

Arsenic is principally employed in the arts to
produce a vivid and showy shade of green,
which has superseded the less decided tints of
nature. The form in which it is generally
employed in Europe is that of a green powder,
which is commonly known as emerald green,
and to chemists and writers on science as
Scheele’s green, after its discovery. Another
kind is also called Swinifurth green, from a town
in Franconia, where it was extensively manufac-
tured on its early introduction. The chemical
composition of Scheele’s green is arsenious acid,
six parts; oxide of copper, two; acetic acid, one.

Yellow pigment, or hartal, a sulphuret of arsenic,
is used in dyeing a yellow colour.

Artocarpus integrifolia is the jack tree; its
wood is used for dyeing yellow. The yellow
orange colour of the clothes of the phonugye ascetic
priests of Burma is obtained from it.

Baccaria sapida, the letuku of Assam, is a
small tree. Its bark is used as a mordant with
the roots of Morinda angustifolia.

Berberis aristata, B. Asiatica, and B. lycium, all
yield the russet yellow dye.

Bixa orellana yields the arnotto; it is used to
impair a bright orange colour to silk goods, and
to afford a deeper shade to simple yellows.

Bombax Malabaricum is supposed to yield one of
the substances known as mochras, small pieces of
a dark-brown resin-like looking substance, generally
mixed with some fragments of bark. The other
mochras is in large opaque yellow pieces, curi-
ously convoluted, and is supposed to be an exu-
dation from the areca catechu palm.

Borax is occasionally used with turmeric in
calico printing.

Butea frondosa and B. superba yield the tisso
flowers, which are used to dye yellow.

Cassapinia sappendow, adding lac, and with
alum as a mordant, dyes woolen and cotton stuffs
of a dark red and shades of red. The chips are
soaked for two days in water with lac and alum,
and then boiled, and the liquid used as a dye.

Calyssacon longifolium is the suringa of the
Bombay Presidency. Its bark and powdered
roots are used for dyeing. In Kaira and Surat
it is largely used, Surat utilizing 1803 maunds
yearly. Its flowers are employed for dyeing silk.

Carthamus tinctorius has small leaves and an
orange flower. C. oxyacantha, with larger leaves
and a yellow flower, is a native of the Caucasus.
They furnish the safflower of commerce. C. tinc-
torius is cultivated in China, India, Egypt, America,
Spain, and the whole of the Indian Archipelago.
The flowers contain two pigment principles, one
known as safflower yellow, which is extracted
by pounding and washing the dried flowers; the
other is safflower red, or carthamine, which is the
dye of commerce. When a weak soda solution of
carthamine is left in contact with oxygen, it first
becomes yellow and then red, and on saturating
this red liquor with citric acid, red carthamine is
thrown down. The affinity of carthamine for
cotton and silk is such, that when it is recently
precipitated, these substances immediately com-
bine with it, and become at first rose red and
afterwards of a fine red, so that they may be
thus dyed without the intervention of the mordant;
the stuffs so dyed are rendered yellow by the
alkalies, and the colour is to a certain extent
restored by the acids. Carthamine is never used
in dyeing wool. When it is precipitated from
concentrated solutions, it furnishes a liquid paint,
which, evaporated upon saucers, leaves a residue
of somewhat metallic lustre, used as a pink dye-
stuff, and which, mixed with finely-powdered talc
and dried, constitutes common rouge. Safflower
yellow is soluble in water. When the infusion is
evaporated, it leaves an extract very soluble in
water, precipitated by acids and soluble in alkalies.
It is not reddened by oxidizing agents.

Carthamine yields six or seven distinct shades of
red, such as pink, rose, crimson, scarlet, etc. In com-
bination with the flowers of Nyctanthes arbora-bris-
ta (harsinghar), it yields a golden orange, a deep
orange, and a salmon colour; with turmeric it
gives a splendid scarlet and other tints; and when
it is combined with indigo, Prussian blue, etc.,
a series of beautiful purples, a delicate mauve colour,
and a deep purple are produced.

The crimson dye is said to attach without
the aid of a mordant; but otherwise, of all the more
or less beautiful tints produced, scarcely one will
stand washing without being fixed with mordants.

From February to May the flowers are picked
off each day as they appear, leaving the flower-
heads on the stalk. All that is detached is the
fragile-looking corolla, which issues from the
summit of the prickly teats-like flower-head. If
they be intended for sale to the India dyers, they
are simply dried; but if for export to Europe in
the form of the safflower of commerce, the florets
are dried with water and pressed into lumps.
A mat as a strainer is stretched on a wooden
frame; on this the lumps of florets are laid, and
water is slowly poured over them, while a man
stands between them with his feet, supporting himself
on two sticks as crutches. In this way the yellow
colouring is eliminated from the flowers, the
presence of which would detract from the beauty
of the crimson tint for which they are chiefly
prized. When the water comes clear through the
strainer, the process is complete. The flowers are
then made up by hand into round flat cakes, the
water squeezed off, and they are dried in the sun.
In this form they are known as the safflower of
commerce. Exports from India have been:—

Cassia auriculata, the avari shrub, is common in
all the south of India. Its bark is largely used
as a tan. It takes the place of oak bark. The
flowers yield a yellow colour, and the bark is used
with myrobalsan as a dye for giving a buff colour
to leather.
Cassia tora seeds are used as a yellow dye. They are said also to form an ingredient in dyeing blue with indigo. About seven immersions are required to fix the colour.

Casterina equisetifolia and C. muricata have been used about 1854 by M. Jules Lépine of Pondicherry, who made an extract from the bark which was treated by bichromate of potash. With alum as a mordant, it gave a reddish mauve, and with iron, a black colour. By simple exposure to the air, a mauve red was produced, which stood the washing well.

Catechu is an extract from the wood of the Acacia catechu. In commerce it is also known as terra japonica, and gambier also is often so named; have been used in India to give a brown dye to cotton; and have been extensively employed in the calico-printing works of England. The salts of copper with sal-ammoniac cause catechu to yield a bronze colour, which is very permanent. The proto-murinate of tin produces with it a yellowish brown. A fine deep brown hue is also produced from catechu by the perchloride of tin, with an addition of nitrate of copper. Acetate of alumina gives a brown, and nitrate of iron a brown-black. For a golden coffee-brown, catechu entirely superseded madder, one pound of it being equivalent to six pounds of that root. It is prepared for dyeing purposes, by being steeped in water with a little lime; the solution is then strained off, and is ready for use. The dyeing principle is catechene, which is insoluble when oxidized, to effect which, in Great Britain, a salt of copper along with sal-ammoniac is used. From 1877 to 1881, Great Britain imported annually about 30,000 tons of catechene and gambier.

Cedrela toona has white fragrant flowers, which yield a sulphur-yellow and orange. The yellow dye is extracted by boiling in water till three-fourths of the water is evaporated.

Chavica betlo is the pan or betle-leaf plant. The leaf is said to be used in Kanoj for colouring the border of chintz made there, called fard-pakhta.

Cinnabar, a sulphide of mercury, the shingar or vermilion of the bazaars, ground and mixed with water, imparts a fresh pink tint to cotton cloth dipped into it.

Cochineal is a foreign dye from the Coecus cacti. The importation into British India of cochineal in 1880-81 was 4182 cwt., and in 1881-82, 2886 cwt. From 1877 to 1881, Great Britain imported about 30,000 cwt. annually. The aniline dyes have not seemingly affected it.

Cocosnut rind produces a dirty brown (khaki) colour. Lime, soda, and alum are used as mordants. The rind is powdered, and soaked for a few days in water, and afterwards boiled. The stuff is washed in this water, and a subsequent wash in lime-water gives the cloth a red tint. For brown tints, lime-water is not used. Dipping in an infusion of myrobalans renders these colours darker and faster.

Copper, sulphate of, is used with lime to produce a shade of light blue, principally in leather-dyeing. Verdigris, a subacetate of copper, the zangar of the bazaars, is occasionally used in calico printing.

Coscinium fenestratum, a climber of the western forests of India, grows wild. Its roots and stems contain a quantity of yellow colouring matter similar in property to that of turmeric, and yields its colour to water; sells at 3 to 5 annas the pound in the bazaars of S. India. It is used also medicinally.

Croceus Cashmirianus of Kashmir yields the saffron. The saffron of C. sativus, as a cosmetic, is largely imported into India from Europe.

Curcuma zerumbet root, powdered and mixed with the powder of sappan wood, forms one of the abir red powders which Hindus throw about during the holi festival, as with the Confetti at Rome.

Cyperus longus and C. pertennis furnish the nagar-motha roots used by dyers to perfume cloth.

Datisca cannabina roots give a yellow dye.

Delphinium ajacis furnishes the aspharg dye; a decoction of the flowers and stalks give a sulphur yellow dye to silk, known as gandhak; also used in calico printing. D. speciosa flowers are similarly used.

 Diospyros mollis. The celebrated shan black vegetable dye is made from its fruit. It grows on the mountains that separate the province of Tavoy from the Siamese territories. Isolated plants may be seen in the gardens of Tavoy and Moulmein.

Earl. A soft, drab-coloured kind of fuller's earth, called Multani mitti, is used in the Panjab for dyeing cotton cloth various shades of buff and brown. It is also used in lieu of soap for washing the hair and body.

Black mud from the bottom of tanks and old rice swamps, with the gum of Acacia Arabica and myrobalans, is used as a dye to produce a shade of blue-black. It is used alike for coarser cottons, blankets, and carpets, and for the finer silks. The fabric is dipped in the mud and a decoction or infusion of myrobalan.

Emblica officinalis produces the Aonla fruit, which yields a blackish dye. It is pounded and boiled with water, and the cloth is dipped into the decoction to obtain the colour called abinsi, a shade of blue-black. When mixed with myrobalan and sulphate of iron, a black colour is obtained. The leaves are used for tanning leather, and cost at Rs. 4 the cwt.

Gardinia jambolana bark is used as a mordant for blue or black dyes.

Euphorbia tirucalli is the milk-hedge plant of Southern India. Its ashes are used as an alkali in dyeing, and form an ingredient of the red dye with clay-root. It is also said to enter into various other dyeing receipts.

Ficus religiosa. The pipal tree roots are boiled in water, and with alum imparts to cotton cloth a very pale pink colour.

Garcinia gambogia. The Toung-tha-lai or Pay-yai-shin of the Burmese, yields a gum-resin which can be dissolved in spirits of turpentine, and affords a beautiful permanent yellow varnish for metallic surfaces.

Garcinia mangostana, the mangoosteen. The rind of its fruit is used for dyeing black.

Gardenia floridana. In Japan, materials for dyeing are taken from a species of Betula, and from the Gardenia floridana.

Glycyrrhiza glabra is the liquorice plant. Its wood is used in calico printing in the Panjab.

Gossypium Indicum, the cotton plant; its flowers are used in the Manipuri district as a yellow dye.
Grisea tomentosa, a shrub of all India, yields the red godari or dhauri flowers, and these and the leaves are used in dyeing—the leaves in dyeing sleepy-skins and leathery red, and the flowers (dhauri) in Northern India, along with morinda bark, also as a red dye. In Kandah the flowers form a considerable article of commerce inland as a dye.

Hedichium spicatum, the Ka-pur Kachri, grows in China and the sub-Himalayan forests. It is made into a decoction along with Charilia, Parmelia Kantschadalis, and Nagor-matha (Cyperus longus), and used in dyeing and calico printing to impart a fragrance to the cloth. It is also used, like camphor, to preserve fabrics from insects.

Hydrotis umbellata of Lamark is the Oldelandia umbellata of Linneaus. It furnishes the chay-roots, extensively used by dyers in the south of India. It has been tried in Great Britain, but has not been successful, owing, as it is supposed, to deterioration of the chay-root during the voyage.

Hibiscus rosa-sinensis, the shoe flower. Its root is a purple, and a purple juice is employed for dyeing a lilac colour, and for blackening leather. It has been found useful as a litmus.

Holigarna longifolia, the Thit-kha-ya of the Burmese, is one of the black varnish trees.

The Indigo of commerce is obtained in different countries from species of Indigofera. Since 1878, an indigo has been chemically produced, but not in commercial quantities. I. tinctoria of India, Mauritius, Madagascar, and St. Domingo, furnishes the largest quantity of indigo. The plants called in India I. anil and I. pseudo-tinctoria are supposed to be varieties of I. tinctoria. It is used principally as a blue dye. From 1850-51 to 1860-61, its export from India ranged in value from £1,734,338 to £2,424,932. In the 7 years 1875-76 to 1881-82, the value of the indigo exported from India has run up to 4½ millions sterling:

- 1875-76, 110,342 cwt. Rs. 2,57,50,053
- 1876-77, 106,394
- 1877-78, 108,405
- 1878-79, 106,651
- 1879-80, 106,829
- 1880-81, 106,555
- 1881-82, 186,500

In the five years 1877 to 1881, the imports into Great Britain ranged from 58,283 to 81,088 cwt. Manilla indigo is a liquid extract. Formosan indigo is an excellent blue dye, but as imported into China it was much adulterated with earth and refuse sugar. In Pech-chih-li, a very good indigo is sold under the name of king-tien.

Isatis tinctoria, the woad of Europe, yields a blue dye; another species, I. indigotica, is named as a plant of Shang-hai and Chusan; and I. tinctoria, under the name of tien-tsing, is also said to be cultivated in China.

Iron oxide, with myrobalans, as with tannin and gallic acids, produces black. Sulphate of iron, in particular, is useful, and it is very extensively used in combination with sugar (charred), and sometimes with myrobalans. It is also used with other substances for various colours. With myrobalans it produces a greyish, purplish black dye.

Iron, impure sesquioxide, in the form of goa or red ochre, is abundant in many parts, and is extensively used by Hindu devotees for dyeing their clothes a dull orange colour; and is used largely by dyers for several other colours. The earth is simply powdered and mixed with water, into which the cotton cloth is fixed. Red ochre of a lighter colour than goa, is known as himji; and yellow ochre (hydrated sesquioxide of iron) is occasionally used as a dye, under the name of ramraj, also called zard or pili mitti.

Jatropha curcas, the physic nut. Its juice or oil boiled with oxide of iron dyes black.

Jatropha glandulifera grows wild throughout India, and its leaves are said to yield a green dye of great beauty for cotton cloths.

Justicea sp. According to Mr. Fortune, near Ningpo, a bastard species of Justicia furnishes much indigo. The plants being thrown into pits in the open field, and filled with water, after the rotting of its herbage, lime is added, and the liquid thoroughly mixed up and beaten; the water is then drawn off, leaving the thick indigo paste at the bottom to dry, preparatory to being packed in bamboo baskets. The froth rising upon these pits of liquid is collected and made into an extract, called tien-hwa or ts’ing-tai, in imitation of a powder formerly brought from Persia, and in great repute as a paint, and a specific medicine.

Ka-bi-ii of Akyab is used to tinge fishing nets a brown colour.

Khandelia Rhedidia of Tavoy; its bark is used to dye cotton thread of a dirty red colour.

Lac. Coccus laca, the lac insect of India, is found on many trees, but the best of its produce is on the Butea frondosa, Ficus religiosa, and the Schleichera trijuga, and Vatica laccifera. When the female is about to lay her eggs, she secretes a peculiar glutinous substance from the margins of her body, which in the end covers the whole insect as with a cell. When hardened by exposure to the air, this substance becomes of a more or less deep red or orange colour, hard, and translucent. This is lac in a crude state, and it often entirely covers a branch. The lac or resinous incrustation is separated from the wood, converted into shell-lac, and cakes of lac-dye formed. It has always had competitors with cochineal and other dyestuffs, but the aniline dyes have now almost driven the lac-dye out of the market. The quantities and values of the exports from India of lac and its products were as under:

In the five years 1877 to 1881, Great Britain imported from 51,159 to 104,273 cwt. of shell-lac, seed-lac, and lac-dye.

Laurus cinnamomum, tejpat; its leaves are used with myrobalan.

Lawsonia inermis. Mahommedan women in Asia use the leaves and shoots for dyeing their nails red, also the palms of the hand and the soles of the feet. The leaves are beaten into a pulp with rice-water, and in that form applied, and the following morning washed off. The manes and tails of the horse are stained in the same manner; sometimes men dye their hair.

Lichens of the mountains of Ceylon, the Neill-cherries, the Koondah hills, and the Himalayas furnish dyestuffs.

Parmelia perlata, P. Nepalese, a yellow dye, and P. borreti, a deep brown dye. Sticta orygonosse and several other species give a beautiful pink dye. Ramalina farinacea is used for food; Ramalina vulpina yields a fine deep yellow dye.
Lichens of the Koudahs are the Cetraria glauca and another species, Lecanora Tarta, Cygorrhiza deusta, Cladonia rangiferina. At the Exhibition of 1851, the Parmelia perlata sent from the Neighbouries and Ceylon was valued at from £195 to £225 per ton; and the Rocella fusiformis sent from Ceylon at £380 per ton.

The Chulchulicara of the Panjab is a mixture of dye lichens, the Parmelia Kamtschaladis, P. perlata, and its variety P. sorediata; Unsea florida, Ramalina calicaris, and Physicia leucomea. Lime is used in calico-printing in combination with gum as a resist paste. It is also employed with sugar to excite fermentation in indigo, and to convert it into indigo white, in the presence of hydrogen.

Madder dyestuff of Europe and Western Asia is the root of the Rubia tinctorium, and yields the well-known Turkish red. The madder used in India is from the Rubia cordifolia, locally known as the manjith. Turkey madder roots at one time realized about 20s. or 30s. the cwt., and manjith somewhat less. During the 11 years 1850-61 to 1860-61, the value of the manjith exported from India ranged from £10,694 to £34,579. The sale of both these plants has been very greatly affected by the discovery of the online dyestuffs. Great Britain has diminished its imports of them as under, in cwts.:—

Mallotus Philippinensis furnishes the kapri or Kamela, extensively used in India as an orange dye, principally for silk and wool. It is in the form of a red mealy powder on the capsules, which are gathered in March, and rubbed together, trodden on, or shaken in bags till the farina separates. Four parts of the powder, one of powdered alum, and two of carbonate of soda, are rubbed well together with oil of sesamum, and then boiled in water, into which the silk is dipped. It is, however, sufficient to mix it with water alone, or with water containing half its weight of carbonate of soda. It does not require a mordant. It also produces in the N.W. Provinces, a rich flame colour of great beauty and permanence. Colonel Beddome says that some of the powder, carefully collected by the Forest Department, brought a high price in England. The bark is used for tanning.

Marsdenia tinctoria, a native of Sylhet and Burma, is cultivated in Northern India. Its leaves yield more and superior indigo to the Indigofera tinctoria.

Mica, in a roughly powdered form, is used by dyers and washermen to sprinkle on cloth to give it a sparkling appearance.

Morinda citrifolia, M. bracteata, M. tinctoria, and M. umbellata are dye plants common in India and eastwards to China. The dyestuff is obtained both from the roots and the bark. M. bracteata contains in its bark two colours, yellow and red, changing to crimson by the application of alkalis. In many places the roots of the M. umbellata are employed instead of choy-root in dyeing cotton yarn red. The colour is neither so bright nor so strong. Dr. Heyne thus describes the process.

Take 4 lbs. pounds of white cotton yarn and soak it in 14 pounds of gingerly oil; a strong lye made of the ashes of the milk-hedge, and the yarn steeped in it for four nights, being dried in the sun during the day; it is then washed in brackish water, and dried in the sun. Or 5 seers (kutch, 134 pounds?) of togora root, M. critifolia, finely powdered, are put into a pot of water together with the yarn, and kept all night over a fire of cow-dung. In the morning it is taken out and dried in the sun. The same process is repeated for two successive days and nights, which completes the process.

The red dye obtained from the roots of the M. citrifolia is in general use for dyeing the yarn of the native cloths, both silk and cotton, and better single colours of the kind are rarely seen. The use of a mineral mordant in the native process is known, and, with the exception of weak lye made from the ashes of some jungle plants, no other application is made beyond the simple solution of the extract from the wood itself. Most of the Madras red turbans are dyed with the bark and root of M. citrifolia; it yields three permanent shades, a bright red, a pink red, and a faint red. The plants are cultivated and come to maturity in three years; the roots are then dug up and sorted into three kinds, according to the fineness of the fibres. The fibres are then cut and beaten down well, and afterwards ground to powder, which latter is used for the dyeing. Morinda umbellata grows wild throughout South-Eastern Asia. The bark of the roots of plants three years old gives the best dye. It is one of the commonest of the red dyes of India; though the colour is dull, it is considered faster than the brighter tints obtained from other substances.

Melanorhiza nisatissima is the black varnish that-say tree of Burma, used to lacquer boxes. M. glabra is similarly useful.

Melastoma Malabathricum and M. macrocarpum are shrubs of South-Eastern Asia; their berries are used to dye black.

Memecylon tinctorium; a cold infusion of its leaves gives a yellow colour. It is used for dyeing cotton cloths and grass mats. It also forms an ingredient of the dyes obtained from sappan wood and myrobalans, and it is likewise used with the choy-root, Heliotis umbellata, as a red dye.

Mangifera indica is a tree of both black and red, but more especially for orange. The colours imparted to silk, with different mordants, were as follows:—

1. Muriate of tin, 3 shades of orange, varying with the temperature of the bark and the time of immersion.
2. Acetate of alumina, 2 shades of flame colour.
3. Acetate of iron, 2 shades of drab.
4. Acetate of iron with a decoction of galls, a fine black of two shades.
5. Mixed with manjith, a variety with red and pink are obtained, but not equal to manjith alone.

Nyctanthes arbor-tristis flowers are dried in the sun and kept for use. They are then boiled in water, 1 pound to 10 gallons, evaporating 9 gallons. The fibre is then dipped into it, and is dyed a fine orange yellow; but it is a fleeting colour.

Parmelia Kamtschaladis, the Chalara fichen of the Himalayas, is used as a perfume in calico printing, price Rs. 5 the cwt. P. caperata, P. perlata, and P. physoedes are known.

Pentaptera tomentosa, a tree of the Cuddapah and Kurnool forests. The bark is used with iron for dyeing black.

Phylanthus emblica bark is used as a tanning
DYES.

substance for barking sails, nets, and lines. Its fruit is used in dyeing black.

Pistacia vera flowers, called buzznak, are used in the Punjab and N.W. Provinces in silk-dyeing, as also are the galls formed on this plant.

Polygonum Chinese, or barbatum, and P. aviculare all produce a beautiful blue colour, much like that from indigo. The leaves are first dried, then pounded, and made into small cakes, which are sold in the shops. Three cuttings of P. tinctoria are obtained in China annually. It has been introduced into Belgium. It has red flowers.

Potash is used in extracting the crimson dye from safflower, and also occasionally in calico printing. It is usually obtained from the stalks of the Penicillaria spicata or bajar.

Psidium guajava or pomegranate. An infusion of the root bark yields a deep blue precipitate with salts of iron; a yellowish-white one with a solution of isinglass; a greyish-yellow one with corrosive sublimate, and potash or ammonia colours it yellow. A light red dye is produced from the flowers. The rind of the fruit is ground and boiled, and the concentrated decoction is used in dyeing cloth a greenish brown or khak-rezi colour. The cloth is simply dipped in the decoction. But it is more generally used along with some other dye as a colour concentrator, in which case the rind is boiled along with the other dye. It is used for fixing the colour of turmeric in yellow and orange shades, and turmeric with indigo for the various shades of green.

Psychotria. The wood of the jack, the root of the psychotria, the bark of the gamboge trees, the flowers of the butea, the rind of the Bengal quince, the leaves of the memecylon and the touk-yat, all produce bright yellow dyes.

Pterocarpus santalinus. Red sanders wood is hard and of a bright garnet red colour, and is employed in dyeing a lasting reddish-brown on wool. It only yields its colour to ether or alcohol. The exports of this wood from Madras in one year amounted to nearly 2000 tons. Price, £6 to £9 the ton.

Quercus infectoria and other species yield the gall or dyers' nut-oak. Q. infectoria is called the gall oak, because the gall or nut-gall is produced on it. It is a native of the countries from the Levant to Kurdistan, and is supposed to yield the product known as Mecca galls, F. I. galls, and Bussora galls.

Randia dumetorum fruit, the main-phil, is used in calico printing as a colour intensifier.

Rhamnus catharticus is the buckthorn of Europe and Asia. Its foliage and bark can be employed for the preparation of a green dye. R. chlorophora, Lindley, and the R. utilis of China, furnish a superior green pigment for silk.

In 1848, M. de Montigny, consul at Shanghai, forwarded to the Minister of Commerce green cottons named Liou-sai (that is, cloth dyed with the tree bion). Father Holot stated that these cottons are commercially known by the name of Sc-lo-pou (green-coloured cloth) when dyed with the bark; Ngheou-lose (water lily green colour) and Ngheou-lo-pou (water lily green cloth), that is to say, dyed of the colour of the leaves of nymphaea, when they have been dyed with the Lo-kao. The cost of dying in green a square metre (39 inches and a fraction) of cotton stuff, either with the bark or the Lo-kao, is about 50 cents (about 6 annas and 6 pies). M. de Montigny sent at the same time 10 catties (about 13 pounds) of Ph-chow-elle (green colour), cost 4800 rupees (about 10 rupees 6 annas), 50 catties (about 60 pounds) of Tong-lob, a green paint said to be prepared from the seed of No-mee, cost 20,800 rupees (about 42 rupees 4 annas).

Rheum Moeroctiftum, the rhubarb root, is used to obtain a yellow on woollen and silk.

Rhizophora mangle, the mangrove bark, in Arakan yields a dye of a chocolate colour. A decoction of a mangrove bark of Penang is said to produce a deep black in material previously dyed blue. Mangrove bark is extensively exported to China as a tenning substance.

Rin-nay, of the Burmese, is used for dyeing phoungye (priests) clothes with yellow orange colour.

Rubia cordifolia supplies the Indian manjith of commerce, and R. tinctoria the madder, both of them yielding a red dye. See Madder.

Rutella comosa, of Assam, the mai-gye of Burma and Tenasserim furnishes the blue-root dye, which is prepared after the manner of indigo. It grows wild. R. indigofera is cultivated in Burma for local use as a blue dye. Its yield is about 8 cwt. per acre.

Saltpetre in solution is used in wool-dyeing.

Saffron, from the Crocus sativus of Europe, is largely imported into India as a cosmetic. Saffron from Kashmir, from its price, is prohibitive as a dye; it is used as a drug and cosmetic.

Semecarpus anacardium is the marking-nut tree; the juice of the nut is used for marking cloth.

Soda salts, in the form of impure carbonate or sulphate of soda, are used as detergents, for washing cloth as a preliminary in calico printing. These salts, efflorescing on the surface of the ground, have rendered tracts of land in Hindustan un cultivable. A carbonate of soda, called rassi, is prepared from the reh efflorescence, by dissolving it in water and allowing foreign substances to settle.

Sajji is a mixture of the carbonates of soda and potash. It is made by dissolving wood-ashes and reh in water, and exposing the solution to the sun for several days. It is used in extracting the crimson dye from safflower; also in bleaching.

Soymida febrifuga is used to produce one of the klaki or dirty browns of which cotton stuffs are oft dyed; it is used also along with more valuable arroto and kapila.

Strobilanthes fuscatus, the rampat of India, is a small shrub. Its leaves and twigs are boiled in water with the yarn to be dyed reh, which, however, is not a permanent colour.

Symposium racemosum, S. confusiflora, S. paniculata, bark and leaves, yield yellow dyes. The bark is used in calico printing and leather-dyeing, and as an auxiliary to other dyes; they are used with madder.

Tagetes erecta and T. patula, the marigolds; their flowers soaked in water yield a yellow dye, when squeezed out by the hand. Common people use it for their house clothing. The shades of yellow are called gendia and champai.

Tamarisk galls, from Tamaris articulata, T. orientalis, and other species, are known to the Indian dyers and calico printers as the main.
DYES.

Tephrosia apollinea, of Nubia, and T. toxicaria, of the Nile.

Terminalia. Several species of this genus produce the commercial myrobalan fruits or nuts, which yield with alum a good durable yellow, and with salts of iron a black colour. Those of T. bellerica are used for dyeing cloth, also in tanning.

The bark and leaves of T. catappa are astrigent, and with salts of iron yield a black pigment.

A decoction of the bark of T. chebula is employed in tanning leather, and is used as a mordant in dyeing. Its nuts, when mixed with alum, yield a dye which chints print and carpet-weavers consider their best and most durable yellow. Along with ferruginous mud, it gives a good and durable black dye; and the outer coat of the rind with sulphate of iron yields a black dye, which is used by dyers and harness-makers. It forms an ingredient in dyeing red, along with sappan wood. All the madder-dyed cloths are first steeped in it.

The dyers pound the outer rind of the fruit, and mix it with water; the cloth is simply dipped into this mixture. The colours obtained are black with sulphate of iron, green with turmeric, dark blue with indigo, and brown along with catechu. It is used more as a concentrator of colour than as contributing much of its own.

The nut of T. chebula is the most valuable. The fruit consists of a white pentangular nut, of which the shell or covering is used both by dyers and tanners.

Terminalia arjuna. The inner bark is broken into chips, and the dye extracted by boiling. It is one of the barks employed in producing the khaki brownish colour on cotton cloths. If the cotton yarn or cloth has been previously dipped in a mordant solution of alum and myrobalans, a darker fast colour is produced.

In 1890-91, India exported 315,628 cwt., value Rs.12,37,057, and in 1891-92, 391,566 cwt., value Rs.14,44,925.

Thit-in-myeng of Akyab dyestuff, yellow, and with oil and lac, a red colour is obtained.

Toddalia acetabulata is a common shrub of the Peninsula. Its root has a yellow wood and yellowish corky bark, which yield their colour to water. It is supposed to be the lopez root formerly famed in Europe. The root-bark sells at 3 to 5 annas the pound.

Turmeric dye is a dirty yellow with an alkaline earth.

Vatica Roxburghiana yields the piney varnish. Ventilago acalyculata is said to be a native of Central and Northern India, and V. maderaspatana is found in Ceylon and the Indian Peninsula and Burma, and is employed by the native dyers to produce an orange-red dye. These two plants were for long confused one with the other, and it is not yet known whether V. acalyculata is as rich in dyestuff as that of V. maderaspatana, which furnishes the popular chukkay of the Tamil and the raktta pita of Bengal. V. maderaspatana is a climber. Its root-bark, combined with Hedysotis umbellata, yields a beautiful chocolate colour or brownish-purple, and with galls a black dye. It sells at 3 to 5 annas the pound. Its colouring matter occurs in the roots and wood of the plant.

It is used in Bangalore by the carpet-weavers. The dye is extracted by boiling the chips of the wood in water. Simple dipping in the solution imparts the dye, but the colour is fleeting. If the cotton yarn or cloth have been previously dipped in a mordant solution of alum and myrobalans, a darker colour, which is fast, is produced.

—Rozh.; Ainslie; Crawford; Mason; Tomlinson; M'cCulloch; Simmonds; Fortune; Exhibitions, 1851, 1862; Birdwood, Veg. Prod.; Maritime Commerce; Stat. Abst.; Poole’s Stat. of Comm.; Ure’s Dictionary; Annual Statement of Trade.

DYNASTIDE. Macf. This insect family of dung-beetles is represented by the genera Orystes, Illyg.; Xylotrephys, Hope; Phleumrus, Latr.; Orphnus, Macf., in India.

DYSOXYLON. One species, of Java, yields a fruit used as garlic. D. championii is a great tree of the central province of Ceylon, found up to an elevation of 4000 feet.—The. D. proceraum, a timber tree of Assam. D. multiplagum, Arn., Guarea paniculata, Rozh., a tree of Chittagong and Tiperah.—Roef. i.e. 240.

DYSOXYLON MACROCARPUM. Bl. Guarea bicinataris, Rozh. | Amora ficiniformis, W. Hill.

A great tree of Ceylon, found in the central province, up to an elevation of 3000 feet, and at Batticaloa.—The. p. 60.

DYZTISCIDE. Macf. This insect family of aquatic coleoptera in India is represented by the genera Cybister, Curt.; Dytiscus, Linn.; Eunetes, Erich; Hydaticus, Leach; Colymbutes, Claire.: Hydroporus, Claire.

DYUPETIR, a name of Indra, seemingly the origin of the name Jupiter, perhaps from Jiva, life, and Pira, father. Dyupetir may, however, be from the words Deo, god, and Pira, father, or from Div, the sky, and Pira, father. See Dyans.

DYUTA. Sansk. Gambling with dice, chess, etc., or betting on cocks, rams, etc. Dyuta-pratigraph, also Dyuta-purnima, in Hinduis, is the night of the last day of the light half and eve of the first day of the dark half of the month Kartik, which is to be spent in gambling in honour of Lakshmi, the goddess of fortune.—Wilson.

DZAT. Burm. An open shed near a Burmese pagoda.

DZU NAWAZ, A.D. 490-525, a Himyariate king of Yemen, who visited Medina (Yathrib), of which half the population were Jews, and he became a convert. He invaded Najran, and destroyed 20,000 Christians, throwing them into a blazing trench.

—Koran Surra, 85; Mair, i. 162.

DZUTU. Tek. The scalp-lock of Hindu men.

E

E. This letter in the English language has three distinct sounds, as in the words here, her, and there. In Sanskrit, the e is always long; and the sound of the Arabic e can be better indicated by the English letter y; but to imitate the sounds of some of the e letters of the languages of South-East Asia, the English e has to be duplicated, thus, ee. To obtain, by means of the English e, its sound as in there, the e is usually accented, as in Veda. In the languages of Southern India, and in Malealams and Tamil especially, the initials e or are very commonly pronounced as if preceded by an initial y, B-A as B-yea.

E character in the Chinese tongue means a barbarian, and is applied by them to all foreigners, as the Hindus apply M'hecha, the Greeks and
EAGLE.

EAGLE.

Latins, Barbaros and Barbarus, as Jews used Gentle, and as Arabs use Ajiam. In the 50th article of the British treaty with the Chinese, it was stipulated that E should not be used to designate the people of Britain. Yuen is another Chinese term for foreigner, the exact meaning of which has not been mentioned; and the term Hung-mou-yin, red-bristled man, was also applied to the British.

EA of the Chaldees is Schalmann, the saviour. Ea is, moreover, the Ommu-2, or giver, of the fragments of Berosus in the sculptures of Assyrian palaces and on cylinders, the Eubannes of Hygin, and the Oes of Helladis.

EAGLE.

Neshr., . . . . . . Chal. Sherza, . . . . . . Hind.
Adler, . . . . . . Ger.

The eagles, the Aquilinae, are arranged by naturalists as a sub-family of the Falconidae, of the order Raptorets, or birds of prey, the Accipitres of Linneus, and the Rapaces and Raptatores of other authors. Dr. Jordan arranges the Aquilinae into five groups, viz. True Eagles, Kite Eagles, Hawk Eagles, Serpent Eagles, and Fishing Eagles. They are birds powerful in flight, and are often named in Scripture. Job xxxix. 27 says:

"Is it at thy voice that the eagle soars,
And therefore maketh his nest on high?
The rock is the place of his habitation.
He abides on the erg, the place of strength.
Thence he pounces upon his prey.
His eyes discern afar off."

1. TRUE EAGLES.

(a) Aquila chrysaetos, Linn., Golden Eagle.
Falco aiger, Gmel. | Aquila adaphina, Hodgson,
F. melanotus, Lath. | A. nobilis, Pallas.

The golden eagle is found over the greater part of northern and central Europe, Asia, and America; it is, however, rare in India, and only in the Himalaya, for in Ould and the N.W. Himalaya it is the hammercutter to which Europeans give the name of golden eagle. It is named Buteo and Buteetus by the Mongols, and the Bearcoote which Atkinson notices in his travels. It is 3 to 3½ feet long; and the Kirghis and other Mongol tribes train it to kill antelopes, foxes, and even wolves. It is carried on a perch between two men, or on a horse.

(b) Aquila imperialis, Bechst., Imperial Eagle.
Aquila moglinik, Gmel. | A. nipalensis, Hodgson.
A. heliaca, Sav. | A. chrysaetos, Jordan.

The imperial eagle is found throughout the Himalaya, is not uncommon in Central India and on the table-land, but is rare in the south of India. It commences to seek its prey about an hour after sunrise, hunting slowly at no great elevation over bushy valleys and ravines, and occasionally over cultivated ground, pouncing on hares, flirkin, rats, lizards, etc., but will eat carrion.

(c) Aquila nebula, Gmel., Spotted Eagle.
Aquila melanotus, Sav. | A. vittata, Hodgson.
Kal-janga, . . . . . . Hind. | The spotted eagle is found throughout India, N. Africa, Western Asia, and the S. of Europe, and is tolerably common in the Karnatic and in Malabar. It prefers the vicinity of cultivated places; it lives on small animals,—rats, squirrels, lizards, and frogs.

(d) Aquila fulvus, Gray, Tawny Eagle.
A. fusca, . . . . . . A. novioides, Blyth.
Wokhab, . . . . . . Hind. | Dholver of the. WAGRI.
Ali., . . . . . . Tam. | Bursawul of the YERKALA.
Alawa, Salwa, . . . . . . Tel. | [This resembles the imperial eagle in miniature. It is found in a great part of India, is very abundant in the Dekhan, but is unknown in Malabar, Bengal, and to the E. of India. It prefers dry open plains. It quests slowly over fields, and feeds on hares, partridges, rats, lizards, and occasionally enters villages and towns and carries off chickens and ducklings. It pursues and robs kites, falcons, and other birds of prey. Its feathers are used for feathering arrow-shafts.]

(e) Aquila hastata, Less., the Long-legged Eagle; Spizaeus punctatus, Jerd.
This eagle is not common. It robs birds' nests.

(f) Aquila pennata, Gmel., Dwarf Eagle.
Spizaeus nullioides, Jerd. | Butaquilla strophias, Hodg.
Aquila minuta, Brehn. | Aquila pennata, Jerd.
Gilhri mar., . . . . . . Oodalat gedda, . . . . . . Tel.

This eagle is found in W. Asia, N. Africa, and S. Europe, and throughout India, frequenting groves of trees, gardens, and cultivated land, and pouncing on squirrels, rats, doves, pigeons, chickens. Hens with chickens readily recognise it, and call their young to them. Crows often pursue it out of their bounds.

2. KITE EAGLES.

(g) Neopus Malatensis, Reinwardt, Black Eagle.
Aquila perdigora, Hodgson. | Nisaeetus crvorius, Jerd.
Hengong, . . . . . . Bhot. | Adavi nella Gedda, Tel.
Lahmong Bong, Telph. | Lahmong Bong, Telph.

This eagle is found in most of the hilly and jungly districts of India, of Burma and Malayan. It is generally seen circling or questing for prey at no great height. Its chief food is obtained by robbing birds' nests of the eggs and the young.

3. HAWK EAGLES.

(h) Nisaeetus Bonelli, Temm.
Nisaeetus nivosus, Jerd. | Nisaeetus intermedius, Bon.

This eagle is about 27 inches long, and is found throughout India in the hilly and jungly districts. It preys on game birds, and peafowl, ducks, herons, and waterfowl, also on tame pigeons. Dr. Jordan thinks it could be trained to hunt hares, antelopes, fawns, and bustard.

(i) Limnaetus niveus, Temm.
This small eagle occurs in Bengal (Sadal), and north to the Himalaya, and easterly into Burma, Malayana, and the Archipelago.

(j) Limnaetus cristatellus, Temm.
Falco Lathami, Tick. | Fabriattus, Gmel.
The crested hawk eagle is found throughout Central India, the Peninsula, and Ceylon, and is said to inhabit the Himalaya, Kamaon, and Bhutan.
It sits on a high tree, and pounces on hares, partridges, young peafowl, jungle-fowl, etc.

(k) Limnactes nipalensis, Hodg., Spotted Hawk Eagle.

Nisaetus nipalensis, Hodg. | Falco orientalis, Temm. N. pulcher, "

Rel, bole... BHT. Kanzha Cheel, ... LRT.

This has been found in the Himalaya, Khasaya Hills, and Ceylon. It kills pheasants, partridges, and other small birds.

(i) Limnactes kieniri, De Sparre, Rufous-bellied Hawk Eagle, Spizaetus alboogularis, Tickell. This is rare in the Himalaya and Central India.

(m) Limnactes caligatus, Horsf., is a dark-coloured bird of Malacea.

4. SERPENT EAGLES.

(a) Circatus Gallicus, Gmel., Serpent Eagle, C. brachydactylus, Meyer.

Sap mail, ... BENG. Pamula-gedda, ... TEL.

Mal-patas, ... CAN. Rawul of the ... WAGI.

Sam-patra, ... HIND. Kendatele of the YERKALA.

The serpent eagle is found in the south of Europe, N. Africa, all over India and Asia, and prefers the open ground, questing like a harrier. It eats any creature, but snakes and lizards are its chief food, hovering in the air, and pouncing suddenly like a stone down. It seizes with its talons the snake by the back of the head, and the snake often twines its body around the bird, and eumenas it.

(c) Spilaris cheela, Daud.

Falco albidus, Cuv. | Circatus nipalensis, Hodg.

Circatus undulatus, Jerd. | B. melanotus, Jerd.

Talij baj, Sab cheeg, BENG. Botta genda, ... GONI.

Fari baj, ... CAN. Murayala, ... MAHI.

Geam, ... ... Nalla pamula golda, TEL.

The crested serpent eagle is found all over India, in Assam, and Burma. It lives on snakes, lizards, rats, frogs, and insects. This is Falco bido of Horsfield.

(p) Spilaris bacha, Daud., from Java and Sumatra; is the Falco bido of Horsfield.

(q) Spilaris spilogaster, Blainv., from Ceylon and S. India.

(r) Spilaris holosphilus, Vigors, is from the Philippines.

5. SEA EAGLES OR FISHING EAGLES.

(a) Pandion haliaetus, L., Osprey; Fish Hawk.

Pandion Indicus, Hodg. | Pandion fluvialis.

Mach moral, Dala, BENG. | Pantang, ... LEPCH.

Mach varia, Verai ali pong, TAM.

Macharyas, ... | Koramin gedda, TEL.

Mach-rang, ... HIND. Heggul of ... YERKALA.

The fish hawk of Europe, Africa, and Asia, is spread all over India; abundant near the coast, and along marine lagoons. It plunges from a great height into the sea, and carries off a goodly-sized fish, but is frequently robbed by the Haliaetus leucogaster. P. leucogaster, Gould, occurs in Australia.

(c) Poliopterus ichthyetus, Horsf., White-tailed Sea Eagle.

Pandion lineatus, Jerd. | Ichthyetus lucarius, Hodg.

Ichthyetus bicolor, Gray. | Haliaetus plumbeus, Hodg.

I. Horshilhi, Hodg. | BENG. Madulaya, ... HIND.

This eagle is rare south of the Nerbada, but common in Hindustan, Burma, and Malaya. It lives chiefly on fish, but will carry off a teak or wounded duck.

(u) Poliopterus humilis, Temm., a miniature of the last; it is found in Malacca and the islands. It is the I. manus of Bhlyh.

(v) Haliaetus furciventer, Viell., Ring-tailed Sea Eagle.

Falco Macei, Temm. | Haliaetus Macei, Blth.

H. albipes, Hodg. | Haliaetus unicolor, Gray.

Macha rang, ... BENG. Koral, ... BENG.

Mach mut, ... HIND. Bala.

Mach korol, ... | Kokna, Uga, of the LOK.

The ring-tailed sea eagle is found throughout the N. of India, along the Ganges and Indus up to Kashmir. It lives on fish, turtle, and snakes.

(w) Haliaetus leucogaster, Gmel., Grey-backed Sea Eagle.

Blagrus leucogaster, Blth. | F. dimidiat, Hofm.

Ichthyetus culturinigis, Bl. | F. maritimus, Gmel.

Falco blagrus, Daud.

This sea eagle is found throughout India, in Burma, Malaya, and Australia, chiefly on the coast and near the mouths of rivers. It lives on sea-snakes, crabs, rats, and on fish which it picks up on the beach.

(x) Haliaetus leucogephalus is of N. America and N.E. Asia.

Aquila neviodius, the tawny eagle, is a native of Asia and Africa, extending into southern Europe. It is nearly allied to the imperial eagle. The white-headed sea eagle is the adopted emblem of the United States of America. The wedge-tailed eagle of Australia, Aquila audax, preys indiscriminately on all animals,—lamb, the kangaroo, bustard. Haliaetus leucogaster is the Australian sea eagle. Batueur eagle, Helotaros caudatus, is of Africa.

The eagle takes a part in the mythology of the Hindus. The allegory of Krishna’s eagle pursuing the serpent Buddha, and recovering the books of science and religion with which he fled, is an historical fact disguised, namely, that of Krishna incorporating the doctrines of Buddha with his own after the expulsion of the sect from India. The Gulf of Cutch, the point where the serpent or Takshak race attempted to escape, has been from time immemorial to the present day the entrepôt for the commerce of Sotula, the Red Sea, Egypt, and Arabia. There, Buddha Trivirama or Mercury has been, and is yet, invoked by the Indian mariners, especially the pirates of Dwarian; and whether Buddha or Mercury came from or escaped to the Nile, whether Buddha Trivirama be the Hermes of Egypt, to whom the four books of science, like the four Vedas of the Hindus, were sacred,—the statues of Nemi, the representative of Buddha exactly resemble in feature the bust of young Memnon, and the Buddhists appeared in the Gujerat Peninsula, and the adjacent Indian continent was the cradle of Buddhism, and in Saunshtra are three of the five sacred mounts of the Buddhist faith, i.e. Gnmnr, Satrunjya, and Abu.—Jerdon, Birds of India : Todo’s Rajashast.

EAGLE STONES. The Greeks believed that the eagle stone or atiles were only found in the nests of eagles. The eagle stone bore some analogy to the toad-stone. Pliny stated that a round perforated stone, if found in an eagle’s nest, will
prove to be a specific against disease, and a charm against shipwreck and other disasters. Eagle stones are the Hajar-ul-akab of the Arabs, who describe them as resembling tamarind stones, but hollow, and found in eagles' nests, and believe that the eagles bring them from India.—King.

EAGLE-WOOD.

Agalugan, ... Dr. B. Ud-i-Bukhooor, H.D., Pers. Lignum. ... B. Ud-i-Kimari, ... Chin-hiang, ... Ch. Ag-r, ... Dukh. Agel-hout, ... D. Lignum. Aloes woods, ... Eagle-wood, Incense wood. Agallocha, ... Lignum. ... Gr. Aasleeg, ... Heiz. Ahel, Ahelim, ... Heb. Ahiloth, ... A. Ud-i-Chini, HIND, Pers. U. Ud-i-Hindi, ... 

A highly-fragrant wood, much esteemed by Asians for burning as incense. It is made into the pastilles called Ud el Hindi in Hindustan. The trees are several kinds of commerce, and supposed to be obtained from the Aloexylon agallochum, Lour., Aquilaria agallocha, Roxb., the Ag. Malaccensis, Lam., and the Aquilaria secundaria. The eagle-wood incense seems to be a resinous deposit in the interior of the tree. It is mentioned in Num. xxiv. 6, Prov. vii. 17, Cant. iv. 14. In Siam, only one kind of tree is known to produce this; it is only found in one tree out of twenty, and labourers often cut up several before finding any of it. It chiefly occurs in the trees on the islands in the Gulf of Cambodia. They have a knowledge of the outward indications, and, feeling the tree, preserve the dark diseased portion, which is sold at ten shillings the pound.—Boering, Siam; Rogers, Ill; O'Sh.; Roxb.

EAKA and Rai are races often included under the name of Limbu, along with the Kirata, or Kirans, and in appearance they are all very much alike.

EAPAY, according to the Karen, the Creator.

EARL GEORGE WINDSOR devoted years of his life to the investigation of the countries and races of the Eastern Archipelago. The principal part of his writings appeared in the Journal of the Indian Archipelago. He also wrote The Eastern Seas, or Voyages and Adventures in the Indian Archipelago in 1832-34, with Observations on the Commercial Resources of the Archipelago, 1837; also Native Races of the East Indian Archipelago Papuans, London, 1853.

EARNEST MONEY, Tirmantha, TAM., is paid down in almost every transaction of India.

EAR-RING. Eoutrum, Gr.; Inaurus, Lant. Mentioned in Genesis xxxiv. 4, Judges viii. 24, Hosea ii. 13; are worn in the ears by men and women in Eastern countries, and other ornaments are worn round the neck like the golden bulla and leather torus of the Roman youth. Phylacteries are mentioned in Deuteronomy vi. 8, 18. The Malay women of Menangkabu, in Sumatra, place a saucer-shaped gold ornament in the ear. The Dyak women of Borneo also do this. Ear-plugs are worn by all the Burmese, male and female, in a perforation made in the lobe of the ear, which is gradually enlarged, until it will admit an orna-

ment of the proper diameter. These are made of gold, silver, pine-beck, horn, wood, rock-crystal, glass, etc., according to the means of the wearer; amber is the favourite and most fashionable material, being worn by the ladies of the court of Ava. An amber pair of ear-plugs cost 100 rupees. Mahomedan and Hindu women in India wear gold ear-rings. The humbler Tamil women insert rolls of palm leaves. The lobe of the ear is sometimes torn by over-stretching.—Local Committee, Rangoon.

EAR-SHELLS belong to the genus Halioptis and family Haliotidae of the mollusca.

EARTH, Globe, World.

Arad, ... ARAB. Zamin, ... Pers. Myay, ... BURM. Bhu, ... SANSK. Terre, ... Fr. Tierra, ... Sp. Erde, ... Ger. Gahru, ... Sansk. Dany, Jahan, Zamin, HD. Toprak, ... Turk. Terra, ... It., Lat.

The surface of the globe has 31,625,625½ square miles, of which the waters are 23,814,121. The surface covered with water is therefore to dry land as 1.2. The islands form scarcely 3 of the continental masses. In astronomy the symbol of the earth (É) is the inverted emblem of life, and probably bears some reference to terrestrial corruption and decay.

EARTH-Bath is a form of medical treatment occasionally adapted on the littoral tract of the Persian Gulf, and eastwards to the Indus. It had a great run in London about the middle of the 18th century.

Earth Goddess, Mrittika. Human sacrifices were made to this deity in the Tributary Mahals.

Earth Nut, Arachis hypogea, ground-nut. In the year 1879-80, the quantity exported from India was 48,455 cwt., value 2,85,519 rupees.

Earth - Oil is found in great abundance in Burma, where deep pits are sunk to obtain it. It is found more or less in almost every residency in Japan, growing on hills dug in certain spots in the ground for it to drain into.

Earts of kinds are largely used in India. A white earth from the hill state of Dehkanal, in Cuttack, locally called Teelak earth, is used for making the marks on the forehead, nose, arms, and breast, particularly by Hindu devotees, but also by high class natives in the Madras Presidency. That obtained from the banks of the Dhumserie Nuddoe is used for making a white paste to plaster over their idols. An earth obtained near Seel-Chitta, in the Jummoonah Nuddoe, in Nowgong Zillah, is used in painting.

The Chamarfo earth of Spiti is of a bright, deep red colour, and used in dyeing.

The Chasarfo is an orange-coloured dye-earth of Spiti.

Mitti-gachi, called also Multani Mitti, or Ghi multan, is a soft sapaneous earth, used for washing the hair, also medicinally. Its white variety, termed Khujru, is eaten. Its yellow variety, termed Kakhri, is used for dyeing cloths. A light-green variety, sabzi matti, is used for washing the hair.

The Gehru and Hirnji, or red ochres, are impure sesquisoxides of iron, used by Hindu ascetics for dyeing their cloths of a dull orange colour. Yellow ochre, or hydrated sesquisoxide of iron, is the dyestuff called ramraj. The black earth of tanks is used for dyeing a blue-black. Reh, an
Impure carbonate or sulphate of soda, is used in
dyeing, as a detergent for washing the cloth.—

**EARTHENWARE.**

Aardgoed, DUT. Terraglia, IT.
Crockery, ENG. Gliniaus naczynia, POL.
Vaseille de terre, FR. Gorschetschnia polzow,
Poterie, DUT. Poche.
Irdena Waaren, GER. Loza de barro, SP.
Chenikam, GUI. HIND, Pani, TAM.
Stoviglie, IT. Kunda, TEL.

Porcelain, stoneware, flint-ware, deft, ironstone,
china-ware, etc. Earthenware and porcelain im-
ported into India in the six years 1874–75 to
1879–80 ranged in value about 10 and 12 lakhs
of rupees.
Sir George Birdwood says, truest to
nature, in the directness and simplicity of its
forms and their adaptation to use, and purest in
art, of all its habiliments and sumptuous handcrafts,
is the pottery of India;—the unadorned rude earthen-
ware, red, brown, yellow, or grey, made in every
village, and the historical glazed earthenware of
Madura, Sind, and the Punjab. Unglazed pottery
is made everywhere in India, and has been from
before the time of Menu; and the forms of it
shown on ancient Buddhist and Hindu sculptures,
and the ancient Buddhist paintings of Ajunta, are
identical with those still everywhere thrown from
the village hand-wheels. In the sculptures of
Bhuvaneswar, the form of the kalasa or water
jug is treated with great taste as an architectural
decoration, especially in its use as an elegant finial
to the temple towers. In the same sculptures is
seen the form of another water vessel, identical
with the amriti, or ‘nectar’ bottle, sold in the
bazaars of Bengal. . . . The principal varieties of
Indian fancy pottery, made purposely for exportation,
are the red earthenware pottery of Travancore
and Hyderabad in the Deccan, the red glazed
pottery of Dinapur, the black and silvery pottery
of Azimgur in the North-Western Provinces,
and Surajgura in Bengal (Bhagulpur), and imitation
bidri of Patna and Surat in Gujerat, the painted
pottery of Kota in Rajputana, the gilt pottery of
Amroha, also in Rajputana, the glazed and unglazed
pierced pottery of Madura, and the glazed pottery
of Sind and the Punjab. In all these varieties of
Indian pottery is an artistic effect, unconsciously
sought to be produced. . . . The potter’s art is of
the highest antiquity in India; and the unglazed
water vessels, made in every Hindu village, are still
thrown from the wheel in the same antique forms
represented on the ancient Buddhist sculptures
and paintings. Some of this primitive pottery is
identical in character with the painted vases found
in the tombs of Etruria, dating from about B.C.
1000. It is interesting to find that pottery is still
made in India for daily use, which is as ancient
reality older than the oldest remains we possess
of the ceramic art of ancient Greece and Italy.
None of the fancy pottery made in India is equal
in beauty of form to this primitive village pottery,
and most of it is utterly insignificant and worthless.
The only exception is the glazed pottery of Madura,
and of Sind and the Punjab, which alone of the
fancy varieties can be classed as art pottery, and
as such is of the highest excellence. The Madura
pottery is in the form generally of water bottles,
with a globular bowl and long upright neck; the
bowl being generally pierced so as to circulate
the air round an inner porous bowl. The outer
bowl and neck are rudely fretted all over by

**EARTHQUAKES.**

Myas-gyes, BURM. Zabalah, HIND, PERS.
Tremblement de terre, FR. Terremuto, IT.
Erdbeben, GER. Terremoto, SP.

Earthquakes are of repeated occurrence in the
south and east of Asia. Captain Baird Smith, in
a memoir on Indian earthquakes, enumerated
162 of them between the years 1800 and 1842,
and many of these were felt in the delta of the
Ganges. Dr. Tholozan (Comptes Rendus), physician
to the Shah of Persia, examined the records of
earthquakes in the works of the principal
Arabian and Persian historians, from the 7th to
the 17th centuries, and found 111 intense and
considerable earthquakes, in which houses were
destroyed, sometimes entire towns, with loss of
life. Some of these over many days, notably that
of Khorasan in 644. The Musulmans always
fear giving the accompanying meteorological
circumstances, with remarkable precision. High winds
were frequent, and whirlwinds. Persia experienced
earthquakes 52 times during those ten centuries,
—31 times alone, and 21 times together with Syria,
Mesopotamia, Egypt, Turkestam, etc.; Irak, 10
times; Khorasan, 9 times. Mesopotamia was 23
times agitated,—7 times alone, and 16 times along
with neighbouring countries. Egypt was attacked
18 times alone, and 9 times with other countries.
Syria 9 times alone, and 17 times with other
countries. The results of his inquiry corrected
two assertions that have been made. One is that
of Van Hoff, that from the commencement of
the 13th to the latter half of the 17th century, there
was an almost complete cessation of earthquakes
in Syria and Judea; the other, that of the cele-
brated orientalist Quatremère, that the north-
est portion of the red sea, comprising Egypt, has
been nearly always exempt from earthquakes.
In Egypt, 27 earthquakes are recorded in seven
centuries (796–1482). The most extended record
of earthquakes is that by Mr. Walford in the
Statistical Society’s Journal for 1878. In 1881,
Herr Fuchs recorded 244 in Der Naturforscher,
—86 in winter, 61 in autumn, and 56 in summer.

Earthquakes are repeatedly felt at Kabul.
Vigne tells us (Pers. Narrat. p. 212) that there
are usually a dozen in the course of a year. While
the British were besieged in Jalalabad in 1841,
itself walls were thrown down by an earthquake.
The surface of the Sunderbuns has more than
once sunk below the level of the ocean; and evi-
dence of subsidence are on the whole coast from
Cape Negris to Akyab on the eastern side of the
Bay of Bengal; but Reguin, or Flot Island, as
well as all the other islets and rocks on that part
of the coast of Arakan, are undergoing the pro-
cess of upheaval. This fact was brought to notice
in 1840, by means of the nautical surveys of the
brig Childers. The coast from Akyab to Cape
Negris is indented by deep and narrow gulfs
similar to the fiords of Scandinavia, and lies within
the prolongation of the great volcanic band of
the Sunda Islands, which extends from Java to Sumatra,
Barren Island, and Norecondam; and indeed all
the islands on the coast of Arakan bear evident
markings of subterranean fire. In the island of
Cheleba, 300 miles south-east from the Sand-
heds, in lat. 15° 51’ N., and long. 93° 28’ E.,
there are two mud volcanoes which rise to a

1013
EARTHQUAKES.

It again, that the same commotion, earthquake, the volcanic eruption of a volcano, by which the sea was driven over the land, and the effects of which were felt as far as the city of Ava. An earthquake is said to have occurred 100 years earlier, and the inhabitants believe that a similar phenomenon occurs every century. In the island of Kyauk Phyoo, 35 geographical miles north, or nearer to the Sunderbuns, a volcanic eruption took place suddenly, east of the station, at 6 p.m. in June 1852. Again, on Christmas eve 1855, the island was illuminated for miles around by a huge column of fire thrown up by the volcano; and in April 1857, about 10 A.M., the volcano was again in commotion. We learn from the Philosophical Transactions (vol. liii.), and from the Journal of the Asiatic Society (vol. x. pp. 351-493), that the town of Chittagong, in Bengal, was violently shaken by an earthquake on the 2d April 1762, the earth opening in many places, and throwing up water and mud of a sulphurous smell. At Bardavon a large river was dried up; and at Bar Charra, near the sea, a tract of ground sunk down, and 200 people with all their cattle were lost. It is said that 60 square miles of the Chittagong coast suddenly and permanently subsided during this earthquake; that Ces-lung-Toom, one of the Mug mountains, entirely disappeared, and another sunk so low that its summit only remained visible. Foul Hills are also described as having been variously rent saunter, leaving open chasms from 30 to 60 feet in width. Towns, which subsided several cubits, were overflowed with water; among others, Deep Gong, which was submerged to the depth of 7 cubits. Two volcanoes are said to have opened in the Seeta Canha Hills. The shock was also felt at Calcutta. While the Chittagong coast was sinking, a corresponding rise of the ground took place at the island of Ramree, Re- guin, and at Cheduba (Johnston's Physical Atlas).

The entire Eastern Archipelago rests on a volcanic base nearly circular in form, commencing from the west coast of Burma, and passing through the great islands of Sumatra, Java, Celebes, and Luzon. In the last island, one of the Philippines, are some violently active volcanoes. The volcanic chain goes round the outer circle of the Eastern Archipelago, and the volcanic action consequently affects the whole group, working along the western end of the Indo-Chinese peninsula, i.e. on the Arakan and Chittagong coast, up to the Himalaya, 1000 miles away. In the Kangra, Kulla, and Lahou districts, the Jwala Mukhi, fires of Kangra, the Mani Karn boiling springs of Kullu, are but two indications of the pent fires which lie beneath.

In 1640, from an eruption at Bulhayan, 180 miles from Zamboanga, in Mindanao, large masses of stone were flung to a distance of 6 miles. The ashes fell in the Moluccas, and in Borneo. Dense darkness covered Zamboanga. Ships at sea lighted their lamps at 8 A.M., but the light should not be seen through the clouds of sand. The noise of the eruption was heard at Manila. The mountain whence the eruption originated disappeared, and a lake was formed and still remains in the locality.

The island of Simo, one of the Batu group, on the west coast of Sumatra, had an earthquake and sea-wave on the 9th March 155—7. Before the occurrence the island had 120 houses, and a population of 1045. On that day 96 houses were destroyed, and 675 of the inhabitants, besides 103 temporary residents, lost their lives. An earthquake was felt at the fall of the evening, shortly before the inundation. All the inhabitants then assembled on the open space in the middle of the campion, but a moment afterwards they tried to make their escape from thence, as they dreaded the fall of the houses, which were already tottering. They were driven back, however, by a rush of water which approached from the back of the campion. Running back from this, they were overwhelmed by another terrific wave, which, out of 292 persons, swept off 206. Two waves met each other at this point, and large masses of rock were carried from the sea for 100 to 200 paces inland, and the water retired with force, sweeping much into the sea. Soon after the earthquake, heavy reports like distant cannon shots were heard, on which was observed approaching at a great distance from the sea, a wave of the height of a full-grown cocoanut tree, and which dashed with furious force on the island. Some saved themselves by flight, the rest were overtaken by the water and swept away. Three such waves succeeded each other.

In the Philippines, the most fatal earthquakes occurred in 1601; again, on the 30th November 1610, 30th November 1645, 20th August 1658, in 1675, 1699, 1796, 1824, 1852, in 1863, and 1869, and from the 13th to the 24th July 1872? On the 20th July a violent shock was felt at 4 o'clock in the afternoon, which lasted 40 seconds, and completed the work of destruction begun by the previous ones. All the volcanoes in the island were in eruption, and in many places the earth opened, throwing up boiling water and sand. At 11 o'clock the same night a fourth shock occurred, lasting 55 seconds, and scarcely a building was left standing in Manila.

In 1645, for two months there was a succession of fearful earthquakes. In Cagayan, a mountain was overthrown, and a whole town engulfed at its foot. Torrens of water and mud burst forth in many places. All the public buildings in the capital were destroyed, 600 persons were buried in Manila beneath the ruins of their houses, and 5000 altogether are said to have lost their lives.

An earthquake of 1796, in the Philippines, was sadly calamitous.

On the 3d June 1862, at half-past 7 in the evening, a flame was seen to rise from the earth and gird the city of Manila, and at the same time a terrific quaking of the earth took place. It lasted for a minute, but in that short space nearly the whole of Manila was reduced to a heap of ruins, upwards of 1000 persons killed, and many thousands injured. The priests, their
Earthquakes.

Choristers and sacrificers, and the Christians who were hearing the vesper of Corpus Christi, were nearly all buried under the ruins of the cathedral and other churches. The flame that surrounded the city was seen from the bay to ascend towards the sky; and another, a triple-snaked one, came from the land over the water to the shipping. On shore the earth everywhere sunk at least 2 feet.

Earthquakes are frequent in the Moluccas, and indeed in all the islands between Sumatra and 125° of E. longitude.

On the 21st December 1846, three shocks of an earthquake were felt in Ternate. The first two were very heavy, and accompanied by a thundering noise, and columns of ashes were ejected, and a lava stream flowed to the north of the mountain without causing any damage. Other two earthquake shocks were subsequently experienced at Ternate, and on the 8th of April 1847, about half past 3 o'clock, a severe earthquake took place, which was felt in a direction from north to south.

In the month of March 1847, a sinking of the mountain Nimenbock (which is three days' distance from Kapang) took place, in consequence of which many houses with their contents were destroyed by great stones that rolled down.

A severe earthquake was experienced in Batavia, and over an extensive region in Java, in 1847. A Mower of ashes fell at Batavia on the night of the 17th October 1847, which came from the Gunung mountain, in the district of Limbangan, residence of Preanger. On Sunday the 17th October, at 11 o'clock p.m., earthquake shocks, following each other in quick succession, were felt at Tjundur. A shower of ashes began to fall the same night, and by the following morning had clothed the earth, grass, trees, and buildings with a brown covering. The earthquakes had not wholly stopped at Tjundur on the 29th October. The shower of ashes reached as far as the frontiers of the residency of Bantam, a distance of more than 80 miles to the westward of the place of the eruption.

The island of Gunung Api, or Fire Mountain, is wholly a volcano, and has caused repeated desolation around it.

In 1856 Japan was shaken by dreadful earthquakes. From the province Sacaza, as far as Miaco, the earth quivered for forty days successively. In the town of Sacaza 60 houses were thrown down. At Nagsama, a small town of about 1000 houses in the kingdom Oomi, the earth gaped and swallowed up one half of that place; the other half was destroyed by a fire. Another place in the province, Facata, much frequented by merchants, and likewise called Nagsama by the natives, after it had been violently shaken for some days, was at last swallowed up by the sea; the water overflowed the coasts, washed away the houses and inhabitants, and left no footstep of that once rich and populous town. A strong castle in the kingdom of Mino, built at the top of a high hill, after several violent shocks, sunk down and disappeared of a sudden in the gaping earth, a lake quickly filling the place where the castle had been. Another accident of the same kind happened in the province Ikeja. Many more gaps and openings were observed up and down the empire.

At Yeddo, at 8 o'clock on the morning of the 27th July 1783, a great wind arose, accompanied by subterranean murmurings, which increased till the 1st August. On that day earthquakes shook the houses, the shocks increasing in intensity; the summit of the mountain was rent open, fire and flame burst forth, showers of sand and stones were thrown high in the air, great chasms rent the earth, into which thousands fell in their flight. The shocks continued until the twelfth day, and were felt over a space of thirty leagues. Twenty-seven towns and villages were destroyed; the rivers overflowing, inundated the whole country, and completed the work of destruction.

On the 234 of December 1854, at 9.45 A.M., shocks of an earthquake were felt on board the Russian frigate Diana as she lay at anchor in the harbour of Simoda, not far from Jeddoo in Japan. In fifteen minutes afterwards (10 o'clock), a large wave was observed rolling into the harbour, and the water rapidly rose on the beach. The town, as seen from the frigate, appeared to be sinking. This wave was followed by another; and when the second receded, which was at 10.15 A.M., there was not a house, save an unfinished temple, left standing in the village. These waves continued to come and go until 2.30 P.M., during which time the frigate was thrown on her beam-ends five times. A piece of her keel 81 feet long was torn off; holes were knocked in her by striking on the bottom, and she was reduced to a wreck.

In the course of five minutes the waters in the harbour fell, it is said, from 23 to 3 feet, and the anchors of the ship were laid bare. There was a great loss of life; many houses were washed into the sea, and many junks carried up—one two miles inland—and dashed to pieces on the shore. The day was beautifully fine, and no warning was given of the approaching convulsion; the barometer standing at 29.87 in., thermometer 58°; the sea perfectly smooth when its surface was broken by the first wave. It was calm in the morning, and the wind continued light all day.

In a few hours afterwards, at San Francisco and San Diego, the tide-gauges showed that several well-marked and extraordinary waves had arrived off the coast of California. The origin of these waves, and those which destroyed the town of Simoda and wrecked the Diana, was doubtful the same. But their birthplace is not known to be near the coast of Japan.

B.C. 505, Earthquake in China.
A.D. 286, In the island of Niphon, a lake 723 miles long by 124 wide formed in one night.
893, In India, 185,000 souls destroyed by an earthquake.
1040, A mountain overthrown, and 50,000 persons killed.
1139, Gausana, in Persia, destroyed, and 10,000 of its inhabitants killed.
1505, Kabul almost destroyed by an earthquake.
1586, Several cities of Japan destroyed.
1703, Jeddoo, in Japan, overthrown, 200,000 persons perished.
1729, 20th June, a fearful earthquake in old Delhi, and shocks occurred for a month and two days.
1727, A mountain overthrown, 77,000 persons perished.
1731, Pekin destroyed by earthquake, 30th November, 100,000 people destroyed.

A great storm and earthquake devastated Calcutta in 1737, described in the Gentleman's Magazine printed in 1738-39. The account runs thus:— In the night between the 11th and 12th October 1737, there happened a furious hurricane.
EARTHQUAKES.

at the mouth of the Ganges, which reached 60 leagues up the river. There was at the same time a violent earthquake, which threw down a great many houses along the river-side. In Golgotta (Calcutta) alone, a port belonging to the English, 200 houses were thrown down, and the high and magnificent steeple of the English church sank into the ground without breaking. It is computed that 20,000 ships, barks, sloops, boats, canoes, etc., have been cast away. Of nine English ships then in the Ganges, eight were lost, and most of the crews drowned. Barks of 60 tons were blown two leagues up into land over the tops of high trees. Of four Dutch ships in the river, three were lost with their men and cargoes. 300,000 souls are said to have perished. The water rose 40 feet higher than usual in the Ganges.1

1780, Tabreez was destroyed by an earthquake, 15,000 houses thrown down, and multitudes perished.

1782, A furious cyclone occurred at Surat.

1793, 1st April, an earthquake at Japan, 53,000 persons destroyed.

1804, Hall-storm at Allahabad.

Heyen mentions an earthquake in Mysore in the year 1800, whilst a great hurricane raged between Onjole and Madras.

On the 16th June 1819 an earthquake was felt over a great extent of country, but its centre was in Cutch. It is the most violent recorded in India. The first and greatest shock occurred a few minutes before 7 in the evening of the 16th June 1819. The alarmed inhabitants of Bhojj fled in all directions to escape from their falling habitation, and the violent undulations of the ground, the crash of the buildings, caused dismay and terror. The shock lasted for two or three minutes, and during that brief time Bhojj was almost levelled with the ground, and nearly 2000 persons perished in Bhojj alone. The walls of Bhojj fell about 6.48 p.m. Before 11 p.m. three shocks occurred. On the 17th the earth was frequently in motion, attended with gusts of wind. Until the 1st July there were two or three shocks daily; one daily throughout July, one every three days in August and September, about six in October, and three in November,—about 100 in all. The great shock was felt at Calcutta at 7.6, Cutch time, 18 minutes later than at Cutch; at Chunar, 7.15; at Pondicherry, 8 p.m.; at Ahmadabad, 7.19. At Khatmandu it was felt sensibly in the evening; also in Sind. It embraced a space of 18 degrees of latitude and 20 of longitude.

1827, Fort Kolltan, near Lahore, destroyed by earthquake.

1847, Jahalabad walls thrown down.

On the 11th November 1842 occurred a severe earthquake, of which Calcutta appeared to be the centre of emanation. The shocks extended 300 miles north to Darjiling in the Himalaya moun-
tains, to Chittagong, or 250 miles to the east, and to Monghir, or 210 miles on the west; and it was also felt on board the Agincourt 70 miles south of the Floating Light.

Earthquake shocks were experienced in Travancore in February 1823, 19th September 1841, 20th November 1845.

1852, Manila injured by earthquakes.

1853, Shiraz destroyed by earthquakes, and 10,000 people killed.

About the middle of the 19th century, several earthquakes are recorded to have occurred in British India, but the precise dates have not yet been found.

In July 18 — ? smart shocks of an earthquake were felt at Lahore, Rawal Pindi, Attock, and Wazirabad. The shock of an earthquake was felt at Peshawur on the 16th September 18 — ? about 7 A.M. The vibrations were barely sensible, but the concomitant rumbling noise was well defined. On the afternoon of the same day, the valley was visited by a dust-storm, followed by drizzling rain, which continued throughout the night.

In January 18 — ? there occurred an extended earthquake at Chittagong on the eastern coast of Bengal, and also at the Kangra valley to the north of the Punjab, and in the N.W. Himalayas; the same earthquake was felt in the south at Sholapur, at Bombay, at Mahabaleshwar and other places on the Western Ghata, and in the Madras Presidency at Ramandrug near Bellary. An earthquake about the middle of the 19th century was felt all over Bengal, at Dacca and Silehar in Cachar; as also in Assam on the 14th December, a day previous to the shocks at Chittagong. Dewangiri also was agitated. On the 19th August 18 — ? the same day that an earthquake was felt at Singapore, severe shocks were experienced on the west coast of Sumatra. The Sumatra Courant of the 20th thus described them:—Since noon yesterday, repeated shocks of earthquake have been felt here. At 6 o'clock several movements were observed. Sometimes there were horizontal and sometimes vertical shocks. The shocks fell at 8.45, 10.25, and 11.30 p.m., with a duration on each occasion of from 2 to 3 minutes; at 2.25 the shocks were the heaviest, and lasted fully four minutes. To-day, at about 4.30, 8.30, 11, and 11.45 A.M., these movements were repeated with diminishing severity. Further shocks were felt at Pading on the 25th and 26th August. Udrapura, Batang Kapas, Painam, Rau, and Natal announce heavy earthquake shocks at those places. At Natal the fort was rent to its foundations in several places.

An earthquake was felt on the 26th July 1854 all over Lower Bengal.

1854, Anasace and Simoda, in Niphon, were destroyed by earthquake, and Jeldo much injured.

1855, 11th November, Jeldo nearly destroyed by earth-
 quake, 50,000 inhabitants overwhelmed.

Earthquakes occurred in Travancore on the 17th March 1856, on the morning of the 11th August 1856, again at 4.25 p.m. of the 22d August, again on the 1st September.

An earthquake occurred at Bombay on the 8th December 1857.

Mount Abu is subject to frequent shocks of earthquakes.

An earthquake of the 24th August 1858 was felt in Calcutta and Madras. Proime in Burma, barely 50 miles east of the active volcanoes at Ramree and Cheduba, suffered considerably; many pagodas were shaken down and houses destroyed. At Kyouk Phyoo they had rain all the 23d. Between 4 and 5 p.m. a slight shaking of the floor was first perceptible, suddenly followed by a rumbling noise and a vibratory motion of the ground, till the earthquake became violent. This vibratory action of the earth from E. to W. lasted
of Tibet, on which he entered at Ta-chien-lu, and advancing to Li-tiang and Ba-than, he found that the latter place had been rebuilt, having a few years before been wholly destroyed by a frightful series of earthquakes, which devastated the whole neighbourhood.

On the 24 March 1878, Sinda had a long continued earthquake. It was the third in six months. About the same date a severe earthquake was felt at Peshawur, Rawal Pindi, Lahore, and Murree. A large portion of the inner wall of the fort at Peshawur fell down from the shock.—Curt. M'Murdie in Tr. Inst. L. Sin.; Jameson's Edinburgh Journal, 1820.

EAST.

By the Hindu, who worships the sun, the cardinal points are named with reference to the east: Apara, the front, or the east, to which he turns in his daily morning worship; Apara, behind, or the west; Vana, the left hand, or the north; and Dakshina, the right hand, or the south. By the Mahomedian, who turns his face to the west, towards Mecca, these terms are exactly reversed, and Dachin, which still means the right hand in Kashmiri, is now used to denote the north.

The cast, the Morgenland of the Germans, has been the theme of innumerable writers, on its people and on their customs. Border in its Oriental Customs, Ward in his Hindoes, Harly in his Eastern Monachism, Roberta in his Oriental Illustrations of the Scriptures, Bunsen's Egypt, his God in History, Max Muller's Sacred Books of the East, and the Hebrew Scriptures, have given to the western nations a vast amount of information. The races occupying the south and east of Asia are of Turanian and Mongol origin, Semitic, Aryan, and African, all various in personal appearance, habits, and customs.

The Shemite, says Layard, whether Hebrew, Arab, or Syrian, has a brilliant imagination, ready conception, a repugnance to any restraint that may affect the liberty of his person or of his intellect. He conceives naturally beautiful forms, whether they be embodied in his words or in his works; his poetry is distinguished by them, and they are shown even in the shape of his domestic utensils. This race possesses in the highest degree what we call imagination. The Shemite, says Layard, shows a ready eloquence; his words are glowing and appropriate; his descriptions true, yet brilliant; his similes just, yet most fanciful. These high qualities seem to be innate in him. The best character of the Bedouin, says Burton (Pilgrimage, p. 44), is a gentleness and generosity. The three great monotheistic systems which have divided the civilised world, came forth from nations of Shemite origin; among them arose the priests or prophets of all those nations who hold to the unity of God. In the south and east of Asia are representatives of those three great religions, Jews, Christians, and Mahomedans. The Aryans of the Eastern Asia are in two distinct branches, viz. the East Aryans, a designation given to the Brahmanic Indians who moved into India, to distinguish them from the West Aryans or Persians, who migrated into the northern country of the Zend.

for about 2¼ minutes, and then suddenly ceased. The earth opened in various places, and a peculiar bluish soft sandy matter exuded from them, and the scene closed by an eruption from the volcano. The Proserpine ship was lying in 11 fathoms of water at the time of the shock, and the sensation felt by those on board was like that experienced when running on a reef; the vessel trembled in every part of her.

On the 10th January 1869, a severe earthquake occurred in Assam, Cachar, and Muniipur. At Silehar the ground rose about 20 feet in a long wave, and the river rushed backward for an hour. The earth opened in many places, and volumes of blue sand and water were thrown up, and a similar splitting of the earth occurred at Muniipur. It extended a long distance into Upper Burma. It was very severe in the hills to the N.E. of Muniipur. Even in the hills the ground opened extensively, and water rushed out, with mud; people fell into the fissures and were injured.

In Chittagong and Eastern Bengal, earthquakes have been felt every few years, some shocks being pretty severe. Sita Khood is perhaps the centre of volcanic action in the Chittagong district.

In North Aroat, in 1859, there occurred some shocks in Tripati and Chandragiri. One shock was felt at 5 P.M., on the 24th February 1850, taking its course from east to west. The noise resembled that occasioned by a railway train going at full speed, and was audible for the space of one minute, during which time the ground trembled. The shock took its course from the foot of the Tirumallay Konda, a hill seven miles north of the Chandragiri Kasbah, and travelling southward, terminated at Thorno Kumbala village, seven miles south of Chandragiri. The shock was felt west as far as Pakala, some 16 miles off, and on the north-west as far as Bimavaram, 10 miles distant.

A shock of an earthquake was felt at Trichinopoly on Friday morning of 18—about a quarter before four. The shock lasted nine or ten seconds, passed on from west to east; not a cloud was visible in the heavens, which were beautifully clear.

1867. The town of Djocta in Java destroyed by an earthquake.

1872, 14th and 15th Dec., Lehree, Eastern Cutchee, destroyed by an earthquake, and about 500 persons killed.

Earthquakes occurred at Kulla-jo-Kuhar in Kohistan in 1873. On the 1st July there occurred a very severe shock about noon, and four or five shocks were felt between that and the next morning; most of them were preceded by a noise like that produced by firing a heavy gun.

On the 5th of August there was another earthquake at Kulla-jo-Kuhar. Two landsips took place near Kulla-jo-Kuhar, and slips in the Karo and Kamhu hills also.

On the 14th, at Kulla-jo-Kuhar there was another earthquake between five and six in the evening; and on the 15th there was another shock about the same hour, with similar noise, at Jakro, about two miles from Kulla-jo-Kuhar.

In 1876, in the Philippine Islands, earthquakes were altogether 41 in number, viz. 11 in North Luzon, 8 in South Luzon, 15 in Central Luzon, 1 in Mindoro, 2 in Maabate, 1 in Leyte, and 4 in Mindanao.

Captain W. J. Gill, R.E., travelled in 1877-8 on the western frontier of China, on the borders
The Parsee follow the fire-worship which seems to have been a corruption of doctrines taught by Zoroaster. The East Aryan races in India pursue a worship of nature, of spirits, and of demons; have adopted physiological doctrines as revelations, are worshipping deified mortals and heroes, and are believing in many incarnations of two deities called Siva and of Vishnu. They are spread all over India, and have imparted to its Prior occupants a considerable acquaintance with their religious books. These prior peoples constitute the bulk of the inhabitants of British India, and have merely added on to their own nature, and spirit, and devil-worships some of the legends and philosophical views of the East Aryan Hindu; and amongst them and the professors of Hinduism are a multitude of sects worshipping Siva, or Vishnu, or Brahma, or all of these, or their incarnations, or deified heroes, or a mere vikratham or idol of stone, or wood, or brass, with or without a form.

Another body of religious men, the Sikh, considerable from their activity and their late political power, converts from the Jit or Gete races in the Punjab, have adopted doctrines partly obtained from the monotheistic Mahomedans, and partly from the Aryan Hindu; but though their faith is only about 200 years in existence, they too have broken up into several sects.

The Mongolian, whether Scythian, Turk, or Tartar, is without imagination or strong reasoning powers, but is intrepid in danger, steady in purpose, overcoming all opposition, despising his fellows, a great conqueror. Such has been his character as long as history has recorded his name; he appears to have been made to command and to oppress. We find him in the infancy of the human race, as well as at later periods, descending from his far-distant mountains, emerging from the great deserts in Central Asia, and overrunning the most wealthy, the most mighty, and the most civilized of nations. He exercises power as his peculiar privilege and right—"Legard, Nineveh," ii. pp. 233 to 244; Burton's Mecca, iii. p. 44.

EASTERN GHATS run along the Coromandel coast for about 1000 miles from Balasore, running S.W. to Ganjam, thence to Naggery, near Madras, where they join the range which crosses the country in a north-easterly direction, from the W. Ghats, north of the gap of Palghat. The average elevation of the E. Ghats is about 1500 feet,—Cauvery Hills 4000 feet, Condappily 1700 feet, west of Madras estimated 3000 feet; hills seen from the Moghalbundi, between Point Palmyras and Chilka lake, appearing in irregular scattered groups, 300 to 1200 feet. See Ghats.

EASTERN PENINSULA, a term frequently employed to designate the Malay Peninsula, to distinguish it from the Western or Indian Peninsula.

EASTERN TURKESTAN, Chinese Turkestan, or Little Bokhara, may be described as the country to the east of the Pamir steppes. It is bounded on the north by the Tien Shan range, on the south by the Himalaya and Kousen Lun, and on the east by the great Gobi desert, which stretches away to the confines of China proper. This province was held by the Chinese, but in 1862 an insurrection broke out, and by 1864, Yakub Beg, the leader of the rebel forces, succeeded in completely ousting the Chinese, and seating himself on the throne. He evinced no small powers of governing, was brave, energetic, and prudent, and by his liberal treatment of merchants, and his merciless severity to robbers, did all he could to encourage trade. He was known under the name of the Kushbegi, or commander-in-chief, but he assumed the title of Atalgh Ghazi. He received with honor and distinction Mr. Shaw, who with Lieutenant Hayward penetrated into Yarkand, and he expressed a desire to send an envoy to the Cisjery of India. His brief career ended in his murder. The chief towns in Eastern Turkestan nearest to British frontier are Yarkand and Khotan. Williams in his Middle Kingdom gives the population of Yarkand, 200,000; Kashgar, 80,000; Siaram, 31,000; Aksu, 20,000.

The entire territory of Little Bokhara, assuming it to extend as far as the meridian of 90°, thus including the great lake of Lob, is sterile in the extreme, but relieved by large and fertile oases,—a feature common to the continuation of the desert eastward, where it becomes the great desert of Gobi or Shamo. The most important and best known oases are those of Kashgar, Yarkand, and Khotan. Of these, the first named lies at the foot of the southern spurs of the Tien Shan range, and consists of a well-watered tract, on the principal river of which, called by the same name, is the city of Kashgar. This was for many centuries the seat of an independent prince, but, after a rebellion in 1826, was reduced by the Chinese authorities to a secondary position in the district of Iii, of which Yarkand is the capital, and to which Khotan has also been attached. Kashgar city is in lat. 39° 25' N., and long. 74° E. (approximately); and the river on which it is situated, after a course of 300 miles, unites with that of Yarkand to form the Tarym, which, after a further course of 250 miles, falls into the great lake of Lob-nor. Both these streams are famous for the jasper and jade-stone which are found in their beds. Yarkand is situated in lat. 38° 10' N., and long. 76° 30' E., on a river of the same name. It is walled, but has an extensive suburb and has a population variously estimated at from 40,000 to 200,000. It has belonged to China since 1757, and is governed by Mahomedan and Chinese officials alternately. The environs are highly cultivated, producing wheat, barley, rice, fruits, and silk, and there is extensive pasturage. Yarkand is known to the Chinese by the name of Ya-lo-kiang. Khotan lies to the eastward of Yarkand, and is situated in an oasis said by the Chinese to be about 1000 li or 350 miles in circumference, immediately to the north of the Kara-korum pass. It is watered by a great number of streams, almost all of which flow into the Lob-nor. It contains the six towns of Khotan, Yurun-Khash, Kara-Khash, Djira, Keria, and Takhabin. Khotan city is situated in 37° N., and 80° 39' E., a position which very nearly corresponds with the site assigned to it as immediately to the N.E. of the Kara-korum pass. It is the Illi-ichi or Ho-tenant of the Chinese, and is supposed to contain about 50,000 inhabitants. It was originally a Hindu colony, and is supposed to have been founded about the 2d century, but the magnificent Buddhist temples and monasteries were all destroyed by the Mahomedan conquerors. The northern portion of Little Bokhara, under the
The **English East India Company** obtained their first charter from Queen Elizabeth in 1599. Their second charter in 1661, from Charles II., was extended in 1665. In 1702, Lord Godolphin united the old company with a new one that had been established in 1698, and renewed their charter in 1773, with a grant of a monopoly to China. When renewed in 1813, it was with permission for other merchants to trade; but a fresh charter in 1833 disconnected them wholly from commerce, made them entirely a political body, and permitted British subjects to settle in India. In the beginning of 1857, on a sudden moving of the martial races, the native army of Bengal revolted, and the predatory races in great portions of Northern India rose in a rebellion, which was only suppressed with much loss of life and at great expenditure of money; and it was then deemed advisable for Her British Majesty in 1858 to assume the direct government of the country, and to rule through a Viceroy, the first of whom was Lord Canning. On the 1st November 1858, it was proclaimed throughout India that its government had been transferred from the East India Company to the British sovereign.

The English East India Company, formed in 1599 by royal charter, had a capital of £30,133. Their first adventure of goods was to the value of £37,000, in five vessels under Captain Lancaster, and in the first fifteen years their profits were to the extent of two hundred per cent. In 1613 they were allowed by Jahanigir to settle in Surat. In 1634 Shah Jahan gave a firman for two English factories to be formed in Bengal; and subsequently, in gratitude for the benefits derived by one of the ladies of the zenana of prince Shuja, from them, he accorded to Mr. Doughton Shah Jahan granted the privilege to the English of free trade in Bengal. The first factory of the company was at Masulipatam, but in 1625 it was removed to Armegon, and subsequently (1639) Mr. Day removed it to a village in the territory of the raja of Chandragiri. Here he erected a factory, which was first called Fort St. George, but afterwards known as Madras. In 1662, Charles II. ceded Bombay to the company. In the time of James II., the company, in 1690, obtained the King's permission to send Admiral Nicholson with 12 ships of war, 200 pieces of cannon, and 600 men, to seize and fortify Chittagong, and establish a kingdom; but this proved a failure, and fresh troops were sent out under Captain Heath, who burned down Balsore, and proceeded to Chittagong. But, finding this too strong, he sailed to Madras, which, with Bombay, were the sole possessions remaining to the English. But at this time Amurzgeb had accepted the terms of peace which the English offered, and allowed them to return to trade. Accordingly, Mr. Job Charnock, on the 24th August 1690, landed on the left bank of the Hoogly, and laid the foundation of Calcutta. In 1698, the three villages of Calcutta, Chuttanuitti, and Govindpore were purchased for Rs. 16,000, and shortly after, during the reign of William III. of England, the fortress of Fort William was erected. About this time, 1698, a rival English company had been started, from which much injury resulted to the English interest; but on the 22d July 1702 these two companies were amalgamated, under the title of the United Company of Merchants trading to the East. In 1715
1561. Mr. Muir, in a tract published in 1621, estimates the quantity of Indian commodities imported into Europe, and their cost when bought in Aleppo and in India, as follows:—

Cost in the East Cost when brought into

£60,000 pepper, 3,000,000 6d.
16,875 6d.
5,000 6d.
4,000 6d.
1,000 6d.

1652-53, 27th February. English massacred by the Dutch at Amboyna. 1654, Dutch paid £2615 to the king.

1655-66. English abandoned as unsuited for commerce, Fort St. George, the nucleus of Madras, founded by Francis Day in 1639, was E. I. Co.'s earliest territorial possession, properly so called, in India. The land on which it stood, with an area roughly equal to that of England in length, by 1 mile in breadth, was purchased from the Raja of Chandragiri, and the factors at Armagoan were removed to it. The factory at Hoogly was established in 1644, and at Balasore in 1645. In 1665, a council of professional services rendered by Mr. Gabriel Boughton, surgeon of the Hopecell, to the Emperor Shah Jahan, additional privileges were granted to the company.

1646. The Governor of Bengal, who had also been professionally attended by Boughton, made concessions which placed the factories at Balasore and Hoogly on a more favourable footing.

1647. Original company and Sir W. Courten's association.

1653. Madras raised to a presidency.

1655-66. Land Cromwell £50,000, and obtain acknowledgment of their rights.

1655-66. First factory in Bengal of E. I. Co.

1657-58. Unite with merchant adventurers, and form a new joint stock.

1657. Charter of company renewed by Cromwell, and in 1661 confirmed by Charles II.

1658. Charter of company published at a factory at Kasimbazar (spelt Castle Bazaar in the records).

1659. 3d. April. Charter by Charles II. (Extended 1665.)

1661. Bombay was ceded to the British crown as part of the dower of Catharina of Braganza, but was not delivered up until 1665. King Charles transferred it to the East India Company, for an annual payment of £10, in 1668. The seat of the Western Presidency was removed to it from Surat in 1684-97.

1662-66. Sivaji founded the Maratha rule.

1664. The English I. Co. formed, and their capital built in 1674 at Pondicherry.

1664. In a work, "Treasure by Foreign Trade," p. 59, Mr. Thomas Mun, a director of the E. I. Co., was the first regard paid as an article of commerce.

1667-8, 24th January. The first notice of tea in the company's records. In a despatch to their agent at Bantam of that date, he is ordered to send home 100 lbs. of tea at the best he can get.

1667. Charter renewed ares, and authority to establish a mint at Bombay.

1667-75. Prohibit seamen from settling at Bombay.

1680, 28th October. St. Mary's Church, foundation-stone of the present St. Mary's at Madras.

1681. Sir Josiah Child published a treatise, in which it appears that the company then had 566 partners, 36 ships of from 100 to 775 tons; that the customs duties on the trade amounted to £90,000 or £70,000 a year.

1682. Benoist, settlement in, by E. I. Co. (Ceded to the Dutch, 1823.)

1684. Attempt to check interlopers.

1685-86. Resolved to prosecute interlopers in England; on account of hostilities against Moghul and Nawab of Dacca.
EAST INDIA COMPANY.

Queen Victoria was proclaimed Empress of India at a darbar of unparalleled magnificence held on the 3rd December, on the memorable day of the 14th of August, which was set apart by His Majesty, the 26th of November, and by us, for the purpose of celebrating the establishment of the new dynasty.

From the date of that small factory grant in 1613 at Surat, the English East India Company grew, in India, up to the year 1857. In that interval they decided the fate of kings, emperors, and rajahs, and had drawn under their direct rule 150,000,000 of people, with 70,000,000 more under allied sovereigns. Their dominion was at length in 1858 absorbed under the administration of the British Crown, consequent on a great revolt of the native sepoys army of Bengal, during which the predatory races of the north, and the dissatisfied and discontented of the south, took the opportunity to plunder and strive for independence, and during their efforts much innocent blood was shed, and many horrors enacted. In the century of their rule, however, amongst the servants of the company, there had been many great statesmen, many eminent commanders, and many learned men. For one hundred years large parts of India had been under their sway. During their rule they put down predatory warfare everywhere.

They established security of person and property from governmental aggression.
They introduced civil and religious liberty, instituted colleges, schools, museums, and polytechnic institutions for the introduction of a pure and rational philosophy, and the dissemination of knowledge.
They instructed the young in a knowledge of the medical science of the West.
The English language was made known to them. They formed and introduced the Hindustani language as a lingua franca. Molesworth's Maharatta Dictionary, and the works translated and published by Colonel Jervis and others, Morris's Telugu Dictionary, Campbell's Telugu Dictionary, Gilchrist's Hindustani Dictionary and Grammar, Shakespear's Hindustani Dictionary, have been published; Richardson's Burmese Dictionary, Morrison's Chinese Dictionary, and works on botany, natural history, medicine, and physical science.
They established printing and newspapers, and gave the freedom of the press.
They translated into many languages—the Bible, a book of pure morals.
They abolished mutilation and sanguinary punishments.
They abolished slavery in most parts of India.
They abolished sati, human sacrifices, and infanticide.
They put down thuggi and its kindred iniquities.
They placed the remotest parts of India in communication with the whole civilised world.
They abolished transit duties.
They formed roads and bridges on a scale unknown to India under any previous government.
They gave India the benefits of steam communication on its shores and rivers, and of railroads.
They introduced agricultural and horticultural societies for the improvement of cultivation and produce.
They established commercial chambers and banks, and displaced the innumerable coins of its former rulers by a new coinage.
They formed great dams on wide rivers, and excavated great canals for irrigation and traffic.
The English East India Company began as peaceable merchants, but, as is the custom of the East in all countries without police, they retained armed guards over their factories, which led on the one hand to defensive and aggressive acts, and, on the other, tempted needy soldiers of fortune to try to plunder them or to seek their aid,—acts which led them by degrees to the acquisition of their vast territorial possessions.
They formed a great and cheap army, about 300,000 strong, from amongst the conquered races, and with them they made conquests in India, in China, in Sind, in the Panjab, in Afghanistan, in Aden, in Burma, in Assam, in Arakan, and Tenasserim, and twice took Egypt.
They formed a powerful navy, which gave to the Company the great influence over the lawless tribes that fringe the coasts of the Red Sea and the Persian Gulf, and the east coast of Africa. Their work was partly war, partly political, and partly scientific, and they did thoroughly and well whatever fell to them to perform.
Their Courts of Sadr and Foujirdar Adalat, their Supreme Courts of Judicature, with Judges and Session Judges throughout the land, administered
to each race their own laws, and a great body of
magistrates, and Courts of Small Causes, furnished
the people with the means of obtaining justice,
and gave the Government the means of repressing
crime, with the blessing of internal peace and
progressive civilisation.

The service of the state was opened to every
Indian race, it having been provided by Acts 3
and 4 W. iv. c. 85, p. 87, 'That no native of the
said territories, nor any natural-born subject of
His Majesty resident therein, shall, by reason only
of his religion, place of birth, descent, colour, or
any of them, be disabled from holding any place,
office, or employment under the said company.'

EAST INDIAN is a term which has been
adopted by all classes in India, to distinguish the
descendants of Europeans and native mothers.
European and Indian were for a short time in
use, but have ceased to be employed, and other
names, such as Half-caste, Chatikar, and Chi-chi,
by the Hindus and Mahomedans of India, are
derogatory designations. Chatikar is from Chitta,
trousers, and Kar, a person who uses them. The
Mahomedans equally wear trousers, but concealed
by their long outer gowns. The East Indians
are also known as Farangi, a person of Europe,
similarly as Hyderabadis, Bengalis, and Hindustanis
are employed for natives of Hyderabad, Bengal,
or Hindustan. The humber East Indians, if asked
their race, reply that they are Wallandez or
Ollanday, which is a modification of Hollandais,
the name having been brought down through the
seventeenth and eighteenth centuries from the
Dutch, who were amongst the first who trafficked
with the East. East Indians have, in India, all
the rights and privileges of Europeans, and might
advantageously be so styled. They are of French,
Dutch, Danish, Spanish, Portuguese, and British
descent; but many of those of mixed Portuguese
origin—Xaviers, De Castellas, etc.—are merely
descendants of converts to Christianity or of
household slaves of Portuguese officers. East Indians
are chiefly employed as clerks in public offices in
all the subordinate civil departments of the British
Indian Government.

East Indian is a commercial term applied to
distinguish many vegetable products of that region
from others of similar character of other countries.
East Indian arrowroot, bird-pepper, copal, ebony,
galls, gum, indigo, myrrh, screw tree, tagamahacca.

EAST INDIES. This geographical term is used
to distinguish the tropical countries in the eastern
parts of the world, from the West Indies,
composed of the islands lying in the tropics
between North and South America. The term is used
by the British, the Dutch, French, Portuguese,
and Spaniards, to indicate their respective territorial
possessions in the East. The West Indies belong
principally to Great Britain, but to possess the
East Indies has been an object of ambition to
western races from prior to historic times. The
first great inroad of strangers into what is now
British India, was that of the Eastern Aryans,
about 3000 to 1500 years before Christ, who now
form the brahmical tribes of British India,
—intellectual men, but without territorial posses-
sions. Semiramis, B.c. 1200, moved with a
great army, and entered India from the N.W., but
was defeated and driven back with great slaughter.
Alexander of Macedon approached India from a
similar N.W. route, but he stopped short in the

Punjab, moved southwards along the right bank
of the river Indus, and then crossed the Baluchistan
desert to Babylon, where he died. Many Scythian
races, of whom, however, little is known, appear
to have advanced in India to the neighbourhood
of Gujerat, in the early centuries of the Christian
era. The Arab khilifs who succeeded Mahomed,
Mahomedans from Ghuzni, from the vicinity of
the Oxus, and from Persia, obtained possession
of great parts of the country now designated British
India, the British being the present rulers over
much of the lands which previous conquerors
obtained.

The Dutch East Indies, or, as that nation calls it,
Nederlandsche Indie, Netherlands India, are com-
promised in the great islands of the Eastern Archi-
pelago from Sumatra eastwards. They are the
rulers or paramount power of five-sixths of the
whole Eastern Archipelago.

The Spanish East Indies are chiefly the Philip-
pine Archipelago. The chief town of Manila was
founded in A.D. 1581, and they have continued in
undisturbed possession ever since.

The Portuguese, who of all the Europeans were
earliest in the field of conquest, now hold only
1086 square miles in the small settlements at Goa,
Daman, Diu, and Macao.

The French, who in the 18th century strove for
supremacy with the British, now hold Pondicherry,
Mahe, Chandernagar, Karikal, and Yanaon, with
Annam in Further India.

The Danes, until early in the 19th century, had
small patches of territory at Serampour, Negapatam,
and Chinsurah. There are many Rajput, Hindu,
and Mahomedan rulers in British India. Ceylon
is a British colony, and Burma, Siam, Acheen, and
other states are under independent rulers. See
British India; India.

EASTWICK, EDWARD B., of Bombay Army,
Assistant Political Agent, Kattyawar, Sind, 1839-
1842, was Professor of Hindi, Hindustani, and
Mahrati, at Haileybury. Author of Vocabulary
of the Sindi Language;—Dry Leaves from Young
Egypt, London 1847-1852;—Translator of Bopp's
Comparative Grammar, and of various standard
Hindustani and Persian works;—Editor of the
Autobiography of Lutfullah;—On the Revenues
of Khypoor; On the Pedigree of the Amirs of
Sind, published in Parliamentary Paper;—trans-
lated the Kissah-i-Sanjian, also the Zartash-nanah;
—wrote on Alore and Rohri;—translated Schiller's
Revolt of the Netherlands, Memoir of Pir Ham-
rao Khan, Bagh-o-Bahar, Anwar-i-Seheli, Gulis-
tan;—Author of Handbook of India, in four
volumes, and of the Kaisar-nanah-i-Hind, in three
volumes folio;—was private secretary to
Lord Cranborne when Secretary of State for
India; was Member of Parliament for Penrhy
and Falmouth, 1868–1874.

EASTWICK, CAPTAIN WILLIAM JOSEPH,
was born in 1808, and went to Bombay in 1827;
was with the field force under General Welsh at
Colnhpar, and in the S. Mahtram country. He was
the Political Officer attached to the army of Lord
Keane in 1858, and accompanied it through Sind.
He was entrusted with the negotiation of the
treaty of 1859 with the Amirs of Hyderabad,
by which the Indians was thrown open to commercial
enterprise, free of all imports and vexations inter-
ference. He held political charge of the districts
at the foot of the Bolan pass, constituting the
EBONY.

Loose of British military operations in Afghanistan. He was appointed Acting Resident in Sind. In 1847 Captain Eastwick was elected to a seat in the East India Direction, and in 1858 was appointed to the office of Deputy Chairman.

EBONY.

A black wood, exceedingly hard and heavy, of great durability, and susceptible of a high polish. It is exported from Upper Egypt, Abyssinia, Zanzibar, Madagascar, Mauritis, Ceylon, India, and Jamaica. The ebones of South-Eastern Asia are obtained from several species of Diospyros, Dalbergia, and Bauhinia, growing in the Mauritis, Ceylon, in several parts of the Peninsula of India, as Coimbatore, Malabar, Canara, the Dekhan, in the Circars, Ganjam, Cuttack, and Gunjur; also in Assam, the Malay Peninsula, in Penang, Siam, and eastwards through the Asiatic Archipelago to the Philippine Islands. True ebony is of so deep a black, as to be used to personify blackness.
